Before long, however, Henry began scheming to escape the intolerable controls. In 1261 the pope absolved him of his oath to the Provisions; Simon de Montfort, his most implacable opponent, went into exile; Henry was king again in fact as well as name. Success was short-lived. He needlessly antagonized some magnates; in 1263, as disorder spread, Simon returned to lead the insurgents. Later that year Henry and Simon agreed to submit to the arbitration of Louis IX of France. Louis declared in favor of Henry and condemned the Provisions of Oxford in the Mise of Amiens, 23 January 1264; civil war broke out.

Although it started auspiciously for Henry, with the capture of Northampton, he was defeated at Lewes, 4 May 1264, and forced to surrender. From May 1264 until August 1265 Henry was kept in confinement and Simon was the effective ruler of England. Henry was forced to accept a new system of government, concentrating power in Simons hands.

This scheme was intended to remain in force throughout Henry's last years and into the reign of his son Edward. But it offered no basis for peace, though Simon sought to strengthen his position by summoning representatives of the towns and counties to the parliament of January 1265. In May 1265 Edward, who had been a hostage for his fathers good behavior, escaped and defeated and killed Simon at the Battle of Evesham, 4 August 1265.

All Simons acts since Lewes were now annulled, his supporters deprived of their lands. But the rebels were impossible to subdue. Eventually, with the help of the papal legate, a settlement was devised in the Dictum of Kenilworth, 31 October 1266, by which the Montfortians were punished according to their degree of complicity in the rebellion. The bitter and devastating war with the "Disinherited" ended in 1267, the year that the Provisions of Westminster were reissued, in revised form, as the Statute of Marlborough.

The last years of Henry's reign were dominated by preparations for the crusade, led by Edward, which set out for the Holy Land in 1270. Henry died on 16 November 1272, but his widow, Eleanor, lived until 25 June 1291.

Henry IV (1366–1413; r. 1399–1413)

The only legitimate son of John of Gaunt, duke of Lancaster, a younger son of Edward III. Henry was born at Bolingbroke, Lincolnshire, probably in April 1366. Although a king's grandson, he could never have had any real expectations of becoming king and received no training for kingship.

He played a political role as one of the appellant lords who opposed Richard II and accused, or “appealed,” his close advisers of treason in the Merciless Parliament of 1388, but much of his early life was devoted to jousting, fighting in Prussia, and journeying to the Holy Land. Early in 1381, when only fourteen, he was married to Mary de Bohun, a joint heiress to the earldoms of Essex and Hereford, then aged about eleven. Their eldest son, the future Henry V, was born in 1387, and Mary died in 1394, leaving four sons and two daughters.

When Richard II banished him for life and confiscated the vast estates (1398), most of which he had inherited from his father, Henry had only two real choices: to remain in exile for life or to return and lead a rebellion. Joined by Archbishop Arundel of Canterbury, also exiled by Richard, and with a few other followers, he landed at Ravenspur, Yorkshire, in July 1399. Tenants of his Lancaster manors hastened to join him; his army grew rapidly, owing its main strength to the support of the Percys: Henry earl of Northumberland, Thomas earl of Worcester (Northumberland's brother, formerly steward of Richard's household), and Hotspur, Northumberland's renowned warrior son.

England was overrun without a fight. Richard was captured and induced to abdicate by the guile of Arundel and Northumberland. The oath that Henry swore at Doncaster—that he had come to claim his own inheritance, not the crown—was conveniently forgotten. On 30 September 1399 in the parliament at

Westminster, without specifying the exact nature of his title, Henry claimed the throne. Twelve days later he was crowned king. Holding the crown was to prove more difficult than winning it.

Among the nobility and gentry Henry found little support, and he was afraid to offend them by asking his parliaments for the taxes he needed. In the early part of the reign the great officers of state, the chancellor and treasurer and other counselors, were drawn from the humbler ranks of clerks and squires. Lack of money and financial inexperience were his greatest handicaps. Lavish grants from the royal revenues were made in the hope of winning friends and loyal support; they only added to the problem. Plots to depose Henry and restore Richard helped ensure the latter's death but did not end opposition to the new king.

Moreover in 1403 he married, as his second wife, Joan of Navarre, widowed duchess of Brittany, whom he may have met while in exile. A foreign queen, generously endowed with estates and a household that was, like Henry's, regarded by the Commons as extravagant, provided a further target for critics. Though earlier rebellions had been easily suppressed, the Welsh rising led by Owen Glendower proved a serious harassment for most of the reign. The Percys, entrusted to defend the northern border and to govern north Wales, defeated the Scots at Homildon Hill in 1402 but soon became discontented with the role Henry permitted them and with the payments he was able to afford them.

The Percys' first rebellion was defeated at Shrewsbury in 1403, owing to Henry's swift reaction. Hotspur was killed in battle and his uncle Worcester captured and beheaded, but the old earl of Northumberland lived to rebel again and finally to menace Henry from exile in Scotland. With his parliaments Henry had a constant struggle to secure money and to prevent them taking control of his council, from which his humbler friends were slowly excluded. After the Long Parliament of 1406 Arundel, his ablest counselor, became chancellor and controlled the government for several years but had to face new rivals: the emerging Beaufort family, the children of Gaunt's mistress and then wife, Katherine Swynford, and thus the king's half-brothers.

Meanwhile Henry had been stricken with the mysterious illness that disfigured, disabled, and eventually killed him. After several years of campaigning in Wales the king's eldest son, Henry, succeeded in defeating the rebels and now joined the Beauforts to control the council. Thomas Beaufort replaced Arundel as chancellor. At some point the Beauforts tried to force Henry to abdicate in favor of the prince, but as the plot failed evidence is almost entirely lacking. After some disputes, mainly over the question of war with France, a formal reconciliation between father and son was effected, and

Henry the usurper was able to leave his son an undisputed succession when he died in 1413.

Henry V (1387–1422; r. 1413–22)

The popular and Shakespearean hero-king *par excellence*, although liberal historians have been less impressed with his militarism and religious intolerance. Born in 1387 to the future Henry IV and Mary de Bohun, he was too young to be involved in the political intrigues of Richard II's reign. Richard took him to Ireland in 1399 and knighted him during this expedition, which opened England to the invasion and usurpation of Henry IV. Henry V would later rebury Richard among the kings at Westminster Abbey.

Young Henry was made Prince of Wales; from 1400 to 1408 he earned his spurs combating the Welsh revolt of Owen Glendower and the Percys. The prince played a major role at the Battle of Shrewsbury in 1403. During his father's illness (1410–11) Henry and his supporters dominated the royal

council, but Henry IV feared his ambition and differed with the prince over which faction to support as France fell into turmoil. The king removed his son from the council. The final two years of Henry IV's reign were a period of tension and frustration for the Prince, which may explain the later stories of his dissipated lifestyle.

Henry succeeded on 20 March 1413. He was faced with both religious and political plots that threatened the tranquility of his realm. His erstwhile friend Sir John Oldcastle, perhaps the model for Shakespeare's Falstaff, led a Lollard conspiracy in 1414 to kill the king and seize London. The conspiracy was discovered and put down, but Oldcastle remained at large until 1417, when he was taken and executed. The king remained a vigorous persecutor of Lollards. Henry, self-righteously pious, supported the efforts of the Council of Constance to end the Great Schism of the papacy, and he was a supporter of elaborate public liturgy. The king joined public worship and private devotion in his monastic foundations, a form of piety long out of fashion with monarchs. The palace at Sheen was to be restored, almost in anticipation of the Escorial (in Spain, by Charles V), with a Carthusian house and a house of Brigettine nuns.

On the political front Henry V was faced in 1415 with a plot led by the earl of Cambridge, Lord Scrope, and Sir Thomas Grey to eliminate the Lancastrian dynasty and declare the earl of March as the legitimate heir of Richard II. March revealed the plot to the king as Henry was preparing to invade France. The leaders were executed, and Henry, his domestic enemies all in flight, was free to pursue foreign ambitions.

Ignoring his questionable title to the English throne and sure of his right, Henry V revived Edward III's claim to the French crown, and it is with his French conquests that Henry is forever identified. France was torn by strife between the aristocratic factions of Armagnacs and Burgundians under the mentally ill Charles VI. Henry led a plundering expedition to Normandy in August 1415. The English captured Harfleur and then marched toward Calais. On 15 October they were overtaken by a vastly superior French army at Agincourt. Henry proved an inspirational leader who skillfully deployed his archers to win a stunning victory that encouraged English ambition and a desire for French wealth and ransoms.

Henry returned to Normandy with a second expedition in 1417, bent now upon a genuine conquest. When the Armagnacs murdered the duke of Burgundy in 1419, the new duke, Philip the Good, allied with Henry. Careful diplomacy and continued military pressure forced Charles VI to agree to the Treaty of Troyes, 21 May 1420. Under its terms Charles disinherited his son (the future Charles VII) in favor of Henry V, who became regent of France and married Charles's daughter, Catherine of Valois.

France south of the Loire remained defiant and unconquered. With the vital support of his Burgundian allies Henry pursued his conquests against the disinherited dauphin and his Armagnac allies. During the course of the campaign Henry contracted dysentery; he died at Bois de Vincennes on 31 August 1422, not yet 35 years of age. Charles VI outlived him by two months. Under the terms of the Treaty of Troyes the crowns of England and France passed to Henry Vs infant son, Henry VI, who grew up to be an incompetent and hopeless weakling.

Henry V's dream of a French conquest was lost by 1453, and he has been condemned by historians for squandering England's resources in an unattainable quest for foreign glory. Yet to contemporaries he was an heroic figure. A cunning propagandist and diplomat, a skillful and ruthless general, and—as historians are discovering—a just and careful administrator, he can be faulted for dying inopportunistly.

Henry VI (1421–1471; r. 1422–61, 1470–71)

The third and last Lancastrian was a remarkable king but far from a great one. Born at Windsor on 6 December 1421, the son of Henry V and Catherine of

Valois, daughter of Charles VI of France, he was the youngest monarch ever to ascend the English throne (1 September 1422); his minority was accordingly the longest.

His peaceful accession is a tribute to the stability won by Henry IV and Henry V after the Lancastrian revolution in 1399. Henry VI is also the only English king to have been crowned king of France (Paris, December 1431), thereby reaping the fruits of Henry V's campaigns and shouldering unique obligations of government and conquest. At age 31 he became one of the few English kings to suffer mental collapse, which fatally impaired his ability to govern. By 1450 his cousin Richard duke of York had already challenged his capacity to rule; he eventually (by 1460) challenged Henry's right to reign, and Henry was deposed by Richard's son, Edward (crowned as Edward IV), on 4 March 1461.

Unlike Edward II and Richard II he escaped death and thus was a rallying point for Edward IV's opponents, to the extent that Henry was restored to his throne in October 1470—the first king since the Norman Conquest to have two reigns. In 1471, when Edward returned and crushed his opponents with a new ruthlessness, Henry was put to death in the Tower of London on Edward's order (21 May). But the manner of his death made him a political martyr, and when his nephew Henry Tudor seized the crown in 1485, as Henry VII, Tudor propagandists exploited Henry VI's reputation as a martyred innocent, unjustly deposed by the usurping Yorkists, a myth designed to further Tudor claims to the throne. Henry VII sought to have him canonized, and only Henry VIII's break with Rome brought the process to a halt. Today the Henry VI Society keeps alive Henry's memory as a deeply wronged monarch.

The tragedy of Henry VI is matched by his disastrous rule. Shakespeare's portrayal of him, not as the central figure of his reign but as the passive victim of forces beyond his control, is not completely fictional. Generally acceptable arrangements were made for the government of England and English France after Henry V died. The baby king was put in the charge of relatives and respected soldiers, with Queen Catherine standing at his side until ca. 1431. He was bright and healthy, but tensions between his uncles—especially Henry V's brothers, John duke of Bedford (d. 1435) and Humphrey duke of Gloucester (d. 1447), and his great-uncle Henry Beaufort, cardinal-bishop of Winchester (d. 1447)—were disruptive for the realm and unsettling for Henry. These divisions were reflected in attitudes to the growing military crisis in France, precipitated by Joan of Arc's victories (1428–30), and they were not removed by Henry's coronation in Paris (December 1431).

The king was carefully educated in “good manners, letters, languages, courtesy, and nurture”; he had an instructive library and an interest in history, religion, and education (reflected, for example, in his fascination with King

Alfred). The most notable result was the founding of Eton College and King's College, Cambridge. But successful kingship demanded more than sound education and moral precept. As he emerged from his minority (ca. 1436), he seemed naive, trusting, and without a warrior's instincts. He governed increasingly by faction, based in his household, and he sought an end to the French war in which his father and the nobles made their reputations and fortunes. While Cardinal Beaufort and William de la Pole, earl of Suffolk, were his mentors, others, like the duke of Gloucester, were alienated.

The war and the "dual monarchy" of England and Lancastrian France stretched England's resources, and Henry tried radical ways to arrange peace, including releasing Charles, duke of Orléans (captured at Agincourt, 1415), marrying Margaret of Anjou (1445), and surrendering Maine. These were unpopular policies, and his commitment to Edmund Beaufort as chief adviser, after he had surrendered Normandy (1450), was resented by nobles, parliament, and soldiers.

The events of 1450—when Suffolk was murdered, the southeast rebelled under Jack Cade, and the duke of York returned menacingly from Ireland—were a severe crisis. Henry's mental collapse (August 1453) caused confusion in government and worsened relations between the court and York; the country was brought to the brink of civil war.

At St. Albans (May 1455) Henry was wounded in a confrontation with York, and thereafter Queen Margaret controlled both king and government. In July 1460 Henry was captured at Northampton by York's allies, the earls of Salisbury and Warwick, and forced to accept York as his heir. But when Warwick was himself defeated at St. Albans (February 1461), Henry was reunited with his queen and their only son, Edward, and fled to the north.

Captured in the north in 1465, he was imprisoned until Edward IV's own difficulties allowed Henry's ineffectual restoration (the "readeption" of October 1470). Nemesis came when his son was killed and his queen captured by Edward at Tewkesbury (May 1471); the pathetic monarch was killed shortly afterward. As a king Henry VI was incompetent rather than malevolent; though with laudable intentions and qualities admirable in a private person, he lacked the practical and political abilities to be a successful ruler.

Henry VII (1457–1509; r. 1485–1509)

Henry had two links with the house of Lancaster. His father, Edmund Tudor, was the son of a Welsh squire and Catherine of Valois, Henry V's widow. His mother, Margaret Beaufort, was a descendant of John of Gaunt.

Finding favor at the court of Henry VI, the Tudors sought refuge in Brittany after the return of Edward IV in 1471. Styling himself earl of Richmond, Henry cannot have seemed a serious threat to the Yorkist monarchy, but his prospects were transformed in 1483 when in rebellion against Richard III he forged an alliance between Lancastrian diehards and men loyal to Edward IV's children. In 1485 this coalition was successful, overthrowing Richard at Bosworth Field (22 August), establishing Henry VII on the throne, and securing the union of the Roses through his marriage to Elizabeth of York, Edward IV's daughter.

The establishment of the Tudor dynasty was Henry VII's main achievement. For the first few years his regime was precarious, but with the birth of Prince Arthur (1486) and the defeat of the Lambert Simnel rising (1487) it could be seen to be putting down roots. The king, however, had cause to be anxious until the end. The Yorkist imposter Perkin Warbeck proved troublesome until his capture and execution in 1499, and the death of Henry's heir in 1502 was a tragic blow. All depended on his second son, the future Henry VIII, who succeeded him peaceably in 1509.

Henry VII was an astute ruler, well schooled by his exile. His rule was characterized by caution and calculation and by a reliance on a select circle of peers, bishops, and knights, many of whom he had learned to trust as fellow exiles. His government was far from novel in terms of personnel and policies; continuities with Edward IV's reign are striking. In essence his rule amounted

to a reinvigoration of personal monarchy through the council, household, and chamber. In his strengthening of the crown and disciplining of the nobility he was favored by circumstances. The civil wars and difficult times under Richard III had weakened the aristocracy, giving the crown new scope for a broader power base in the political nation.

Henry is often remembered as a parsimonious accountant-king. In his early years he was not ungenerous, and lavish spending on pageantry and building projects indicates that he knew the importance of princely munificence. He also knew that money was power, and he used every means to strengthen the crown financially. Throughout his reign he imposed fines on recalcitrant subjects, and in his last years few great subjects were not ensnared in bonds for good behavior. In the last decade of his reign he was generally felt to be miserly and rapacious; his death in 1509 was a relief to many of his subjects.

Henry VII's reign was a time of economic and cultural revival in northwest Europe, and under him England shared in this general vitality. He took a prominent part in the emerging concept of Europe as a group of nation-states, led by the more visible "new monarchs," and was responsible for some striking diplomatic and trading initiatives, the most celebrated being the Treaty of Medina del Campo (1489) with Spain and his sponsorship of the Atlantic voyages of the Cabot brothers. England was ever more open to European cultural influence, Italian as well as French and Netherlandish. Henry invited the Italian humanist Polydore Vergil to write the *Hystoria anglica*, the best account of his reign. The Florentine artist Pietro Torrigiano executed the fine effigy under which he came to rest in his own chapel in Westminster Abbey.

Henry of Blois Plaques

The Henry of Blois Plaques (London, British Museum MLA.52, 3–27, 1), made before 1171, are two semicircular, concave, copper-alloy plaques (diameter 7.01, 7.05 inches), forged, engraved, gilded, and enameled in the *champ levé* technique (fig. 72). One shows two bust-length angels, one holding a chalice, emerging from clouds and swinging censers. The inscription around the curved edge reads:

The aforementioned slave shapes gifts pleasing to God. May the angel take the giver to heaven after his gifts, but not just yet, lest England groan for it, since on him it depends for peace and war. (Stratford 1983)

The other has a kneeling, bearded, and tonsured figure holding a crosier and proffering a rectangular object. An inscription identifies the donor as Bishop Henry. The border inscription reads:

Art comes before gold and gems, the author before everything. Henry, alive in bronze, gives gifts to God. Henry, whose fame commends him to men, whose character commends him to the heavens, a man equal in mind to the Muses and in eloquence higher than Marcus (that is Cicero). (Stratford 1983)

Once believed to be English, the plaques are now accepted on the strength of stylistic and technical comparisons with mid-12th-century continental manuscripts and enamels as Mosan workmanship (that is, originally from the Meuse Valley), possibly produced in England. Made for Henry of Blois between 1129, when he became bishop of Winchester, and his death in 1171, they originally belonged with a group of now lost plaques. Thus the two surviving inscriptions should not be read continuously. Traditionally Henry was thought to be clasping the shrine of St. Swithun. No document, however, specifically mentions his enrichment of this Winchester shrine, making it more likely that he offers an altar, which could have been commissioned by Henry for any English house. The two surviving plaques were perhaps attached to such an altar or possibly occupied the top and bottom terminals of an associated altar cross. They bear testimony to the close links between a prestigious English patron and a Mosan goldsmith during the mid-12th century.

Henry of Lancaster (ca. 1310–1361)

Son of Henry earl of Lancaster; second cousin and trusted adviser of Edward III; created duke of Lancaster in 1351. Henry was renowned throughout Europe for his military prowess, diplomatic skill, chivalry, and piety. His extensive estates descended through his younger daughter, Blanche, to her husband, John of Gaunt.

In 1354 Henry wrote a religious allegory, the *Livre de seyntz medicines*, which survives in two manuscripts and a fragment. Noteworthy for its lay authorship and relative originality, the book offers frequent glimpses into contemporary aristocratic life, from war and hunting to flirtation, feasting, and popular medicine.

Henryson, Robert (ca. 1425/35–1505)

Scottish poet. Although Robert Henryson was perhaps the greatest poet writing in English during the 15th century (his dialect was Middle Scots), little is known about his life. The only sure information is Dunbar's brief reference in "Timor Mortis Conturbat Me," amid mention of other dead Scots writers, to a "Maister Robert Henrisoun" of Dunfermline. The name is a common one, but a Master Robert Henryson, who may be the poet, is listed at the University of Glasgow in 1462 and as a witness to three deeds in Dunfermline during 1477–78. Many early manuscripts and prints refer to him as schoolmaster at Dunfermline, an important royal and monastic town. In unpublished notes to

his 17th-century Latin translation of Henryson's *Testament* (and Chaucer's *Troilus*) Sir Francis Kynaston tells a humorous if dubious anecdote about the poet's death, though he also perceptively notes his wit, learning, and literary skill. It seems likely that Henryson was born about 1425, though some would say a decade later; from Dunbar's poem we know he must have been dead by 1505. Perhaps a notary as well as a schoolmaster, Henryson does not seem to have held ecclesiastical office.

The three major works in the canon—the *Fables*, *Testament of Cresseid*, and *Orpheus and Eurydice*—are undoubtedly by Henryson, though we have no sure idea of their dates or order of composition. Some of the dozen or so short poems usually attributed to him are more doubtful. The textual tradition of Henryson's poetry is almost as uncertain as his biography. Most of the works are found in witnesses that date from at least 75 years after the presumed time of his death. Moreover the printed editions of his works (many of which have been lost or exist only in unique copies) are generally more authoritative than the surviving manuscripts, which were often copied from prints. Henryson's influence on later Scots literature was not great, and he was so obscure to English readers that his *Testament* was included in editions of Chaucer throughout the 16th century as the conclusion to *Troilus and Criseyde*. Its true authorship was not recognized in print until Urry's edition of Chaucer in 1721.

As is also true for Dunbar, Henryson's short poems are written in various genres and meters, which he handles with skill. They range from "Sum Practysis of Medecyne," an extravagant, and often gross, rhymed alliterative burlesque of quack prescriptions (supporting the belief of some that Henryson had studied medicine), to the devout lyricism of "The Annunciation." Most of the short poems deal with serious Christian themes, especially the uncertainties of this world. "The Ressoning betuix Aige and Yowth" and "The Ressoning betuix Deth and Man" are vigorous *memento mon* debates about the inevitable passing of earthly joy, which is also the subject of three powerful meditations: "The Praise of Age," "The Thre Deid Pollis," and "The Abbey Walk." A more humorous treatment of temporality is found in the superb and original *pastourelle* "Robene and Makyne," in which a shepherd returns a maiden's love too late. "The Bludy Serk" and "The Garmont of Gud Ladeis" are chivalric moral allegories in ballad stanzas, more vividly told than their probable sources. The metrically complex "Ane Prayer for the Pest" is a more topical poem whose sense of human powerlessness before the divine is also found in the poet's longer works. Like "Sum Practysis of Medecyne" "Against Hasty Credence" is fierce social satire (against flatterers) that may derive from Lydgate. Another secular satire, "The Want of Wyse Men," is probably not by Henryson.

The least well regarded of Henryson's major works is *Orpheus and Eurydice*,

a 414-line narrative in rime royal (with Orpheus's complaint in ten-line stanzas) followed by a 218-line *moralitas*, or moral, in heroic couplets. The poem tells the familiar story of how Orpheus's beloved wife, Eurydice, fleeing the attempted rape by Aristaeus, was bitten by a serpent and taken to Hades, where she was finally discovered by her grief-stricken husband. By his harp playing Orpheus made the infernal gods promise that she could leave with him, on condition that he not look back. Moved by affection, he did so look on the return journey and so lost her forever. The *moralitas* identifies Orpheus as the intellectual part of the soul, Eurydice as the affectionate part, and Aristaeus as virtue.

The narrative in *Orpheus and Eurydice* is based on Boethius's *Consolation of Philosophy* (book 3, meter 12), whereas the *moralitas* and some of the narrative details are based on Nicholas Trevet's commentary on the *Consolation*, itself derived from the commentary of William of Conches. The poem reveals Henryson's interest in human limitation, his poetic skill (especially in Orpheus's complaint), and perhaps even his allegorical audacity (as in his not unprecedented identification of the rapist with virtue). Very different from the ME romance *Sir Orfeo*, Henryson's poem is a learned, rhetorically sophisticated allegory that is also a defense of poetry. Like Boethius Henryson allows no explicitly Christian reference in this deeply Christian work.

The *Testament of Cresseid*, 79 rime royal stanzas plus Cresseid's complaint in seven nine-line stanzas, is Henryson's acknowledged masterpiece. On a cold night in Lent the poet reads Chaucer's account of Cresseid before turning to another book about her wretched end. Having become a prostitute after her rejection by Diomedes, Cresseid is then punished with leprosy by the planetary gods for her blasphemy in blaming her misfortune on Venus and Cupid. As she is begging one day with other lepers, Cresseid encounters Troilus. Though neither recognizes the other, Troilus gives her alms in memory of his lost love. After learning the identity of her benefactor Cresseid praises Troilus, blames only herself for what happened, makes her final testament, and dies.

Although the *Testament* is strikingly original, it obviously draws on *Troilus and Criseyde*, as well as on other Chaucerian poems. The formal descriptions of the planetary gods are based on traditional information, though the specific influence of Chaucer, Lydgate, Boccaccio, and the mythography of Pseudo-Albricus has been claimed. The relationship of the *Testament* to the somewhat similar story in the *Spektakle of Luf* (1492) is unclear. The poem reveals a detailed knowledge of medicine (in the account of Cresseid's leprosy), law, and meteorology. Henryson brilliantly adapts a number of literary topoi to his own purposes, including a seasonal opening, citation of a famous source, trial scene, complaint, and testament.

In part because its tone and structure are so deliberately different the

Testament is the worthiest successor to *Troilus and Criseyde*. Henryson not only understands but is also able to reproduce such diverse Chaucerian achievements as consistent but developing characterization, a believable pagan setting, deliberately obtuse narration, and rime royal (in contrast to the metrical ineptness of the English Chaucerians). Henryson is also virtually alone with Chaucer in his sympathy for Cresseid. Although some modern critics judge the *Testament* to be pessimistic or unforgiving, Henryson's Cresseid, for all her physical suffering, grows throughout the poem until, though still a pagan, she fully accepts responsibility for her own actions. Because the *Testament* was printed as the conclusion to *Troilus* beginning with Thynne's 1532 edition of Chaucer, most English Renaissance portraits of Cresseid (including Shakespeare's) depend as much on Henryson as on Chaucer.

Henryson's most complex work is the *Fables*, which consists of a prologue and thirteen beast fables, each with a narrative followed by a *moralitas*, for a total of 2,975 lines, mostly in rime royal stanzas. Beast fables in the Middle Ages were not only elementary school texts but also an important literary genre. The source for Henryson's prologue and seven of the fables is the popular 12th-century Latin *Romulus* collection now attributed to Walter the Englishman. Henryson also drew on Chaucer's *Nuns Priest's Tale* for "The Cock and the Fox" and, directly or indirectly, on Petrus Alfonsi for "The Fox, the Wolf, and the Husbandman." For some of the other tales he may have used other Latin fable collections, some version of the *Roman de Renart*, Lydgate's fables, Caxton's *Reynard* and *Aesop*, and the French Isopets, though specific borrowings are much debated.

Older critics saw the *Fables* as examples of social realism or rustic humor, but, without denying the political seriousness of these works or their insight into Scottish life, critics have increasingly appreciated their strictly literary achievement in recent years. The order of the fables seems carefully designed, and the wit of "The Cock and the Fox" at moments surpasses even its Chaucerian model. The prologue is a sophisticated discussion of the complex relationship between story and lesson, which is then demonstrated in the fables themselves. Henryson's moralities are not dull or dutiful but have an intricate, often ironic, connection with the preceding narratives and constantly challenge the reader. The pessimism with which the natural world is portrayed in the fables is less a questioning of divine justice than a passionate statement of our need for God's mercy. Henryson the man remains a mysterious figure, but his poetry, which is still too often treated as primarily regional, is the most substantial work in English verse between Chaucer and Spenser.

Heptarchy

The word is used in Anglo-Saxon history to refer to the seven kingdoms of Kent, Sussex, Essex, East Anglia, Wessex, Mercia, and Northumbria. The period in which these seven kingdoms were the basis of political organization is between the 6th and the 9th century. “Heptarchy” was already in use before the Scandinavian settlement of the 11th century, but it was given more general currency by such 16th-century writers as William Camden. Essentially it reflects the information provided by Bede for the kingdoms of the 7th and early 8th centuries. Popular in the writings of 19th-century historians, it has

now fallen out of favor.

The term is misleading; it tends to imply that all seven kingdoms were comparable in structure, development, and importance. In fact the differences among them are immense, and it has recently been suggested on the grounds of political importance that it would be better to characterize the period before ca. 800 as that of a Pentarchy: Northumbria, Mercia, East Anglia, Kent, and Wessex; and from the mid-9th century, a Tetrarchy, omitting Kent on account of its absorption by Wessex.

Certainly after the end of the 7th century neither Sussex nor Essex was a force to be reckoned with. Sussex, of some importance in origin legends recorded by Bede and the Anglo-Saxon Chronicle, was treated by Offa of Mercia as a subkingdom, ruled by *duces* and never to regain its independence. Similarly, Essex lost power to the Mercians in the 8th century; in the early 9th it was subordinate to Wessex. There is mention of an East Saxon king after 825, but it is unclear whether the kingdom survived until the Viking conquest of East Anglia.

The kingdoms of the Heptarchy were therefore never equal in importance, although at one moment or another each exercised some dominance over its neighbors. The chief evidence for this is again in Bede, in his famous list of seven kings who exerted authority over the other regions south of the Humber. The kings are Ælle of Sussex, Cælin of Wessex, Æthelberht of Kent, Rædwald of East Anglia, and Edwin, Oswald, and Oswiu of Northumbria. In addition Mercian dominance can be detected in Bede's narrative and more explicitly in the 8th-century charters of Æthelbald and Offa. A 7th-century charter also reveals a brief period of East Saxon overlordship in Kent, during the reign of Sigehere in the 680s.

The question of overlordship draws attention to another aspect of the political structure of the pre-Viking period obscured by the term "Heptarchy." Although the exercise of authority over neighboring kingdoms was an important element, each kingdom was also an overlordship, made up of individual regions, or *provinciae*, some of them apparently ruled by kings or subkings but subordinate to central authority or authorities.

These subkingdoms could be powerful in their own right and not much less significant than the smaller kingdoms of the Heptarchy. The most important subkingdoms are Deira and Bernicia, the two districts that together made up Northumbria. In the late 6th and early 7th centuries both had their own royal dynasties, in competition for overall control of a combined Northumbrian kingdom. Later there were occasions when each province had its own king, one usually being subordinate to the other. In addition, by the end of the 7th century, Northumbria included at least two British kingdoms, Elmet and Rheged.

Mercia was also made up of a number of provinces, some of which, like that of the Hwicce, had royal dynasties. The provincial structure of Mercia is seen in the Tribal Hidage, which lists at least some of the subordinate units. Wessex also included provinces, and Bede and Stephanus describe the takeover of Jutish kingdoms in Hampshire and the Isle of Wight, the last being an identifiable unit in the Tribal Hidage. In East Anglia, Essex, and Kent references to joint-kingship apparently provide further indications of the existence of separate provinces within the individual kingdoms.

The term “Heptarchy” therefore does not do justice to the complexity of the structure of pre-Viking England, nor does it allow for the considerable changes between the establishment of the Anglo-Saxons and the settlement of the Vikings. It implies that the seven kingdoms described by Bede were all created at roughly the same period (late 5th or 6th century) and that thereafter they constituted the backbone of English political geography.

In fact the origins of the kingdoms are obscure. Genealogies and regnal lists suggest that the ruling dynasties were established during the 6th century, but the origin legends of the Anglo-Saxon kingdoms, as preserved in such sources as the Anglo-Saxon Chronicle, need to be treated with the utmost care. Moreover it is clear from Bede that the process of state formation was still under way in the 7th century.

This is most apparent with Wessex. Not only does Bede describe the conquest of the Isle of Wight and the Jutish territories on the mainland, but he also states that the West Saxons had once been called the *Geuisse*, and he refers to them by this term in his account of the period before 688. Thus the kingdom of the West Saxons was being defined as such only in the late 7th century. Similar problems of nomenclature can be seen in references to the Northumbrians and the *Humbrenses*, suggesting that the kingdoms were still developing through the 7th century.

Thus, although at a superficial level “Heptarchy” is a convenient shorthand to describe the political situation revealed in Bede’s *Ecclesiastical History*, where seven kingdoms seem to emerge as being of importance, the term is misleading. It fossilizes a depiction that may have been relatively accurate when Bede wrote but does an injustice to the gradual evolution of the political structure of the 7th and 8th centuries and to the complex pattern of subkingdoms and overlordships that formed the basis of that structure.

Heralds and Heraldry

The term “herald” was applied by 1170, in France, to men who specialized in matters associated with tournaments. Heraldry were at first associated with minstrels and may be seen as an offshoot of that profession.

From at least 1272, and probably from as far back as 1194, English heralds were sent forth with some regularity to proclaim tournaments at royal and baronial courts, both in England and on the Continent. They would return with the replies of those challenged and then accompany their master to the place appointed. At the tournament they would announce the combatants as they entered the field.

From the heralds’ need to recognize knights in the contests developed a special interest in the cognizances, or “arms,” whose use (on shields, pennons, and banners) became general among knights between 1160 and 1220. By 1275 some English heralds were keeping books or rolls of arms to assist them in remembering the hundreds of distinct but often similar arms they encountered.

Thus “heraldry” came to be used more narrowly to designate the arcane “science” related to the design, description, analysis, and recognition of shields or coats of arms. This knowledge was gradually extended to the crest borne atop the helmet, to headgear of dignity (crowns, coronets, etc.), to badges worn by servants (ca. 1360), and to insignia of the Order of the Garter and other knightly orders.

By 1276 England was divided at the Trent into two territories, or “marches of arms,” each with a king of arms. Within his march each king oversaw matters touching tournaments, armorial bearings, and chivalry. Apprentice heralds were called “pursuivants of arms,” and by Edward III’s time kings of

arms, heralds, and pursuivants bore special styles of appointment: Norroy King of Arms (north of the Trent), Clarenceux King of Arms (south of the Trent), Windsor Herald, Hastings Pursuivant, etc.

From the 1330s heralds were entrusted with weighty diplomatic duties, though formal jurisdiction regarding duties and functions was loosely defined into the 15th century. Henry V created the office of Garter King of Arms, with precedence over the provincial kings. The kings of arms had the authority to visit the counties to determine who therein had the right to use armorial bearings and to record those arms that were legitimately borne. This ended the custom of assuming arms as men chose.

Within a few decades the officers of arms came to exercise the significant right to devise and grant armorial bearings, both to individuals and corporations—a right rarely seen outside England. On 2 March 1484 the principal members of the “office of arms” became incorporated as the College of Arms, with a building at Coldharbour in the City of London. Though Richard III’s letter patent to create the college was revoked after his fall, the college was reconstituted and reendowed in 1555.

Hexham and Ripon

The Anglo-Saxon churches of St. Andrew’s, Hexham, and St. Peter’s, Ripon, are linked by the figure of St. Wilfrid. Wilfrid became abbot of Ripon in 660, bishop of Hexham 686–91 and again from 702 to his death in 709, and was named bishop of York in 669. It was while he was bishop of York that he built

the churches at Hexham and Ripon. All that remains of the Wilfridian fabric of both churches are their crypts (fig. 73). There is also a small pre-Conquest apsidal chapel, possibly a mausoleum, east of St. Andrew's at Hexham.

Hexham was a typically Anglo-Saxon monastic site housing at least two churches, St. Mary's and St. Andrew's. A church dedicated to St. Peter may also have been located nearby, although the evidence for its existence is circumstantial (Cambridge and Williams, 1995). The church of St. Andrew was described by Wilfrid's contemporary biographer, Eddius, as multistoried. In the 12th century Richard of Hexham wrote that the church was divided into three stories and that it was possible to walk around the interior on more than one level, suggesting an elevation consisting of nave, gallery, and clerestory. The present church dates mainly from the 12th and 13th centuries; the nave is modern (1908), although evidence of a late-medieval nave has been uncovered (Cambridge, 1979, 1980).

The crypt at Hexham was constructed of reused Roman stone and originally plastered and painted. The main chamber is approximately 14 feet by 18 feet and covered with a barrel vault. There are three niches with cavities for oil lamps sunk into the walls. The relics housed within the main chamber would have been viewed through a grille from the smaller antechamber, which was approximately 9 feet by 5 feet. There are two approaches to the antechamber, the first via a long passage that leads from the exterior of the building down and along the north wall of the crypt and the second via a staircase that descends from the nave. While it is possible to enter and exit from both directions, it is most likely that movement was from the exterior, through the dark northern passage, into the light of the crypt, and on into the church. The symbolism of this movement from darkness into light would have appropriately mirrored the spiritual passage of the pilgrim. A third staircase to the south of the crypt was probably for use by the clergy but may also have provided an alternative exit for those not wishing to disturb proceedings in the church above.

Fig. 73. The Anglo-Saxon crypts at Hexham and Ripon. After H.M. Taylor (1978), vol 3. Reprinted with the permission of Cambridge University Press.

The crypt at Ripon is similar in design to that at Hexham, though not quite so complex. The main chamber measures 11 feet 6 inches by 7 feet 6 inches and is covered by a barrel vault; the antechamber measures 12 feet 6 inches by 4 feet 6 inches and is covered by a quadrant vault. As at Hexham the main chamber contains recessed niches for oil lamps but also a large niche in the east wall probably for relics. At Ripon there are only two passages, one passing along the north wall of the crypt and leading into the antechamber, the second leading directly into the main chamber from the south. It is possible that one was for use by the clergy, the other for the congregation, but it is more likely that one was an entrance and the other an exit, as attempts to move back and forth through a single passage would have led to congestion. The more neatly worked out system of entrance and exit at Hexham may indicate that it represented a slightly later improvement of the Ripon plan.

The design of both crypts is unusual and has no exact parallels. Wilfrid traveled extensively on the Continent, but the crypts do not copy continental crypt designs. They may, however, be an eclectic and original combination of specific elements borrowed from traditional plans.

Hides

The basic unit behind the term "hide" was the area of land sufficient to meet the needs of a single *familia*, or household. The Tribal Hidage (7th century, with 8th-century revisions), a tax levied on regions defined mainly in terms of old tribal units, assessed most of England south of the Humber in terms of hidage; 7,000 hides was regarded as appropriate for a substantial people, such as the Hwicce in the Severn Valley or the East Saxons, 300 or 600 hides for many small groups, especially in the Fenlands. Three hundred hides was later regarded as a reasonable endowment for a bishopric.

In early Anglo-Saxon times the term was not connected with exact measurements of area. Bede used the phrase "terra unius familiae" (later translated as "hide") freely. Drawing information presumably from a lost tribute list of a Northumbrian king, he described the Isle of Man as containing 300 such units, Anglesey 960. The two islands are of roughly the same size, but the fertility of Anglesey may account for the discrepancy. Bede's estimates rarely coincide with the Tribal Hidage, though both sources attribute 7,000 hides to the South Saxons.

The term "hide" was adapted for use in tribute collection and taxation and remained the basic unit for such activity for much of England throughout the Anglo-Saxon period. Kent was an exception; there the tax unit was the

“sulung” (plowland) or double hide, divided into four “yokes.” In much of the Danelaw the term “carucate” (again, plowland) took the place of the hide, and was normally divided, in Scandinavian fashion, into eight bovates. But for the Midlands, East Anglia, and most of the south the normal assessment units at the time of Domesday Book were the hide and its subdivision, the virgate or quarter-hide.

The hide was naturally closely associated with the amount of arable under the plow. For the eastern shires certainly, and probably for much of England, 120 acres was regarded as the proper arable constituent of a hide, with a virgate of 30 acres as the normal holding of a free peasant operating in an open-field system. In parts of Wessex there is evidence of a small hide of 40 acres. Land varied in quality. Hides and virgates and their cognates were primarily part of the sophisticated system of taxation in late Anglo-Saxon England, when the normal imposition of general tax was levied at the rate of two shillings per hide.

High Crosses

The high cross, or freestanding stone cross, is a monument type characteristic of the Anglo-Saxon period. The function of the high cross was primarily either commemorative or didactic, though crosses could also be used for the more mundane purposes of marking boundaries or consecrating ecclesiastical sites. Frequently the function of a particular cross is revealed by its inscription. The didactic function of the Ruth-well (Dumfriesshire) Cross ([figs. 111–14](#): see RUTHWELL CROSS) is emphasized by its inscriptions, all of which deal with

biblical events and many of which relate to contemporary liturgical texts; while the memorial function of the Urswick 1 (Lancashire) Cross is indicated by its inscription: “Tunwini erected this cross in memory of his *baurnæ* (son or lord) Torhtred. Pray for his soul.” Often, whatever its specific function, the cross itself is conceived as a tree of life, with the use of ornament (e.g., the vinescroll at Hexham in Northumberland or the flowering cross at Kirkby Wharfe in Yorkshire North Riding) or inscriptions (the runic poem at Ruthwell or the personal names included between panels of foliate ornament at Bewcastle) underscoring this symbolism.

Fig. 74. Bewcastle Cross, west face. John the Baptist with the Agnus Dei, Christ over the beasts, runic inscription, nobleman with bird. Courtesy of George Hardin Brown.

The origins and development of the high cross are subjects of controversy. Some scholars see it as developing in Ireland or western Scotland and spreading into England, while others see it as originating in the Anglo-Saxon areas and spreading west. There is also no consensus on whether the stone

crosses evolved from cross-slabs carved in shallow relief or from freestanding wooden crosses, though the latter has become the more widely accepted scenario.

The form of the cross-shaft may be either angular or round, while the form of the cross-head may take a great variety of shapes. Carved ornament also varies greatly. Some crosses received no ornament at all; others were decorated with elaborate patterns of interlace (Irton 1, Cumbria), vinescroll (Hexham), or animal ornament (York, Minster 2). The more elaborate crosses, such as the 8th-century Ruthwell and Bewcastle (Cumberland) crosses (fig. 74) or the 10th-century Gosforth (Cumberland) Cross (figs. 18–19: see ART, VIKING AGE), display complex iconographic programs whose exact meanings are still the topic of debate.

Styles and motifs vary chronologically and regionally. In the 8th century a classicizing early Christian influence is evident in Northumbrian vinescroll ornament; stylistically in the deeply carved monumental figures of Ruthwell or Bewcastle; and iconographically in the complex program of biblical motifs on such crosses as Ruthwell. Little Carolingian influence can be detected on the Anglo-Saxon crosses, although the classicizing style of the Reculver fragments and a number of the motifs on the Wolverhampton Pillar have been cited as having late-antique or Carolingian parallels. For the most part Carolingian influence on stone sculpture was indirect, via the 10th-century Winchester style of manuscript illumination. Scandinavian influence, on the other hand, is widespread and enduring. Scandinavian styles and motifs become prominent in the late 9th century, particularly in the north of England, and remain popular through to the Norman Conquest. The Viking period also sees a marked change from ecclesiastical to secular patronage.

The complexity of regional styles of sculpture during the Anglo-Saxon period is only now beginning to be appreciated, thanks to the work of the *Corpus of Anglo-Saxon Stone Sculpture*. This project promises to shed much-needed light not only on the origins of freestanding stone sculpture in Anglo-Saxon England but also on the development of forms, styles, and iconography throughout the Anglo-Saxon period.

Hild (ca. 614–680)

Hild (or Hilda) lived a dual life: 33 years as a princess, then 33 years as an abbess and teacher. Bede's *Ecclesiastical History* tells most of what we know about her. She was born ca. 614, posthumously and in exile, to Princess Breguswith and Hereric, a nephew of King Edwin (616–33). As a child she shared exile in East Anglia at the court of King Rædwald with her great-uncle Edwin. After Edwin regained his kingdom in 617, Hild returned with him to Northumbria. She may have observed his famous council in 627, after which she received baptism with him and 12,000 of his subjects on 12 April after religious instruction from Bishop Paulinus (*Ecclesiastical History* 2.13–14). When Edwin died in 633, Hild returned to exile in East Anglia with her mother, Breguswith, and her sister, Hereswith, who later married King Æthelhere there. In 647 Hild, probably a widow, became a nun and the following year founded the nunnery at Wear. In 649 she became abbess of Hartlepool and in 657 abbess of the double monastery at Whitby (OE *Streoneshealh*).

In 664 she hosted the Synod of Whitby, where King Oswiu of Northumbria decided that the English church would follow Roman practice rather than Irish (*Ecclesiastical History* 3.25). Her side lost, and she observed Roman rules thereafter. During her reign at Whitby she promoted the training of missionaries and scholars. Five of her students became bishops: Ætla, of Dorchester; Bosa, of Deira and York; John, of Hexham and York; Oftfor, of Worcester; and Wilfrid II, of York. Hearing Cædmon sing his inspired Hymn, she recruited him into religious life and sponsored his career as a composer of religious verse, probably used for conversion and strengthening faith

(*Ecclesiastical History* 4.24).

Hild suffered a long illness beginning in 674, dying on 17 November 680. One of the nuns of her monastery, Ælflæd, King Oswiu's daughter, succeeded her as abbess, ruling with her mother, Eanflæd. Several nuns saw visions of Hild's death and ascent into heaven (*Ecclesiastical History* 4.23). Her remains were translated to Glastonbury in the 10th century.

Hilton, Walter (d. 1396)

Mystical writer; a hermit probably until the mid-1380s, then an Augustinian canon at Thurgarton in Nottinghamshire. Probably to be identified with the bachelor of civil law recorded in Lincoln and Ely in the early 1370s; *inceptor* in canon law in the early 1380s. If he was an M.A. before proceeding to the study of law (which is not necessary), he would have been born in the early 1340s.

The chronology of Hiltons works is uncertain. Clark and Taylor have suggested that the Latin tract *De imagine peccati* was Hiltons earliest extant work, written soon after 1381–82. The letter *De utilitate et prerogativis religionis* (or *Epistola aurea*), written to encourage Adam Horsley in his decision to lay down civil office and enter the Carthusian order, was probably written shortly before 1387. The idea of the perversion of the human soul from an image of the divine Trinity into an image of sin is important particularly in

the first of these pieces and in the first book of Hilton's most important work, the English *Scale of Perfection*; there are also similarities between *Scale I* and the *De utilitate* and his English letter *On the Mixed Life* that suggest that all four of these works were written in the mid-1380s. Hilton probably wrote his *De adoracione imaginum*, an anti-Wycliffite defense of the use of images (painting, sculpture, etc.) in worship, in the late 1380s.

The dating of Hilton's other writings is even less certain. These works include the English translations of *Eight Chapters on Perfection* by Lluís de Font, an Aragonese Franciscan contemporary of Hilton's at Cambridge, and the Pseudo-Bonaventuran *Stimulus amoris* (*The Pricking of Love or Goad of Love*); commentaries on the texts "Qui Habitat" (Ps. 90:1) and "Bonum Est" (Ps. 91:1); and *On Angels' Song*, a work on the dangers of seeking physical expression of mystical experience. The attribution to Hilton of a further English commentary on the "Benedictus" is unsure. Three other Latin treatises survive: the *Epistola de lectione, intencione, oracione, meditacione et aliis*, the *Epistola ad quemdam seculo renunciare volentem*, and *Quantum ad futura* (also known as "Firmissima crede"). Finally we should note that the second book of Hilton's *Scale of Perfection* probably marks the culmination of his thought and experience.

Because the two books of *The Scale of Perfection* were written as many as ten years apart, their relationship to each other has been a major focus of the discussion of Hilton's works. Prospective editors of the *Scale* have noted the presence of a long expository passage on the devotion to the name of Jesus (and two other similar passages) apparently added to the text of *Scale I* after it was already in circulation, as well as a number of smaller additions and rewordings, many of which appear to focus on devotion to the person of Christ, rather than the Trinity or the Godhead itself. All of these christocentric additions and alterations were added in the margins and on inserted scraps of paper in BL Harley 6579, on which all modern editions of the *Scale* to date have been based. Despite this widespread editorial practice the current consensus of scholars and textual critics is that the "Holy Name" passage and the passages similar to it were probably added by Hilton himself, whereas the "christocentric" additions were made by later scribes. The forthcoming EETS edition of the *Scale* will therefore base *Scale I* on a manuscript whose text predates both the "Holy Name" and the "christocentric" additions, as well as the writing of *Scale II*. The importance of this textual decision is that it renders invalid a good deal of earlier discussion of the "christocentricity" of Hilton's mysticism.

Probably the most important idea in Hilton's works is that of the human soul as an image of the divine Trinity, perverted into an image of sin: an idea that originates in Augustine's *De Trinitate* and is expanded upon by the

Victorines and the early Franciscan writers. According to this trinitarian psychology the soul comprises the faculties of Memory (or Mind, as it was usually translated into ME), corresponding to the Father; Understanding (or Reason), corresponding to the Son; and Will, corresponding to the Holy Spirit. Through original sin, however, the soul has been perverted into the image of the seven deadly sins. Because the recently enclosed anchoress for whom Hilton wrote *Scale I* could not read and meditate on the Latin text of scripture, Hilton proposes for her an exercise of introspection aimed at discovering and extirpating each of these sins in herself.

Hilton's contemplative exercises for his anchoress correspondent go significantly beyond the meditation on the Passion of Christ that was normally enjoined upon women at that time, though he does briefly discuss such Passion meditations, immediately before proposing his more introspective exercises. This same concern with providing alternative modes of contemplation for nonmonastic or nonclerical audiences also informs his letter *On the Mixed Life*, whose opening sections echo those of *Scale I*. In this innovative treatise Hilton proposes a life of both action and contemplation to a man whose worldly activities and responsibilities do not allow him to retire from the world as a monk or hermit but who feels the same stirrings of devotion that they do.

In *Scale II* Hilton covers much of the same ground as in *Scale I*, with greater psychological and theological precision. Clark has suggested that at one point, at least, his intention was to express more carefully an idea for which he had been criticized (anonymously) in *The Cloud of Unknowing*. *Scale II* describes particularly the progress from "reformation in faith" to "reformation in faith and feeling" (i.e., the point where one actually feels as true what one had previously known only by faith), culminating with the allegory of the journey to the heavenly Jerusalem and a discussion of contemplative prayer and the special gifts of God.

Hilton's works were influential in the century immediately preceding the Reformation, surviving in numerous manuscripts, transmitted in Latin to continental Europe, and printed several times at the end of the 15th century and the beginning of the 16th.

Hoccleve, Thomas (ca. 1366–1426)

Poet, scribe, and minor bureaucrat; author of *The Letter of Cupid* (1402), *La Male Regie* (1405–06), *The Regement of Princes* (1411), a compilation in verse and prose now known as the *Series* (including the *Complaint*, the *Dialogue with a Friend*, and *Learn to Die*; 1419–21), and many shorter religious and

political poems.

Hoccleve's biography looms large in any account of him as a poet, since his supposedly autobiographical passages constitute the main attraction for modern readers, treating as they do Hoccleve's poverty and mental breakdown in an often subtly comic or moving manner. At the same time caution must be exercised in accepting these passages as historical. What is certain is that from 1387 Hoccleve was a clerk at the office of the privy seal in London, where he remained for the rest of his working life. The last payment to him is made in 1426, where he is described as "lately" a clerk of the privy seal. In his *Complaint* he describes the result of a mental breakdown he had five years earlier; his payment for 1416 was paid to him through friends. Most of his poetry is addressed to powerful patrons, often in the explicit hope of reward.

The Letter of Cupid, a translation of Christine de Pizan's *Epistre au dieu d'amours*, praises the virtues of women. It survives in ten manuscripts, two of which are autographs (Durham University Cosin Vii. 13 and Huntington HM 744). *La Male Regie*, written in the form of a confession for a misspent youth, is really a well-shaped begging poem; it is found in Huntington HM 111, another autograph, which contains many other short occasional and religious pieces by Hoccleve. Hoccleve's largest work, *The Regement of Princes*, is in the "mirror for princes" genre and is largely indebted to Latin works in the genre; 45 manuscripts contain the text, of which BL Arundel 38 and Harley 4866 are the most authoritative. The complete *Series* appears in five manuscripts, of which Durham University Cosin V.iii.9 is an autograph, except for the *Complaint*.

Hoccleve claims Chaucer as his master and friend (e.g., *Regement* 2077–2107, 4982–98). From Chaucer Hoccleve certainly learns much, in particular, perhaps, the presentation of the author's own persona in his work as a self-deprecating and naive character. But in Hoccleve's case this topos dominates the poetry (see especially *La Male Regie*, the Prologue to the *Regement*, and the *Series*), and discussion of it has dominated recent critical studies. Some critics take Hoccleve's selfpresentation as purely conventional, whereas others have tried to define the ways in which Hoccleve draws on conventional topoi to negotiate his way out of the crises of poverty and mental instability.

Holy Week and Easter, Music for

The later medieval church celebrated Holy Week and Easter with many unique liturgical forms and ceremonies, often of an intrinsically dramatic character. These included major processions on Palm Sunday, Maundy Thursday, Holy Saturday, and Easter Sunday; the singing of the passions during mass as the New Testament Gospel on Palm Sunday (St. Matthew Passion), Wednesday (St. Luke Passion), and Good Friday (St. John Passion); and in many locales in northern France and England, the performance of two Latin liturgical dramas—the *Visitatio sepulchri*, performed at the end of Matins on Easter Sunday morning, and the *Officium peregrinorum*, performed at Vespers that same evening or on the Monday or Tuesday following. Music is a less significant if still salient component of the extraliturgical, primarily spoken vernacular dramas and cycles of Eastertide and Corpus Christi.

Before the 15th century only a few of these occasions attracted written polyphony in England. There are motets on the Passion of Christ, the Resurrection, and on Mary Magdalene at the tomb, but their performance

contexts are uncertain. There are also polyphonic settings of the refrain hymn *Gloria laus et honor* for the Palm Sunday procession, the *Alleluia pascha nostrum* for Easter mass, and the verses of two antiphons sung in processions to the Cross on Easter and subsequent weekdays (*Crucifixum in came* from *Sedit angelus* and *Dicant nunc Iudei* from *Christus resurgens*). In the 15th century, however, the written repertoire was expanded into a significant corpus of liturgically rooted, functional polyphony for the processions and passions. This was music distinct in its sources and patterns of transmission from the elaborate English polyphonic mass cycles, motets, and antiphons that circulated so widely at home and on the Continent in the same time period. Several of its sources, including Shrewsbury School, Manuscript VI (ca. 1430, from Lichfield Cathedral), and BL Egerton 3307 (ca. 1440, perhaps from St. Georges, Windsor), are relatively comprehensive in coverage and arranged in clear liturgical order.

The 15th-century music for Holy Week and Easter consists of unpretentious settings, mostly for two or three solo voices, some based on chant but most freely composed; it is highly probable that a tradition of simple, improvised settings lies behind these only slightly more sophisticated pieces and continued alongside them well into the 16th century. The music for processions includes settings of processional hymns, antiphons, psalms, and litanies. In the passions, a more extended form mixing chant and partsong, polyphony was applied to all direct speech apart from the words of Christ, thus including the words of the crowd (*turba*) and other individual characters. The narrative passages of the Evangelist and the words of Christ remained in plainsong following traditional “Passion tones.” Performance of the passions had from an early time taken an essentially dramatic approach, indicated by *litterae significativae*, or letter symbols, that distinguished roles in the biblical text and prescribed qualities of performance for the reader. In missals of the English Use of Salisbury these letters were *m* (*media vox*) for the Evangelist, *b* (*bassa vox*) for Christ, and *a* (*alta vox*) for the rest. The English passions, setting only the *a* words polyphonically, are the earliest in a lengthy and distinguished European musical tradition.

Hospitals

Medieval English hospitals differed completely from their modern counterparts; besides being small (usually with a mere handful of inmates, rarely able to accommodate 100 beds), they were almost always religious institutions, either part of a monastery or run by secular clergy on behalf of pious lay people.

Their function was also different; rather than caring for anyone who was ill, they catered only to those who could not afford medical treatment (customarily administered at home, even in extreme cases), as well as offering shelter for the deserving homeless, the aged poor, and travelers. Many hospitals refused to admit pregnant women, but a few in larger cities provided refuge for those who had "gone amiss," equipping their unfortunate offspring with a rudimentary education. Special hospitals (to a number over 350 during

the high Middle Ages) were set up for the isolation of lepers, and others took custody of dangerous lunatics; the aim was to detain rather than to cure.

Well over 750 almshouses were founded in England before 1547, part of a growing fashion for the performance of good works to speed the donor's soul through purgatory and to ensure his or her lasting fame on earth. Londoners like Richard Whittington (d. 1424) and such noblemen as William de la Pole, duke of Suffolk (d. 1450), led the van in this respect; less impressive foundations were endowed by guilds and fraternities to care for brethren who had fallen on hard times. English hospitals offered little in the way of professional medical care, concentrating mainly on cleanliness, tranquility, and a nourishing diet. There can, however, be little doubt that some monks could prepare complex remedies and were in many ways as skilled as trained physicians.

The health of the soul was placed well above that of the body, with the result that all but the feeblest patients were obliged to participate in an incessant round of prayer and meditation. Since many hospitals were housed in the naves of churches, in sight of the high altar, the common requirement that prayers should be said daily for the soul of the founder was easily enforced. The practice of using the wardenship of a hospital as an ecclesiastical preferment encouraged abuses and financial problems; the later Middle Ages saw the creation of royal commissions to investigate incompetent or dishonest administration. Church authorities also were concerned about the possibility of sexual misconduct when nuns were employed in menial nursing tasks.

But money was always the major problem. All institutions relied heavily upon charitable donations and bequests in kind as in cash. Despite these shortcomings medieval hospitals provided a welcome haven for those "poore, sykke, blinde, aged and impotent persones" who, after the Dissolution of the monasteries in the 16th century, found themselves destitute and without succor.

Households, Royal and Baronial

From the outset Anglo-Saxon kings surrounded themselves with permanent entourages that developed gradually into the sophisticated establishments known to us from 7th-century sources. As well as undertaking essentially domestic tasks, the household staff (in particular those of the bedchamber and wardrobe) acted in the financial and political sphere, since, being constantly about the monarch's person, they were available to perform his wishes. Throughout the Middle Ages the household was both a public and a private extension of his person, and it is often impossible to separate the dual functions, especially under strong rulers like Edward I or Henry V.

Contemporaries certainly made attempts to differentiate between ministers of state and offices of the household; it was taken for granted that government by the monarch would be personal, effected through his intimates. The only question was the cost and relative efficiency of such a system and occasionally the king's capacity as a judge of men. The *Constitutio domus regis* provides a valuable and early insight into the royal household in the reign of Henry I, by which time a further subdivision into departments headed by the chancellor, treasurer, chamberlain, stewards, and butler had occurred.

Over the next century the treasury, exchequer, and chancery were split off, to work separately at Westminster, but the chamber (with the privy seal) still perambulated with the king, meeting routine expenses and urgent fiscal needs. It was in response to growing demands for money that the wardrobe, hitherto a storehouse for the monarch's goods, began to demonstrate the flexibility and potential for expansion characteristic of each component of the household. By the late 13th century it was playing a leading role in the government, notably on overseas campaigns, when it functioned much as a modern war office.

A set of household ordinances from 1279 shows the wardrobe not only as “the brain and hand of the court” but as a highly complex financial and administrative machine. This system worked when the king was assertive and able (although Edward I left a great burden of debt), but Edward II's reliance upon unsuitable and unpopular favorites led the baronial opposition to

demand a purge of the household and the implementation of further ordinances (1318 to 1326), designed to impose accountability.

It was partly as a result of these reforms, concentrating on the wardrobe, that Edward II began to exploit the chamber as a potential organ of government. This trend was continued by Edward III, whose costly foreign wars provided an impetus for further developments along similar lines. Parliament voiced strong opinions about the composition of the royal household, either because of corruption and incompetence (as during the dotage of Edward III) or in response to the emergence of a powerful and politically unacceptable “court party” (as in the reign of Richard II).

Richard’s decision to defy his critics by augmenting the military element of his entourage and employing an inner ring of royal knights to enforce his absolutist policies led to his deposition. Henry V deployed experienced soldiers in the household, so he might pursue war with France; this was hailed as evidence of *his* strategic skills.

The character of the monarch thus remained a vital factor in determining the strengths and weaknesses of the household, not least as far as finance was concerned. The feeble and unworldly Henry VI hopelessly overspent the budget of £10,000 a year assigned him in 1440; by 1449 household expenses had reached the staggering total of £24,000 a year and were still rising, despite parliament’s insistence on economies. Part of the problem was the sheer size of Henry’s establishment, increasing from 360 people (well above the level maintained by Henry V, and about that supported by Edward III and Edward IV) in 1437, to 420 ten years later.

Shrewder and more businesslike, Edward IV initiated improvements—set out in the Black Book (1472) and Household Ordinances (1478)—with the intention of rationalizing expenditure. He kept his outlay well below £12,000 a year, while giving the impression of splendor and majesty.

Baronial households likewise served to advertise the wealth and magnificence of the aristocracy, who regarded investment in lavish entertainment, hospitality, and spectacle as money well spent. Indeed the crown was always aware of an element of competition from this quarter, which explains why savage cuts were never seriously attempted at court. Justice Fortescue’s famous maxim that “subgettes woll rather goo with a lord that is riche and may pay their wages and espenses then with thair Kynge that hath noght in his purse” illustrates the importance of ostentatious display to demonstrate political and financial power and attract support.

During the 15th century Humphrey, duke of Buckingham (d. 1460), spent £2,200 (or half his net income) on his household; George, duke of Clarence (d. 1478), set aside about twice this sum on an establishment of 299 staff, whose annual food consumption came to 365 tuns of ale, 2,700 sheep, and 650 quarters

of wheat.

Like the royal model, baronial households were divided into separate departments, headed by a treasurer who controlled overall expenditure and presented annual accounts. These were compiled from books kept by the clerks or yeomen responsible for the kitchen, pantry, chamber, stables, kennels, and other offices, and the level of supervision was high. Right up to the close of the Middle Ages, when a more sedentary lifestyle became fashionable, noblemen pursued a peripatetic existence, traveling with great baggage trains from one castle and manor house to another, with a smaller “riding” household in constant attendance. This enabled them to keep an eye on their far-flung estates and eased the problem of purveyance; the lord could move elsewhere once the reserves of an area had been exhausted.

Hubert Walter (d. 1205)

Archbishop of Canterbury and a leading royal official during the reigns of Richard I and John, who combined the administration of church and state.

Trained in the household of his uncle Ranulf de Glanville, the justiciar, Hubert served as a baron of the exchequer and rose from dean of York to bishop of Salisbury before joining Richard I on the Third Crusade. On the death of Archbishop Baldwin of Canterbury Hubert became the principal clerical leader on the crusade and close adviser to the king.

Though captured while returning from the crusade, King Richard was able to send letters to England successfully urging the election of Hubert to the vacant see of Canterbury in 1193. Two years later the pope extended the archbishops authority by naming him papal legate for England.

From 1193 to 1198 Hubert was justiciar and headed the government in Richard's absence. His extensive instructions for the judicial eyre (judges traveling on a circuit) of 1194 provide the basis for his administrative reputation. Through these detailed administrative and judicial instructions he was responsible for establishing the office of coroner, and he also began the practice of keeping a third copy on file when land disputes were settled by a final concord.

Archbishop Hubert was persuaded to support John as successor to Richard, in 1199, and he helped prepare John's acceptance by the barons. Under John he became chancellor. As chancellor he is credited with beginning the practice of enrolling copies of charters and letters issued from chancery.

Hubert's sarcophagus can be seen in Canterbury Cathedral, and various objects removed in 1890 are on display in the cathedral museum.

Hue de Rotelande, or Rhuddlan (fl. 1174–91)

Anglo-Norman poet; author of two long courtly romances, *Ipomedon* and its

sequel, *Protheselaus*. He lived at Credenhill, near Hereford, and wrote for Gilbert Fitz-Baderon, lord of Monmouth. References in his work suggest his friendship with Walter Map. His romances, set in Norman Sicily and Calabria, are constructed from conventional romance plot elements; they are, however, remarkable for their rhetorical and psychological sophistication and their humorous burlesque of a genre only recently established in French courtly poetry. *Ipomedon* was adapted into three ME versions.

Hull, Eleanor (ca. 1394–1460)

Translator from the French of a commentary on the seven Penitential Psalms and a collection of prayers and meditations, both extant in CUL Kk. 1.6, and the latter also in University of Illinois MS 80.

Daughter of Sir John Malet of Enmore, Somersetshire, Eleanor married Sir John Hull ca. 1410 and bore one son, Edward (d. 1453). She served Queen Joan of Navarre, Henry IV's second wife, and was associated with the Benedictine Abbey of St. Albans. Widowed before 1421, she often stayed at Sopwell, a

priory of Benedictine nuns, and never remarried. Later she retired to the Benedictine priory at Cannington, near Enmore, where she died.

Eleanor's meditations are composed in a common style of affective piety; in contrast her commentary on the Penitential Psalms, which draws heavily on Augustine and Peter Lombard, is learned and latinate. Her prose is competent by the standards of ME translation: generally she controls her long sentences, probably modeled on the "style clerical" of her French original; there are no obvious gross mistranslations; her vocabulary is not excessively Gallic; and she skillfully works in the Latin quotations that are an integral part of the commentary. It is the work of an honest craftswoman carrying out a task for which she had few models, except perhaps Rolles *English Psalter*.

Hundred Years War

The historical context of the Hundred Years War (a term first used, in its

French form, about 1860 and popularized in English by J.R. Green in his *Short History of the English People* [1874]) is the broadly contemporary development of French and English nationhood, expressed in territorial expansion, in the English case through war in Wales, Scotland, and France from the 1270s to the 1450s. In England it was also the result of a growing sense of national consciousness and pride, shown in the perceived obligation to defend territorial interests in France when the kings of France tried to bring them under their control by emphasizing their dying sense of feudal superiority over the kings of England.

In the early 14th century western Europe was at a crossroads. The conflicting attitudes of French and English kings (“feudal” on the one hand, “national” on the other) toward the future of lands in France, ruled by successive kings of England, were at the roots of a war that was to witness England’s disengagement from her historic links with territories now passing under the effective rule of the crown of France.

The sequence of events leading up to the war may be regarded as having begun in 1259, when Henry III renounced his claim to former English lands in return for a new feudal relationship in Aquitaine. A series of acts of confiscation by the French crown soured relations in the coming years. On the death in 1328 of the last Valois-king, Charles IV, Edward III claimed the French crown through his mother, Isabella, Charles’s sister. The claim was rejected. Soldier that he was, Edward could not tolerate such an action. War, he hoped, would settle both this problem and the uneasy status of Aquitaine. By 1340 the two kingdoms were at war.

While some of the war’s battles are well known, there were few formal encounters between opposing armies in the years to come. English practice was to launch *chevauchées*, or raids, into France’s heartlands from a number of points on the coast, such raids being carried out by armies ranging from 5,000 to 13,000 fighting men. It was on one such expedition, led by Edward III and Edward the Black Prince in 1346 that, after a campaign of looting and pillaging, the English army was caught at Crécy, in northern France, and secured victory by using its archers to the best effect. Ten years later, the Black Death having in the meantime taken its toll of the population, the Black Prince met and defeated a French army near Poitiers and took the French king, John II, prisoner.

Two great defeats, the capture of the king, and social troubles at home made France seal a treaty that was territorially favorable to England, at Brétigny in 1360. While the main issues were not settled, direct confrontation between England and France was to be avoided for a decade, although in 1367 the Black Prince won a major victory at Najéra, in northern Spain, in a war closely connected to the main conflict.

In 1369 the war began again. In the next quarter of a century English fortunes declined considerably and the French gradually regained lands ceded in 1360. With the death of the Black Prince (1376) and Edward III (1377), and with Richard II on the throne, a king more inclined to peace, negotiations began. In 1396 a 28-year truce was arranged.

Little more than half that time had elapsed when Henry V, convinced of the justice of his claims, invaded in 1415 and won the historic victory at Agincourt. Finding that the French would not meet his demands, he returned in 1417, but with a different aim; this was now to be a war not of raids but of conquest and settlement by Englishmen. By 1419 he had won Normandy by following a policy of besieging castles and fortified towns, a form of war in which the king made good use of cannon, the latest weapon now available. With the help of John and Philip, successive dukes of Burgundy, Henry imposed upon the French in 1420 the Treaty of Troyes, by whose terms he was to succeed to the crown of France when the king, Charles VI, came to die. But Henry V died first; he could only pass on to his son, Henry VI, the right that he himself had never enjoyed.

After his death the English fought for more than a generation to increase and defend his conquests. They began well, with the important victory won against a Franco-Scottish army at Verneuil in 1424. By 1429, however, with the appearance of Joan of Arc and her triumph at Orleans, the high point of English success had passed. In 1435 the French persuaded Philip of Burgundy to abandon his alliance with the English. Without it their military task, supported by diminishing financial resources and declining support at home, became increasingly difficult. On the other hand the French saw that military reorganization could win what they wanted: the expulsion, by force of arms, of the English. In 1449–50 a campaign achieved the recovery of Normandy; in 1453, after initial setbacks, the same was achieved in Aquitaine. The Hundred Years War was over.

Much of the historical significance of the war lies in the impact it had upon the societies involved in it. That it touched both England and France profoundly cannot be doubted. War had to be paid for, and new fiscal measures influenced everybody, directly or otherwise. Armies had to be raised, organized, led, and paid; the institutional developments required to meet these demands were to be influential, then and later. The period also witnessed new concepts of how war might be fought, new developments in strategy, and, in particular, new weapons to make those strategies effective. The growing appreciation of the importance of war at sea was one such development with a future before it. The need to communicate and negotiate with the enemy led to developments in methods of diplomacy.

Finally the war made the English people more conscious of their history and

individual character, by helping to set them aside from the French, who, although their neighbors, were also their enemies. During the period, and largely owing to the war, English nationalism and self-awareness took a great step forward.

Hundreds and Hundred Rolls

The hundred, known as the “wapentake” in the Danelaw, was the primary subdivision of the shire for purposes of local government. Theoretically the hundred encompassed 100 hides of land, whence the name. But in fact the size of hundreds varied widely. The chief officer for a hundred was the hundred bailiff. At the heart of the hundred’s function was the hundred court, which met every four weeks to hear local pleas and conduct local business.

The origins of the hundreds are much disputed. Possibly they date from the military and administrative reforms set in motion by Alfred the Great; certainly by the 11th century they formed an active and popular part of the system of local government. Hundreds and their courts came in two forms: royally held and privately held. Private hundreds differed in their degree of private control. In some the lord of the hundred merely shared the revenue of the court with the king, while in others he appointed the bailiff, kept court revenues, and had extensive legal powers within the hundred. But whether royally or privately held, the business of the hundred court was always the king’s business. Private hundreds meant private executive power, not private

jurisdiction.

Hundreds and their courts were retained by William I and his successors. The role of the hundred in local administration was multifaceted. It served as a unit for taxation, justice, police work, legal procedure, and military defense. The Normans and Angevins made particular use of the hundred jury as a tool for gathering information. Royal inquests posed questions to the juries of hundreds; responses were recorded on rolls for future reference. Few of these have survived, but one large group did, and these have come to be known as the Hundred Rolls.

The Hundred Rolls were the product of the great royal inquest of 1274. Edward I sent out commissioners to present questions to juries in all the hundreds in England. The questions fell into two groups: those about the usurpation of royal rights by magnates and those about the conduct of officials running the king's government. The answers were the basis for much of the reform legislation Edward introduced, starting with the first Statute of Winchester.

Printed in two large volumes by the Record Office in 1818, the Hundred Rolls are an invaluable resource for the history of local government in the 13th century. In particular they show the hundred as a vital connection between local population and the king, a channel of communication between central government and its constituents. The selection of representatives and jurors of the hundred for the shire court, as well as the habit of bringing local problems to the king's attention, prepared rural England for the development of an effective parliament.

Husband's Message, The

A short OE poem near the end of the Exeter Book. Because of its mode of expression and its concern with the themes of separation and loss of former happiness the 54-line *Husband's Message* is usually referred to as one of the OE "elegies." The term "elegy," however, can hardly be regarded as satisfactory for this poem, in which past troubles are presented as having been overcome and the future is looked forward to with tentative hope. The speaker of *The Husband's Message* has been sent over the sea to convey to a woman the message that the man with whom she made vows of love in the past has surmounted the woes that afflicted him and now wishes her to join him again so that the two of them may live together as lord and lady.

Although the essential meaning of the poem comes across clearly, several fundamental questions of interpretation present themselves. The first concerns the nature of the speaker who conveys the message. Most commentators have taken the speaker to be a human messenger sent by the lord to speak to the woman on his behalf. Some critics, however, offer a less naturalistic reading of the poem and suggest that there is no human speaker at all but that *The Husband's Message* represents a poetic expansion of a message carved on a piece of wood; the "speaker" of the poem is the piece of wood itself. Similar personifications are found throughout the Riddles of the Exeter Book. Related to the question of the speaker is that of the dimensions of the poem. Immediately before the 54 lines of *The Husband's Message* comes a passage of verse that scholars have traditionally interpreted as a riddle (Riddle 60), spoken by a "reed." But some commentators insist that this passage is in fact the beginning of *The Husband's Message* and that in it the speaker introduces itself as a piece of wood.

The final interpretive problem of *The Husband's Message* is that of the passage of runes in the closing sentence of the poem. This cryptic passage has been deciphered in several ways, most notably as the terms of an oath that the man swears to the woman and as his secret instructions concerning the journey she must make to find him. The difficulties of the runes and the other uncertainties in *The Husband's Message* continue to exercise critics but do not detract from the poem's appeal. *The Husband's Message* is remarkable for the restraint and formality with which its heartfelt message is expressed. The underlying emotion is sublimated by the intervening figure of the messenger but remains evident nonetheless.

Hymns

The hymn was originally a popular form of Christian devotion, and in some respects it maintained this character throughout the Middle Ages. The medieval hymn in England was almost invariably in Latin, in uniform stanzas, and set to a unison chant repeated for every stanza. It was practically always used in the offices, whether said or sung (the Office of the Dead, and those of the period from Maundy Thursday to the Saturday of Easter week being the only significant exceptions), and in some form or other it was available as an aid to various other devotions.

The majority of the hymns used in medieval England were the common property of the western church: their texts were by such figures as Ambrose of Milan, Prudentius, Hilary of Poitiers, Venantius Fortunatus, and their contemporaries and successors. Their chants, too, enjoyed a European circulation, though in their English form (and especially in manuscripts of the

Use of Salisbury) they often differed in detail from the continental versions. Irishmen like Columba and Columbanus and Englishmen like Bede contributed to early Latin hymnody, but few of their hymns entered the standard repertoire, and they were probably sung to existing chants.

Latin hymns are usually straightforward in versification, whether quantitative or accentual. Each melodic repetition normally requires a textual unit having the same number of syllables, so that even where the scansion is by quantity the isosyllabic principle is usually observed. The tunes themselves vary from syllabic (one syllable to each note), quasi-recitational formulas to elaborate melodies in which some syllables at least carry several notes. The original rhythm of such melodies is open to doubt, but in the later Middle Ages each note was probably given a roughly equal duration.

The standard English office hymn thus differed in no significant way from its continental counterpart. There was more scope for individuality in the composition of less formal devotional hymnody, of which a large quantity circulated in medieval England. Some of this was similar in form to the sequence. Sequences, when provided with a text (*prosa*), were sometimes referred to as hymns (the traditional title of Notker's collection is *Liber hymnorum*); at first their texts were neither metrical nor uniformly stanzaic, but as time went on they began to settle into a pattern of trochaic six-line stanzas with the rhyme scheme aabccb, each pair of half-stanzas or versicles being musically identical. A great deal of devotional hymnody, much of it apparently meant for the evening devotion sung daily at the conclusion of Compline, is based on this pattern.

Processions were another context for hymns. Fortunatus's poem *Tempora florifero rutilant distincta sereno*, written in elegiac couplets, was dismembered to make an Easter processional, using the couplet beginning "Salve festa dies" as a refrain; and in the Use of Salisbury it was imitated for use on a number of other feasts, such as Ascension and Pentecost. An extract from another poem in the same meter, Theodulf of Orléans's *Gloria, laus et honor*, was also converted into a refrain song and sung at the Palm Sunday procession. These hymns were unusual in not being strictly isosyllabic, so that the melody for the stanzas had to be adapted to fit the variable length of each couplet. Other hymns used processionally were Fortunatus's *Pange lingua* on Good Friday, using the stanza "Crux fidelis" as a refrain, and Prudentius's *Inventor rutili* on Holy Saturday.

The standard hymn and sequence meters, or "rhythms," were imitated in a considerable body of religious poetry, not all of which was intended to be sung. But an interesting case of devotional hymnody is provided by *Dulcis Jesu memoria*, formerly attributed to St. Bernard but now usually regarded as the work of an English Cistercian monk who wrote in the late 12th century.

This is in iambic rhythm, with 42 four-line stanzas, and it provided several hymns for the Breviary. But its music was not originally strophic: each stanza had a separate melody, though certain phrases were carried over from one stanza to another. It carried the title *Iubilus rhythmicus de nomine lesu*, implying a relationship with the sequence—i.e., as a replacement for the final jubilus (melisma) of the Alleluia at mass—a relationship that is borne out by the style of the music.

Vernacular religious poetry was also influenced by the sequence and hymn, and some such poems survive with music. These are mostly imitations of the *Stabat mater* or are devotions on the Passion of Christ, using the trochaic sequence stanza. “Stand wel moder under rode” has music in two manuscripts, while “lesu cristes milde moder” exists in a two-part setting. “Gabriel from evene-king,” for the Annunciation, is a paraphrase of *Angelus ad virginem*, while “Edi beo thu, hevene quene,” in praise of Mary, is again given a two-part setting. Yet another body of hymnic material is to be found in the repertoire of conductus and versified trope.

Latin liturgical hymns were frequently set polyphonically from the 14th century onward, usually with the plainchant melody or its faburden as a basis. A common procedure was for the polyphony to alternate with plain-song, usually so that the first and other odd-numbered verses were sung in plainsong and the others in polyphony. Tallis and Sheppard are among those who treated the hymn in this way in the period immediately prior to the Reformation. The organ was also used to alternate with plainsong, in which case it was usually allotted the odd-numbered verses, the words of which were therefore not heard at all.

The melodies of hymns are given in noted breviaries, in manuscript hymnals (usually attached to psalters), and, for the Salisbury hymns, in printed editions from 1518 on. There are no English sources for the melodies of the office hymns before the 13th century, though there are earlier continental sources for many of them, while textual sources, some with OE glosses, go back to the Anglo-Saxon period. Processional hymns are given in manuscript processionals from the 14th to the 16th century and in 16th-century printed processionals; those for Palm Sunday and Holy Week, and sometimes the others as well, are also given in graduais from the 13th century at least.

Iconography

There is a growing belief that the spirals, interlaced birds and beasts, and foliate elements of early insular art may have conveyed specific ideas. Wamers has shown that on European artifacts decorated in a predominantly insular style, interlaced animals appear on arms, armor, and horse trappings, while religious objects always include foliage. The inhabited vinescroll on many churches and crosses (e.g., the Ruthwell Cross; [fig. 114](#): see RUTHWELL CROSS) was taken over from Mediterranean traditions, and it, too, may have been symbolic, not merely decorative, possibly representing Christ as the true vine. Stevenson has identified miniature crosses incorporated in insular patterns; and the Chi symbol may have been used in a similar way. If true, the cross-carpet pages of insular Gospel books may be considered iconographic as well as formal innovations ([fig. 84](#): see LINDISFARNE GOSPELS).

Early Christian art was also known. Sixth-century Italian painted books had arrived in England by the 7th century: the St. Augustine Gospels (Cambridge, Corpus Christi College 286) were at Canterbury and still survive; and Northumbria acquired books from Cassiodorus's monastery, the Vivarium, in Italy, including an illustrated Bible pandect, the Codex Grandior, and a nine-volume Bible, the *Novem codices*. Roman icons were brought to Northumbria at the same time. In the following centuries two distinct traditions that may owe their origins to these sources spread from Canterbury and Northumbria.

Among the earliest figurative subjects were evangelist portraits. In the Northumbrian Lindisfarne Gospels of ca. 700 (BL Cotton Nero D.iv) they appear to be based on an early Christian tradition of seated figures against an undefined ground, as might have appeared in the Gospel volume of the *Novem codices*, but they are also enriched with elements from other sources. St. John's frontal stance, reminiscent of a Majesty, and his *Hodegetna* ("showing the way") gesture of pointing out the way to salvation (both possibly derived from icons) may emphasize his revelatory nature. St. Matthew's witness has been compared with the peeping scribe in the *Registrum Gregori* (983). If valid, this, too, could refer to revelation. The leaping symbols, which appear in other

northern manuscripts, such as the Lichfield and Echternach gospels (Lichfield, Cathedral Treasury; Paris, BN lat. 9389), and on the Cuthbert coffin are best paralleled in the Majesty of the Codex Amiatinus (Florence, Biblioteca Medicea-Laurenziana Amiatinus 1), which is based on an early Christian model, possibly the Codex Grandior itself.

In the southern Stockholm Codex Aureus (Stockholm, Royal Library A. 135) evangelists are seated under architectural canopies, and in the lunettes half-length symbols have books tucked under their arms. All this echoes the St. Augustine Gospels.

Other images flourished briefly. The Cuthbert coffin has a Virgin and Child (fig. 48: see COFFIN OF St. CUTHBERT) that blends two early Christian iconographies in the Child's sideways stance with his mother's hand on his shoulder (an *Eleousa*., or "mercy," gesture) and the Virgin's flat-handed gesture toward the Child (as in the *Hodegetna*). The Durham Gospel fragment A.II. 17 has an early Christian Crucifixion to which seraphs are added. Both these iconographies proved more popular in Irish circles and quickly vanished from Anglo-Saxon art.

After the mid-9th century Scandinavian mythological imagery appears on stonework, such as the "hogback" grave markers and the Gosforth Cross (figs. 18–19: see ART, VIKING AGE), juxtaposed thematically with Christian imagery. A new sense of thematic (or allegorical) concepts also develops, exemplified by the five senses on the Fuller Brooch (fig. 65: see FULLER BROOCH) and the sense of Sight (?) on the Alfred Jewel (fig. 1: see ALFRED AND MINSTER LOVELL JEWELS).

Under Æthelstan (924–39) strong contacts with Europe led to the presence at Winchester of Louis, the exiled Carolingian prince, and monks from St. Bertin settling at Bath (944) and Winchester (966). An influx of Carolingian manuscripts is likely, since the Winchester style that flourished immediately afterward reproduces features from the Franco-Saxon, Metz, and Reims schools and continental images are introduced. Continental Crucifixion iconography appears in several psalters, the soldiers Stephaton and Longinus replaced by the Virgin and St. John, and the colobium, or tunic, by a loincloth.

By the end of the century copies of the Utrecht Psalter were being made, and the sudden popularity of narrative art may be attributable to its influence. The Three Marys at the Sepulcher in the Benedictional of St. Æthelwold (BL Add. 49598) and the Missal of Robert of Jumièges (Rouen, Bibliothèque Municipale Y.6) reproduce the winged angel and swinging censer of that scene in the Utrecht Psalter, two features that differentiate it from the older early Christian iconography. In the Cotton calendars (BL Cotton Julius A.vi; Tiberius B.v) images for the labors of the months are reminiscent of pastoral scenes in the Utrecht Psalter. Once assimilated, narrative art appears in new contexts

such as the “Cædmon” Genesis and the New Minster Liber Vitae.

At the same time northern ideas resurfaced. The evangelists in the late-Winchester style Grimbald Gospels (BL Add. 34890) recall those of the Lindisfarne Gospels with their leaping symbols and single-draped curtains, no longer confined to St. Matthew; and the witness figure reappears in the Copenhagen Gospels (Copenhagen, Royal Library G.K.S. 10, 2), one of whose scribes had earlier worked on the Missal of Robert of Jumièges.

Anglo-Saxon iconography shares many features with Irish and Scandinavian work. Most notable is the will to superimpose and juxtapose known images to create a rich and subtle artistic language different in concept from the most literal continental art. Where each image in the Utrecht Psalter is complete and independent, those on the Gosforth Cross, or in the “Cædmon” Genesis depend on each other for their meanings to become clear; they create a visual narrative that can be read in conjunction with or independent of the text.

Many of the iconographic innovations of the Anglo-Saxons remained popular long after the Conquest. The “disappearing Christ” Ascension and the beast-mouth of hell, for example, continue to appear in both manuscripts and sculpture (e.g., the 12th-century Winchester Psalter [BL Cotton Nero C.iv; [fig. 153](#); see WINCHESTR PSALTER] and the Lincoln Cathedral frieze from ca. 1140). Indeed the mouth of hell was popular throughout Europe in the Romanesque period, possibly due to its obvious iconographic connection with the sins of gluttony and sodomy (Camille, 1993).

The 11th and 12th centuries are also characterized by the competing iconographies of English and Norman nationalism. The fortified castles and cathedrals that began to appear shortly after the Conquest, with their two-towered facades and strong mural emphasis, were symbols of Norman imperialism. The indigenous clergy may have countered these images with a revival of particularly important, or politically useful, national saints. The cult of St. Cuthbert at Durham, for example, was particularly strong, but his image changed from the peaceful man associated with the Lindisfarne Gospels to an unhappy, irritable, and misogynistic saint who was not to be crossed. His illustrated life (BL Add. 39943; ca. 1200) shows him resting uneasily within his tomb.

The events depicted in *The Life and Miracles of Edmund King and Martyr* (New York, Pierpont Morgan Library M.736; ca. 1130) may have been chosen specifically for their political content. Edmund is shown saving the monastery of Bury St. Edmunds from thieves and Danes and exercising just leadership at all times; the scenes may have been meant as a warning against contemporary infringements on the abbey's rights.

Romanesque artists were also inventive in their own right, developing a

number of alternative iconographies for traditional scenes. Details included in the 12th-century wall paintings in the churches at Hardham and Coombes, for example, are quite unusual. At Hardham Eve milking a cow replaces the usual image of Eve spinning, while at Coombes Joseph appears as part of the Annunciation.

Artists in the Gothic era continued to combine elements of unique, or traditionally English, iconography with new stylistic developments. On a general level the English response to the development of the Gothic style in France was to adopt selected images and other elements of French art and to work them into traditional interests and programs. The English Gothic cathedral, like its French counterpart, was meant to represent the kingdom of heaven on earth, focused largely on the figure of Mary; however, English Gothic artists and architects illustrated this concept through screenlike sculpted facades (which included numerous historical figures) and Lady Chapels rather than through monumental sculpture and a proliferation of rose windows. The flat east end of English Gothic cathedrals was also a structural, and perhaps iconographic, link with the Anglo-Saxon tradition.

Historical references are evident throughout Gothic art in England. The tournaments and Round Tables that were so much a part of court life were designed to invoke the legendary golden age of King Arthur, while the display of coats of arms, banners, and other “hereditary devices” provided visual chronicles of personal and family history. The arms of Ponthieu, Castile, Leon, and England that decorated the Eleanor crosses (ca. 1291), or those of England, Clare, and Poitou on the 1271/72 pavement of the old refectory at Cleeve Abbey (Somerset), are public displays of family titles, alliances, and power (in both cases royal).

The interest in personal history and identity that the display of such images suggests was not limited to the aristocracy. The 14th century in particular witnessed an increase in the power of wealthy professionals, especially merchants, and a corresponding increase in their visibility in art. Lacking, in most cases, the heraldic devices of the nobility, this group displayed their individuality through symbols of their profession (e.g., the funerary brass of the late-14th-century merchant and his wife in the Church of Sts. Peter and Paul, Northleach, Gloucestershire, on which the merchant stands on the symbol of his profession, a woolsack).

The increased display of images of personal identity of all types should be linked to the rise of a new type of image: the portrait. Images of important rulers and clerics had certainly been present in art for centuries, but it is only in the late Gothic era that likenesses, such as that of Richard II on the 1394–95 panel in Westminster, begin to appear.

Impeachment

When impeachment was revived in the early 17th century, it was understood to have a precise meaning: a special form of criminal trial in which the House of Commons presented articles of impeachment against the accused and appointed managers to prosecute these charges and present evidence to support them before the House of Lords. The Lords gave final judgment, acting as judge and jury. The procedure was normally used to try the king's ministers for misconduct while in office.

Impeachments in parliament following much this kind of procedure are found in the Middle Ages. The first took place in the "Good Parliament" of 1376; impeachment was used against Lords Latimer and Nevill, the king's chamberlain and the steward of his household, and against Edward III's mistress Alice Perrers and a group of London merchants (Richard Lyons, William Elys, John Pecche, and Adam Bury). In 1386 it was used—against the wishes of Richard II—to try his chancellor, Michael de la Pole, earl of Suffolk. In 1387 Richard obtained a legal opinion from some of the judges holding that impeachment could not be brought against his ministers without his consent; in 1388 the judges who had given that opinion, along with other royal intimates, were impeached against the king's will at the "Merciless Parliament." It was used once more in 1397 at Richard II's own instigation to secure the condemnation of Archbishop Arundel, Sir Thomas Mortimer, and John, Lord Cobham.

No further attempt was made to use the procedure until 1450, when the Commons tried to impeach William de la Pole, duke of Suffolk, for high treason. Suffolk placed himself in the king's hands, and, to avoid the impeachment proceeding, Henry VI sentenced him to banishment. The procedure then lay dormant until its revival in 1621.

A number of variants on this procedure are also called impeachments in contemporary sources, such as a criminal trial before the Lords on the initiative of a single royal servant acting on the king's instructions. Examples are the 1383 prosecution of the bishop of Norwich, where impeachment was through the chancellor, and the 1397 prosecution of Thomas Haxey, through the steward of England, John of Gaunt. William of Wykeham's trial before the king's council in 1376 is also described as an impeachment.

Inquisitions Post Mortem

In the strict sense of the term this was an administrative jury summoned by a royal official, the escheator, to make an inquisition after the death of a tenant-in-chief of the crown (a vassal who held a fief directly from the king). The jury was to determine what lands were held by the deceased on the day of death, of whom the lands were held and by what service, and the name and age of the next heir.

The purpose of the inquiry was to secure to the king his feudal perquisites—wardship, marriage, and relief—as well as to seize any lands now escheating, or reverting to the king as feudal lord, through lack of a legitimate heir or by forfeiture. The return by the jury often gives information about the widows dower and evidence of the resettling of the fee to create a joint tenancy for husband and wife to remove portions of the estate from nonfiduciary wardship, should the heir be a minor.

The inquisition was set in motion by the writ, *diem clausit extremum*, which directed the king’s officials to ascertain the lands held directly from the king when a tenant-in-chief died, or “closed his (her) final day.” The earliest extant examples are from the 39th year of Henry III’s reign (1254–55). Zeal to secure all possible revenue for the crown meant that the jury reported on many deceased persons who, it was discovered, held nothing directly from the king. Therefore the records are a rich source for information on feudal land and socage land (land held by a specific service, in contrast to the more arbitrary holding by knight service) as well as tenants-in-chief.

In the Public Record Office the inquisitions are combined with a broader set of related records dealing with hereditary descent of land, assignment of dower, lands of lunatics, and proofs of age. The process of proving age was a

picturesque one; persons wishing to establish that they had reached their majority requested the verdict of a jury. This jury contained persons of widely varying social class, from a bishop who had baptized the child of a prominent feudatory to manorial workers or household servants who remembered the birth or baptism. The charm of these returns is in the link between folk memory and an event in the life of a juror who married at the time, broke a leg, came home from war, or had a relative enter a monastery at the crucial time, and who *therefore* remembered that the heir must now be 21 or more years old.

Some potential jurors, probably as an aid to future memory, had been given a gift in celebration of the birth, or entertained at a baptismal party, or saw the event written in a church service book or a chronicle. One juror named Hugh the Carpenter concluded his testimony that the heir had reached majority by asserting that his “memory” was perfect. The age of jurors was always given. The jurors were never cross-examined and few inquests had their findings rejected or even questioned on the ground of misinformation. Some returns have an evident flaw that goes unchallenged.

The feudal guardian was invited to the inquest, and he or she either sent a representative to say that there was no objection or was noted as warned to come but did not appear. Occasionally guardians agreed that the heir or heiress was of age but claimed that the ward still owed the guardian for the right to marry freely. The defects in some details and the formulaic character of the “proofs” should not obscure the fact that proof represented the sense of the neighborhood that the heir was of age.

Investiture Controversy in England

The great controversy between secular and ecclesiastical authority over the appointment of clerics to office. In England the controversy ran from 1100 to 1107; it began when Henry I ascended the throne and recalled from exile Anselm, archbishop of Canterbury and primate of the English church. Henry requested the traditional homage from his archbishop, but Anselm, having heard the pope ban churchmen from homage to laymen, and laymen from investing churchmen, refused. Homage, a reciprocal oath binding vassal to lord, was the foundation of Henry's political and military power and authority; to lose it meant losing customary rights and legal, practical control over churchmen and their fiefs (which constituted a large part of his realm).

Losing investiture—the granting of ring and staff as symbols of ecclesiastical office—diminished royal power to choose and appoint ecclesiastical rulers. Popes, however, viewed these practices as diminishing the church's liberty to appoint its own men and to bind their loyalties to Rome, not to kings; they sought to establish papal control over the ecclesiastical hierarchy.

These issues had surfaced in the time of William I (William Rufus). Anselm had struggled continuously with Rufus to combat his control of the English church and its income. The king refused Anselm permission to correspond with, appeal to, or visit popes, or to hold reform councils in England. Anselm had gone into exile in 1097. But Henry agreed to cooperate, until Anselm refused him the traditional homage, previously paid to Rufus. At first archbishop and king sent joint missions to persuade Pope Paschal to rescind the homage ban for England. When this failed, Anselm obediently took Paschal's side, entering exile in 1103. Then began an intricate ballet of propagandistic justification from all sides, threats and counterthreats, rumors, and political manipulations. Henry claimed his customary rights and sought to conquer Normandy as the "Savior of the Norman Churches"; Anselm suffered as the wronged victim of an ill-advised king; Paschal floundered about.

As Henry swept through Normandy in 1105, Anselm moved quickly, threatening Henry's excommunication. Henry's allies began to desert and his sister Adela, countess of Blois, arranged a meeting. King and archbishop agreed to compromise; Henry would retain homage but abandon investiture. Paschal approved, but Anselm agreed to return to England (thus visibly ratifying Henry's piety) only when the pope implemented Anselm's political philosophy; king and archbishop would be co-rulers of church and state.

Now, finally, Henry could conquer Normandy. From Paschal Anselm won ratification of his primacy and independence from direct papal control. Anselm, through intelligent statesmanship, emerged the victor. Immediately

Henry, with Anselms approval, appointed new pastors to the English and Norman churches. They saw the pope as a distant source of law. The compromise set the pattern for the later papal settlement with the Holy Roman Emperor Henry V (Henry I's son-in-law) in the German investiture controversy (Concordat of Worms, 1122). Although the investiture conflict in England was formally resolved by 1107, feeling about the choice and investiture of clerics would run high well into the middle of the 12th century.

Ipswich

Situated at the mouth of the Orwell River in southeast Suffolk, an Anglo-Saxon *burh* complete with royal mint in Edgars time (957–75). In 991 the Viking Olaf ravaged the town before vanquishing the Saxon host at the Battle of Maldon. By 1016 Ipswich was part of the Danelaw ruled by Cnut.

At the time of the Conquest the half-hundred of Ipswich, which included the town and immediate environs, was a prosperous settlement of 538 burgesses and a dozen churches. Some catastrophe clearly befell the town thereafter, for Domesday Book records that only 110 burgesses were able to pay dues to the king in 1086; more than 300 homes lay in waste. It remains unclear whether the town suffered from Norman reprisals, a late Danish raid, or other factors.

A century later, however, Ipswich was a thriving community, its merchants engaged in commerce throughout northern Europe, particularly with the Low

Countries. As the port of the Orwell, the one easily navigable river in Suffolk, it served as a regional entrepot and transshipping point. In the early phases of the Hundred Years War Ipswich enjoyed strategic importance as the base for naval operations. The fleet that vanquished the French armada at Sluys (1340) set sail from the Orwell.

In 1200 King John granted the burgesses a charter of incorporation whereby they could elect officers, hear crown pleas, and organize a guild merchant (an oligarchy of powerful merchants that was tantamount to the town's government). Over the centuries the town's governors were to have these privileges reconfirmed and expanded, culminating in Henry VI's grant of admiralty jurisdiction in 1446. Knights of the shire for Suffolk were traditionally elected at Ipswich, and the town remained the administrative center for county matters even after crown assizes were removed to Bury St. Edmunds in the 14th century.

Just prior to the Black Death the town ranked fourteenth in the kingdom, based on its lay subsidy assessment. In the 15th and 16th centuries Ipswich merchants were active in the burgeoning cloth industry of rural Suffolk, and the profits of that trade renewed much of the town fabric. The 1523–24 lay subsidy returns revealed the town to be among the ten wealthiest in England.

Ipswich custom allowed a boy to declare his majority at fourteen if he could prove his ability to count and measure, whereas males usually were not considered to be of full age until they reached 21. Another singular tradition mandated that burgage property be distributed equally among all male heirs at the father's death, not just to the eldest son. The shrine of Our Lady of Grace was a popular pilgrimage site until the agents of Thomas Cromwell, earl of Essex, absconded with the golden image in 1535.

Isidore of Seville (ca. 560–636)

The encyclopedic works of Archbishop Isidore of Seville proved of enduring interest and importance to English writers throughout the medieval period. His most celebrated work, the *Etymologies* (*Etymologiae*), composed in twenty books, argues that the nature of every thing can be derived etymologically from its name. Although many of the etymologies appear fanciful or fantastic, the treatise was hugely influential from the earliest period and was scoured for information by such authors as Aldhelm and Eusebius.

An earlier work, *On the Nature of Things* (*De natura rerum*), describes such subjects as the elements, planetary motion, and the nature of eclipses and made Isidore, along with Pliny, one of the most influential authors on questions of natural history in the early Middle Ages. The work was used heavily by Bede, for example, in the composition of his own important scientific treatises. A further work by Isidore, the *Differences* (*Differentiae*), demonstrates his characteristic approach. The *Differences* is carefully divided into two parts, the first of which is alphabetical and discusses the difference between pairs of Latin words (e.g., *religio*, “religion,” and *fides*, “faith”), while the second part considers the differences between contrasting concepts, such as the grace of God and the will of man, or the lives of action and contemplation. It is the clarity and care of Isidore’s exposition here and in his other works that made his books so attractive to later medieval audiences.

Much of the rest of Isidore’s prolific writings concern topics of ecclesiastical administration and biblical exegesis, and a wide range of his works were preserved in a large number of English manuscripts, some dating from the earliest period. Special mention might be made of his *Synonyma* (PL 83: 827–68), an introduction to Christian spirituality, parts of which were translated into the vernacular, and which appears to have been the ultimate source for several passages in OE, both in prose homilies and in verse, including part of *The Seafarer*.

Ivory Carving, Anglo-Saxon

The study of Anglo-Saxon ivories is problematic. Most have no provenance, and scholars cannot agree on dates and attributions. They have never been set in any kind of continuous context.

Elephant ivory was used by the whole Mediterranean Christian world from the 4th to the 6th century, at which point it disappeared. It is not clear where the Mediterranean world acquired its ivory, but it is known that “vast fleets” of Roman merchant ships regularly traded with India for luxury goods, completing the circuit within a year. But with the collapse of the Roman Empire and the rise of the new Muslim Empire in the 7th and 8th centuries, international trade was drastically reduced. The Muslims were also traders, but they limited themselves to expensive land transport and thus were not in a position to supply ivory. The loss seems to have been keenly felt in Europe.

No more decorated elephant ivory survives from European contexts before the 9th century, but Anglo-Saxon and Scandinavian artisans made enterprising use of whalebone instead. Perhaps the earliest example is a writing tablet from Blythborough, Suffolk (London, British Museum MLA 1903, 3–15, 1), decorated with an interlace design similar to 8th-century work. But the finest example must be the little Gandersheim Casket (Braunschweig, Herzog Anton-Ulrich Museum MA58), decorated all over with neatly carved panels of two-footed, winged beasts enmeshed in interlace formed from their own tails. These creatures, called “Anglian beasts,” also appear on 8th-century Northumbrian crosses like the ones at Ruthwell and Rothbury. As on the crosses the design on the casket is carved in a rounded profile against a flat ground. In fact it is

thought to be derived from the inhabited vinescroll motif of the same crosses, representing the design in its final, most abstract phase. A small plaque from Larling, Norfolk, has a similar Anglian beast and also an image of Romulus and Remus (Norwich, Castle Museum 184.970).

Whalebone was obviously a good substitute for ivory (the Gandersheim Casket has a warm color and a pleasing waxy gleam), and in the absence of ivory it must have been used extensively; objects like the Gandersheim Casket do not get produced in isolation. But few whalebone artifacts survive. Perhaps it was easily broken, as most surviving whalebone objects have large pieces broken off.

In the 9th century ivory became available again in Europe. It was widely used by continental craftsmen but not by Anglo-Saxons. It is not entirely clear why this happened. This was the time at which Charlemagne established his huge, wealthy, and stable empire; Constantinople recovered from Muslim attacks and resumed trading with India and the Far East; and Venice became a powerful sea-trading state that Charlemagne attempted to conquer. It all came together neatly: luxury goods arrived in Constantinople, Venetian traders transported them to Europe, and Charlemagne controlled the European markets. Venetian traders also encouraged the Muslims to export goods from deeper in Africa, and thus may have opened an additional source of ivory.

Some of this new ivory apparently reached St. Omer in Flanders, where it was carved in styles derived from Charlemagne's court scriptorium (also called the Ada School). Its own scriptorium produced a style known as "Franco-Saxon." This was the only place in Europe where three trade routes met, and in the 11th century it was also the starting point for English pilgrims to Spain. The wealth of artifacts pouring into St. Omer is unimaginable.

In the 10th and 11th centuries the Anglo-Saxon kings had their capital at Winchester. In 944 Grimbald of St. Bertin founded a daughter house at Bath, transferring to the New Minster at Winchester in 966. This is important because St. Bertin was a neighbor and daughter house of St. Omer. Contacts between the New Minster and St. Bertin were evidently frequent, with good Roman roads between Winchester, London, and Canterbury, and with St. Omer and St. Bertin just across the Channel.

It seems that Grimbald brought with him several Carolingian manuscripts and ivories that were also formative in creating the new "Winchester" style of painting. At the same time "ivories" in the same style began to appear. In fact Europe was still monopolizing the ivory supplies, and Anglo-Saxon craftsmen found a new substitute: morse (walrus tusk), which seems to have been more durable than whalebone.

Grimbald's possessions apparently included a Majesty in a mandorla that may well be the pierced ivory plaque once on an early-10th-century Franco-

Saxon Gospel book from Marchiennes, near St. Bertin (New York, Pierpont Morgan Library M.319A), and an ivory Crucifixion scene (Brussels, private collection) that was copied exactly into the Sherborne Pontifical (Paris, BN lat. 943). The scene shows Christ wearing a loincloth tied with a distinctive and genuinely tieable knot, flanked by a grieving Virgin and St. John the Evangelist, with a pair of flying angels and the hand of God above. These two sources spawned a series of carvings from both Winchester and St. Bertin, including two Majesties, a grieving Virgin and St. John (St. Omer, Musée Sandelin 2822), a Corpus now mounted on a filigreed cross-reliquary (London, Victoria and Albert Museum 7943–1862), a host of Crucifixion plaques that were produced well into the 11th century, and the Heribert Tau (Cologne, Cathedral Treasury). The common features of these objects clearly go back to the two specific original sources mentioned above, and these sources were almost certainly kept at Grimbald's New Minster, because all the elements reappear, composed into new pictures, in the New Minster Charter (BL Cotton Vespasian A.viii) and the *Liber Vitae*, also from New Minster (BL Stowe 944).

The Majesty figure also appears in several manuscripts, including one written by Odbert of St. Bertin but illustrated by an Anglo-Saxon artist and another that Odbert illustrated himself. Other images are also duplicated at Winchester and St. Bertin. A small ivory Nativity (Liverpool, Merseyside County Museum Mayer Collection M 8060) reproduces the scene from the Benedictional of Æthelwold (BL Add. 49598) and from the Boulogne Gospels (Boulogne, Bibliothèque Municipale 11), which were written at St. Bertin and painted by an Anglo-Saxon artist; and an ivory Baptism of Christ (London, British Museum MLA 1974, 10–2, 1) reproduces the figure from the Second Coming in the Benedictional of Æthelwold.

The connections between St. Bertin and the New Minster seem undeniable. But there were also connections between the New Minster and Canterbury. These are seen most clearly in manuscript work, where Edui Bassan of Christ Church, Canterbury, betrays intimate knowledge of the New Minster motifs in his "Grimbald Gospels" of perhaps ca. 1020 (BL Add. 34890). These Gospels contain a copy of the original letter in which Grimbald of St. Bertin was recommended to the Anglo-Saxon king. Lavishly illustrated, they duplicate the New Minster images of the Majesty, the flying angels, and also the enthroned Virgin and Child from a lobed ivory plaque in the Winchester style (Oxford, Ashmolean Museum 1978.332). Edui or his pupil apparently also produced the Missal of Robert of Jumièges by ca. 1023 (Rouen, Bibliothèque Municipale Y.6), where more New Minster imagery appears in the Nativity and in the Deposition scene, which is adapted from the original Crucifixion and the Baptism plaque. New Minster imagery now becomes common in manuscripts attributed to Canterbury.

Associated with those manuscripts is a series of plaques that are not morse but real ivory. Goldschmidt thought they were a provincial subgroup of the Carolingian Reims School, but Beckwith identified them as Anglo-Saxon. Unfortunately he attributed them to the 8th, 9th, and 10th centuries, which is not possible. Reims is where the Utrecht Psalter (Utrecht, Rijksuniversiteit 32) was produced: dating to ca. 830, it is lavishly illustrated with energetic, funny little sketches, and it was at Canterbury being copied in the 1020s and 1030s, where it changed the whole character of Anglo-Saxon drawing. But it had originally stimulated a series of matching ivory plaques from Reims, the best of which are still on the covers of the Prayerbook and Psalter of Charles the Bald, and it probably had similar plaques on its own covers. These Reims School ivories appear to have stimulated a new style of carving at Canterbury.

Beckwith identified eight plaques (Beckwith nos. 5, 6, 7, 9, 21, 22, 23, 24) as being Anglo-Saxon productions, not provincial Carolingian works. Some of the plaques have older carvings on their backs that have been cut down. The Transfiguration panel has a Last Judgment on its back that shows a cross-legged dancing angel waking the dead and the damned being consumed by the Jaws of Hell (London, Victoria and Albert Museum 253–1867). Cross-legged figures became common in the early 11th century, and Beckwith showed that they were known in a Prudentius manuscript from Christ Church, Canterbury. But the Jaws of Hell motif was a specifically Anglo-Saxon invention, first seen in the Tiberius Psalter from Winchester in the 1020s (BL Cotton Tiberius C.vi) and then in the New Minster Liber Vitae of ca. 1031. So the primary carving on this panel cannot be earlier than the 11th century and must be Anglo-Saxon. The Transfiguration on the front may look Carolingian, but it cannot be earlier than the 11th-century carving on the back, and this must also be true of the complementary Ascension panel (London, Victoria and Albert Museum 254–1867).

The *Traditio Legis* and Enthroned Virgin panels (two halves of a book cover; Paris, BN lat. 323) have acanthus frames very like those on the Transfiguration and Ascension. All four panels show strong influence from the Utrecht Psalter or Reims School ivories, as seen in the gently bulging, flexible bodies, the splayed hand gestures, the style and placing of the ground and clouds, and especially the central apostle of the Transfiguration, who is very like the Nathan on the cover of the Psalter of Charles the Bald. This distinctive figure reappeared as the Psalmist on the cover of the prayerbook of Charles the Bald by the same craftsman.

Anglo-Saxon craftsmen used motifs from other sources, too. The *Traditio Legis* seems rather Ottonian, with its flat relief and its figure-of-eight-shaped mandorla. The mandorla is made of layered acanthus leaves, as in the dedication panel from the Magdeburg antependium (front panel of an altar).

This was donated by Otto I, and it features the enormous, rimmed halos also seen in the Transfiguration, Ascension, Traditio Legis, and Enthroned Madonna. Another significant source may be an ivory or manuscript from New Minster, as Peter and Paul in the Traditio Legis panel seem to be based on the New Minster flying angels. This combination of influences echoes the influences on the manuscripts attributed to Canterbury. So perhaps the ivories were also made at Canterbury.

But more ivories belong to this group. In the Braunschweig Museum is an ivory casket in the same style. Its lid is decorated with New Minster flying angels, and on the side is a Baptism incredibly like the one in the Benedictional of Æthelwold. Beckwith's list included two panels with an extraordinary image of Christ baptized in a tub (London, Victoria and Albert Museum 257–1867; Paris, Musée de Cluny). This image reappears in another plaque now in Florence and is currently believed to belong to the “later Metz” group. The plaque is carved in the same style as the casket, with an identical acanthus frame, and has an identical figure rushing forward with a towel. None of this material has been recognized before, but Canterbury now emerges with a character of its own and appears to have monopolized the supply of elephant ivory.

In summary England's peripheral position forced it to use whalebone and morse before it gained temporary access to ivory in the 11th century. In the 8th century the style mimicked contemporary stone crosses; but Carolingian ivory workers mimicked the work of manuscript illumination instead, and the strong European influence at Winchester and Canterbury evidently encouraged Anglo-Saxon carvers to do the same.

In this context it is difficult to know what to make of three objects. The whalebone Franks Casket (London, British Museum MLA 1867, 1–20.1; [fig. 63](#); see FRANKS CASKET) is usually accepted as 8th-century Northumbrian; although there is no comparative material, it has clear Scandinavian content, and runes continued to be used well into the 11th century. In fact an 11th-century date has also been argued for the casket, and this might fit the context better. The ivory Genoels-Elderen Diptych (Brussels, Musées Royaux d'Art et d'Histoire 1474) was identified as Anglo-Saxon by Beckwith, but most scholars now see it as European. And an enormous whalebone Adoration plaque has been attributed to Anglo-Norman England and to Spain (London, Victoria and Albert Museum 142–1866).

Ivory Carving, Romanesque

Although they survive in large quantities, most English ivories lack inscription and provenance and have become detached from their original objects, so they can be dated or classified only through stylistic analysis. This is subjective at best, but it is more than usually difficult in this case because of the wide range of techniques, details, and artistic habits found on each object. Few pieces seem to be by the same hand, or even from the same workshop, and scholars disagree dramatically about every aspect of the field.

But there are some generally accepted conclusions about English Romanesque ivories. Most of them are morse ivory (walrus tusk), which became common during the 11th and 12th centuries, while in Europe elephant tusk continued to be used. The two media have different aesthetic properties.

Morse is a fine-grained white substance that takes a sharp edge and lends itself to tiny detail; elephant tusk looks more like cream swirled with melted butter and seems to be softer or at least more easily worn. Both can darken with age. The properties of these materials cause noticeable differences between the kinds of work practiced on the Continent and in England during the Romanesque period.

Much European Romanesque ivory was carved in the Low Countries and continues a 600- to 700-year-long tradition stretching back through the Carolingians to early Christian times. These are narrative panels showing biblical scenes on a flat undetailed background and surrounded with a classicizing acanthus frame. Some English Romanesque ivory joins this tradition, but the more interesting material exploits the working qualities of morse and differs markedly from European work. It is smaller in scale, rich with exquisite detail, and experimental in type and concept.

These properties are especially suited to work in the style of the Canterbury School, which can also be identified in contemporary stonework and manuscripts. The style is typified by fibrous foliage, raised beads in borders and foliage, pierced beads, chevrons, and figures with some sort of dampfold drapery. The style can be seen beginning in an early- to mid-11th-century tau cross from the royal Norman Abbey of Jumièges (Rouen, Musée Départemental des Antiquités). This gave rise to a series of similar English taus, whose rich foliage is highly evocative of the older royal Winchester style. One of these is an early- to mid-12th-century tau from Battle Abbey. Battle Abbey was founded by the first Norman king of England, William I, so in ivory, as in other media, the Romanesque Canterbury style seems to be a royal Norman response to an existing royal Anglo-Saxon style.

Fig. 75. Tau Crosier with Christ Pantocrator (London, Victoria and Albert Museum 371–1871). Reproduced by permission of the Board of Trustees of the Victoria and Albert Museum, London.

Most of the ivories in this style are of the highest quality, and one of the

most exquisite is a tau cross from Liège Cathedral (London, Victoria and Albert Museum 371–1871; [fig. 75](#)) that has been dated variously from ca. 1100 to ca. 1150 and later. In type and style it belongs to the Jumièges-Battle Abbey tradition. An interesting feature of this tau and others like it is its ambiguity. It contains a Virgin and Child on one side and a Pantocrator on the other, and in the volutes are St. Michael and human figures fighting monsters that develop out of the foliate arms of the volute. The veins in the leaves and the hairs on the monsters' necks are individually sculpted. But, exquisite as it is, what does it mean?

An earlier example from this group is the John of Beverley Crosier (private collection on deposit in the British Museum), dated mid- to late-11th-century. John of Beverley was bishop of Hexham 687–706 and archbishop of York from 706 to 714(?). He died in 721 and was canonized in 1037; this crosier may have been made for, or as a result of, that canonization. Like the taus discussed above the crosier has a foliate volute framing figurative scenes. Scholars cannot agree on the interpretation of these scenes. Bede, writing in the 8th century, likened some of the miracles of John of Beverley to those of Sts. Peter and John the Evangelist, and this may be the clue. On one side the central figure grasps the chin of a seated man with thick hair. This closely follows the story of how John of Beverley cured a skin-diseased mute whose speech and hair returned instantly. The incident was witnessed by the deacon Berethun, who can be seen in the background. But that figure bears a large key and may also represent St. Peter, while the other two figures could be Christ curing a leper or a dumb youth. On the other side Sts. Peter and John the Evangelist cure a lame man (Acts 3:5), but one of the saints holds a long-armed cross, so the scene could instead be a Harrowing of Hell, or it could illustrate several other miracles by John of Beverley in which he healed people without touching them. The cryptic inscription could refer to any of these events, and one is forced to wonder if the ambiguity is deliberate.

A second group of ivories, while associated with this royal Canterbury School, do not seem to belong directly to it, having more unusual compositions and greater affinities with metalwork. One is the unique St. Nicholas Crosier (London, Victoria and Albert Museum 218–1865; [fig. 116](#): see St. NICHOLAS CROSIER), whose interpretation has long been debated. This object has a curious “Art Deco” quality to it, in that the ivory of the volute appears to split and burst and curl into foliage. In one place it grows a tendril that becomes the crib of the Nativity.

Consider also the equally unique Cloisters Cross (New York, Metropolitan Museum, Cloister Collection 63.12; [fig. 47](#): see CLOISTERS CROSS). Like the St. Nicholas Crosier it swarms with tiny, exquisite figures, and its interpretation is also still being debated. Similar in style and quality is a tiny statuette of the

Flight into Egypt (New York, Metropolitan Museum Dodge Fund 940.B100 [40.62]). Both objects eschew decorative tricks like beading, zigzag patterns, or repeating drapery patterns and make their impact through the sheer technical genius of their craftsmen.

An interesting feature of the Cloisters Cross is its apparent affinity with the best imperial metalwork. In design and decorative structure it is very like several crosses by the European craftsman Roger of Helmarshausen, who worked in imperial circles on the Continent. The Liège Tau, discussed above, may also have imperial connections, in that it could well have been made in a royal English center, such as Winchester or Canterbury, at precisely the time when imperial enamelwork, possibly by Godefroide of Huy, was acquired by Henry of Blois, bishop of Winchester and brother of King Stephen. Liège itself is an imperial center near Godefroide's native Huy, and it is tempting to wonder if there was some sort of exchange.

All the ivories discussed above are innovative in design and concept, exquisite in detail and finish, and often minute in scale. This is what makes them different from European work, and the whole approach may have been stimulated by the unique qualities of the new morse medium. They appear to have been prized in imperial and royal circles in England and abroad and to have been personal property rather than official paraphernalia or general decoration; none could be adequately appreciated from a distance, as the European narrative plaques might have been, and it is possible that there was some kind of elite connoisseurs' market for this material.

A third, coherent group of ivories, although of lesser quality, is associated with the mid-12th-century Lewis Chessmen (now in the British Museum) and with work in Scandinavia. This group is clearly discussed and illustrated by Michael Taylor. It may have been practiced on both sides of the North Sea: in addition to Scandinavian elements (such as the "berserker" pawns biting their shields and several Urnes-style motifs) this group shares several foliate motifs with the royal Canterbury group discussed above and many of its innovative and ambiguous tendencies, too. It might be remembered, for example, that chess was an exotic new introduction to England at this date, and no other chess sets are remotely like the Lewis figures.

The Canterbury group may not be the only one to parallel developments in stone. A portable altar from Norwich and two plaques in the Bargello Museum, Florence, may parallel the style of contemporary architectural friezes (e.g., the frieze on the west facade of Lincoln Cathedral), while a bizarre Deposition plaque may relate to the group of sculpture schools around Hereford with their mixture of Irish and Scandinavian elements and their smattering of motifs garnered from the pilgrim routes to Santiago. But these examples are rare, and no useful discussion can be made here.

In the final analysis it is difficult to establish clearly distinguished schools of ivory working and even harder to define dates or interpretations. It is easier to point to the undeniable qualities of the work: its organic, “Art Deco-like” qualities, its possibly deliberate ambiguities, its attention to detail, its fine finish, its generally small scale, and its experimental, innovative nature. In all these respects English Romanesque ivory differs markedly from contemporary European work, and it may have commanded highly prestigious and specialized markets.

J

Jack Upland, Friar Daw's Reply, and Upland's Rejoinder

Three related works exemplifying the English vernacular tradition of attacking (and defending) the friars. Written between ca. 1390 and ca. 1450 in the Midlands dialect, they are explicitly Wyclif Fite or anti-Wycliffite in sentiment. Because they are concerned primarily with detailed exposition of mendicant practices, church doctrine, and canon law, these works are generally considered more polemical than poetic.

Jack Upland, an item-by-item prose critique of the behavior of the friars, was composed by an anonymous Wycliffite. The author's persona, an unlettered but truth-telling countryman, may be partly indebted to William Langland's *Piers Plowman*. The piece survives in two manuscripts and, with a misattribution to Chaucer, in three early printed editions.

Friar Daw's Reply is a contemporary response to *Jack Upland*, written in rough alliterative verse by an author who adopts the persona of an unlearned friar ("Daw Topias"); he is named John Walsingham in the scribal *explicit* at the end of the poem. It survives in a unique copy, Bodl. Digby 41, together with *Upland's Rejoinder*. In this educated and strident retort the poet defends the friars from the attacks made in *Jack Upland* and in the course of the poem insists that Lollards should be burned as heretics.

Upland's Rejoinder, a scathing response to "Friar Daw," also in rough alliterative verse, is written in the margins of *Friar Daw's Reply*. The *Rejoinder* displays a variety of coarse, personally directed attacks against the Friar, as well as a significant degree of Latin learning. Its author is unknown.

Jacob's Well

An early-15th-century sermon collection in ME prose. The work survives in a single manuscript (Salisbury Cathedral 103) written ca. 1450. It is one of many vernacular manuals intended to assist priests in their pastoral duty of religious instruction. In *Jacob's Well* internal emphases and references suggest an unsophisticated rural audience. The clerical author is anonymous.

The collection is divided into 95 chapters, each comprising a sermon of approximately 30 minutes' speaking length. The sermons seem to have been intended for daily oral delivery—in the first chapter the author says that the succeeding chapters will take 94 days, and in the final chapter he notes that the preceding chapters will have taken two whole months and more.

The modern title of the work derives from “fons Jacob” in the heading to the first chapter, a reference to the well on whose curb Christ rested while journeying to Samaria and where he talked with the Samaritan woman (John 4:6–26). The collection is structured around an elaborate allegory of the human body as a shallow pit that must be made into a deep well. Through its five entrances, the senses, the pit allows the ingress of the streams of the Great Curse (the automatic excommunication imposed for certain sins, the particulars of which were read in churches four times a year). Beneath these waters is a deep ooze, the seven deadly sins, which must be removed using

various implements of contrition, confession, and satisfaction. The watergates of the senses must be stopped up and the pit deepened with the spade of cleanness until the seven springs of grace, the gifts of the Holy Ghost, are found. The bottom of the well must be leveled with equity; corbels (projecting stone supports) representing the articles of faith must be laid. The mortar consists of sand (memory of sin), water (tears), and lime (burning love of Christ). By the plumb-line of truth the well is built of this mortar and of stones (the works of faith). To ascend to heaven the soul must use the ladder of charity. To draw the water of grace from the well one must use a windlass (the mind), a rope (belief, a threefold intertwining of faith, hope, and charity), and a bucket (spiritual desire for all goodness). Thus may one drink one's fill of the sweet water of grace and, ultimately, the sweet wine of joy.

The allegory is worked out in punctilious detail, foot by foot, inch by inch, rung by rung, using colloquial language, down-to-earth similes and metaphors, and vivid references to everyday life. Much of the doctrinal substance of the work is based on the *Speculum Vitae* and the sermons are enlivened by numerous narrative exempla that the author took from the Latin *Alphabetum narrationum*.

Jews

Jews first arrived in England in the decades after the Norman Conquest. These first settlers, from Rouen in Normandy, probably came to London at the command of the king, perhaps to strengthen mercantile links between the two cities. The community flourished, and by the 1140s the Jewish population had spread to several provincial towns, a process that may have begun even before 1100. But despite its increasing financial importance, intellectually and culturally, English Jewry remained closely linked to the community of Rouen until the conquest of Normandy by Philip II (Philip Augustus) of France in 1204.

Throughout the reigns of William II (William Rufus) and Henry I the Jews of London remained closely tied to the royal court. Rufus prevented massacres in England of the sort that devastated the Rouen community in 1096, during preparations for the First Crusade, and Henry I issued a formal charter of liberties, asserting direct royal jurisdiction over all Jews in England and guaranteeing their right to travel freely, avoid local tolls, and hold land. Stephen tried to continue this policy, but the Anarchy witnessed a distancing of the Jewish communities from the court; Jews sought locally a protection the king could no longer provide. By the end of his reign (1154) Jewish settlements were established at Oxford, Norwich, Winchester, Cambridge, and a number of smaller towns, including several under seigneurial rather than royal jurisdiction. It may also have been in Stephens reign that moneylending replaced trade as the primary economic support of the community.

Henry II's reign brought renewed stability and newly expanded cultural and intellectual contacts with the Jews of Spain, Provence, Italy, Germany, and northern France. Jewish and Christian lenders competed on more or less equal terms to supply the liquid capital required by the expanding economy. Some extraordinary Jewish fortunes were made through moneylending, including that of Aaron of Lincoln (d. 1186), the wealthiest Englishman of his day.

Henry II protected these financiers in the traditional way, borrowing from them in his early years, then shifting to direct taxation, particularly during his last decade. But storm-clouds were building. In the years after 1144 the first known charges of ritual murder—i.e., that Jews crucified Christian children—

circulated around Norwich. Further charges were reported in Gloucester in 1168 and in Bury in 1181. Thomas Becket's supporters complained publicly that the king treated Jews better than he did the Christian clergy, and the 1180s saw the first attempts by local lords to expel Jewish communities from their territories.

With the coronation of Richard I (1189) the stormclouds broke. An attack on the Jews of London was followed within six months by massacres in Norwich, Lynn, and York, where virtually the entire Jewish population was murdered by a mob or committed suicide. Enthusiasm for the Third Crusade and the resentments of local knights indebted to Jewish lenders contributed to the outrages at York; the rioters carefully burned all records of Jewish debts they could lay hands on. These events helped prompt a reorganization of the king's administration of Jewish debts and brought renewed orders to royal officials to protect "the king's Jews" from attack. But the motives for royal concern were largely financial. Under Richard, John, and Henry III taxation of the Jews became a more and more important royal resource, with ultimately disastrous consequences for the prosperity of English Jewry.

Between 1210 and 1217 heavy taxation combined with civil war to reduce the Jewish population. Thereafter, however, the pressure eased; by 1240 the Jews had recovered both their prosperity and their numbers. Altogether there may have been around 5,000 Jews in mid-13th-century England, and between 1240 and 1260 they paid close to £70,000 in royal taxes. This ruinous taxation fell mostly on their wealthiest leaders and permanently reduced their financial value to the crown.

It also exacerbated tensions between the Jews and the Christian majority. To pay their taxes Jewish lenders were often forced to sell their bonds at a discount to Christian lenders, who would then foreclose on the mortgaged estates, acquiring them at a fraction of true value. Henry III's courtiers were active in this traffic, which became one of the many complaints voiced against his government in 1258. Simon de Montfort's followers were particularly anti-Jewish and perpetrated several massacres in 1263 and 1264.

The English Jews never recovered from this combination of taxation and attack. Restrictive legislation between 1269 and 1275 made it illegal for Jews to hold feudal property and eventually forbade their lending money. By this date, however, few other occupations were open. Some lending probably continued, therefore, even after its prohibition in 1275, but under subterfuges that make it difficult to trace. Pressure to convert had emanated from the royal court since the 1230s, when Henry III founded a special house in London to support such converts. This pressure mounted under Edward I, though with little success. Royal taxation also continued, but its receipts were paltry in comparison to the years between 1240 and 1260. The Jewish community was never a significant

financial resource for the monarchy under Edward I, particularly in comparison with the receipts from parliamentary taxation.

Jews were a frequent target of crusade-inspired legislation, and in 1288 Edward, in connection with his oath to go again on crusade, expelled the Jews from Gascony. The expulsion of the English community in 1290 was also associated with this planned crusade, but its immediate cause was a bargain the king struck in parliament between April and July 1290. When Edward returned from Gascony in 1289, after three years abroad, he faced large debts and a rising chorus of complaint. To secure a tax he agreed to a number of reforms.

The final concession he made was to expel all the Jews from England; it was specifically in gratitude for this that his subjects granted him a tax of more than £100,000. And so the expulsion was announced. Jews were permitted to take their liquid wealth; their debts and real estate were confiscated by the crown. Their departure was completed by 1 November 1290. Several vessels were lost in rough seas, and at least one group of Jews was deliberately drowned by the sailors transporting them. The survivors traveled first to France, and some probably remained there despite the French order to expel them. Others traveled to Italy, Savoy, Germany, Spain, and the Holy Land.

No organized Jewish community was permitted to settle in England again until the 1650s, when Oliver Cromwell readmitted the Jews as part of his spiritual preparations for the end of the world.

John (1167–1216; r. 1199–1216)

Born on December 24, 1167, he was the youngest of the four sons of Henry II and Eleanor of Aquitaine to reach manhood. His father intended him to be the ruler of an autonomous kingdom of Ireland (and from 1185 he bore the title Lord of Ireland), but with the deaths of his elder brothers he aspired to wider ambitions. After the death of the childless Richard (1199) he became king of England, duke of Normandy, duke of Aquitaine, and count of Anjou, and he prevailed against the claims of his nephew Arthur of Brittany, son of his brother Geoffrey.

It was a difficult inheritance. The financial burdens of Richard's reign had been extraordinarily heavy, for his crusade and ransom, and for the defense of the continental dominions against persistent attacks and subversion by Philip II (Philip Augustus) of France. The revenues of England, vital for survival, were devalued by inflation. The balance of advantage in resources and influence had tipped decisively in favor of the French crown. Normandy was war-weary, weakened, and demoralized; when Philip renewed his attack in 1204, the will to resist suddenly collapsed and John retired to England without putting up a fight.

John never reconciled himself to the loss of Normandy. His efforts to accumulate a war chest were remarkably successful, but achieved by a relentless and ruthless exploitation of royal rights over subjects that exposed the arbitrary nature of many of his royal powers and called their legitimacy into question. His barons, seeking to rebuild family fortunes after the loss of their Norman estates, had to bid expensively for royal favors granted, or withheld, capriciously.

Disaffection was for a time deflected by John's resistance to Pope Innocent III, who set aside a royal nominee for the archbishopric of Canterbury and instead appointed Stephen Langton, whom the king rejected. John's stand was generally supported by the laity, who patiently endured an interdict for six years. John confidently disregarded a sentence of excommunication while his coffers were augmented by the appropriated revenues of the clergy. That the English clergy should be so completely at his mercy was, however, a chilling demonstration of royal power to override established rights, and there was a growing feeling among some of the barons that their own safety and their families' fortunes depended on getting rid of him.

Faced by incipient rebellions and an invasion fleet mustered by Philip of France, John could not ignore the ultimate papal weapon, a sentence of deposition. He accepted the pope's terms for lifting the sanctions and in addition offered his kingdoms of England and Ireland as fiefs of the papacy, in effect putting them under the protection of the Holy See.

John's carefully nurtured grand strategy for the defeat of the French king collapsed when his allies, the count of Flanders and his nephew Emperor Otto

IV of Germany, were decisively defeated by Philip at the Battle of Bouvines, May 1214. Open rebellion erupted in England. At a moment when neither side could be sure of winning, an attempt at a negotiated peace produced Magna Carta (June 1215), by which the crown's claims to executive privilege were brought within the bounds of agreed law. As a peace formula it failed, and John had it annulled by the pope. He was winning the civil war when he died (October 1216). Loyalists reissued Magna Carta to rally support for his infant son, Henry III.

While curtailing the possibility of tyranny Magna Carta also recognized the advantages of efficient royal government, which John had done much to foster. He understood administration and did much in a short reign to refine and rationalize it. He created a precedent (in the Thirteenth of 1207) for a proper taxation system. He created the navy that thwarted Philips projected invasion. He failed, however, at the crucial arts of government in the management of men and what was currently recognized as "good lordship."

John has been portrayed as a monster of depravity. This is a fanciful elaboration of a distorting half-truth. He was no more domineering than his father and brother, and hardly more morally reprehensible, but he lacked their redeeming qualities. He was crafty and vindictive and instead of charismatic leadership could offer only dogged determination. Failing to inspire loyalty, he tried to dominate by menace and—constantly fearing disloyalty—he fed his fears by a corrosive suspicion. He is a classic case of a ruler undone not merely by adverse circumstances but by defects of personality.

John of Salisbury (ca. 1115–1180)

Scholar, diplomat, friend of Thomas Becket, and bishop of Chartres, renowned chiefly for his *Policraticus*, a treatise on contemporary *mores* and political philosophy, and his *Metalogicon*, a defense of the trivium (grammar, logic, rhetoric) and commentary on Aristotle's recently rediscovered *Organon*; both works were completed and dedicated to Becket in 1159. His letters, a number of which are to Becket, are valued for both their historical content and their style. He also wrote a memoir of the papal court (*Historia pontificalis*), lives of Becket and Anselm of Canterbury, and two more obscure pieces of philosophic poetry, the *Entheticus maior* and *Entheticus minor*.

Judgment Day I and II

Judgment Day I is an anonymous OE poem of 119 lines from the Exeter Book. Its date and source are unknown, though it was most probably composed ca. 800 and loosely based on 2 Peter 3:6ff. While undoubtedly an eschatological

work, *Judgment Day I* may also be considered a wisdom poem with Doomsday as its theme.

The poem opens with “That shall happen,” abruptly establishing Doomsdays inevitability. The poet follows with details of earths destruction and an aftermath of desolation. Set against these descriptions are exempla of three kinds of men. The “grim-thinking” man will seek hell on Doomsday, damned for his material concerns. Another sinful soul is likened to a feaster, who thinks little beyond the banquet before him. Yet the man who is mindful of his sinful nature will rise to heaven on Doomsday. The poet closes by imploring the audience to repeat the poem’s principal message: one must “think well” now in order to share the glories of heaven.

Judgment Day II is a 306-line anonymous translation of Bede’s *Versus de die iudicii* found in a single manuscript, Cambridge, Corpus Christi College 201. It was probably composed in the late 10th century, possibly in conjunction with the Benedictine Reform. Its provenance is unknown, though arguments have been made for Worcester, York, and Canterbury. A prose rendering of *Judgment Day II* comprises much of the homily known as “Wulfstan XXIX.”

The poem opens with a description of a forest grove in which a speaker chastises himself for his iniquity, employing the discourse of soul-body dialogues. Interwoven into this confession are vivid descriptions of what Doomsday will hold for all humanity, “each according to his deeds.” The poet depicts hell, with its torments of extreme heat and cold, while portraying a heaven devoid of worldly afflictions. Yet these details are not mere displays of poetic virtuosity; Graham D. Caie counts *Judgment Day II* among “devotional exercises that act as an incentive to penance.”

Judith

An incomplete OE biblical poem, surviving in BL Cotton Vitellius A.xv, coming immediately after *Beowulf*. Although *Judith* was copied by the same scribe who wrote the text of *Beowulf* from line 1939b to the end of the poem, the parts of the manuscript containing the two poems were originally separate, as is indicated by the battered condition of the last page of *Beowulf* (originally an outside leaf) and by the textual deficiency at the beginning of *Judith*. The damage to this manuscript caused by the Cotton fire of 1731 affected the text of *Judith* in places. In modern editions of the poem manuscript readings are supplemented by reference to the edition of Edward Thwaites (1698).

In its present state *Judith* begins with the last word of a metrical line and consists of 348 lines and this single word. The text is complete to the end of the poem. There has been considerable debate as to how much of the beginning is missing. It has been argued both that the poem is substantially complete with only a few lines lacking and that about three-quarters of the original composition (some 1,000 lines) may be missing. The latter view is more widely accepted and is supported by the "fitt" division of *Judith* in the manuscript. The text of the poem begins near the end of a fitt (IX) and continues through fitts X to XII, with something over 100 lines in each fitt. The view that a large part of *Judith* has been lost is borne out by comparison of the OE text with its source, the book of Judith. The OE covers about a quarter of the book of Judith, concentrating particularly on chapters 12–15. It should be noted, however, that the poet's treatment of the source is not uniform: in particular most of the final chapter (16) is omitted, although the ending of the OE is complete.

The *Judith*-poet shows great assurance in adapting biblical material to the structures of vernacular poetry. Working probably in the 10th century, this poet re-creates the original in strikingly Germanic terms, exploiting the ideals of the heroic tradition to express approval for Judith and the Bethulians and condemnation of the unheroic Assyrians and their contemptible chieftain Holofernes. The OE poet even introduces a battle, complete with beasts of

battle, to give solidity to the presentation of the retreat of the Assyrians. The poet's treatment of the source, however, is also consistent with traditions of exegesis of the book of Judith current in the early Middle Ages. The approach is not narrowly allegorical and contrasts strongly with that of Ælfric in his "Homily on the Book of Judith," but the themes of the Bethulians as the people of God and of Judith herself as a figure of the people of God in a hostile world (as developed most systematically in the 9th-century commentary of Hrabanus Maurus) are sensitively explored.

Julian of Norwich (1342/43-after 1416)

Mystical writer and the first known woman author in English literature. Her book of *Showings*, or *Revelations of Divine Love*, ranks with the best medieval English prose and is a primary text in the literature of mysticism. It is extant in a short version, probably written first, and in an extended form, completed 20 years later.

Biographical information about Julian is sparse. It is limited to facts in her own text, mention in a few wills, and a passage in the *Book of Margery Kempe*. Julian's birthplace is unknown. The dialect in the oldest extant copy of her book shows northern features, leading to the conjecture that she may have come from Yorkshire. Sometime between 1413 and 1416 Margery Kempe visited Julian and received counsel from her. As late as 1416 Julian was living in Norwich in Norfolk as an anchoress, enclosed in a cell attached to the Church of St. Julian. She may have received the name Julian upon her entrance into the anchorhold.

On 8 May (or possibly 13 May) 1373, at the age of 30 and a half, she fell seriously ill, most likely while still at home. She then recalled having prayed in her youth for a bodily sickness, to prepare her for death, and for the wounds of true contrition, natural compassion, and resolute longing for God. Surrounded by her mother and friends, and attended by a priest, she believed, with them, that she was about to die. Suddenly, however, while she was looking at a crucifix, her health returned. Then followed a series of fifteen visions, mostly of the crucified Christ. These were interrupted by attacks from the Devil, and then confirmed in a sixteenth and final showing. This experience gives the content to the short version of her book, in which she explains that the visions were threefold in character—visual, intellectual, and spiritual or intuitive. The long version of the text is enriched with 20 years of theological reflection, pastoral counseling, and spiritual growth. Her teachings are oriented to the instruction of other believers, her “even-Christians.”

The shorter version of Julian's book is extant in one manuscript copy—the 15th-century Amherst Manuscript (BL Add. 37790). The longer text is complete in three manuscripts: the Paris Manuscript (BN Fonds angl. 40), copied around 1650; and two Sloane manuscripts (Sloane 1—BL Sloane 2499, early 17th century; Sloane 2—BL Sloane 3705, an 18th-century modernization of Sloane 1). Excerpts from the longer version exist in Westminster Treasury 4 (W), written in the early 16th century; and in a 17th-century manuscript from Upholland Northern Institute (formerly St. Joseph's College). The Upholland manuscript was written by English Benedictine nuns, living at Cambrai, after the Dissolution of the monasteries. The earliest printed edition (1670) is by

Serenus Cressy, an English Benedictine, chaplain for the Paris house of the nuns.

T.S. Eliot, in the *Four Quartets*, familiarized the literary world with Julian's key phrase, "All shall be well," and with some of her mystical symbolism. Thomas Merton cited her as "one of the greatest English theologians" (1967). An observance at Norwich (1973) commemorated the sixth centenary of her showings. Since then Julian has become the focus of extensive study by literary scholars and theologians and has a growing following as a spiritual guide.

Textual critics disagree on the choice of a preferred copy text for a Julian edition. Colledge and Walsh (1978) opted for Paris, favoring its more conventionally correct rhetorical structures. Marion Glasscoe selected Sloane 1 for a student edition (2d ed. 1986). Glasscoe notes the pitfalls of following, in disputed readings, either Sloane 1 or Paris, or creating an eclectic text; nonetheless, she finds special qualities to recommend reliance on Sloane 1, which, she says, often reflects "a greater sense of theology as a live issue at the heart of human creativity" (1989: 119) thereby coming closer to Julian's central concern.

Theological approaches diverge widely. A plethora of devotional books have been based on a surface reading of the *Revelations*, stressing Julian's optimism and oversimplifying her doctrine of love. Her terms "substance" and "sensuality" are often misunderstood. A misreading, sometimes abetted by inaccurate translations, assumes that by "substance" Julian means the human soul and by "sensuality" the body or the five senses. Substance designates, rather, "the truth of our being, body and soul: the way we are meant to be, as whole persons" (Pelphrey, 1982: 90): "Where the blessed soul of Christ is, there is the substance of all souls that will be saved by Christ.... Our soul is made to be God's dwelling place, and the dwelling place of the soul is God. ... It is a high understanding inwardly to see and to know that God our creator dwells in our soul; and a higher understanding it is inwardly to see and to know that our soul which is created dwells in God's substance, of which substance, through God, we are what we are" (Long Text, ch. 54).

Usually "sensuality" refers to that human existence which becomes God's in the Incarnation: it is the "place" of the city of God, the glory of the Trinity abiding in collective humanity. Human beings are called to be helpers or partners in the unfolding of what humanity is meant to become—a city fit for God to reign and find rest in. These difficult concepts are carefully explored by Pelphrey, who succinctly summarizes Julian's teaching about divine love: "The reflection of divine love into humanity is... seen to take place in three ways: in the creation of humanity (our capacity for God); in the maturing or 'increasing' of humanity (to which she also refers as our 'remaking' in Christ);

and in the perfecting or fulfilling of human beings through the indwelling Christ" (1982: 90).

Julian presents this theology principally through the parable of the Lord and the Servant: "This story conveys Julian's insights about the first Adam, the cosmic Christ, the Trinity, and the unity of all who are to be saved. The one great reality in the parable is the person of Christ, in whom are mysterious compenetrations of other realities—the Adam of Genesis; the total Adam (all humanity); Christ as the second Adam (and in one sense the first Adam, since to his eternal image all things were made); and Christ, meaning all humanity to be saved. The basic parable weaves into other metaphors: for example, the sinful Adam fell in misery to the earth, but likewise the divine Adam falls on the earth—into human nature in Mary's womb—and makes the garden of the earth spring forth with food and drink for which the Father thirsts and longs, in his unending love for the treasure which was hidden in the earth" (Bradley, 1984: 209). The Trinity is revealed in Christ. God is active as "maker, preserver, and lover," an insight Julian experienced when she saw creation in the likeness of a hazelnut. Since God is the ground of the soul, the desire for God is natural, and sin (all that is not good) is unnatural. Prayer unites the soul to God, the foundation from which the prayer arises. In the depths or core of the believer, the being of God intersects with the being of the creature and is the root of a "godly will" that always inclines toward the good. Nonetheless, humanity continues to sin, for evil was permitted to arise contrary to goodness, which will triumph in the end in the form of a good greater than what would otherwise have been. How "all things shall be well," as Christ promised Julian, will remain hidden until a great deed is accomplished on the Last Day (Long Text, ch. 32).

Literary and linguistic critics contribute to the explication of this mystical core. Reynolds explores the key images of Christ as courteous and "homely," in its medieval sense. Courtesy signifies that Christ possesses without limit the largesse and fidelity attributed to the medieval knight. Courtesy fuses with "homeliness," the familiar manner used at home, among equals, and implies nearness, so that "we are clothed and enclosed in the goodness of God" (Long Text, ch. 6). In his familiar aspect Christ is mother, an image rooted in scripture and in biblical exegesis but developed with originality by Julian. As the archetypal mother Christ bears his children not to pain and dying but to joy and endless living. His Passion is a birthing, which entailed the sharpest throes that ever were, and was undertaken to satisfy his love. The maternal image further signifies that humanity dwells in Christ, as in a mother's womb, and is also fed, nurtured, chastised, and tenderly cared for, as a child. The sensual nature of humanity (that which is born into time) is in the second person, Jesus Christ, and is knit—as in fabric making—to its ground in God. This

motherhood metaphor has attracted the attention of feminist criticism, adding to Julian's popularity today. The overall lesson of the revelations is love in three meanings: uncreated love, or God; created love—the human soul in God; and a love that is bestowed as virtue, enabling believers to love God, themselves, and all creation, especially their “even-Christians.”

Junius Manuscript

Bodl. Junius 11, a partially illustrated codex of OE biblical poetry, consisting of two textual booklets. Book I (pp. 1–212) contains *Genesis A*, *Genesis B*, *Exodus*, and *Daniel*, metrical paraphrases of much of Genesis, Exodus 13–14, and Daniel 1–5; Book II (pp. 213–29) contains the religious poem *Christ and Satan*, linking the Old and New Testaments. The Anglo-Saxonist Francis Junius (Du Jon) the Younger acquired the manuscript ca. 1651 from James Ussher, archbishop of Armagh, and published an edition of its contents at Amsterdam in 1655 (*Cædmonis Monachi Paraphrasis Poetica Genesios ac præcipuarum Sacra pagina Historiarum, abhinc annos MLXX*). Influence of the poems on John Milton’s *Paradise Lost* (written 1650–63) has been suggested but not proven. Because of the subject matter of the poems Junius ascribed their authorship to Cædmon, the 7th-century Anglo-Saxon poet referred to by Bede, and consequently the codex became known as the “Cædmon Manuscript.” The Bodleian Library acquired it in 1678, after Junius’s death. Before its acquisition by Junius Sir Simonds D’Ewes (1602–1650) may have had it on loan from Ussher, when William Somner made a transcript from it.

Pages 1–229 were paginated by Junius: page 230 is blank. Leaves measure ca. 12.7 by 7.7 inches and are arranged in seventeen quires, mostly once consisting of eight folios, but with several leaves now lost. Book I was written in Anglo-Saxon Square Minuscule by a single scribe ca. 1000; Book II was written by three different scribes in rounder hands ca. 1000–25. The manuscript was corrected by another scribe who altered spellings from Anglian to late West Saxon orthography. The writing in Book I is well spaced in a fairly narrow column of 26 lines, that in Book II is cramped into a wider column of 27 lines.

Forty-eight outline drawings in Book I, illustrating the Genesis poems, were executed by two artists, the second using colored inks (red, green, black, brown); seventeen are full- or nearly full-page; some have OE captions added. There are many blank spaces left for illustrations that were never completed. A

few drypoint drawings also occur. The first artist also added zoomorphic and floreate initials at the beginning of sections of text in the first part of Book I; plainer initials, sometimes paneled, on pp. 75, 83–136, and 156–209 were executed by the scribe. The second artist also illustrated Cambridge, Corpus Christi College 23, fols. 1–40 (Prudentius, *Psychomachia*), which was given to Malmesbury Abbey ca. 1033–44. A third artist added drawings on pp. 31 and 96 in the later 12th century.

The use of a combination of leather thongs and cord for the five bands of the present binding may date it in part to before ca. 1050. The bound codex was probably at one time chained. A design for the cover and spine of a binding (but probably not for this manuscript) may be preserved on p. 225. There is a 14th-century title *Genesis in anglico* (p. ii); M.R. James suggested the manuscript was the *Genesis anglice depicta* listed in the early-14th-century catalogue of Christ Church Canterbury, but this is not proven.

Juries and the Jury System

Trial by jury is a method for resolving legal disputes that relies on a group of laypeople to provide answers to particular questions. As this procedure developed, such a group was referred to as a “jury” (*jurata*), reflecting its duty to answer under oath; its answer, required to be truthful, was the “verdict” (*veredictum*). Trial by jury, though not universally available, was characteristic of a great deal of civil and criminal litigation in the Middle Ages.

Long before actual trial by jury became the norm, Anglo-Norman monarchs used panels of sworn laypersons to identify suspected criminals. This was but an instance of the more general reliance upon the citizenry to provide information for a variety of legal, administrative, or fiscal purposes, a practice with both Scandinavian and Carolingian roots. The most noteworthy example of this practice is the massive collection of land-holding information in Domesday Book. Where jurors were used to identify suspected criminals, trial of guilt or innocence was originally by means of an ordeal, typically the ordeal of water. Only with the papal abolition of clerical participation in ordeals in 1215 did a jury verdict become the typical procedure for resolving questions of criminal culpability.

By 1215 jury trial had already been used in civil cases with some frequency. During the later 12th century Henry II had made it available to decide certain land disputes. These juries were referred to either as petty assizes or grand assizes, depending on the nature of the plaintiff’s claim. From these beginnings trial by jury in civil cases was made more widely available. During the 13th century new forms of action relating to real property claims were developed, as were writs of trespass, remedies for wrongs to person or property. Trial by jury was the standard mode of proof in all these cases. Not all civil claims were triable by jury, however. Most notably defendants in the contractual actions of debt and covenant were allowed to wage their law (swear an oath supported by eleven “oath helpers”) to avoid liability.

Medieval legal theory conceived of the juror as, in effect, a witness to the facts to be tried, possessing knowledge obtained before trial. Thus sheriffs were required to impanel jurors from the locality nearest the place where the facts in question occurred. Unlike a modern jury knowledge of the parties or the facts was not a ground for disqualification, although bias or interest was. While some research suggests that jurors had largely ceased to be “self-informing” before 1400, Sir John Fortescue, in the mid-15th century, still referred to them as witnesses. In any event the notion that jury verdicts should be based entirely on evidence presented in open court is a modern one, a principle that did not emerge until the 18th century.

While early jury trials in civil cases were often conducted in the royal courts at Westminster, in the 14th century procedures were established so that most civil jury trials could take place in the county in which the operative facts occurred; from around 1220 the vast majority of jury trials in criminal cases were held in the counties. In civil cases the central courts continued to keep track of pleadings and other procedural matters in voluminous detail; there is little direct evidence of what went on at trials.

What little we know suggests a process a good deal more informal than anything we would recognize today. The idea that rules of evidence should limit the parties' freedom during trial does not appear to have been important. Nor is there any reason to believe that trial judges attempted to exercise firm control over process or outcome. The jurors, after hearing the evidence and perhaps the legal arguments from the parties, were charged simply to decide "according to conscience."

In criminal cases there is reason to believe that jurors often concocted verdicts to impede the harsh penalties of the law. Thus, for example, recent scholarship has demonstrated that jurors often gave fictitious accounts of homicides to justify self-defense verdicts where that defense would not have been available if an accurate factual account had been given. In such cases jurors in effect nullified the common law to the extent it was inconsistent with societal notions of culpability.

While an analogous nullification phenomenon may have been at work in civil cases, it has yet to be documented. However, no procedural device existed by which judges could review a jury verdict after the fact and reverse it as inconsistent with common law. The action of attain, whereby a second jury was called upon to state whether an earlier jury had made a "false oath," seems to have been limited to cases of corrupt or bad-faith verdicts. Thus common-law procedure lacked a mechanism for ensuring that verdicts would be according to substantive common-law rules. Accordingly it is possible that jurors in civil cases enjoyed considerable discretion to apply communal notions of justice, even where inconsistent with common law.

Justiciar

The king’s justiciar was the official authorized to act on the king’s behalf. The need for such a deputy emerged from the nature of the medieval English monarchy and the lands it governed. The king was at the center of administration, his personal rule of paramount importance to the daily affairs of the realm. The realm, from the Norman Conquest onward, often comprised various lands of which England was but one. To govern each of these areas effectively the king was required to travel; yet in his absence matters in England necessitated his presence.

To alleviate this problem the king came to place a great reliance in administrative matters on his kinsmen and close associates. Soon after the Conquest Odo, William’s half-brother, deputized for him during his journey to Normandy. Henry I continued this practice and drew his deputy, Roger of Salisbury, from the ranks of the professional administrators. Roger’s duties included handling matters of justice, such as presiding over the exchequer. Furthermore Roger issued writs in his own name; contemporaries described him as “second to the king.” The term “justiciar,” however, was not yet associated with Roger or his office.

The title came into being during Henry II's reign, although the duties of this *justitiarius* were much the same as under Roger. The main distinction was that justiciars in Henry II's time, such as Richard de Luci and later Ranulf Glanville, handled a far greater volume of business. The loss of Normandy in John's reign curtailed the need for a deputy to the king, as he now spent most of his time in England. However, the justiciar, until his dismissal in 1234, did play a significant role in governing during the minority of Henry III and subsequently during the baronial movements of 1258–65. Nonetheless, after regaining control from the barons, Henry III felt that such an office was too high and exercised a control too independent of the king; he allowed the justiciarship to lapse.

K

Karole

The karole (Eng.) or *carole* (Fr.) was a genre of communally performed dance used in much of western Europe between the 12th and 16th centuries. It was executed to music sung by the participants, who were linked by hand, little finger, or sometimes by kerchiefs or sticks, into a single line. This could follow any track established by the karole leader or join into a closed circle that moved clockwise. Every step unit started with the left foot.

Modules of text, of tune, and of step units in specific dance meters were assembled in various combinations and in various recurrence patterns of unchanging text sung by all and changing text (open to improvisation) sung by the leader. Recurrence patterns included burden-and-stanza, stanza-and-refrain, rondeau, virelai, and some more complex than these. Surviving texts, most of which are literate creations, range from the simple and repetitive to the complex and virtuosic. The three components of text, tune, and dance were combined to greatly different effect for different subjects, which included the seasonal calendar, Christian doctrine, narratives, personal love and complaints, satire, and topical comment. Occasions of use included agricultural rituals, Christian holidays, and private after-dinner recreation. The exhilarating, even cathartic, potential of the karole was greatly feared by the Christian church, and numerous pious and doctrinally orthodox karole texts are evidence of attempts to harness it to blameless use. Some pious stanzaic texts whose stanzas consist of two units in different dance meters may have been made after secular or impious models, but with both the improvisatory possibility and the leader-and-group relationship eliminated.

The term “carol” is now used indiscriminately for karole and for contemporary and later songs (generally associated with Christmas) whose texts have no structural dance component.

Katherine Group

Five ME religious prose works, written ca. 1190–1230 and found together in the Bodleian Library manuscript Bodley 34, although also occurring in other manuscripts, individually or in partial groups with other texts, such as the *Ancrene Wisse*. The Group includes the *Life of St. Katherine*, the *Life of St. Margaret*, and the *Life of St. Juliana*; a religious allegory about the protection of the soul, *Sawles Warde (The Guardianship of the Soul)*; and a treatise on virginity, *Halt Meiðhad (Holy Virginity)*. Its earliest manuscript witness, Bodley 34, is written in the same west Midlands dialect as the *Ancrene Wisse* (named the “AB dialect” by Tolkien).

According to Dobson the Katherine Group and the *Ancrene Wisse* can be localized in Herefordshire and possibly more precisely to the anchorhold of the Deerfold associated with Wigmore Abbey. The *Ancrene Wisse* is known to have been written for female recluses. Whether the five texts of the Katherine Group were intended for the same or a similar audience is unknown, although the *Ancrene Wisse* specifically recommends one of them, the *Life of St. Margaret*. In addition source study indicates that the English works were composed with female readers in mind.

Although the six texts of the AB dialect are closely related, there is little reason to assume they were written by the same author. The survival of such a consistent group of works written by different authors but all devoted to the exposition of a distinctive and predominantly feminine spirituality raises questions of the training and concerns of the authors as well as about the role the female audience played in the inspiration of such material.

The three saints’ lives provide models of female saints successful in their

conquest of temptation. Although the three lives have much in common with their Latin sources, the English versions highlight specifically feminine concerns, such as feminine weakness and dependence, the female contemplative's presumed fear of isolation, the disadvantages of the uneducated woman in the face of temptation, the Devil's interest in women and his presence even in the most domestic of settings, and the dangers of the sexual temptation of the female saint. These feminine aspects of temptation are resolved in all three lives by the female protagonist's dependent, romantic relationship with her betrothed, Christ, a concretization of the *sponsa christi* ("bride of Christ") motif that is characteristic of both the Katherine Group and the *Ancrene Wisse*.

Sawles Warde, once thought to derive from Hugh of St. Victor's *De anima*, is now believed to be a translation of a Latin sermon attributed to Anselm of Canterbury, "De custodia interioris hominis"; both the Latin and English works are allegorical explications of Matthew 24:43–51. The English work, however, significantly develops the drama of the household, one of whose members is an unruly female character, Will. Furthermore it has been altered to emphasize the needs and concerns of the female reader. In keeping with the developments of the 12th-century renaissance the work provides a psychologically sophisticated exploration of the fluctuations of the human heart in its pursuit of abstract goals.

Of the five works in the Katherine Group *Hali Meidhad* most fully develops the assumption that lies behind them all—that Christ is the best husband for the female recluse. By exploring the nature of marriage, childbirth, and the care of a home in contrast to the more secure and rewarding life as a contemplative betrothed to God, the work shows the female recluse how to transform all her earthly desires into desire for Christ. Most startling is the assumption that women transfer rather than transcend the desires of the flesh, an assumption that can be shown to underlie many texts written for women in the religious life.

Along with the *Ancrene Wisse* the works in the Katherine Group constitute an important step in the stylistic development of early ME prose. But their style is not as narrowly dependent on that of OE religious prose as was once thought; rather it is indebted to both the native English and continental Latin tradition, and the stylistic sophistication of the works is due in large part to their fusion of the two traditions (Millet and Wogan-Browne, 1990: xiii-xiv, xxxiv-xxxviii). Like the *Wisse* the Katherine Group is also noteworthy for being among the earliest ME writing composed for a specifically female audience.

Kempe, Margery (ca. 1373–after 1438)

Controversial mystic and author of the first extant autobiography in English. *The Book of Margery Kempe* is both a mystical treatise consisting of the author’s visions and conversations with Christ and a narrative of her life, including her conversion, pilgrimages, and arguments with church authorities. Kempe, who was illiterate, dictated her autobiography to two different scribes. The original manuscript has been lost, but a 15th-century copy was discovered in 1934.

Born in the East Anglian town of King’s Lynn ca. 1373, Margery was the daughter of John Brunham, mayor of the town. At the age of twenty she married John Kempe. After the difficult birth of their first child Kempe suffered

a breakdown. This experience, followed by business failures in brewing and milling, led eventually to her mystical conversion. Her first ordeal as a mystic was to convince her husband to be celibate, but only after twenty years of marriage and fourteen children did he agree, on the condition that she pay off all his debts. With the consent of her husband and the church Kempe was finally free to pursue her vocation as a mystic.

The “way to high perfection,” however, was fraught with difficulties. Kempe encountered hostility from people who doubted her holiness and questioned her orthodoxy. She traveled around England seeking support and verification of her visions from many holy people, including the anchoress Julian of Norwich. Nevertheless, she continued to arouse suspicion and persecution for her behavior, including her bold speech and her “boisterous weeping.” She was arrested as a Lollard, threatened with burning at the stake by her English detractors, and deserted by her fellow pilgrims on her travels abroad. Kempe’s weeping in particular inspired her contemporaries to revile her and modern readers to label her “hysterical.”

Kempe’s travels took her to the Holy Land, Italy, Santiago de Compostela, and finally, near the end of her life, to Danzig, Prussia. The *Book* ends with her return to King’s Lynn, where she still inspires both hostility and marvel as a woman in her sixties.

The Book of Margery Kempe departs from the medieval saint’s life and mystical treatise. Unlike the saint’s life, which is biographical, Kempe’s book is autobiographical. As author and narrator of her own life Kempe develops some hagiographic conventions, such as the themes of her suffering, patience, and charity, while ignoring others. Her book is also unusual as a mystical treatise. Kempe’s visions and revelations are grounded in everyday, autobiographical details, including her struggles for acceptance, her fears for her own safety, and her travels.

Kempe’s work is divided into two sections, or books. The first book ends with the death of her scribe. Kempe spent four years trying to convince the second scribe to recopy and finish her book. He hesitated because of her notoriety and the illegibility of the first scribe’s writing but finally agreed. The 15th-century manuscript that survives may be a copy of the original dictated by Kempe to the second scribe. This copy belonged to Mount Grace, a Carthusian monastery in Yorkshire, but was later lost. William Butler-Bowdon discovered it in 1934 in his family library, and Hope Emily Allen identified it as *The Book of Margery Kempe*. (It is now BL Add. 61823.) Until 1934 only brief extracts of Kempe’s book had been known; these extracts, printed by Wynkyn de Worde (ca. 1501) and Henry Pepwell (1521), misleadingly omit Kempe’s autobiographical passages, and one incorrectly labels her a “devout anchoress.”

As a mystical treatise Kempe's *Book* is often compared with the work of her contemporary Julian of Norwich. Kempe's mysticism, like Julian's, belongs to the tradition called affective piety, characterized by personal devotion to Christ's humanity, particularly in the Nativity and Passion. The emotions, or affections, play a crucial role in this devotion. By identifying with the suffering humanity of Christ the mystic is transported through her emotions to spiritual love.

Kempe's life and mysticism, however, differ considerably from Julian's. Her boisterous weeping, her insistent identification with Christ, her self-preoccupation, and her refusal to live the more orthodox life of a nun or recluse distinguish her from Julian of Norwich. Critics in her own time as well as today fault her for the excessive emotionalism and literalness of her visions. Yet Kempe's mysticism was not unique. She found models for it in the lives and mystical works of other female mystics, such as Marie d'Oignies, Birgitta (Bridget) of Sweden, and Elizabeth of Hungary, and in the writings of the English mystic Richard Rolle.

The core of the controversy about Margery Kempe is her version of imitating Christ. Although the practice of imitating Christ's suffering was common in medieval spirituality, Kempe is preoccupied with this suffering. Her meditations on the Passion elicit this suffering and her roaring draws attention to it, disrupting sermons and disturbing the people around her. In addition Kempe's use of erotic language to describe mystical union—words like ravishment, dalliance, and even homeliness—is boldly literal. She translates the mystical concept of marriage to Christ into an alarmingly worldly one, as Christ instructs Kempe to take him to bed with her as her husband (ch. 36). Although Rolle before her had used sensual imagery to describe mystical union, Kempe's usage startles with its emphasis on the literal rather than the figurative or symbolic.

Kempe's book poses problems for literary analysis as well. Her narrative is not strictly chronological, and with its digressions and repetitions it seems unconstructed. How much Kempe's scribes contributed to the shape of the narrative is a further problem facing literary analysis. Finally Kempe's illiteracy makes the question of influence an interesting one. She exhibits some knowledge of both Latin and vernacular religious texts in spite of her inability to read or write.

Like her book Margery Kempe is an interesting and problematic subject. As a woman charting her own "way to high perfection" she challenged the religious, social, and gender expectations of her time. Her book offers valuable insight into the struggles of an extraordinary medieval woman who refused to conform to those expectations in her pursuit of a "singular grace."

Kentish Churches

The earliest churches of Kent have long been identified as a distinct group, which, because of their Mediterranean appearance and use of traditional Roman materials, are usually associated with the Augustinian mission, and

dated between 597 and 669. Kent is the only area of Anglo-Saxon England where it is recorded that Roman churches were still standing and adaptable at the time of the mission, and the churches of Stone-by-Faversham, St. Martin, Canterbury, and St. Pancras, Canterbury, can claim some Roman fabric.

The churches that constitute this group in Kent are Sts. Peter and Paul, St. Mary, St. Pancras, and St. Martin at Canterbury; St. Andrew at Rochester; St. Mary at Lyminge; St. Mary at Reculver. The naves are short—about one and a half times the width, which ranges from 28 feet to 22.5 feet. All, where reconstructible, have rounded eastern apses, nearly as wide as the nave. These can be stilted and are sometimes divided from the nave by triple columns or piers. There are entrances in the northern, southern, and western walls, while each doorway and each corner is marked by a pair of buttresses. In several churches there are side porticus, or chambers, that may have had a variety of functions, such as sacristy or funerary chapel. The Church of Sts. Peter and Paul, Canterbury, had a burial porticus for the royal family on the south and for the early archbishops of Canterbury on the north.

This church, as befits a mission center, also possessed a narthex in its earliest phases. Excavations have revealed how the core of the 7th-century church survived the many later Anglo-Saxon developments of the west and east ends.

The fabric of these buildings is a mixture of Roman brick and flint, and the floors were of brick-faced concrete. The triplearched columns at Reculver were decorated with restrained cable and stepped patterns, and from Canterbury some loose capitals of possibly 8th- to 9th-century date have survived, but on the whole there is much less sculptural decoration than in the Northumbrian churches. The inspiration for the plan and arrangement of these churches probably derives from Italy.

Kentish Hymn

An elaborate, 43-line celebration of the Trinity, based on a loose combined rendering of the *Te Deum* and *Gloria*, liturgical hymns that are both represented elsewhere in OE. The poem begins with a brief exhortation to Christian people to love and praise God (lines 1–6), while the rest of the *Hymn* consists of a lengthy address in praise of God, begging for his mercy. A similar blend of the *Te Deum* and the *Gloria* (along with some psalms) has been observed in the Antiphonary of Bangor, compiled in Ireland toward the end of the 7th century, but neither hymn appears to have been common in liturgical use in England before the 10th century.

The *Hymn* is found in BL Cotton Vespasian D.vi alongside a long poetic paraphrase of Psalm 50 in the same mixture of West Saxon and Kentish dialect; the manuscript also contains a number of interlinear Kentish glosses. The Kentish verse rendering of Psalm 50 appears to have been composed by a poet different from the author of the *Hymn*, but both poems were probably inspired as part of the 10th-century Benedictine Reform.

Kilpeck

Kilpeck Church in Herefordshire was given to St. Peter's Abbey (now Cathedral), Gloucester, in 1134. Located immediately to the east of the castle, it has one of the richest displays of sculpture on a small church in England and is the best surviving example of the so-called Hereford (or Herefordshire) School. The three-cell plan has a stilted apsidal sanctuary, square presbytery, and rectangular nave. Architecturally it depends on local sources: the rib-vaulted apse with short barrel-vaulted forebay comes from the south-transept chapel at Tewkesbury, the pilaster responds with quadrant shafts in the apse recall Hereford Cathedral presbytery, while Gloucester Cathedral provides the continuous quadrant molding of the east window and the right-angled chevron on the south doorway and the chancel arch. These churches also inspire some of the figurative and foliage sculpture at Kilpeck: ribbed draperies and some corbel heads relate to capitals in the west bays of the north nave triforium at Tewkesbury, while the grotesque heads on the south doorway ([fig. 76](#)) recall one at the apex of the westernmost arch of the nave arcade at Gloucester. The Tree of Life tympanum is allied to the local Dymock School, modified with foliage details from the crossing capitals at Hereford Cathedral. Hereford is also the source for the beaded medallions on the south doorway and the egg-shaped heads and bulbous eyes of the jamb figures of the chancel arch. The latter detail also appears locally on the bronze door knocker at Dormington. The form of the chancel-arch figures relates to Hereford Cathedral MS. P.4.iii, while their super-posed arrangement may derive from the south-transept portals at Santiago de Compostela. The dragons' heads projecting from the west wall and the intertwined decoration of the jambs of the south doorway speak of a Viking tradition.

Kingis Quair, The (The King's Book)

The earliest Scottish love vision (ca. 1424?), describing the poet's courtship of a highborn lady; the poem survives unique ly in Bodl. Arch. Selden B.24.

The authorship question has not been fully resolved. Norton-Smith, the most recent editor, accepts the evidence of a scribal colophon attributing the work to James I of Scotland (1394–1437) as well as the correspondence between James's historical situation and the events in the poem. Other critics consider the work's failure to receive acknowledgment and praise from contemporaries the most serious evidence against James's authorship. The language of the poem indicates Scottish origin, heavily influenced stylistically by Chaucer and, to a lesser extent, Lydgate.

The poem is 1,379 lines long and written in rime royal. In its opening stanzas the sleepless poet turns to Boethius's *Consolation of Philosophy* and muses on Fortune's instability; after hearing the Matins bell he begins to tell of events that have befallen him. Clearly echoing Palamon in Chaucer's *Knight's Tale*, the poet had seen a lady from the window of a tower in which he was imprisoned and prayed to Venus for help in winning the lady. That night he fell asleep and dreamed of being carried up in a heavenly journey to visit Venus and Minerva; the goddesses warn him that love must be grounded in

reason and virtue, then send him back to earth to implore Fortune's help in his courtship. Fortune lifts him high on her wheel and wishes him well, then tweaks his ear to awaken him. A white dove carrying a hopeful message confirms Fortune's apparent promise of comfort, and the poem ends on a note of joy and thanks.

The Kingis Quair mixes realistic and imaginative elements as the poet fulfills his stated intention to write "sum newe thing" (89). Events follow sequentially, interrupted only by the "flashback" narration of the dream vision. The poet moves from despair and uncertainty after his youthful capture at sea to a Boethian acceptance of divine governance over Fortune's wheel. The details of capture and imprisonment may reflect James's real situation as a prisoner in England for eighteen years (1406–24), at the end of which time his marriage to Lady Joan Beaufort took place. Conventional poetic devices with a rich literary ancestry raise the poem above mere narration: an ascent through the spheres, meetings with divine or semidivine instructresses, descriptions of an ideal landscape and its population of "diuerse kynd[s]" of plant and animal species, and so on.

The Kingis Quair does not concern itself primarily with formal philosophical or metaphysical issues but rather with representing the dreamer's psychological state as he contemplates the vagaries of love and fate. The poet's unqualified pleasure in recounting his experience marks a stylistic departure from Chaucer's narratorial stance, in spite of the many Chaucerian influences evident throughout the work. In both style and content *The Kingis Quair* remains one of the finest examples of 15th-century dream poetry.

King's College, Cambridge

Founded by King Henry VI in 1441, the college was foreseen as modest in size, and a three-storied college building—the first of that height in Cambridge—was begun on a restricted site. Soon Henry was prompted to provide an extravagant endowment and to enlarge the college to 70 scholars; its mission, almost exclusively to train theologians, set it apart from other Cambridge colleges. A bold new site, fronting on the town's major commercial and religious street, was put together contiguous to the original location, and the area was cleared of existing structures.

Henry VI gave written instructions for a series of integrated college buildings around a large, 238- by 230-foot closed quadrangle with a chapel occupying its entire north side. A cloister cemetery with a tall bell tower between the chapel and the river was envisioned. Although the east side of the quadrangle was started, only the chapel was actually completed. The present open quadrangle, roughly the same size and in the same position as originally planned, was completed in the 18th and 19th centuries, leaving the chapel isolated with its famous vista from the river unimpeded.

Fig. 77. King's College, Cambridge, chapel. After G. Webb (1956). Reprinted by permission of Yale University Press.

Fig. 78. King's College, Cambridge, chapel exterior, south side. Courtesy of L. Hoey.

King's College Chapel (figs. 77–79), one of the most extraordinary buildings from the late Gothic period, was begun in the late 1440s under the direction of master mason Reginald Ely, who is given credit for the architectural details and essential elements of its elevation; the stylistic features evolved out of earlier work in England, especially East Anglia. From the exterior the 288-foot-long chapel with towers at its four corners appears to have one interior space with a row of lower side chapels—to provide privacy for religious contemplation—located between the buttresses; however, the interior is actually divided by a low screen into an antechapel, serving as an educational space and anticipatory in visual expression, and the chapel proper, which imparts a sense of enclosure that resolves the spatial tensions.

Fig. 79. King's College, Cambridge, chapel interior. After anonymous 19th-century lithograph. Courtesy of W. Leedy.

Construction was slowed by 1461, when Henry VI was deposed. The foundations for the whole structure were laid, but less than half the building was actually built.

Work speeded up again ca. 1476 under the direction of John Wolryche and

carried on under Simon Clerk from 1477 until 1485, when Richard III was slain at Bosworth. By then the walls of five eastern bays were complete with their outer roof. Work continued in a desultory way until 1506, when Henry VII (d. 1509) started to fund construction on a grand scale and later left instructions in his will that the chapel be completed. The design for the antechapel, the great fan vault over the entire chapel, towers, and battlements were finalized and built by 1515 by John Wastell. The stained-glass windows, rood screen, and choir stalls were finished by 1538. Work carried out after 1515 was funded largely by Henry VIII.

Over time the concept for the chapel changed from an act of piety and religious conviction—Henry VI had wanted “no curious entail or busy moldings”—to one of dynastic propaganda and artistic splendor under Henry VII. The iconographic program for completion of the chapel included extraordinary large-scale heraldic sculpture and elaborate fan vaulting with heraldic bosses that were intended to influence public opinion through art by proclaiming the efficacy of the new Tudor dynasty. The idea was to reinforce the notion that Henry VII was the legitimate holder of the throne, a claim made through his “uncle of most blessid memory,” Henry VI.

Knight Service and Knights' Fees

The Norman Conquest introduced knight service into England. William's chief followers accepted their land as a fief (Lat. *feodum*) from the king in return for military service, and in turn provided that service by granting out some of their land as fiefs to knights (*milites*) in return for service. Similar obligations were imposed on the lands held by churches.

The usual term of such service in England was 40 days a year. Yet arguably the difference from before 1066 was of degree, not of kind. Military obligations in Anglo-Saxon England had ultimately rested on possession of land. What the Conquest did was to replace a relatively uniform system of military obligation, based on one man serving for every five hides worth of land, with a series of arbitrary arrangements between the king and his tenants-in-chief (nobles who held fiefs directly from the king). The king came to agreement with an individual landholder on the number of knights with whom he would serve when military service was levied.

These quotas were established in the time of William I, although lordships were often confiscated, and regranted piecemeal, or split up when heirs failed or daughters inherited, and fresh units emerged, with new quotas of knight service. From the time of Henry I these usually reflected the number of knights actually enfeoffed on the land in question. Our analysis of such matters must be to some extent conjectural; the earliest list of the quotas comes in the *cartae baronum* of 1166, Henry II's attempt to record what obligations tenants-in-chief owed and how many knights they had in fact enfeoffed on their lands.

If arrangements between the king and his great nobles followed soon after the Conquest, those between the nobles and their knights who actually performed the service owed the king crystallized slowly. To begin with, most service was probably performed by knights who lived in the lord's household, maintained directly without being granted land. By the time of Domesday Book (1086) many lords had granted out portions of their land in return for service, but most of the early grants were life tenures only; only under Henry I did grants of hereditary fiefs become the norm.

There is evidence that under the first two Norman kings the number of knights owed by the subtenants may have fluctuated. One of the earliest surviving charters of enfeoffment, from the Abbey of Bury St. Edmunds in the reign of William I, grants a fief for the service of either three or four knights.

The bishop of Worcester and his subtenants were still disputing how much service the latter owed the bishop in 1095.

Furthermore, while the Norman system of military obligation had been designed to provide military service for the crown, from early on elements of that service were commuted for money payments with which professional knights were hired. Tenants-in-chief might hire knights when the king required actual service, or the king might demand money (*scutagium*: scutage —“shield money”) and hire troops, particularly for service in Normandy. Alternatively, after the 40 days of unpaid service were up some or all of those serving unpaid might continue to serve, now for pay.

The first use of the term “scutage” is in 1102, but this is probably after the actual appearance of the levy. Abbot Suger of St. Denis described William II (William Rufus) as “a great merchant and paymaster of knights.” This financial element meant that what became important was not so much the knight himself but the unit of obligation, the knight’s fief or fee. This was what had been granted for the maintenance of the individual knight; there was no fixed value, nor was the fee necessarily a coherent economic unit, though scutage was usually levied at 30 shillings per fee, irrespective of the value of individual fees.

Other factors encouraged this development. Lords expected other obligations beyond military service. Castle guard was one, but more important in this context was the aid, a financial levy either by consent or as of right on certain specified occasions. Magna Carta limited these to two: knighting of the lord’s eldest son and the marriage of his eldest daughter. Those holding directly of the king would, in addition, have to contribute an aid to help ransom him if he were captured.

On most lordships many subtenants owed the service of less than a full knight. On the Clare lands in Kent and East Anglia, in 1166, 23 of 66 subtenants owed less than one knight’s service, and others had quotas with a fractional element. The “service” for such fractional fees was almost inevitably in terms of money, whether or not the king might want actual knights from the lords.

By the late 12th century the knight’s fee had clearly become the key to the military system, since even where service was raised it no longer bore any exact correspondence to the number of knights theoretically enfeoffed. In 1198 Richard I levied knight service for the defense of Normandy. He asked not for the service of all the fees owed but for one-tenth of this amount, to be, however, for a year rather than 40 days. General inflation, particularly the increased cost of military equipment and wages (where paid), meant that a single knight’s fee no longer sufficed to support a knight. By the early years of Henry III the crown recognized this and formally divorced the obligation for

actual service from the number of knights' fees on which scutage or aids were paid. The earldom of Cornwall, given to Henry's brother in 1231, was assessed at 215 knights' fees for scutage, though the actual service was but five knights.

By now many landowners who would once have been knights were unable or unwilling to face the financial burdens of knight service and were no longer being knighted. And such was the maze of subtenancies and fractional fees (created not least by divisions among coheiresses in default of a male heir), as well as of men holding fiefs from more than one lord, that scutage was difficult to collect and failed to yield the sum it theoretically should have.

By the time of Edward I the old system of military obligation was anachronistic. He tried to reform and revive the concept of unpaid service by imposing the obligation on all freeholders with land worth over a certain amount; in 1297 he attempted to levy overseas service on those owning land worth over £20 a year. Such measures proved ineffective and unpopular. Though the king still might resort to the traditional "feudal" levy, this no longer raised sufficient troops, and magnates were sometimes asked to bring as many extra men as they could, often at their own expense, but with the hope of reward from the profits and conquests of the campaign.

However, more and more men served for money. Nobles were given indentures (contracts) in which they agreed to raise a set number of men—not necessarily knights—in return for money for wages and expenses. Such contractual service began on a large scale with Edward I's wars in Wales and Scotland and was to be the norm for the 14th century.

The last two occasions on which knight service on the old assessment basis was raised were in 1327 and 1385, in both cases for campaigns against Scotland. Whether the final levy in 1385 was intended as a serious military effort or as an excuse to raise scutage to provide help to a nearly bankrupt government has been much debated. Certainly the limited period of unpaid service was a major disadvantage, and the traditional levy was, by the 14th century, outdated. So, too, was scutage; the few thousand pounds it could raise were a drop in the ocean given the spiraling costs of warfare; the crown had to look to other and more effective methods of raising money.

Labor Services

The holding of land obligated tenants to perform specific services. These services varied with the types of tenurial relationship common at the time. Thus tenants of knights' fees rendered military service to their lords. Tenants in grand serjeanty performed exalted personal services, while those in petty serjeanty rendered more menial ones. Tenants in socage—freeholders—frequently made annual payments or nominal payments in kind, such as a pound of pepper or a rose. However, the bulk of the rural population consisted of the dependent or unfree peasantry (villeins, serfs, or naifs), and their landholding required the rendering to their lords of both customary rents, in money or kind, and labor, or work services.

Work services comprised a broad range of activities, clearly affected by the varieties of the rural economy throughout England. But whether in open field, woodland, or fen, the services embraced the many kinds of agricultural labor. The works were usually designated “week work,” meaning services to be rendered each week, usually in terms of a specific number of days per week. The obligation to plow the lord's demesne, at least once a week, was ubiquitous in the fields of the Midlands and of east and southeast England.

Other commonly encountered duties included reaping, binding, threshing, hay making, winnowing, mowing, digging, hedge planting, pruning, scouring of ditches, carting services, and repairs to farm buildings and fences. Detailed lists of such services are readily found in manorial extents (surveys of manorial resources, including anticipated revenues and services), especially those of the 13th century, when many English landlords—and probably peasants as well—were determined to have local agricultural customs set down in writing.

The works described in careful detail in the 13th-century extents are comprehensive in their coverage of rural labor, so much so that it is difficult to take seriously the not uncommon medieval charge that servile tenure was characterized by an “uncertainty” of services. At first glance, indeed, the work obligations appear to have been relentless in their frequency. However, many

of the works—often described as constituting the obligation for one day—could have been performed in half a day's time or less.

In addition the degree to which the actual work services were in fact exacted was affected by local economic need, personal health, individual willingness to work, and religious duty. Works could be commuted into money payments. Instead of rendering labor services personally—or through substitutes—peasants were sometimes excused all or some of the services for their monetary equivalent. This was especially common in the 12th century and again from the latter half of the 14th century to the 16th.

Illness also canceled work services. Entries in the annual account rolls of manors often record the number of works excused specific individuals because of illness. Conversely court rolls frequently contain notices of people refusing to work and being amerced (fined), a reminder that “absenteeism,” for whatever reasons, is not just a modern industrial problem.

Religious feasts, or holy days, canceled work services by effectively prohibiting all servile work. Sundays and the universal celebrations of Christianity were such times; so were the more local saints' feast days. The number of such feast days varied from region to region, of course, but it was not unusual for anywhere from a dozen to forty days a year to be removed from the work calendar of this world of a six-day working week.

As arduous as work services were, their descriptions in manorial extents suggest that they were not necessarily the results of arbitrary decrees by ruthless landlords. Some degree of peasant cooperation was required not only for the system to function but even to exist at all. This is reflected in the degree to which work obligations have their own internal limitation. For example, the number of work “days” each week is usually restricted, often to three or four. In such works as digging the length, breadth, and depth of trenches are frequently noted; the amount of grain to be threshed is set down; in carting services the distances to be traveled are specified, and it is sometimes made clear whose animal or cart is to be used.

Even at the harvest season, when the maximum amount of work was often demanded, with the peasant bringing his whole family and additional labor to the fields, it was not uncommon to find lords being obligated to provide meals.

Work services as a condition of servile tenure existed throughout the medieval period. Their origins are obscure, with both Germanic and late Roman antecedents having been proposed. But whatever and wherever the beginnings, the system was at its peak in the 13th century, when population pressures created a time of high farming by landlords who, eager to derive maximum profit from favorable market conditions, exacted work services from the peasantry more vigorously than in either the 12th or 14th and 15th centuries, when commutation was more common than in the 13th. By the 16th

century villein or customary tenure had been transformed into copyhold tenure, which made tenure fairly secure by basing it on set terms or rents, and although documents still spoke of the duty to render “all accustomed services owed,” the English countryside had become a world dominated by the payment of rent.

Lady Chapel

A distinctive formal feature of English Gothic church architecture; provision of a Lady Chapel was a central objective of the campaigns of choir remodeling and eastern extension that altered the floorplans of most English cathedrals and abbey churches from the later 12th through the 14th century. The Lady Chapel, a large hall church of roughly the same dimensions as the choir itself, was most frequently located in a rectangular space thrusting eastward from the east end of the choir. In churches laid out like Salisbury this was a low, projecting space emerging from the main mass of the building by only a few bays, as at Salisbury itself, or almost entirely freestanding, as at Gloucester or

Westminster. High projecting Lady Chapels sustained the roofline of the main building, as at Bristol or Worcester. A second popular location for the Lady Chapel was in the place of honor immediately beneath the east window in churches with an aisled rectangle plan and flush east end, as at York. There are a number of common exceptions to these schemes of eastern axial placement, the most significant being north of the choir in a location east of the north transept, as at Ely.

The rapid proliferation of Lady Chapels in England is tangible expression of the intensification of devotion to the Virgin Mary in later medieval England and the pressure to house new Marian liturgies (in particular the daily morning Lady Mass and evening Salve service) in appropriate spaces. An element of popular demand for access to worship services may have also played a role (an issue that needs more scholarly exploration); certainly in abbeys and cathedrals the chapel became an important place of worship for pilgrims and the local laity, especially devout women, and a center of guild and confraternity activities. Archival data establishes the endowing of choirs (including boys) and the presence of organs in the Lady Chapel from an early date, and by the 15th century in many places the master of the Lady Chapels music became the highest-ranking practicing musician in ecclesiastical service. A considerable portion of the medieval English repertoire of polyphonic mass music and Marian antiphons was composed for performance in the Lady Chapel.

Lady Mass

A daily votive mass to the Virgin Mary, usually celebrated as a morning mass around the time of Prime. Daily Lady Mass is to be distinguished from the celebration of a weekly votive mass for Mary on Saturday as part of the Marian Commemoration, normally substituting for the principal mass that day. The latter is an older custom widespread in England by the 12th century that had its roots in the Carolingian era. Adoption of Lady Mass began in major English establishments in the mid-12th century and was nearly universal by the early 13th, when Abbot William Trumpington of St. Albans (1214–35) ordained that the abbey celebrate a Lady Mass daily “seeing that it was done in all the noble churches in England.” Like the earlier introduction of the Feast of the Conception of the Virgin in the 1120s and the later adoption of the evening Salve service, the emergence of the Lady Mass testifies to a particularly intense devotional fervor for the Virgin Mary in England. It seems additionally to reflect a growing popular demand by the lay public (including women) for greater access to worship services, a pressure also addressed by the building of Lady Chapels to house votive Marian services (the daily morning Lady Mass and evening Salve service).

Lady Mass was a solemn, sung mass rather than a low, spoken mass. Surviving liturgies show it to have been observed with a great deal of flexibility in the choice of liturgical forms, including substitutions and interpolations that involved polyphonic music. Lady Mass, indeed, was the principal focal point for new liturgical composition and polyphonic music making in England from ca. 1200 to 1400, and most surviving English mass music of these years appears to have been intended for it. Endowed choral positions (including boys) and organs are documented in Lady Chapels from an early date, and these would principally have been employed in the performance of Lady Mass.

La3amon or Layamon (fl. ca. 1200–25?)

Author of the *Brut*, a major poem of the early ME period that contains, among other items of interest, the first account in English of the Arthurian legend. La3amon identifies himself in the opening lines of his poem as a priest residing in Ernle3e (Areley Kings, Worcestershire). Having resolved to write a history of England, he says, he consulted as source material Bede's *Ecclesiastical History*, a Latin book written by Sts. Albin and Augustine, and Wace's *Roman de Brut*. In fact La3amon appears to have made little use of Bede's history (tentatively identified by scholars as the OE translation of Bede) or the untitled Latin text (identified still more tentatively as a book containing selections by Albin and Augustine of Canterbury, the Latin text of Bede, or a mere fiction invented by the poet to display his erudition). Thus, with some significant modifications and additions, La3amon's poem is essentially an English paraphrase of Wace's *Brut* rendered into alliterative long lines, some 16,000 in number. Because of an allusion in the opening lines of the poem to Eleanor, "who was Henry's queen," it is generally accepted that the *Brut* was written some time after the death of Henry II in 1189 and possibly even after the death of Eleanor herself in 1204; but scholarly opinion relating to the precise date of composition ranges from the late 12th century to the second half of the 13th.

The *Brut* survives in two manuscripts dating from 1250–1350. Although both are thought to derive from a common archetype, BL Cotton Caligula A.ix is commonly held to be closer to its exemplar—and hence to La3amon's original text—than is BL Cotton Otho C.xiii. The latter is considered an inferior text because its scribe apparently attempted to modernize his original by eliminating many of the rhetorical embellishments intended to give it what has been called an "antique colouring" (Stanley). These embellishments include lengthy repetitions of detail and incident and archaisms of the type that survive in and characterize the Caligula text—that is, the many coinages and poetic compounds with a distinctly Anglo-Saxon ring about them and the marked preference for words of Anglo-Saxon origin (many of which have been replaced in the Otho text by French loanwords).

In subject matter and method La3amon imitates Wace so as to be able to afford his readers a history of the Britons from the time of Brutus, great-grandson of Aeneas, to the ascendancy of the Saxons over the Britons during

the reign of Cadwalader in the 7th century. La3amon's additions to and modifications of his Anglo-Norman source have much to tell us, however, about his purpose in adapting Wace's poem into English: as scholars have been quick to notice, La3amon's numerous accounts of feasts, sea voyages, and battles, many of which have no counterparts in Wace's poem, evoke the ethos of OE poetic accounts of such events and seem to have been intended to do so. Similarly Wace's interest in love, courtesy, and the ideals of chivalry is not one that La3amon shares: indeed, in his adaptation of many of the events described in Wace's poem, we find La3amon attempting to recreate the ethos of the heroic, as opposed to the chivalric, world. His Arthur, for example, is not a Norman king presiding over a chivalric court as in Wace, but a Saxon chieftain as disposed to committing acts of brutality and violence as to rewarding his faithful retainers, after a battle, with rings, garments, and horses. As in the mead halls of OE poetry, there are *scops* in Arthur's court and *dream* (joy) when a victory is being celebrated; by the same token here and elsewhere in the poem there prevails, as in OE verse, an overwhelming sense of the role played by Fate in the human lives, but especially in the lives of those destined to enter the field of battle.

Further evidence of La3amon's familiarity with and desire to imitate the verse of OE poets can be discerned in his use of formulas, not simply as tags and line fillers but also to advance his narrative in a manner in keeping with the formulaic practices of OE poetry. Not surprisingly, perhaps, the *Brut* is most noticeably formulaic in passages that have no counterpart in Wace and in which La3amon seems to have been particularly eager to recreate the ethos of the past, such as his accounts of feasts, sea voyages, and battles. Equally indicative of La3amon's admiration for the verse of the OE poets is his use of certain rhetorical tropes and patterns found in their poetry. With an unmistakable sense of what he is about La3amon employs, with varying degrees of frequency, the kenning, the descriptive epithet, the simile, litotes, variation, chiasmus, and more complex structural repetitions, such as the envelope pattern, repetition parallels, and balance parallels.

La3amon's unmistakable nostalgia for the pre-Conquest period is reflected not only in the poem's style and content but also in its verse form. He patterns his verse, like his language and themes, after that of the OE poets. La3amon's basic metrical unit is the alliterative long line consisting of two two-stress hemistichs linked by alliteration, rhyme, or both. His use of rhyme as well as alliteration, of a longer line (to accommodate the hypotactic constructions of ME), and of some metrical patterns that do not conform to the metrical patterns of OE verse suggest that La3amon was working within a much more flexible prosody than that governing the composition of OE poetry; however, his verse should not be relegated, as some of his critics have suggested, to the

ranks of “popular” poetry. Rather it is an evolutionary form of the “classical” alliterative verse of the English Middle Ages.

Lai, Latin

One of the most expansive and impressive genres of medieval lyric poetry and nonliturgical musical composition, cultivated primarily from the 12th to the 14th century. In formal terms the Latin lai is essentially a secular sequence, constructed on the principle of progressive repetition wherein each formal unit is normally stated twice, creating a chain of double versicles, or musically paired lines of text. Unlike the sequence, however, it may also feature triple and quadruple versicles, repetition of musical phrases within the individual versicle, and the return of earlier musical material. The Latin lai is to be

distinguished from the narrative lai and Arthurian lai in French (which were also evidently sung in their original performance contexts), but not from the independent lyrical lai in French, with which it shares its form, distinctive melodic idiom, and important contrafact relationships (the crafting of new texts for existing melodies). The later Latin sequence and planctus are also closely related stylistically and formally. Among examples in insular sources *Samson dux fortissime* and *Omnis caro peccaverat* (the *Song of the Flood*) are the most ambitious. Important English sources of the Latin lai with music include the Later Cambridge Songs (CUL Ff.i. 17), BL Harley 978, and BL Arundel 248; sources without music include the Bekyngton Anthology (Bodl. Add. A.44), BL Arundel 384, and Bodl. Rawlinson C.510.

Lancaster, Duchy of

The duchy of Lancaster was the greatest and richest landed estate of late-medieval England. It expanded into a collection of manors, castles, and jurisdictions in nearly every county of England and Wales. It had its origins in the Norman honor of Lancaster, erected into an earldom and joined with the earldom of Leicester by Henry III for his younger son, Edmund Crouchback.

Edmund's son Thomas married the heiress to the earldom of Lincoln, Alice de Lacy. He suffered forfeiture and death as the leader of the opposition to Edward II, but his nephew Henry of Grosmont proved a loyal servant of Edward III and was restored to the earldom in 1345. In 1351 the earldom was elevated to a duchy, and Duke Henry was given palatine (i.e., semiregal) powers in the county of Lancaster. Henry's heiress, Blanche, married Edward III's fourth son, John of Gaunt, who succeeded his father-in-law as duke in 1362.

John was the greatest lord in England in the final years of Edward III's reign and throughout the reign of his nephew Richard II. He created a strong retinue based upon the duchy, and he developed its administrative cohesion and independence. John attempted to add to the family's wealth through the marriage of his heir, Henry Bolingbroke, to the Bohun coheiress Mary. Henry, however, became involved in the Appellant opposition to Richard II (1388); he was exiled in 1398. When Gaunt died in 1399, the threat posed by the duchy's wealth and power led Richard II to confiscate it. Henry returned to England as the champion of property rights. At his landing he claimed only the duchy, though he proceeded to depose Richard and assume the crown.

Henry IV protected the duchy by an act of parliament, providing it would remain the private possession of his family. It thus continued to enjoy its own administration. The attainder of Henry VI gave the duchy to the Yorkists, and Edward IV, by act of parliament, joined the County Palatine to the duchy and made them estates tied to the crown. The palatine court was abolished in 1873. The chancellor of the duchy still serves as a minister without portfolio. The sovereign, when traveling in a private capacity, still does so as the duke or duchess of Lancaster.

Lancaster, John Duke of (John of Gaunt; 1340–1399)

The fourth son of Edward III and Philippa of Hainault; earl of Richmond

(1342–72), duke of Lancaster in 1362 after receiving the largest English inheritance in right of his wife Blanche (d. 1368).

From 1366 to 1374 Gaunt deployed Lancastrian resources as a retinue captain and royal lieutenant, first to support his elder brother the Black Prince's intervention in Castile (1367) and from 1369 as a mainstay of his father's shrinking power in France. In 1372 he assumed the titular kingship of Castile after marriage to Constanza (d. 1394), daughter and heir of the deposed Pedro I. In 1376–77 Gaunt's defense of his enfeebled father's government, undermined in the Good-Parliament of 1376, and his maladroit attacks on the privileges of London and the church (in the course of which he was a patron to John Wyclif) brought him widespread unpopularity.

From 1377 to 1385 he cooperated with fellow nobles in council and parliament, and at conferences and on campaign, in defending his nephew Richard II's authority, though failing to cement good relations with Richard and the envious court favorites who emerged in the 1380s. From 1386 to 1389 he withdrew abroad, first pursuing (1386–87) and then compromising (Treaty of Bayonne, 1388) his Castilian claim, and then acting as royal lieutenant in Aquitaine (1388–89). In 1390 a chastened and friendlier Richard created Gaunt duke of Aquitaine for life, probably with the idea that he and his heirs would hold the duchy as part of the peace settlement he tried to negotiate with the French crown over the next few years.

Gaunt's support, backed by his huge permanent retinue, was again a stabilizing force in Richard's rule. The duke was dependent on royal favor to uphold his authority against Gascon opposition and to advance his Beaufort children (by Katherine Swynford, whom he married in 1396, facilitating their legitimation). A strong believer in royal prerogative, Gaunt continued to support Richard, despite the suspicious death of his brother, Thomas duke of Gloucester (1397), and the exile of his son Henry of Bolingbroke (1398). Gaunt died at Leicester on 3 February 1399 and was buried in St. Paul's Cathedral, London.

His lasting achievement was the acquisition in hereditary semiregal (palatine) powers in the county of Lancaster for his successors. His memory was to be honored as the forebear of ruling houses in 15th-century England, Portugal, Castile, and Aragon, and—through the Beauforts—of the Tudor dynasty. Chaucer's *Book of the Duchess* is an elegy on Gaunt's first wife, Blanche, perhaps written for him. An impression of the magnificence of his household can be gained from the ruins of the domestic apartments he built at Kenilworth Castle, Warwickshire.

Lancaster, Thomas Earl of (ca. 1278–1322)

The most powerful nobleman of his time and determined opponent of Edward II. Through inheritance and marriage he controlled five earldoms: Lancaster, Leicester, Lincoln, Salisbury, and Derby. Their enormous wealth enabled him to amass the largest private retinue in the kingdom.

As Edward II's cousin Thomas was a natural ally of the new king in 1307. Yet he soon changed course. In 1311 he helped draft the Ordinances and in 1312 shared responsibility for Piers Gaveston's execution. Thereafter he steadfastly championed the Ordinances. Between 1314 and 1318, after the rout at Bannockburn, Edward needed Thomas's retinue to fight the Scots in the north, giving Thomas the opportunity to implement reforms.

Unfortunately Thomas himself sapped the effort. Instead of applying himself to government he held aloof. He was not widely liked or trusted by his peers. Some thought that his insistence on reform cloaked an urge to seize power. He was prone to feuding and could be violent, arrogant, self-righteous, and grasping. Even his wife, Alice de Lacy, deserted him.

After 1318 Edward outmaneuvered Thomas and ousted him from government. When the Marchers rebelled in 1321, Thomas joined in, but their forces were defeated at Borough-bridge. Thomas was captured and summarily

executed on 22 March 1322. His stance as a staunch defender of the popular Ordinances probably accounts for his posthumous reputation. Almost immediately after his death it was said that miracles were performed at the sites of his execution and burial, and common people called for his canonization.

Lanfranc (ca. 1010–1089)

An Italian, from Pavia, of legal background, Lanfranc arrived in Normandy ca. 1042. After briefly teaching in Avranches he entered the newly founded Abbey of Bee and became its first prior-schoolmaster, accepting lay and ecclesiastical students from throughout Europe to study the liberal arts at Normandy's foremost school. One contemporary remarked that there was no learning in Normandy before Lanfranc's light shone throughout the land.

Lanfranc's scholarly reputation brought him into contact with the earliest of the reform popes, Leo IX, and with subsequent papal reformers throughout his career. In his most famous work, *Liber de corpore et sanguine Domini* (*On the Body and Blood of the Lord*, 1059), written at papal request, he stated the papal case against Berengar of Tours's denial of the transformation of bread and wine into the body and blood of Christ, for which Berengar was declared a heretic. Lanfranc remained in close contact with his own student Pope Alexander II, who granted Duke William of Normandy the papal banner to conquer England in 1066.

By the 1050s Lanfranc may have been William's closest adviser. His biographer reports that William "set him on a watchtower" over all the

churches of Normandy and England. In 1060 he became the first abbot of the ducal monastery, St. Étienne at Caen, built by William, perhaps at Lanfranc's arrangement, to reconcile papal protests against William's marriage to Matilda of Flanders (who concurrently built the nunnery of Holy Trinity in Caen).

Declining election in 1067 as archbishop of Rouen, in 1070 Lanfranc accepted the archbishopric of Canterbury and became primate of England at William's request and Pope Alexander's order. He became William's collaborator in re forming the church, investigating and systematizing its traditions, and bringing monks from Bee and Caen to rule English abbeys and sees.

Lanfranc joined with William to obstruct the radical Pope Gregory VII's effort to subject England and William to papal lordship. He sometimes served as regent in the king's absence, once quashing a serious baronial rebellion. His involvement in the Domesday Survey (1086) seems clear. Lanfranc successfully controlled the Conqueror's son and successor, William II (William Rufus), until he died in 1089; thereafter Rufus despoiled the church, attempting to reverse many of the Conqueror's and Lanfranc's policies. But his reforms, reinstituted by his student Anselm, set a pattern for the English church to the present day.

Langton, Stephen (ca. 1155–1228)

A notable biblical scholar, theologian, preacher, and archbishop of Canterbury. Born in Lincolnshire, Langton went ca. 1170 to study in Paris, where he became master of theology. In a lengthy and productive career he wrote the *Questiones theologicæ* (lectures on theological and moral problems), commentaries on scripture, and numerous sermons. The modern system of

chapter-division for the Bible is also attributed to him.

In 1206 Langton was made a cardinal-priest by his former Paris friend Lothar of Segni, Pope Innocent III. Immediately thereafter Langton became involved in the events associated with the disputed election to the see of Canterbury following the death of Hubert Walter in 1205. Innocent voided the elections of the two candidates supported by the monks of Christ Church Canterbury and by King John and pressed instead for the election of Langton, whom he consecrated on 17 June 1207. John's refusal to accept Langton as archbishop led to six tumultuous years during which England was placed under interdict and the king excommunicated. Returning to England in 1213, Langton mediated the struggle between the barons and the king that led to the drafting of Magna Carta. It is likely that he was responsible for those provisions of the Charter guaranteeing the liberties of the church.

Langton attended the Fourth Lateran Council in Rome in 1215. Despite his suspension by the pope for his failure to enforce papal censures against the barons opposing John he supported the broad program of church reform initiated by Rome. From 1218, when he returned to England, until his death in 1228 Langton was a loyal supporter of the young Henry III. As archbishop of Canterbury he was an able administrator and defender of the interests of the English church. Langton's efforts to raise the standard of the English episcopate paved the way for such reformers as Grosseteste and Pecham and for a wide participation by bishops in the life of medieval England.

Language, History of the

Old English

When the last of the Roman legions withdrew from Britain in the early 5th century, the inhabitants of the parts of the island that had been under Roman rule for four centuries were left to defend themselves. These Celtic Britons, who had come to depend on Roman arms for protection, found themselves vulnerable to attack from the Picts and the Scots in the north, as well as from seafaring raiders along the southeastern coast. According to Bede in the year 449 Vortigern, one of the Celtic leaders, asked for help from a Germanic tribe on the Continent, who responded to the call but then turned on their Celtic hosts. Traditionally this date has been taken as the beginning of the migration to Britain of Angles, Saxons, and Jutes, although there is a growing body of archaeological evidence for a Germanic population in Britain during the 4th century. With the arrival of these Germanic peoples, who spoke related dialects, the English language can be said to have begun (the name “English” itself being derived from the name for the Angles).

Anglo-Saxon, or Old English (OE), is a West Germanic language, most closely akin genealogically to Dutch and Frisian. It has dialectal divisions that probably reflected differences already present in the continental homes of the invaders as well as some features that developed in England after the settlement. Of the four OE dialects West Saxon is the one in which the most extensive collection of texts is preserved. Kentish was spoken in the southeast; Mercian, in the Midlands between the Thames and the Humber; and Northumbrian, north of the Humber (fig. 80). Except for place-names, including especially names of rivers, OE shows little influence from the Celtic language of the population who had been in the British Isles for perhaps a thousand years. As more of the Germanic settlers arrived, the Celts were driven to the western and northern parts of the island and to Ireland.

Fig. 80. Dialects of Old English. After A. C. Baugh and T. Cable, A History of the English Language (1993). Reprinted by permission of Prentice Hall.

Although little affected by the Celtic language that it displaced, OE did incorporate considerable vocabulary from two other foreign sources, Latin and the Scandinavian languages. Beginning in 597 with the arrival of Augustine, the conversion of Britain to Roman Christianity introduced words into OE to describe the new religion and the new religious and cultural concepts.

(Augustine's mission was actually a reintroduction of Christianity, because Irish monks had been preaching the gospel in the north since the founding of Iona by Columba in 563. However, 597 marks the beginning of a systematic attempt on the part of Rome to convert the inhabitants.) From the earliest period of Christian influence come words that survive in only slightly altered form into Modern English: *abbot, angel, bishop, candle, deacon, disciple, hymn, martyr, mass, noon, nun, palm, pope, priest, rule, shrine, temple*, and many others. From the Benedictine Reform of the latter half of the 10th century come additional borrowings, many of which, as before, have to do with religious matters: *apostle, cell, cloister, creed, demon, dirge, font, idol, prophet, sabbath, synagogue*.

Scandinavian attacks upon England during a period of nearly 300 years left their mark on the history and language of the Anglo-Saxons. Between 787 and 1042 there were at least three waves of invasions and subsiding activity. Alfred the Great's victory over the Danes in 878 resulted in the Treaty of Wedmore, by which the Danes withdrew from Alfred's territory and remained east of a line running from Chester to London. This territory was subject to Danish law and hence became known as the Danelaw. The chief effects of contact with Old Norse, the ancestor of the modern Scandinavian languages, can be seen in the borrowings of individual words, some of them forming new semantic distinctions with their English cognates; for example, *skirt, scale, scab*, and *loan* developed from Old Norse borrowings, while native English *shirt, shale, shab(by)*, and *lend* continued to be used with shifts in meanings.

Loanwords from Latin and Old Norse appear above in their Modern English spelling. For some of these words the OE pronunciation would not be far from that of present-day English. King Alfred's West Saxon pronunciation of *arcebiscope* 'archbishop,' for example, would probably be understandable now, a fact concealed by superficial conventions of spelling. The sequence *sc* represented the *sh* sound, and the letter *c* by itself represented either the *ch* sound in *arch* or the [k] sound now spelled sometimes with *c* (*cat*), sometimes with *k* (*king*, OE *cyning*). Other spelling differences that cause a page of OE to look strange are equally superficial. The "a-e digraph" [æ], known as "ash" in OE, is the short vowel in the word "ash" itself, pronounced in OE as in Modern English, but spelled *æsc*. The two symbols *þ* (thorn) and *ð* (eth) were the equivalent of Modern English *th*- like *th*- either symbol could represent either the voiceless *th*- (as in *thin*) or the voiced *th*- (as in *then*). With a few such rules of thumb many OE words are immediately recognizable and pronounceable: *bæp* 'bath,' *scip* 'ship,' *fisc* 'fish,' *bæc* 'back,' and so on.

However, just as spelling conventions of different periods can conceal similarities, so can they conceal differences. All the OE words cited above have a short vowel. The long vowels that survived into ME were affected by the

15th-century Great Vowel Shift, which caused the phonology, or sound system, of Modern English to be strikingly different from that of OE, ME, and indeed other modern European languages, such as French, Spanish, Italian, and German. Thus, in reading both *Beowulf* and Chaucer, it is important to know that *ride* ‘ride’ has approximately the vowel of Modern English *reed*; *mē* “me” that of *may*; and so on.

Foreign influence on vocabulary by way of loanwords is easier to identify than influence on morphology (inflectional forms) and syntactic structure. The inflectional system of OE was reduced from that of Indo-European but still quite full in comparison with that of Modern English. Endings on words were used extensively to show grammatical and semantic relationships. For example, although the noun was no longer inflected for the locative, ablative, and vocative cases, as in Indo-European, it did have forms for the nominative, genitive, dative, and accusative (as well as sometimes the instrumental). Nouns also had grammatical gender (masculine, feminine, and neuter), and declensions were further determined by the vowel or the consonant that preceded the case ending at a prehistoric stage of the language. The definite article agreed with the noun in gender, number, and case. The adjective, which in present-day English is inflected only in the comparative and superlative, had in OE even more grammatical categories than the noun that it modified. It agreed with the noun in gender, number, and case; it had the positive, comparative, and superlative degrees; and it was inflected differently depending on whether a definite article or possessive pronoun preceded the adjective (the “weak” form) or no such determiner occurred (the “strong” form).

With all these grammatical distinctions available in the noun phrase alone, any one phrase will illustrate only a minority of the possible categories. Consider the OE equivalent of “that good king” (where N, G, D, and A represent the nominative, genitive, dative, and accusative cases, respectively):

SINGULAR	PLURAL
N. sē gōd-a cyning	N. ðā gōd-an cyning-as
G. ðæs gōd-an cyning-es	G. ðāra gōd-ena cyning-a
D. ðæn gōd-an cning-e	D. ðæn gōd-um cyning-um
A. ðone gōd-an cyning	A. ðā gōd-an cyning-as

To give an adequate illustration of noun-phrase inflections it would be necessary to show similar paradigms for a feminine noun (e.g. *wund*, “wound”), a neuter noun (*scēap* “sheep”), a consonant-stem noun (*oxa* “ox”), and several minor noun declensions (such as the “mutated plurals” of *fōt*, *fēt* “foot, feet”) and to repeat all of these examples in a phrase that did not have a

demonstrative or possessive pronoun and thus would follow the strong pattern.

The personal pronoun had the categories of gender, number, and case that the noun had, and in addition it was inflected for the dual number, meaning “we two” and “you two.” Despite the loss of the dual number the pronoun of present-day English retains the earlier inflections more fully than any other part of speech:

SINGULAR				
N. ic (I)	þū (you)	hēo (he)	hē (she)	hit (it)
G. mīn	þīn	his	hiere	his
D. mē	þē	him	hiere	him
A. mē	þē	hine	hīe	hit
DUAL		PLURAL		
N. wit (we two)	git (you two)	N. wē (we)	gē (you)	hīe (they)
G. uncer	incer	G. ūre	ēower	hiera
D. unc	inc	D. ūs	ēow	him
A. unc	inc	A. ūs	ēow	hīe

The verb in OE showed distinctions of person, number, and mood that are almost completely lost in Modern English, as well as distinctions of tense that are retained. OE also had many more “strong” verbs (called “irregular” in grammars of Modern English), which formed their past tense and past participle by a vowel change: for example, *sing*, *sang*, *sung*. The personal endings may be illustrated by the strong verb *drīfan*:

INDICATIVE	SUBJUNCTIVE	INDICATIVE	SUBJUNCTIVE
<i>Present</i>	<i>Present</i>	<i>Past</i>	<i>Past</i>
ic drīf-e	ic drīf-e	ic drāf	ic drif-e
þū drīf-st (-est)	þū drīf-e	þū drif-e	þū drif-e
hē drīf-ð (-eð)	hē drif-e	hē drāf	hē drif-e
wē drīf-að	wē drīf-en	wē drif-on	wē drif-en
gē drīf-að	gē drīf-en	gē drif-on	gē drif-en
hīe drīf-að	hīe drīf-en	hīe drif-on	hīe drif-en

It is often remarked that the highly inflected grammar of OE—its *synthetic* quality—allowed a freer word order than that of Modern English, an *analytic* language. If such relationships as Subject, Object, and Indirect Object can be shown by endings on words, then it would stand to reason that a relatively fixed word order, like SVO (subject, verb, object) in Modern English, would not be necessary in OE. As useful as this generalization is for the overall history of

the language, it is sometimes taken as implying too much. OE syntax did indeed allow patterns that do not occur in Modern English, but it would be wrong to say that OE syntax was “free.” Recent studies have revealed increasingly subtle rules governing patterns that occurred and, significantly, patterns that did not occur.

For example, a word like *pā* could be either an adverb (“then”) or a subordinating conjunction (“when”). *Aā* thus introduces different syntactic structures in its role as two different parts of speech, although one cannot always be certain which reading was intended; for example, modern texts punctuate *pā* as an adverb in *Beowulf* 1274, *Pā hē hēangewāt*, “then he wretched departed,” but as a conjunction in 512, *pā git on sund rēon*, “when you two on sea swam.” To read either of these clauses with the other part of speech would change meaning and style, with implications for the relative degrees of parataxis and hypotaxis in a text. For clauses with *pā* over which modern readers disagree, ongoing studies in OE syntax are revealing hitherto unnoticed regularities. In this pattern as in others (negation, question, conjunction, etc.) the apparent freedom of OE syntax has less to do with its rich inflectional system than with our incomplete understanding of the syntax.

Middle English

The Middle English (ME) period illustrates both the influence upon language by the forces of history and culture and also the lack of precise fit between linguistic periods and historical periods. Traditional dates for ME (e.g., 1150–1500) can vary by a century, depending on the criteria used. The most important external event, not only for ME but for English history generally, was the Norman Conquest in 1066. Yet some of the changes in phonology and grammar that set ME apart from OE were already in progress, and the full impact of French loanwords entering English would be greatest two centuries later.

When Edward the Confessor died childless in January 1066, Harold, the son of Godwin, Edward’s principal adviser, was elected king. His election was challenged, however, by William, the duke of Normandy and a second cousin to the late king, who saw that the only way to gain the English throne was by force. After elaborate preparations William landed in England in September and the next month, near Hastings, defeated Harold’s army in one of the great battles of history. Harold died on the battlefield, and William was crowned king of England on Christmas Day, 1066.

With William’s victory came the introduction of a new nobility into

England. For the next 200 years French was the language of everyday affairs among the upper classes. English continued to be spoken by the mass of the population, many of whom knew no French. In its unofficial status, and without a standard variety to serve as a conservative influence, the English language underwent momentous changes and increased dialectal diversity. These changes occurred in all aspects of the language—its phonology, morphology, syntax, and lexicon. They were so extensive in each component that it is difficult to say which is the most significant; in any event the changes in phonology and grammar reinforced each other.

In considering phonological change it is natural to think first of developments in the stressed, root vowels of words, and indeed, between OE and ME, there were half a dozen to a dozen important changes in stressed vowels, depending on the dialects: the vowel [æ] in *sat* “sat” was backed to [a] in ME (only to return to [æ] in Modern English); the long and short high front vowels [ū] in *synn* “sin” and *hȳdan* “hide” were unrounded; the West Saxon diphthongs *ea* and *eo* were “smoothed” to monophthongs, and so on. However, the most sweeping phonological change between OE and ME occurred in unstressed syllables, where full vowels were reduced to the mid-central vowel [ə], known as “schwa,” pronounced “uh.” In OE the qualitative distinctions among unstressed vowels spelled *e*, *a*, *u* were necessary to keep inflectional endings separate. When these were reduced to schwa, the grammatical distinctions were no longer conveyed. A separate change of final *-m* to *-n*, and then the dropping of all inflectional *-ris*, contributed to the leveling of inflections; for example, the dative plural ending *-um*, the weak ending *-an*, and the dative singular ending all became [ə], spelled *-e*.

The effect of these changes on the inflections of the nouns, adjectives, and verbs, and the further simplification that was brought about by the operation of analogy (e.g., *shine/shone* becoming *shine/shined*), changed English from a highly inflected, or synthetic, language to an extremely analytic one. A noun phrase like *the good king*, for example, was declined almost as in present-day English, with the *-s* ending in the genitive singular and in the plural, but otherwise no inflections of the noun, and no inflections of agreement for any categories of gender, number, and case for the article or the adjective. (The apostrophe for the genitive was an 18th-century innovation, based on a misunderstanding of the history of the language.) The only inflections of the adjective that occurred in the 14th century but not today were for the plural and for the weak form, when the adjective followed an adjective or possessive pronoun, as in *the goode king*. Even these remnants were disappearing, as evidenced by the omission of the inflectional *-e* for metrical purposes in Chaucer’s poetry.

The personal pronoun lost fewer categories than other parts of speech

because of a greater need for separate forms for the different genders and cases. The dual number disappeared, and dative and accusative cases were combined. For the third person plural (*they, their, them*) *th-* forms were adopted from Scandinavian to replace the *h-* forms of OE. This replacement occurred earliest in the north of England and more slowly in the south. Chaucer's usual forms were a mixture of the two sources: *thei, here, hem*.

Among the verbs the leveling of inflections followed the general tendency, although as we shall see in the discussion of ME dialects, certain distinctions of person and number that have since been lost were still used in ME and into the Renaissance. The principal change is the marked decrease of strong verbs. Nearly a third of the strong verbs in OE died out early in the ME period, and many of the rest reformed their past tense and past participles with *-ed* rather than with a vowel change. Thus, *sing-sang-sung* has remained strong into Modern English, but more than 40 strong verbs from OE, such as *help'helped-helped* (originally *helpan-healp/hulpon-holpen*), followed the pull of analogy. New verbs that were formed from nouns and adjectives or borrowed from other languages were regularly conjugated as weak.

The changing syntax of English, as the language moved from the highly synthetic stage of late OE to the increasingly analytic stage of early ME, can be seen in a document like the Peterborough Chronicle. Written in installments between 1070 and 1154, this text of the Anglo-Saxon Chronicle spans an important transitional period. Although we have seen that OE word order cannot be called free, it regularly employed certain patterns of subject and verb that became increasingly rare in the later ME period. In addition to the Modern English order SV, OE had VS and, in subordinate clauses, S... V (with the finite verb in final position). All of these patterns are still possible even in the last years of the Peterborough Chronicle. Thus the word order looked much like that of OE at a time when the inflectional system looked much like that of Modern English. By the time Chaucer was writing, two centuries later, the pattern S... V was no longer normal English syntax, and VS was used mainly in questions.

Fig. 81. Dialects of Middle English. After A.C. Baugh and T. Cable, *A history of the English Language* (1993). Reprinted by permission of prentice Hall.

While the loss of inflections and the consequent simplification of English grammar were only indirectly due to the use of French in England, French influence upon the vocabulary is much more direct and observable. The full-scale borrowing of French vocabulary occurred especially toward the end of the ME period, when upper-class French speakers were learning English. To cite such examples as *government*, *empire*, *liberty*, *religion*, *confession*, *faith*,

judge, jury, fashion, dress, coat, beef, bacon, salad, peach, poet, geometry, grammar, marriage, sound, and vision is simply to point toward whole areas of everyday life where hundreds of additional French borrowings into ME now seem indispensably a part of English.

Reading Chaucers poetry is easier for speakers of Modern English than reading many other ME texts composed about the same time—for example, *Sir Gawain and the Green Knight* from the northwest Midlands or Barbour's *Bruce* from the north. The reason is that Chaucer's English was the London variety of the East Midland dialect, one of five traditionally identified dialects of ME (along with West Midland, Northern, Southern, and Kentish; [fig. 81](#)). For reasons having to do with the external history of English—the economic, political, cultural, and social settings of the language—it was the London dialect that became the basis of the international standard variety of modern times. If a city in the west Midlands had been the center of government and commerce instead of London, then standard English today would no doubt have many more of the features that are found in the alliterative poems of that region, and those texts, such as *Gawain* and *Piers Plowman*, would be easier to read now. Still, as the following lines from *Gawain* show, there were features of dialects beyond London that eventually became standard, displacing the London forms. The first four and the last four lines of a 30-line stanza are given below. The opening lines, in the alliterative long-line meter, show Gawain in bed in the morning; the last four lines, which are in the rhyming meter of the “wheel” that ends each stanza, describe the unexpected visitor to his bedroom.

Þus laykez þis lorde by lynde-wodez	1178
euez,	

plays woods' edge

And Gawayn þe god mon in gay bed	
lygez,.	
fair lies	

Lurkkez quyl we daylyȝt lemed on be	
wowes,	

Lies snug while shone walls

Vnder couertour ful clere, cortyned	
aboute... .	

coverlet bright curtained

Wyth chynne and cheke ful swete,	1204
----------------------------------	------

Boþe quit and red in blande,

white mingled together

Ful luffly con ho lete

amiably did she speak
Wyth lyppez smal laʒande.
lips slender laughing

Characteristic of the West Midland dialect are the rounded vowel in *mon* “man”; the pronoun *ho* for “she”; and the present participle ending *-ande* in *laʒande* “laughing” instead of *-ing*. In all of these features Chaucer’s London dialect has the form that continued into Modern English. However, for the third person present indicative, Gawain has the modern form in *laykez* “plays” and *lygez* “lies,” whereas Chaucer has the *-eth* ending. These lines from the *Millers Tale* illustrate some of the differences between the two dialects:

He syngeth, brokkyng as a nyghtyngale; trilling	3377
He sente hire pyment, meeth, and spiced ale, spiced wine, mead	
And wafres, pipyng hoot out of the gleede; cakes fire	
And, for she was of towne, he profred meede. city-bred offered money	
For som folk wol ben wonnen for richesse, won by	
And somme for strokes, and somme for gentillesse. by force by gentleness	
Somtyme, to shewe his lightnesse and maistrye, agility skill	
He pleyeth Herodes upon a scaffold hye. the part of Herod stage high	3384

The feminine pronoun is now *she*, and the present participle has the modern ending, spelled *-yng(e)*, in *brokkyng* and *piptyng*. The older ending *-eth* for the third person present indicative occurs in *syngeth* and *pleyeth*, which are spelled with the *th* letters of modern orthography instead of the thorn, *p*, of the

Gawain text. Thus a comparison of the excerpts from *Gawain* and from the *Canterbury Tales* reveals the sources of several significant grammatical categories in Modern English. Through such comparisons philologists have gained a fairly full picture of the language throughout the ME period and of ME sources of sounds, inflections, and syntactic structures in English of the present day.

Lantfred (fl. ca. 970–80)

A Frankish monk, perhaps from Fleury, who spent a number of years during the 970s at the Old Minster, Winchester, perhaps at the invitation of Bishop Æthelwold (963–84). Lantfred is known principally from a corpus of Latin writings, of which the most important is the prose *Translatio et miracula sancti Swithuni*, composed ca. 975 to commemorate and publicize the translation of the relics of St. Swithun (an obscure 9th-century Winchester bishop) to a shrine within the Old Minster on 15 July 971, as well as the many miracles that took place at the shrine.

Lantfred's *Translatio* is the first Anglo-Latin work to commemorate the "translation" of a saint (i.e., the relocation and reconsecration of a saint's relics), a form of veneration that became increasingly popular in subsequent centuries. The work is stylistically ambitious, being written throughout in rhyming prose and displaying a large number of learned-sounding Greek words. Lantfred was an eyewitness to many of the miracles he describes, and his work gives important firsthand reports of many features of Anglo-Saxon life.

The cult of St. Swithun became widely established in England, partly as a result of Lantfred's *Translatio*, and the work itself was subsequently rendered into hexameters by Wulfstan of Winchester, probably in the early 990s. Some other Latin works may be attributed to Lantfred on stylistic grounds, including two satirical poems on the procedures of a Winchester classroom, a longer poem on the role of divine Providence in human life, and a letter apparently written after Lantfred's return to Fleury requesting the return of books that he had left behind in England.

Lapidaries

Treatises on the properties and uses of precious stones and gems, commonly compiled in the ancient period and popular in the Middle Ages as well. The standard sources of information on gems for the Middle Ages included Pliny's *Natural History* (book 37) and two later sources drawn from it, Solinus's *Collectanea rerum memorabilium* (*Notes on Memorable Things*) and Isidore of Seville's *Etymologies* (book 16). Pliny and Solinus record the physical properties of stones but demonstrate their skepticism about the few magical properties that they record; Isidore includes medicinal properties.

Apart from these sources early-medieval lapidaries followed two traditions: the Christian tradition that focused on biblical exegesis and the secular tradition that focused on magical and medicinal properties of stones. Examples of the Christian tradition occur in biblical commentaries, which center on three lists of jewels: the twelve jewels of the high priest's breastplate (Exod. 28:17–20); the nine ornaments of the king of Tyre (Ezek. 28:13); and the twelve foundations of the holy city (the New Jerusalem; Rev. 21:19–20).

The earliest-known Christian lapidary, Epiphanius's *De duodecim lapidibus* (*On the Twelve Stones*; A.D. 394) describes the stones, including medicinal uses, and interprets them figuratively in terms of the Old Testament tribes of Israel. Bede's commentary on Revelation (*Explanatio Apocalypsis*), which contains a detailed description of the jewels that form the foundations of the holy city, includes Epiphanius as a source. Aldhelm, Alcuin, and Boniface also made use of the Christian lapidary tradition. The OE Lapidary (mid-11th century), the oldest known lapidary in a vernacular language, derives its material from Latin glossaries on the stones in the book of Revelation.

As a source of the secular tradition the Latin medical lapidary ascribed to Damigeron (1st century A.D.) features magical properties ascribed to each stone. In the well-known *Liber lapidum seu de gemmis* (*Book of Stones or Gems*; ca. 1067–81) Bishop Marbode of Rennes appears to have used Damigeron's lapidary as his primary source for the stones' magical properties. The *Liber lapidum*, a lapidary poem of 740 Latin hexameters that includes some 60 stones, survives in 160 manuscripts as well as translations into vernacular languages. Marbode's lapidary poem was widely cited as an authority in the 13th century and formed the basis of most late-medieval lapidaries both Latin and vernacular.

In the latter half of the 12th century and later the influence of eastern lapidaries led to the production of lapidaries detailing the magical properties of gems engraved with sacred or symbolic characters, often astrological in nature. The earliest known English references to magical engraved gems occur in a medical lapidary extant in Bodl. Digby 13 (12th century), a manuscript that also contains Marbode's treatise and Isidore's *De gemmis*.

From the 13th century on lapidaries began to demonstrate an increased reliance on observation, as well as an increased interest in the medicinal properties of precious stones and their relationship to other aspects of the observed universe. So while Arnoldus Saxo (13th century) and other later lapidary writers (including Albertus Magnus, the leading figure of natural science of the 13th century) repeated some of the fabulous material from Marbode, they also cited other sources and increasingly attempted to concentrate on the physical properties of stones.

Law, Anglo-Saxon

Early English law is documented in three main ways. First there is a substantial series of law codes, issued by kings or, less often, by some "unofficial" authority. These are unique among the early-medieval Germanic codes in that they are couched in the vernacular. They are also alone insofar as the four 7th-century codes, broadly similar to the legislation of Merovingian Gaul, are followed by a long sequence of royal edicts by most kings from Alfred to Cnut, quite like Carolingian capitularies but with no real 10th- and 11th-century parallels west of the Byzantine Empire.

In addition there are retrospective statements of "traditional" law and custom in post-Conquest sources, from Domesday Book through the late 12th century, the most important of which is the "unofficial" *Leges Henrici primi* (ca. 1115). Finally the corpus of about 1,500 charters, comprising outright grants of property or privilege along with leases and wills, provides evidence for property law, barely mentioned by the codes. It is possible to isolate from these and the various narrative sources about 180 cases of law in action, covering "criminal" as well as "civil" justice.

Despite this wealth of material, and Liebermann's huge and heroic edition and glossary of the codes, pre-Conquest law has not drawn the attention from historians that its interest and importance warrant. The general view is that law reveals the "archaism" of the Anglo-Saxon polity. But there is ample evidence for dynamic and creative change.

The early codes have their context in the mechanisms of feud and wergeld. Redress of injury to person or property was left to the victim or his or her associates. The king's part was to speak for those with no associates, like traders without local kin; to penalize abuse of feuding procedure, like avenging

a thief legitimately slain because caught in the act; and to underwrite social peace generally, hence taking fines from thieves convicted by process rather than caught red-handed, who were otherwise liable only for restoring the stolen goods.

Courts in the earlier period were either local moots, where royal officials might preside, or the royal court itself. Documents of the 8th and 9th centuries bestow rights to take fines. Early charters are otherwise “church law”; they grant land in perpetuity and with free disposition, so permitting church endowment. Such advantages were also sought by laypeople, who founded what Bede saw as pseudo-monasteries to pass royal donations on to the heirs of their choice, normally their children.

Each of these areas saw major changes from 900 to 1066. There was, first, a deliberate development of an idea of crime against society as a whole. Free subjects at the age of twelve took an oath not only to be loyal but also to abstain from serious crime and to report crimes by neighbors. Charters and archaeology, as well as legislation, show that thieves, even if not caught in the act, forfeited their goods and were executed and buried in unconsecrated ground. The common-law notion of “felony”—that is, of major crime as breach of faith and punished as such—is Anglo-Saxon in origin.

After 900 a hierarchy of courts was created, with the local moot reorganized as the hundred (“wapentake” in the Danelaw), and courts of the borough or shire interposed between it and the royal court proper. Recorded lawsuits came about as often to the shire as to the king himself. Shire and borough courts certainly had royal appointees (bishop, ealdorman, and the reeve, developing eventually into the shire-reeve or sheriff) as presidents; their possible role is revealed by regular complaints of pressure and corruption. “Private” justice remained a reality at local levels, in some hundreds, but shires were never “privatized” as in feudal Europe. There are almost no records of hearings in lord’s courts before 1066.

Lastly “bookland” (land held by charter) was now the expectation of laity, though many also held land on lease from major ecclesiastical and secular lords. Bookland could be alienated and distributed by wills; lawsuits tend to focus on the legitimacy of alienations that litigants claimed to be hereditary and therefore inalienable from the kin. Bookland was “freehold,” as feudal tenure was not. But it could be granted only by kings, and grants remained conditional on performance of obligations, notably military service. Suits over bookland must be heard in the king’s court. Close links between kingship and bookland are shown by the way that will makers invoke royal support for their bequests.

Thus in many ways Anglo-Saxon law resembles the “common law” supposedly founded by Henry II. It seems likely that England’s unique legal

system owes much to the vigorous institutions inherited by the Normans and Angevins from their Anglo-Saxon predecessors.

Law, Post-Conquest

England in the high Middle Ages developed a pattern of law largely independent of continental Roman and canon law that still sets the Anglo-American legal system apart.

As in other early medieval kingdoms the early Anglo-Saxon kingdoms’ laws consisted of unwritten custom, characterized by family or community responsibility for prosecution of criminals and by methods of proof that seemed reasonable in their own social context, strange though they may seem both to modern eyes and to the lawyers of post-Conquest kings. Even though periodic attempts would be made to write down England’s laws, they would never be codified in the manner of Roman or canon law. Eventually a multiplicity of courts arose; besides the king’s court there were traditional popular courts, lords’ private courts, and the church’s jurisdiction.

Growth of lordship meant that lords set up courts to give justice to their peasant farmers, taking responsibility from the family and village community. Some notion of royal supervision of justice survived, however, along with Roman and Carolingian precepts of royal authority. Serious crimes became “pleas of the crown,” which the king and his sheriffs were responsible for punishing. The “king’s peace,” his special protection for members of his household, could be extended to privileged persons or groups beyond the royal entourage, and it eventually would cover the entire kingdom.

The Norman Conquest brought great change in English law, even though William I promised to maintain the laws of his Anglo-Saxon predecessors. The triumph of dependent forms of land tenure or feudalism brought a revolution in land law, weakening the idea of property or land ownership. Basic features of the land law evolved later in the Anglo-Norman period, as knights holding uncertain tenures gradually acquired something approaching hereditary right.

Feudal land-holding also strengthened lords' control over their nonfree peasant farmers through private courts, and it led to new feudal courts for disputes concerning free knightly tenants. Feudal courts defined the lord-tenant relationship with little supervision by the king or his court.

Still another category of courts appeared after 1066, when William I sanctioned the creation of separate ecclesiastical courts; their jurisdiction over spiritual matters included marriages and testamentary bequests. The Conqueror and his sons were concerned to punish serious crimes—felonies—and the concepts of “pleas of the crown” and “king’s peace” expanded. A result was a need for itinerant justices to circulate about the counties, taking some judicial work off the sheriffs’ shoulders.

Henry II wrought a revolution in English law, moving the kingdom closer to a common law, a single law for all free subjects, enforceable in the royal courts and overriding old local and feudal customs. Henry launched a two-pronged attack. One aspect was a royal campaign for suppression of crime; the problem could no longer be left to the victim’s initiative. The king commanded that local juries of presentment accuse suspects to be tried by ordeal before itinerant justices. The second aspect was supervision of the lords’ feudal courts to protect tenants from arbitrary seizure of land. The king sought to ensure that the feudal courts functioned in accord with “due process of law” by imposing the royal court’s supervision over magnates’ courts.

Henry II and his advisers devised several instruments to achieve these ends. Royal writs became readily available to litigants, enabling purchasers to transfer suits from county courts or from their lords’ courts to the king’s court, where they expected an impartial hearing. Juries, an information-gathering instrument or institution used by the Frankish kings, were transformed into means of settling disputes; groups of neighbors gave evidence collectively about disputed landholdings—the possessory assizes—or brought accusations against those suspected of committing crimes in their community—juries of presentment, forerunners of the grand jury. Henry I’s practice of sending itinerant justices on circuits to hear cases, taking royal justice to the people, was revived. By the end of the 12th century royal justices were also sitting regularly at Westminster.

Henry II’s innovations set the basic shape of English law until modern times, although change continued. By the early 13th century use of the jury expanded, as it replaced the ordeal as the means of proof in criminal cases. Also in the 13th and 14th centuries the action of trespass appeared, providing remedies for torts, that is, wrongs not criminal in intent but nonetheless resulting in damages to the victim. Henry II’s efforts to make the feudal courts work effectively had the longterm effect of reducing their role, for more and more disputes between lords and tenants moved into the royal courts. The

result was that lords steadily lost control over their tenants and derived little benefit from their lordship.

This loss of lordly privilege affected the king, greatest feudal lord of all. Edward I, at the end of the 13th century, resolved to remedy this; he sponsored a series of statutes reforming England's land law. His statutes aimed mainly at protecting lords' rights to the few feudal privileges they still enjoyed, the "feudal incidents," financial windfalls chiefly when a tenant died without heir or with minor heirs.

It was too late, however. The balance of power had shifted from lords to their knightly tenants, and the tenants were claiming the right to alienate their land freely, with almost full proprietary rights over tenures. Royal judges, mainly from tenant families, sympathized with tenant interests. They sanctioned subterfuges, such as uses and trusts, devised by tenants to prevent land from falling under the lords' control, escaping the feudal incidents.

English common law, originally concerned chiefly with felonies and with rights to feudal tenures, expanded its scope to accommodate a growing number of commercial cases, such as contracts and debts. Also the decline of the church courts brought into the common law courts some cases formerly heard by ecclesiastical judges. Another late-medieval trend was growth of conciliar courts, branches of the king's council that would attain greater prominence in the Tudor period. These courts were not bound by the increasingly rigid rules that hampered the common law courts, and they were influenced by the Roman tradition of placing safety of the state ahead of individual rights. One conciliar court, chancery, has special significance. The chancellor, responsible for issuing the writs originating common law pleas, began to hear disputes for which no available writ offered a remedy. The result was growth of an alternative to the traditional royal courts, a court of equity capable of greater flexibility than the common law courts.

Law in Middle English Literature

Law is one of the great themes of ME literature. The focus is usually on one or more of the following areas:

Legal Procedure

Virtually every genre of ME literature contains trial scenes. Outstanding examples from romance are *Launfal*, *Gamelyn*, *Havelok the Dane*, and *Bevis of Hampton*; from drama, *Mankind*, *Wisdom*, and all four of the major Corpus Christi cycles; from beast fable, Henryson's "Taill of the Sheip and the Doige" and Caxton's *Reynard the Fox*; from lyric, "London Lickpenny," "The Power of the Purse," "Quia Amore Languet" (allusions); from vision and allegory, *Pearl*, *Piers Plowman*, *The Assembly of Ladies*; from the short narrative poem, the tales given by Chaucer to the Man of Law, the Physician, and the Second Nun. Much of the writing is directed against contemporary abuses of the law. The primary targets are corruption of the judicial system (e.g., *Gamelyn*, Langland's account of the trial of Lady Meed) and the widespread use of law by the powerful to oppress the poor and weak (e.g., the *Second Shepherds Play*, the trial of Wrong in *Piers Plowman*).

Legal Terminology

The ME poetic vocabulary is rife with terms, often highly technical, taken from the sphere of law. One of the earliest instances is the 13th-century debate poem *The Owl and the Nightingale*. The most impressive instance is *Piers Plowman*, which contains over 700 words and phrases with legal significance, more than 100 of which are the first recorded examples in English. Because the language of law was rich in metaphorical possibilities, most of its words having taken on specialized meanings while retaining broader meanings in ordinary usage, it lent itself to poetic exploitation. The form and terminology of legal documents proved especially popular—for example, Usk's *Testament of Love*, the *Charters of Christ*, and the deeds, wills, and letters patent in *Piers Plowman*.

Legal Philosophy

The literary use of legal procedure and terminology often exists within the larger framework of theories about justice, the nature of law, and the relations among its various kinds. Gower's *Confessio Amantis* and Chaucer's *Parliament of Fowls* take as their philosophical basis the doctrine of natural law. The conflict of justice and mercy in *Mankind* and *The Castle of Perseverance*, as well as the rival claims of the Old and New Laws in *St. Erkenwald*, *Piers*, and the cycle plays, has been seen by many critics to reflect the historical tension between the common law and the late-14th-century rise of equity law (a system of justice not bound by strict common-law rules).

Several factors contributed to the marriage of law and literature in the Middle Ages. Many writers had themselves received a legal education, the practical alternative to a university degree, or held some administrative position in government. Noteworthy instances include Chaucer, Gower, Usk, Hoccleve, Henryson, and almost certainly the author of *Piers Plowman*. If one's theme was religious, it was virtually impossible to avoid the use of legal terms and concepts. Penitential doctrine relies heavily on the language of the law; and the story of salvation itself (the breaking of God's law, the consequent punishment on earth and in the "penitentiary" of purgatory, the chance for pardon, the Last Judgment) is legal to the core. It is not surprising that the heaviest concentration of legal diction in Chaucer is to be found in the *Parsons Tale*.

The cosmic view of law that prevailed during the period offered the broadest possible context for the metaphorical development of legal themes. As expounded by Thomas Aquinas, this view derives the validity of positive or legislated law from the principles of natural law, which in turn derive from the divine or eternal law of God. No matter how great the multiplicity of laws, therefore, their ultimate authority is always the same. In essence all law is one law. This perspective guaranteed the propriety of such terms as *felon* (perpetrator of a serious crime), *seisin* (possession of real property), and *escheat* (reversion of property to one's lord for lack of heirs or in punishment for a crime) in poetic treatments of sin and salvation.

When the conditions that supported the union of law and literature faded in importance—a postmedieval development—so did the union itself. Its persuasive appeal was much diminished by the spread of general education, the rise of secular literature, and the growth of legal positivism, which rejects the idea that all law is one law—indeed, even the idea that divine and natural law are worthy of the name.

Lawyers

By 1300 there were professional lawyers practicing in almost all courts above the level of the purely local manorial court. The church courts were the province of canon lawyers. They consisted of a small elite of university-trained advocates, whose practice was largely confined to the consistory courts of each diocese, the provincial courts of Canterbury and York, and the courts held by papal judges delegate, and a much larger group of proctors, of whom few had studied canon law at university and who represented their clients in these and other courts.

The lay courts were the province of the common lawyers. Their elite were the serjeants of the Common Bench, specialist advocates in the main central court for civil litigation, normally holding its sessions at Westminster. The Year Books report the arguments these men advanced for their clients in Westminster Hall and the judges' reactions to the arguments. The same small group of around 30 men also represented clients in the other main royal courts: King's Bench, the Eyres, and the Assizes. Separate groups of serjeants, also specialist advocates, were to be found in the county courts and in the courts of the City of London and other major cities, but their numbers were much smaller.

Each of the royal courts also had its own professional attorneys; lawyers whose functions were to appear in court in place of their client, sue process on their behalf, and engage and brief serjeants when a case came up for hearing. The largest group of professional attorneys was to be found in the Common Bench: over 200 of them by 1300. Professional attorneys were also to be found

in city courts but perhaps not in county or other local courts. The common lawyers were not university-trained, but there is evidence that well before 1300 formal instruction in common law was being given at an elementary and a more advanced level. Among the attorneys of the Common Bench was to be found a group of “apprentices” (learners) whom the court encouraged to attend the hearing of litigation so that they might master the skills of the serjeant.

There had been professional canon lawyers in England for well over a century by 1300, and canon law had been studied in English universities for as long a period. Prior to the emergence of the two universities men are known to have gone to the Continent (especially to Bologna) to study canon law. By 1200 professional lawyers were beginning to emerge in the common-law courts. Their emergence was made possible by changes in the conduct of litigation and in the rules relating to the appointment, by litigants, of legal representatives. By the mid-13th century there was a group of serjeants specializing in advocacy in the Common Bench at Westminster and a separate group in the London city courts. There was also a small group of professional attorneys in the Common Bench.

The years between 1356 and 1367 saw a drastic and permanent reduction in the size of the elite of Common Bench serjeants, down to little more than one-third of its size in 1300. Either then, or shortly afterward, the crown came to control admission to this elite.

The first royal judge to be appointed from the ranks of serjeants of the Common Bench was Richard of Boyland, appointed a justice in eyre in 1279: by the reign of Edward II serjeants supplied a majority of the judges of Common Bench and King’s Bench. By 1330 permanent appointments to the higher judiciary were made only from their ranks. The serjeants had a monopoly of advocacy only in the Common Bench; during the 14th century a group of senior apprentices came to play a significant role in providing specialist advocacy for litigants in other royal courts.

By the mid-14th century senior and junior apprentices were living together in the Inns of Court. Three of the four inns (the Middle and Inner Temples, and Gray’s Inn) were in existence by 1388, Lincoln’s Inn by 1422. The Inns of Court also provided educational facilities; so, too, at a more basic level, did a number of inns of chancery.

Learning and Intellectual Life (1050–1200)

The period between approximately 1050 and 1200 has come to be identified intellectually and culturally as the "Renaissance of the Twelfth Century." Even though it does not exclusively correspond to a single century, it signifies a distinct phase in an intellectual movement that represented a new attitude to the universe in virtually every respect. That attitude can be briefly described as the rediscovered belief in the value of the created order and in the efficacy of secondary, created causes. From having been largely discounted or ignored in an inimical world between the 5th and the 10th centuries, where God was treated primarily as the avenging God of the Old Testament aspect, to be feared and placated, the world in the 11th century gradually came to be seen as a more amenable place, with God increasingly depicted as man's friend as well as judge, through the person of his Son.

The new sense of the humanity of Christ was one of the salient changes in the religious outlook of the Middle Ages. It extended from the spirituality particularly associated with Cistercian monasteries in the early 12th century to new apostolic groups like the Arnoldists and Waldensians, new monastic orders like the Cistercians and Premonstratensians, and in the 13th century the Dominican and Franciscan friars. It carried a renewed emphasis upon man as having been made in God's image, developed by Augustine in his doctrine of the Trinity. Hence an individual, in coming to know himself—another of the imperatives of 11th- and 12th-century religious experience—came to recognize his affinity with Christ as God-man, which, among the apostolic groups, entailed living as Christ had lived in this world, without possessions or powers other than those of spiritual ministration.

Human beings accordingly received a new dignity, even if, religiously, that dignity was most fully manifested in submitting to Christ and emulating his

life of renunciation and humility. It gave a new interior character to religion, expressed in the new sacramental emphasis in the 12th century upon private penance and atonement as an internal spiritual state, in contrast to their public forms, and upon the quality of religious life as the true test of Christian discipleship.

At the same time, but not always among the same people, there was a corresponding recognition of the dignity and worth of the natural world as being just as much God's creation as the work of divine reason in which man participated. The world thereby became a more intelligible place; the order and regularity of the heavens and the earth were visible expressions of God's causality. Until the middle of the 12th century this new cosmological awareness of nature and the universe as subject to a rational order arose from a new reading of the predominantly Platonic and Neoplatonic sources, known in the West since the 5th century (apart from recently acquired Arabic medical knowledge) from translations made probably at the Benedictine Abbey of Monte Cassino in southern Italy.

The new outlook therefore began indigenously, as did the new religious awareness. It was only in the middle and second half of the 12th century that this outlook was reinforced and, in the case of cosmology and knowledge of nature, largely transformed by the influx of a large body of translated Arabic and Greek science, mathematics, and philosophy. By the early 13th century this new knowledge included the greater part of Aristotle's writings, now the background to an intellectual life focused on the universities, the new centers of learning.

Even before the translations, however, in the first half of the 12th century, the educational setting for most learning was changing from the monasteries, which had been the intellectual centers from the 6th to the 11th century, to the new cathedral schools, accompanied by the emergence of professional teachers, such as Peter Abelard (d. 1142), who traveled from one center to another, attracting a following of students. It was in the cathedral schools, especially around Paris and northeastern France, that the new systematic study of the Bible, theology, and nature occurred, freed from the monastic demands of liturgy and corporate life.

This secular milieu of the cathedral school, based upon a town and directed toward the world, rather than within the cloister, was lacking in pre-Conquest England, where cathedrals had mostly been monastic communities. They had therefore missed the new intellectual developments that had begun in the 11th century, largely insulated as they were from the revival of monasticism and canon law as part of the movement for religious reform on the Continent. Those came with the Normans. The association of Lanfranc and Anselm with the Norman Abbey of Bec, the outstanding Benedictine monastery north of the

Alps in the later 11th century, brought to England two of the foremost religious and intellectual figures of the age.

Probably as a direct consequence of Lanfranc's presence there was a school for grammar and music at Canterbury in 1087; by the early 12th century new schools were coming into existence in such towns as Winchester, Oxford, and Lincoln, to be followed by those in the other main centers during the rest of the 12th century. Apart from Oxford, however, they did not attain more than local standing, and Oxford's important time as a university was to be in the succeeding centuries.

Intellectually, as well as religiously, despite the spread of the new monastic orders, especially the Cistercians from the 1120s, England remained on the periphery. The intellectual traffic was mostly one-way, from England to the Continent, above all to the major cathedral schools: Reims, Chartres, Tours, and Paris, among others. That need and attraction for the other side of the English Channel engendered a tradition of travel long before the 18th-century Grand Tour; in the 12th century it led English scholars to Spain, in the wake of the reconquest from the Muslims, and put them in the forefront of the discovery and transmission of Arabic and Greek scientific and medical texts, previously unknown in the West.

These different circumstances, distinguishing intellectual life in England from that on the Continent, gave English activity a particular stamp, accentuated by a political tradition of two centuries of comparatively strong late Anglo-Saxon government. We can point to three main characteristics as their product. The widespread practice of historical writing was part of a monastic culture going back to Bede, reinforced by the Anglo-Saxon Chronicle: a unique vernacular record of a country's history, which continued until the 1130s. Monastic writers of history remained dominant in the 12th century, varying from the very good, like William of Malmesbury, Orderic Vitalis (who wrote in Normandy), and William of Newburgh, to Geoffrey of Monmouth, hardly to be taken seriously by the later 12th century. Furthermore secular clerics, such as Roger of Hoveden and Ralph of Diceto, were also writing history.

The second characteristic was the association of English scholars with the renewed study of natural phenomena and their involvement in the discovery and transmission of Arabic astronomy, mathematics, and medicine as well as engaging in their own investigations and composition of treatises. Their independent activities, for the most part not associated with any school, testify to the late development of institutional successors to the monasteries in the first half of the 12th century. By an odd chance a number of these naturalists were from the West Country, foremost among them Adelard of Bath. Others included Daniel of Morley, Robert of Chester, Robert of Ketton, Roger of

Hereford, and Alfred Sareshel. They were the precursors of an Oxford scientific tradition that extended through the Middle Ages.

Finally there were the works on law and government, like those by Glanville and the *Dialogue of the Exchequer*, drawn from experience of the one state in northern Europe that, at the time, had an established system of law and central and local organs of government. They were complemented by John of Salisbury's *Policraticus*, affirming the legitimacy of secular government as natural to man, and not—according to the hitherto prevailing Augustinian doctrine—the result of sin. In forming his view John was confirming from his own involvement in government the Stoic belief, learned from Cicero and Seneca, that man was naturally a civic and social being who should live in human association. Sixty years after the *Policraticus* the barons, in Magna Carta, expressed in a nontheoretical way their belief in the legitimacy of rights within a political community, a belief never to be lost.

Leather Manufacture and Trade

Leather was an essential commodity in the Middle Ages, used for clothing, containers, saddlery, armor, and, in the form of parchment, for books and record documents. There was also an extensive internal and overseas trade in hides. It was not a commodity from which huge profits could be made, but because of its ubiquitous use it was of fundamental importance in the economy. Though there were village tanneries, the manufacture of leather and leather goods was from early on concentrated in towns. The number of artisans involved in the industry and the importance of the trade in hides are reflected in the formation of urban craft associations of leatherworkers in the 12th century. In small towns the richest leatherworkers retained a position of importance in the social hierarchy throughout the Middle Ages.

There were two main divisions in the leather industry: cow- and oxhides were tanned; sheep-, goat-, and calfskins were tawed, as were furs. In both cases the process was designed to drive moisture out of the skin and to replace it with a preservative.

Tanning was a lengthy process; skins were scraped and cleaned and then soaked in a series of liquids usually made with oak bark (from which was derived tannin). The enormous quantities of water used meant that tanners were frequently sited by rivers. The completed process, which should have taken a number of months, left a stiff product, red leather, which then had to be curried with tallow, oil, or other lubricants to render it supple. The tanned and curried leather was bought by shoemakers, girdlers, armorers, saddlers, and bookbinders for manufacture.

If tanners manufactured leather goods, there was a danger that they would use badly tanned and substandard leather. Therefore, within towns, strenuous efforts were made to separate the occupations of shoemaker and tanner and at

times to distinguish the craft of currier as well. Such efforts were not always successful, and the confusing terminology of the leather industry reflects this overlapping of interests. Tanners tended to be the most successful of these groups; they controlled the supply of raw materials. Shoemakers, in contrast, were one of the most numerous groups of artisans but were generally badly paid and of low repute.

Tawing preserved leather without the use of tannin. It embraced a wide variety of techniques, many involving the application of oil or alum to hides, and it could be a simple process, more economical of space than was tanning. Sheep-, goat-, and calfskins were usually treated with alum, rubbed in to give a stiff white leather (giving rise to the term “whittawer,” or “white-tawer,” for craftsmen engaged in this activity). This was then worked over to render it supple and treated with emollients, such as oil or eggs. Tawed skins could be very fine; they were used for the expensive Cordovan leather from which the name “cordwainer,” for shoemaker, derives. However, most shoes were made of the more durable tanned leather; tawed leather, being more flexible and elastic, was generally used for gloves, points (laces), bags, and purses.

A specialized branch of the craft was greytawing, the tawing of furs, generally restricted to major cities. A related occupation was parchment making, where the leather was stretched and thinly shaved and deprived of as much grease as possible. Tawing and the making of goods from tawed leather were far less subject to national and local regulation than the manufacture and use of tanned leather. Industries, like glovemaking, that used tawed leather employed a great many women, often as piece workers, and outside London there was no real attempt to demarcate manufacture among different craft groups.

The sale of leather benefited those who marketed it, as opposed to those who worked it. There was an extensive but unquantifiable internal trade in hides and red leather. Much came to the market on the hoof, and in the later Middle Ages urban butchers increasingly profited from the sale of hides as a byproduct. Hides and red leather were also brought to town by country merchants and tanners. Hides were exported from Ireland to England and from England to the Continent. Although less important than the internal trade, this overseas trade can be more readily traced through the customs accounts after the erratic local system of tolls was welded into a national customs system in the time of Edward I.

Letter of Alexander to Aristotle

The earliest vernacular version of the immensely popular Latin *Epistola Alexandri ad Aristotelem*, of which later medieval translations exist in Middle Irish, Old Icelandic, French (twice), ME, and German. The two English translations are unconnected and the OE version in particular demonstrates considerable divergence from its source. The Latin *Epistola* purports to be the text of a letter sent by Alexander the Great to his former teacher, Aristotle, describing the natural wonders he has seen in the course of his campaigns in India. The account of the curiosities to be found in India, such as men with the heads of dogs (*cynocephali*), proved hugely influential, and spawned a great number of related medieval treatises on marvels and monsters. The OE translation is found in the same manuscript as *Beowulf* together with two further works, the *Life of St. Christopher* and *The Marvels of the East*, which both deal with monsters, including *cynocephali*.

The OE translator of the *Letter*, however, appears to be aware of a parallel tradition, exemplified by Orosius, whose *History against the Pagans* (early 5th century), which was translated into OE, interpreted Alexander himself as morally monstrous, a figure of overweening pride. The OE *Letter* subtly alters and edits its source to point up Alexander's arrogance in a way unparalleled in any other vernacular rendering.

Three closely related English manuscripts of the Latin *Epistola* survive, including one from the Anglo-Saxon period, which together provide a witness to a particular variant form of the text that is identical to that translated into

ME. The absolute and slavish literalness of the ME version, however, only serves to point up the originality of the OE translator, who appears to have been working within a quite different tradition.

Libraries

The libraries of medieval England shared in the preservation of the culture of Latin Christendom and contributed to the growth of literacy. The early libraries were monastic and rural. Benedictine houses preserved the tradition of books and regular reading and provided that each monk receive one book and be given a year in which to read it.

By the 12th century houses of the new monastic orders maintained the

practice of copying manuscript books in their scriptoria and housed libraries according to guidelines established by Cassiodorus (d. ca. 583) and Isidore of Seville (ca. 560–636), authors of basic rules for the transcription and copying of manuscripts and the care of books. The places for book storage in monasteries varied and often became designated as the library: *arca*, *archiva* (arc, or chest); the *scrinium* (a stack attached to a desk); or *armarium* (book press).

By the 12th century, however, the “library” was usually a separate book room or building. Changes in terminology came to reflect a growing specialization in institutional development: *libraria* generally denoted libraries that lent books (derived from *liber*, meaning either a single book or a collection of books); *biblioteca* (from the Greek *bibliotheke*, a book case or chest) came to designate a nonlending research depository.

We can learn about the contents of medieval libraries first by studying extant catalogues, inventories, or shelf-lists that show what books were available in particular libraries at particular times. Some of the earliest English library lists date from the 12th century and include those of Christ Church, Canterbury (ca. 1170), Durham, Lincoln, Bury, Reading, and Rochester (1202). A second way of determining the books of a given library is to identify the provenance of as many surviving books as possible, taking note of handwriting, illumination of manuscripts, notes on ownership and transfer, press marks, and the survival of medieval bindings.

An excellent example of the “reconstruction” of a medieval collection is the 12th-century library of the Benedictine house at Bury St. Edmunds. Developed by gift, purchase, and copies made in its scriptorium (especially under Abbot Anselm, 1121–48), the main categories of books included Bibles and commentaries, liturgical books, the texts of the major Church Fathers (especially Augustine, Ambrose, Jerome, and Gregory the Great), Latin classics (e.g., Virgil, Pliny, Plautus, Terence, Cicero, Seneca), histories, 12th-century scholastic textbooks (e.g., Peter Lombards *Sentences*), works on canon law, standard authors like Boethius, Cassiodorus, and Isidore, books of sermons, grammar, rhetoric, and “modern” Latin literature, such as the poems of Walter of Châtillon. The expansion of library holdings is evident by the latter half of the 13th century, when a Franciscan author compiled the *Registrum Anglie de libris doctorum et auctorum*, a “union catalogue” of the principal books in the libraries of 183 English religious houses.

The friars were also largely responsible for additional innovations. The Dominican Humbert de Romans (ca. 1260) set down the principal duties of librarians and librarianship and recognized the need for extensive reference libraries. Libraries by the 13th century included more reference tools: encyclopedias, abstracts in florilegia (volumes composed of extracts), and dictionaries and lexicons whose use was facilitated by such new technologies

as alphabetization. Books in common use for reference, such as Bibles, papal decretals, sermons, and chronicles, were kept in a chained reference section (*libri catenati*). Books used less frequently and duplicate copies were available for circulation.

Books were costly and valuable commodities. Paper was scarcely known in England before 1307; most books were of parchment. The finest was vellum or calfskin; somewhat less expensive was sheepskin. Parchment, ink, binding materials, and, not least, the scribes time contributed to the high cost. It has been estimated that labor and materials for a Bible could equal more than 1,500 hours of work and vellum from a dozen animals.

By the 12th and 13th centuries there was a remarkable growth in the book trade and the manufacture of smaller books. Book fairs were held at Paris, Oxford, and London. Libraries acquired books as gifts, often as duplicates from mother abbeys. Books were also routed on a circuit and copied in scriptoria. Rome lent books to Canterbury, for example, and Canterbury made books available to diocesan sees. There were also donations by patrons and bequests in wills. Oxford's late-medieval library reflected the important bequest of Humphrey, duke of Gloucester (in 1439). Royal patronage also facilitated the growth of libraries and bishops frequently endowed episcopal and chapter libraries.

The newer libraries of the high Middle Ages were urban, reflecting the growth of schools and universities. Cathedral libraries served the needs of their schools and the developing universities. York, Durham, and Canterbury housed the most famous cathedral libraries, and many college libraries at Oxford and Cambridge retain substantial numbers of their medieval books. Although the size of medieval libraries is difficult to estimate, about 4,200 manuscript codices attest some 500 library collections by the 16th century. These were the libraries of medieval England in all their diversity: libraries of monastic and religious houses, of cathedral and collegiate churches, and of universities and colleges.

Lincoln

In 1086 Lincoln had 970 inhabited houses and was worth £100 in annual revenues to the king. With its rebuilt minster and castle it commanded the junction to two Roman roads, the Foss and Ermine ways, in addition to having access to the North Sea at Boston via the River Witham and to the Midlands via the Fossdyke (the dike or ditch running on each side of the Fossway, the old Roman road from Axminster to Lincoln) and the River Trent. Strategic battles were fought there in 1141, 1216–17, and 1266.

Links with the Continent, especially Norway, drew Lincoln into international trade, and Henry II granted it a monopoly of trade throughout Lincolnshire. By 1202–04 it ranked as fourth-wealthiest town in England. By 1130 Lincoln was held at farm: the city paid a fixed sum to the king—£140 in the 1150s, increased to £180 in 1156—in lieu of taxes. It had the largest and wealthiest Jewry, outside London, by 1194. The weavers bought their own charter in 1130, and Lincoln cloth was traded internationally. Autonomy emerged slowly from the guild merchant; there were two bailiffs by 1154, an alderman of the guild merchant from ca. 1189, transformed into mayor by 1217, a council of 24 (possibly by 1206, definitely by 1219), four coroners from 1200, and its own common seal by 1220–30. Two burgesses were sent to the 1264 parliament and regularly thereafter.

Lincoln's large Jewish population had a synagogue by the marketplace and brought wealth and skill but also tension. In 1191 citizens were fined for assaulting Jews, and in 1255 the Jews were accused of the ritual murder of Little St. Hugh. In 1265 24 citizens were named to protect Lincoln's Jews. In other respects Lincoln society was the typical urban mixture of craftsmen,

merchants, minor gentlemen, cathedral clergy, Gilbertine monks from St. Katherine's Priory, and friars from the five main orders. The city also supported three hospitals.

Lincoln had three weekly markets and St. Botolph's annual fair, confirmed in 1327. It was the region's center for wool and grain. In 1334 and 1377 Lincoln was England's fifth-wealthiest town, though recession was apparent by the early 14th century. The weavers' guild was impoverished, and although in 1326 Lincoln became a "home staple," or port through which wool was required to be traded, it could not afford to maintain its vital waterways. The Black Death killed possibly 60 percent of the inhabitants, and by 1365 the city was in decay. In 1369 the home staple was moved to Boston and some Lincoln merchants followed.

While other towns prospered in the late 14th century, Lincoln declined. Its tax-paying population had fallen to 3,569 by 1377 (from an early-14th-century population between 5,000 and 10,000). In 1378 three bailiffs were appointed to share the burden of the fee farm, the annual tax sum owed the king, and four were so charged in 1401. By the 1390s the citizens could not maintain all their 38 to 46 parish churches, and disturbances between oligarchy and commonalty flared at election times. Routine constitutional squabbling over the liberty of the dean and chapter, and that of the constable of the castle, intensified; in 1390 the mayor and councillors attacked market stalls within the cathedral close.

Lincoln's plea of poverty, for a reduced fee farm in 1409, elicited unusual sympathy. Henry IV granted it county status, with its own quarter sessions, plus enhanced economic opportunities, through the granting of more judicial responsibilities and a second annual fair. However, by 1428 there were three uninhabited parishes and seventeen drastically depopulated ones. In 1434 and 1436 Lincoln was remitted half of its taxes; nine complete tax exemptions were granted between 1437 and 1472.

Decline was attributed in 1447 to "continual pestilence and the withdrawal of merchants." A handful of merchants of the Staple were active in the 1460s, but Lincoln had been overtaken by Boston and Hull. Attempts to revitalize the city by adding adjacent rural townships in 1464 and 1484 were in vain. By the subsidy of 1524-25 Lincoln had fallen to eighteenth in urban ranking, its inhabited area having shrunk to virtually a single street. The union of parishes in 1549 left only nine functioning.

Lincoln Cathedral

Lincoln was the seat of a huge diocese stretching from the Thames to the Humber. The Anglo-Saxon cathedral had been at Dorchester-on-Thames, but the see was moved to Lincoln about 1072 as a result of the Norman preference for linking cathedrals with important towns or cities. The new building was begun by Bishop Remigius in the 1070s and may have been close to completion when Remigius died in 1092. The Romanesque cathedral had a three-bay eastern arm with solid side walls that may indicate a high vault. The echelon plan of the cathedral—whereby the nave and side aisles end in semicircular apses—is similar to others in the first generation of Anglo-Norman architecture, such as Canterbury Cathedral and St. Albans Abbey, although the rectangular chapels opening off the east sides of the transepts are less easy to parallel.

The most unusual feature of Remigius's cathedral was its western end, which seems to have taken the form of a fully defensible castle keep. This structure was two bays deep and projected beyond the line of the nave aisle walls to both north and south. Three great arches form a facade reminiscent of Roman triumphal arches or city gates; they have parallels in contemporary castle architecture as well. Items like machicolations and garderobes testify to the seriousness of defensive intent on the part of the builders. The uncertainty of Norman control in the north may have inspired this extraordinary combination of church and donjon, but the only time it was likely used as the latter was in 1141, during the civil war between King Stephen and Empress Matilda. The cathedral may well have been burned as a result of this military action, and the repairs and alterations undertaken by Bishop Alexander in the mid-1140s transformed the Romanesque church. Alexander added elaborately sculpted portals and a sculpted frieze to the west facade, as well as two richly

decorated west towers. He seems also to have vaulted the nave, presumably with a rib vault.

In 1185 the cathedral was damaged by what the chroniclers call an earthquake, perhaps the collapse of a vault. The rebuilding that followed, beginning in 1192, resulted eventually in the complete replacement of the Romanesque church, with the exception of part of the west block and towers. The original eastern termination of this early Gothic structure has itself been rebuilt, but excavations have shown it to have had an unusual polygonal plan. The new project also included eastern transepts with eastern chapels on the model of Canterbury Cathedral, and a new choir known today as St. Hugh's after the bishop of the time of its construction. All this is the work of one of the most innovative and excessive master masons in the history of Gothic architecture. The style of the work, including the three-story elevation ([fig. 82](#)) and the use of detached Purbeck marble shafting, is derived from Canterbury but is interpreted in a more extravagant way. The piers and responds have complexly molded cores and varying numbers of detached shafts, the arch moldings are deeply undercut and embellished with dogtooth, and the upper stories are also richly articulated with shafts, dogtooth, and punched-foil figures. In the east transepts there are pier cores covered with vertical crockets, and in the choir aisles a high dado with one blind arcade superimposed on another forms a striking pattern of spatial and visual syncopation.

Fig. 83. Lincoln Cathedral, plan of 13th-century church. After G. Webb (1956). Reprinted by permission of Yale University Press.

The most famous part of St. Hugh's Choir is its high vault, because of its asymmetrical design. There is a ridge rib here for the first time in English Gothic, plus the extra diagonal ribs known as tiercerons. These latter, with the regular diagonal ribs, meet on the ridge at two distinct junctures instead of the usual one. Three ribs meet at each boss, two from one side and one from the other, and it is these alternating threetoed patterns that give the vault its unique asymmetry. This design may be the result of the master's attempt to combine the six-part vaults set over each bay of the eastern transepts with the triple clerestory windows deemed more advisable in the main choir; the multiple bosses may also continue the pattern established in the vaulting of the lost eastern apse. Although the asymmetry of the vault had no future in English Gothic, the introduction of tiercerons and ridge ribs was to be influential.

Fig. 84. Lindisfarne Gospels (BL Cotton NereD. iv.), fol. 26v. Carpet page introducing Matthew. Reproduced by permission of the British Library London.

Work continued westward with the reconstruction of the western transepts, probably in the second decade of the 13th century. By the 1220s the nave was underway and by the 1230s, the west front. In 1237/39 the new central tower collapsed and the main crossing piers and adjacent areas of choir and transepts had to be replaced, hastily, as it would appear from the crudity of some of the work. The design of the western parts follows in general the lines of St. Hugh's Choir; the most important difference is the greater bay length in the nave,

which gives an unimpeded oblique view of the lateral spaces of the aisles, and the nave vault, where the tiercerons of the choir are arranged symmetrically along the ridge to form a heavily textured pattern that would provide the inspiration for the majority of English high vaults over the next several decades. The new west front incorporated the Norman west block, but extended it upward and outward to form a huge screen of blind arcading below the western towers.

Fig. 85. Lindisfarne Gospels (BL Cotton Nere D. iv.), fol. 27. Opening to Matthew. Reproduced by permission of the British Library, London.

In 1256 attention turned again to the east end of the cathedral, where the polygonal apse was removed and a new presbytery was built as a more appropriate setting for the shrine of St. Hugh. This work, known today as the Angel Choir, was complete by 1280, and continues the three-story elevation of the earlier work to which it was joined. It is still richer in its use of sculptural and coloristic effects than the nave, and incorporates the window tracery first introduced at Westminster Abbey. While the tracery patterns themselves are by no means visually dominant in the designs of the aisle or main wall elevations, they are used to overwhelming effect in the flat east wall, where a huge eight-light geometrical window fills almost the entire facade. This happy marriage of traceried window with terminal wall would dominate English church architecture for the rest of the Middle Ages.

Lincoln remains an essentially 13th-century building (fig. 83); the only notable work of the later Middle Ages was the heightening of the central and western towers and the replacement of windows in the south transept and west faces.

Lindisfarne Gospels

One of the first and greatest masterpieces of European book painting, the manuscript BL Cotton Nero D.iv is of supreme importance both as an individual work of art and, because it is relatively securely dated and localized, as a touchstone for the study of all other works of art of its period. A colophon added in the 10th century, presumably drawing upon oral tradition, tells us that the manuscript was written by Eadfrith, who became bishop of Lindisfarne in 698; that the original binding was supplied by Ethelwald, who succeeded him in 721; and that it was ornamented on the outside with precious metals and gems by Billfrith, an anchorite. Modern study has revealed that Eadfrith the scribe was also responsible for the design and execution of the illumination.

Complete apart from its binding, which was presumably lost at the Reformation, the manuscript contains the four Gospels, each of which is introduced by a miniature of its evangelist, a cross-carpet page, and a major initial (figs. 84–85). Lesser decorated initials occur among the preliminaries to each Gospel. The Gospels are preceded by St. Jerome's letter to Pope Damasus, also introduced by a page of decoration and an initial page, and by sixteen pages of Eusebian canon tables enclosed in decorated arcades.

The intricate ornament of the book combines motifs that may be compared with metalwork and jewelry, such as pieces from the Sutton Hoo treasure, with complicated patterns composed of birds and beasts, some of which appear directly inspired by nature. The evangelist miniatures, though clearly the work of an insular hand, are adapted from Mediterranean models, possibly from southern Italy. All the painting is carried out in an unusually large and varied range of pigments from animal, vegetable, and mineral sources.

The Latin gospel text is a remarkably pure version of St. Jerome's Vulgate, probably also of Italian origin and perhaps copied from an exemplar provided by the library of Wear-mouth-Jarrow, some 50 miles south of Lindisfarne, where books imported from Italy were available. The script in which it is written is a magnificent insular majuscule, developed in early Christian Ireland and transmitted to Northumbria via Iona and the Irish missionaries.

According to the added colophon the manuscript was created for God and for St. Cuthbert, a bishop of Lindisfarne who died in 687. His relics were raised to the altar in 698, and preparations for this event seem to have begun soon after his death, for his saintliness had been recognized even in his lifetime. It is likely that the book was made to honor this translation of his relics. The manuscript certainly cannot be later than 721, the year of Eadfrith's death. Both Eadfrith and Ethelwald had been monks of the community in Cuthbert's time and were personally acquainted with the saint.

In the late 9th century, after a succession of Viking raids upon their monastery, the Lindisfarne community left their island home, taking with

them St. Cuthbert's relics and other treasures, including the Gospels. After seven years of wandering they settled for a century at Chester-le-Street in County Durham. There the colophon was added by a priest named Aldred, identifiable as a member of the community about the middle of the 10th century. He also added an interlinear word-for-word translation of the text into OE, and this is now one of the two earliest surviving translations of the Gospels into any form of the English language.

Literacy and Readership

Anglo-Saxon Period

In Anglo-Saxon England, as in all of early-medieval Europe, the vast majority of people lived traditional lives without the use of writing or reading. "Literacy" was a category of Latin, a language controlled by the clergy. Thus, in this period, reading and, even more so, writing pertained to a group of specialists whose services tended to be at the disposal of lay elites. The clergy themselves were mostly bicultural, and the uses of literacy were not confined to those who could actually read and write, so that the contact of the

technically “illiterate” with literate culture was more than merely casual or conflictive. From the earliest times after the Conversion Anglo-Saxon kings accorded Latin culture high prestige and found use for Latin and its “chaplains” as instruments of power conceived along traditional lines. In fact, from the 7th century, a court literacy, however shallow, was often part and parcel of Anglo-Saxon kingship.

Yet traditional oral forms for the retention and transmission of power remained preeminent: writing recorded the “deeds” and legal decisions of the magnates; it did not supplant spoken forms for many centuries, though writing came into more systematic use as the period progressed. The secular nobility, while deferring to the wisdom available through a secondary association with literate practices, did not easily relinquish the positive benefits of preliterate traditions. It may well be, as Busse argues, that by the 10th century the authority of clerically controlled books became strong enough to conflict with the authority of the warrior class. The deeply socialized traditional formations of the secular nobility, embedded in oral culture, depended on personal contact and were thus fundamentally threatened by the universalistic and impersonal forces of literacy. If it is true, as Susan Kelly has recently argued, that “at the end of this [Anglo-Saxon] period... written documentation had an important place in secular society and was used in ways which could imply a degree of literacy among certain sections of the laity” (1990: 36), it was true only insofar as the lay ruling class had been “clericalized” in its interests and behavior (e.g., began to depend on written records of property transfers, formally promulgated codes of law, etc.). It is interesting to note, for example, that Alfreds secular law code begins with a summary of Mosaic law and modifications thereto derived from the Acts of the Apostles.

In most of Europe the hegemony of Latin writing delayed the emergence of vernacular writing until the high Middle Ages, but in England, alongside one of the richest traditions of Latin writing in Europe, sporadic experiments in vernacular writing began at an early stage and increased considerably in quantity and interest from Alfred the Great’s time (d. 899). It is doubtful, however, that there ever was a continuous or widely disseminated tradition of OE writing. Furthermore the existence of isolated vernacular monuments does not in itself attest to widespread vernacular literacy. Social literacy is a statistical concept, and there are no statistics, only anecdotes about literate laypersons, most of whom were probably unusual. Though many laypeople could indeed read (and occasionally write), these cases are known to us because they are remarkable exceptions to the rule of lay illiteracy. Beyond this, as can be demonstrated from the practices of scribes and the features of poetic manuscripts, literacy itself may have involved methods quite different from the modern method of the silent, speedy scanning of clear and regular

textual patterns; Anglo-Saxon scribes (who give the most immediate evidence of the skills of reading) seem to have struggled through the irregular textuality of manuscripts using oralization, guesswork, and traditional memory to arrive at the general gists of texts.

The basically clerical nature of extant OE literature is attested by the fact that it parallels in its genres and contents the Christian and pan-European concerns of contemporary Latin writing. The bulk of OE writings are adaptations or translations of Latin works. These works imply “illiterate” audiences of sufficient importance or wealth that clerics who knew Latin were willing to make such books for them and that these audiences had become sufficiently convinced of the importance of Latin learning to get it by hearing books read in the mother-tongue or by mastering vernacular reading as a substitute for latinity. Clerical works in OE also imply that much of the clergy was monolingual and hence technically “illiterate.” They do not of necessity imply that the bulk of the intended audience could read them for themselves; many of these works must have been meant for reading aloud to monastic audiences.

Much of the prose is modeled in its vocabulary and syntax on Latin. Even the poetry, the most seemingly oralistic OE writing, is with few exceptions assimilated to the subject matter and genres of Latin writing. On the other hand traditional oral style affected writing and the particular shape vernacular literacy took in England, so that by the early 11th century English had become a powerful, fluent, and autonomous medium of communication in the writings of Ælfric and Wulfstan.

While Latin remained the model of literacy in the vernacular, the appearance of vernacular writing seems to have sparked the idea that reading could become a widely disseminated skill. The preface to the English translation of Gregory the Great’s *Pastoral Care*, part of the famous “educational program” of King Alfred (who himself remained illiterate until middle age and was no doubt in his policies continuing a royal tradition of using literacy for purposes of prestige and control), presents the most explicit evidence we have. Alfred laments the decay of learning “south of the Humber” and the almost total absence, even among the clergy, of those who could translate or understand Latin. For this reason he is undertaking to translate those books most needful for all men to know, which might be read in English even if Latin learning was at a low ebb. He projects that all the sons of “free men” (sons of the political elite, in effect) could be taught to read and write English as long as conditions allowed and that some could be further trained up into Latin learning as preparation for clerical office. Clearly, for Alfred, learning in English is a second-best but an undertaking necessary for the functioning of the realm and the salvation of souls. At the same time he gives

the impression that such widespread literacy in the vernacular would be something unprecedented.

It is doubtful that Alfred's ambitious program was realized or that systematically organized schools for laypeople ever existed. In the succeeding century the Benedictine Reform generated many English texts, but these seem to have been more often for use within the cloister than outside it. Yet Ælfric (d. ca. 1015) had lay patrons, one of whom, Æthelweard, was the composer of a translation of the Anglo-Saxon Chronicle into Latin. But we can see how Ælfric's attitude to the lay user of books and the clerical differs by his comments on the book of Judith to the different audiences. To Ealdorman Sigeweard he teaches a particularistic oral-traditional message: through the fortitude of Judith you learn how "you should protect your country with weapons against an invading army." To an audience of nuns he interprets the same figure in terms of universalistic allegory: Judith is Christ's church keeping itself pure by cutting off the "head of the Devil," and on the moral level she is a figure of virginity.

Both Bishop Æthelwold (d. 984) and Ælfric apologized for their use of English and attributed its necessity to the loss of learning. Nevertheless, the so-called school of Æthelwold fostered a standard grapholect, or form of written language, based on West Saxon; this grapholect was used with remarkable uniformity throughout the land for several decades. Such uniformity implies systematic training in *English* writing, while the concomitant increase in intelligibility between dialects would have at least made reading easier. England was not to have a comparable written standard again until the early Elizabethans.

Middle English Period

After the year 1200 or so the clerical control of literacy in England was challenged by increasingly diverse types of lay readers and by a widening circulation of texts in society. Although universal literacy was never a goal, those who read, wrote, and used texts included more aristocrats, more people from the commercial and lower classes, and more women. It is estimated that by 1400 at least 30 percent of the English population, including most of the nobles and gentry, were able to read and often write in English and perhaps French or Latin. During this same period the wills of aristocrats, gentry, merchants, and tradespeople regularly list the Bibles, devotional books, histories, and grammar texts they bequeath to others. The evidence of literacy claims and book ownership indicates that by the 14th century minimal literacy skills were being taken for granted among the upper and middle classes.

After the Norman Conquest English literate culture was shaped by the mixture of Latin, French, and English languages. Versions of Anglo-Norman French became the language of power and prestige, the imposed public discourse of the subjected Anglo-Saxons and the ruling Normans. Latin remained the dominant bookish language for learning and theology, despite a strong tradition of OE intellectual writing. English continued to be the spoken language of the villages. English law bridged the gap between learned and lay communities. In 1258, for example, the barons' proclamation ("Provisions of Oxford") was sent to sheriffs in Latin, French, and English to be read aloud publicly in whichever language the audience would understand. By the 13th century members of the upper class were expected to be at least functionally bilingual in French and English, with perhaps a small reading knowledge of Latin. However, by the late 14th century English had emerged not only as the spoken language of the majority of people but also as the written language of many official records, and of the courtly poetry of Chaucer and the alliterative poetry of Langland.

Until the 13th century the term *litteratus* was applied to anyone "able to read and write Latin" (or sometimes French), usually the male clergy. By definition everyone else was *illiteratus*, regardless of whether they could read and write English. The English terms *lered* ("learned") and *lewed* ("unlearned") were comparable to the Latin *litteratus* and *illiteratus*. Traditionally *clericus* meant the male clergy and was therefore associated with those able to read and write Latin. But in the 14th century *litteratus* and *lered* could mean someone able to read English, while *clericus* often referred to any man able to read and write

Latin. *Clerk* could mean a member of the clergy, a student, a university-educated layman, a scholar, or a male writer.

A number of factors led to the increased use of writing and books in later medieval England. First, schooling was becoming more accessible to the laity, enabling children of the gentry, tradespeople, and even peasants to acquire basic literacy in French or English. Not only monasteries and cathedrals but also convents, parishes, towns, and guilds sponsored grammar schools, despite economic and political uncertainties and sometimes scarce resources. Young boys were taught Latin literacy and grammar, but most used their skills to master vernacular literacy. Aristocratic boys were usually entrusted to tutors who used the same textbooks and models of literate discourse as the grammar masters. Girls, more educated than we have commonly thought, were most often taught privately to read and less often to write in English or French. After the Conquest literacy training in nunneries was usually in French, but by the 14th century English literacy was common in women's schooling.

Second, changes in book formats made texts more accessible and easier to handle. Calls for a more educated clergy (such as those of the Fourth Lateran Council of 1215) and the creation of the preaching orders of friars encouraged the copying of devotional books in smaller, "pocket" versions, more portable than the lavish vellum texts copied for cathedrals and wealthy patrons. Aids to reading that began in university texts—tables of contents, chapter headings, indices, and line numbers—spread to devotional and secular books for lay readers. Collections of romances, sermons, and documents were compiled on cheaper and lighter parchment and written in a more readable "business" script.

Third, these changes in book format and the laicization of literacy affected people's reading habits. Throughout the Middle Ages reading normally meant reading aloud, whether publicly, in small private groups, or individually. *Lector* meant "reader" and especially "one who reads a text aloud." The written text was usually a prompt to vocalize the book, even to oneself; many works describe their imagined audiences as "all who read or hear read" or "read and listen to" the narrative or treatise. In literate households families shared religious books together after the evening meal, as the father and children took turns reading aloud from the Bible or a devotional text.

But scholasticism and the academic study of texts, together with the growing urban book trade and a wider readership, helped foster silent, private reading and the individual practice of mulling over a text. Books of hours, saints' lives, and other devotional texts were composed for individual, private, and perhaps silent readers. In *The Parliament of Fowls* Chaucer's narrator describes himself unexceptionably as reading privately in his own bed. But some cultural authorities associated books in English for lay readers with

heresy and skepticism and with a dangerous kind of freedom. The avid book collector Richard de Bury (d. 1345) lamented the growing number of lay and especially women readers as a sign of social disorder brought on by the decline of the clergy's control over literacy.

Whether they read themselves or were read to, later medieval lay readers had greater access than their ancestors to traditionally clerical writings through English translations of the Bible, commentaries, sermons, psalters, and penitentials. Anticlericalism and the preachings of Wyclif's followers supported the translation of the Bible into English for lay readers. In addition there circulated among both religious and lay readers the writings of such mystics as Richard Rolle, originally in English or translated into English, as well as translations of saints' lives. Fueled by the spirit of lay piety, prayer books and other devotional books were translated and copied into the vernacular for lay readers, especially gentry and upper-middle-class men and women.

The increasing importance of documents in English legal, economic, and political life also fostered the laicization of literacy. After 1200 many men and some women wrote and signed their wills in English in their own hands; deeds and account records were recorded in family or personal papers. The great collections of family letters (Pastons, Celys, Stonors) date from the late 15th century. A noble or bourgeois household might own not only a Bible but also anthologies of courtly narratives and religious tales (such as the Auchinleck Manuscript) and a domestic book containing family records, advice on conduct and how to run the household, recipes, remedies, herbal lore, and other practical information previously maintained in oral culture.

The lives and writings of medieval English women reveal the complexities of later medieval literacies. Both Julian of Norwich (1342/43-after 1416) and Margery Kempe (ca. 1373-after 1438) describe themselves as "unlettered," but they also dictate long works on their spiritual experiences to scribes. Julian's *Book of Showings* resonates deeply with the biblical and Latin religious writings she heard read or perhaps read herself. Kempe, a brewer and daughter of the mayor of Lynn, participated actively in vernacular culture by having her priests read devotional works to her. Margaret Paston (d. 1484), a member of the landed gentry in Norfolk, composed numerous letters in English to her husband and family concerning both private and public matters; most she dictated to clerks, but a few she inscribed in her own hand. These women were active in English literary culture, were read to by clerks or priests, and used texts as part of their devotional or pragmatic literacy.

By the 15th century private and vernacular reading was widely practiced along with reading aloud in groups among both religious and lay people. English had emerged as the language of both official and familiar writing and

reading. From the king's council to the town council to the household late-medieval England was increasingly familiar with and dependent on written texts.

Literary Influences: Carolingian

The beginning and the end of the Carolingian dynasty are easily determined: Pepin the Short established the dynasty in 751 by deposing the Merovingian king Childeric III; the Carolingians were replaced by a different royal house in 911 in Germany, and in 987 in France. The dates for Carolingian culture, however, can be less clearly defined: it takes its beginning and is most vital under Charlemagne (king of the Franks from 768; emperor of the West 800–14), continues during the 9th century, and then wanes in the beginning of the 10th.

Carolingian culture grew out of Charlemagne’s desire to establish a learned clergy with uniform practices throughout his realm. Books were therefore at the center of his cultural program. Whatever their content, books had to be

copied, and copied accurately; if existing texts were not accurate, they had to be corrected, or correct texts had to be established with reference to texts that were accurate. As far as possible gaps had to be filled. Correct texts and texts considered necessary for the education of the clergy were ordered from abroad, primarily from Rome. The early center for much of this activity was Charlemagne's court at Aachen; there he gathered not only the learned men of his own realm, such as Angilbert of St. Riquier, but also from abroad: Peter of Pisa, Paul the Deacon, and Paulinus of Aquileia from Italy; Theodulf of Orléans from Spain or southern Gaul; Josephus Scotus from Ireland; Alcuin of York from England. While still at the court these men not only corrected deficient texts but also became authors in their own right, their poetry being characterized by a conscious imitation of classical forms. Later these scholars dispersed throughout the realm and established centers of learning at whatever abbey or bishopric they received from Charlemagne (e.g., Alcuin at the Abbey of Tours).

Carolingian culture must have had a certain influence on Anglo-Saxon England during the period in which Alcuin was still alive. His letters contain evidence of "presents" sent to England; these are sometimes identified as metalwork, clothes, and other valuable items, but presumably they also included books (*Epistles* 102, 103, 104). He dedicates and sends his *Interrogationes de libro Geneseos* (*Questions on the Book of Genesis*) to one Sigwulf, whose name suggests that he was an Anglo-Saxon (*Epistle* 80). His letters also speak of one of his students whom he sent back to England to teach there (*Epistle* 64). His *vita* relates that he received many English visitors at Tours. It is hardly conceivable that these visitors did not bring word back to England about Carolingian culture and that they did not take books back as well. Nonetheless, because of the scarcity of extant books that can be clearly shown to have been taken from France to England in the early 9th century, and in the absence of any Anglo-Latin writers of that period whose work could be scrutinized for echoes of Carolingian writers, any statement about Carolingian influence on England during the early 9th century has to remain speculative.

While learning declined in Anglo-Saxon England during the 9th century, partly no doubt because of continuous Viking raids from about 850 onward, the impetus Charlemagne had given to Carolingian culture retained its momentum and produced such scholars and poets as Abbo of St. Germain (d. ca. 921), Ado of Vienne (d. 875), Adrevald of Fleury (fl. ca. 850), Amalarius of Metz (d. ca. 850), Benedict of Aniane (d. 821), Florus Diaconus (d. ca. 860), Freculphus of Lisieux (d. 852), Halitgar of Cambrai (d. 831), Helerpic of Auxerre (fl. mid-9th century), Hrabanus Maurus (d. 856), Hugbald of St. Amand (d. 930), Milo of St. Amand (d. 872), Paschasius Radbertus (d. 860),

Remigius of Auxerre (d. 908), and Smaragdus of St. Mihiel (fl. in the second and third decades of the 9th century). Whether any of these authors immediately influenced England during the 9th century is almost impossible to ascertain because of the scarcity of English manuscripts during this period and because of the apparent absence of English authors writing at this time.

Learning was revived in England in the last decade of the 9th century under Alfred the Great, and this revival drew heavily on the expertise in Francia. Alfred was directly connected to the Carolingian court through his stepmother, Judith. Two of Alfred's advisers came from the Continent, Grimbald from the Flemish monastery St. Bertin's and John the Old Saxon presumably from a monastery in eastern Francia (possibly Corvey). Specific traces of their activities can no longer be ascertained, but there can be no doubt that they were influential. Alfred himself, in the prose preface to his translation of Gregory's *Pastoral Care* mentions that he translated the work "as I learned it from... Grimbald my mass-priest and from John my mass-priest." Alfred's biographer, the Welshman Asser, is also influenced by Carolingian culture: he echoes Einhard's *Vita Caroli*, mentions recent events of Frankish history, and even uses some Latin words considered to be specifically Frankish. The inclusion of events of Frankish history in the Anglo-Saxon Chronicle, which was started during Alfred's reign, also attests to Carolingian influence on England. The exact sources for Alfred's and his circle's translations have not been completely determined, but without doubt both texts and commentaries produced in Carolingian Francia were among them.

Carolingian culture exerted its greatest influence on England in the period when the Carolingian dynasty was replaced by other royal houses in Germany and France. The Benedictine Reform in England (beginning ca. 940) itself was an importation from the Continent; two of its leading men, St. Dunstan and St. Oswald, had spent some time in continental monasteries and must have come in contact with Carolingian culture there. The Reform brought with it the need for manuscripts that seems to have been filled at least partly by scribes in Francia. Of the manuscripts owned in Anglo-Saxon England more than 70 were written in Francia in the 9th and 10th centuries and brought over to England; some of these manuscripts may have arrived in England as early as the late 9th century (i.e., under Alfred the Great), but the bulk came to England in the course of the 10th century.

The content of these manuscripts is the best indication for the areas of major Carolingian influence on England: they include biblical, liturgical, patristic, hagiographic, administrative, and didactic works. Eleven manuscripts, for instance, contain the Gospels, another four the Psalms; the bulk of the manuscripts (nearly twenty) contain patristic works, such as Caesarius of Arles's *Expositio in Apocalypsin*, Augustine's *Soliloquies*, or Gregory's

Dialogues and his *Moralia in Job*. Among the continental manuscripts is a surprisingly large number containing works by Anglo-Saxon authors (not including the four manuscripts with works by Alcuin that, since he produced most of them on the Continent, by necessity had to come from Francia to England): ten manuscripts contain such works as Aldhelms *Aenigmata* (BL Royal 15.A.xvi) and his *Carmen de virginitate* (Oxford, Oriel College 34; Bodley 849), *De templo Salomonis* (Cambridge, Pembroke College 81), *In Evangelium Lucae* (Cambridge, Pembroke College 83; Oxford, Bodley 218), and *De temporum ratione* (BL Cotton Vespasian B.vi; Royal 15.B.xix; Salisbury, Cathedral Library 158). Five manuscripts contain works by Carolingian authors: the *De ecclesiasticis officiis* by Amalarius of Metz; the *Expositio super Sedulium* and *In Martianum Capellam* by Remigius of Auxerre; and the *In epistolas Pauli*, *In Judith*, and *In Hester* by Hrabanus Maurus.

Manuscripts imported from Francia thus do not primarily bring the works of Carolingian authors to England but rather restock English libraries with works essential for the school and church. That works by Anglo-Saxon authors were reimported from Francia indicates how depleted English libraries were; some works by Anglo-Saxon authors, such as Bede's *De templo Salomonis*, *In canticum Habacum*, and *In regum librum*, all found in Cambridge, Pembroke College 81, are extant in England only in manuscripts imported from Francia.

The Anglo-Saxons were familiar with more Carolingian authors than is indicated above; many of them appear not in manuscripts imported from Francia but in manuscripts copied in Anglo-Saxon England and, one might add as an additional Carolingian influence on England, increasingly copied in the Caroline script from the middle of the 10th century onward. Authors whose works are preserved in manuscripts written by the Anglo-Saxons (not including manuscripts written in the second half of the 11th century, since these may already be Norman imports) are Abbo of St. Germain, Adrevald of Fleury, Amalarius of Metz, Hrabanus Maurus, Hugobald of St. Amand, Milo of St. Amand, Paschasius Radbertus, Remigius of Auxerre, Smaragdus of St. Mihiel, and Theodulf of Orleans.

The preservation of these works in Anglo-Saxon manuscripts suggests that many more manuscripts than are extant had been imported from the Continent and were either destroyed, lost, or returned after they had been copied. What is true here specifically of manuscripts containing Carolingian authors is also true generally of other authors. Two of the ten extant Anglo-Saxon *Psychomachia* manuscripts, for instance, come from Francia, but they do not contain the textual variants, the glosses, or the illustrations found in the other eight, so that several manuscripts must be presumed lost or returned to the Continent after they had been copied.

Anglo-Saxon interest in matters Carolingian also appears in the OE glosses

to Abbo of St. Germain's *Bella Parisiacae urbis*, to Amalarius's *Liber officialis*, to Benedict of Aniane's *Memoriale*, and to Milo's *De sobrietate*, and even more so in the translations of parts of Amalarius's *De regula canonicorum*, Halitgar's *Penitential*, and Theodulf's *Capitula*. One might add here both the OE glosses to and translation of Chrodegang's *Rule*, even though Chrodegang is strictly speaking a pre-Carolingian author (d. 766); nonetheless, there can be no doubt that his work was transmitted to England via Carolingian Francia.

The Latin works written by the Carolingians clearly influenced the Anglo-Saxons most strongly, but this influence also extends to the vernacular. BL Cotton Caligula A.vii, written in the 10th century in England, contains the Old Saxon version of the *Heliand*, a poem composed about 830 possibly at Fulda in eastern Francia; the OE poem known as *Genesis B*, as Sievers had originally postulated and as a fragment from the Vatican library later confirmed, is a translation from an Old Saxon poem composed around the same time as the *Heliand*. The Carolingians in the 10th century thus returned to the Anglo-Saxons a type of poetry with which Anglo-Saxon missionaries probably first acquainted them in the 8th.

The Norman Conquest, though ending the Anglo-Saxon period, brought with it one last extensive influx of Carolingian works into England. Among the manuscripts produced at Salisbury immediately after the Conquest, for instance, are some containing Freculphus's *Chronicon*, Paschasius Radbertus's *De corpore et sanguine domini*, Amalarius's *De ecclesiasticis officiis*, and Helpericus's *De computo*; the Durham scriptorium of the same period produced manuscripts with Paul the Deacon's *Homiliary* and Hrabanus Maurus's *In Matthaëum*. The exemplars for these works had in all probability been brought over to England by the new Norman masters.

Literary Influences: Classical

Anglo-Saxon Period

If we were dependent solely on the evidence of surviving manuscript copies from the Anglo-Saxon period for our knowledge of the extent to which classical texts were available and being read in the England of that time, then the list of texts that we would be able to compile would be small indeed. From the period before ca. 900 we would be able to cite only Pliny, Cicero (*Aratea*), Pompeius Trogus (via Justinus's *Epitome*), and commentaries on Virgil by Servius, though the scholar Alcuin's description of the library at York refers to works not merely by these three (assuming that in giving the name "Pompeius" Alcuin is referring to the Pompeius Trogus *Epitome*), but also by Virgil himself, Statius, Lucan, and a number of grammarians including Aelius Donatus.

Moving on to the late 9th and the 10th centuries, we would be able to confirm the presence of texts of Statius (*Thebaid*), Virgil, and the grammarian Aelius Donatus, and to add to our list poetical works by Ovid (*Ars amatoria*), Juvenal, and Persius (*Satirae*). Assignable to the first part of the 11th century are manuscripts of Hyginus's *Poeticon astro-nomicon*, medical texts by Pseudo-Apuleius, Pseudo-Dioscorides, and Sextus Placitus, and possibly also the *Collectanea* of Solinus and Vegetius's *Epitome rei militaris*, though the two

last-named manuscript copies may not have been written until after the Norman Conquest. Considered late-11th-century and thus certainly post-Conquest are copies of Avianus (*Fabulae*), Cicero (*De officiis*), Seneca (*De clementia*), Statius (*Achilleis*), and Vitruvius (*De architectura*).

These are all Latin texts. Of the Greek texts available in England before the Conquest we know almost nothing—though it seems likely that a substantial portion, if not all, of them would have been the work of the Greek Church Fathers. However, although there was clearly a far greater readership for Christian Latin writings than for pagan ones (Bede likens Christians who made use of pagan writings to Israelites going to the blacksmith of the Philistines to sharpen their iron tools), the classical knowledge of at least some Anglo-Saxons seems in fact to have been substantial. Surviving Latin and vernacular works demonstrate familiarity with a range of major poets and prose writers, though sometimes at second hand, through such authors as Isidore, Macrobius, Martianus Capella, Orosius, Servius, Jerome, and Augustine and in particular through illustrative quotations in the writings of Latin grammarians, both classical and postclassical. (Alcuin is excluded from the discussion of Anglo-Saxon Latin writers below, since almost all his writing and possibly much of his reading of classical texts was done on the Continent, though including Alcuin would allow the addition of Valerius Maximus, Aulus Gellius, and Tacitus to the list). So of Bede's citations or echoes of Cato, Cicero, Donatus, Eutropius, Horace, Julius Africanus, Livy, Lucan, Lucilius, Lucretius, Martial, Ovid, Plato, Plautus, Pliny, Pompeius (Festus), Propertius, Sallust, Solinus, Suetonius, Terence, Varro, Vegetius, and even the much-quoted Virgil, the great majority can be shown to be based on materials available to him through secondary sources, and in most cases there is insufficient evidence to suggest any firsthand knowledge of any of the works from which they are ultimately derived. Indeed it is only from Eutropius, Pliny, Vegetius, and Solinus that material is used in such a way that direct knowledge seems unquestionable.

Some acquaintance with classical poets is also shown by minor Anglo-Saxon writers in Latin, with, for instance, an anonymous 10th-century poet of the time of Æthelstan echoing Horace, and with Ovid and Virgil quoted or echoed in the 7th and 8th centuries by Tatwine, Boniface, Lul, and Æthelwold (though material from Horace and Martial in the works of Eddi, Milret, and Boniface is probably derived at second hand, while Boniface and Tatwine are heavily indebted to the grammarians).

The 7th-century scholar and poet Aldhelm, in contrast, seems to have had firsthand knowledge of Virgil, whom he cites freely in his work on meter and who also influenced his diction in his poem *De virginitate*. Other of the quotations with which his work is liberally sprinkled are from Ovid

(*Metamorphoses*), Juvenal, Lucan (*Pharsalia*), Cicero (*In Catiline* and *In Verrem*), Claudian (both *Consulatus iii Honorii* and *Epithalamium Laurenti*), Persius, Pliny, Seneca (*Agamemnon*), Servius, Solinus, Suetonius, Terence (*Phormio* and *Adelphaei*), and Aelius Donatus (*Vita Virgili*). Aldhelm is also greatly indebted to the grammarians of the imperial period and their successors—Audax, Donatus, Pompeius, Phocas, Victorinus, Sergius, and Priscian—and it is from their works rather than from the originals that he appears to have derived material from Lucretius, Cicero, Sallust, and Ennius (though his knowledge of Julius Africanus has come to him via Jerome).

Despite the fact that some quotations from classical authors found in Latin writings of the Anglo-Saxon period seem to have been taken from secondary sources all the above identifications can be made with reasonable confidence, on the grounds of verbal identity. Far more difficult to pin down are the precise sources of classical material in vernacular texts, where sense-for-sense, not word-for-word, renderings are the norm. And in the case of writers like Ælfric and Byrhtferth (a user of both Latin and OE in his *Enchiridion*) this material can generally be shown to have reached them via grammarians, commentary writers, and encyclopedists, such as Donatus, Macrobius, Priscian, and Isidore, or via their own countrymen Aldhelm and Bede. Medical texts owe much to Latin compilations, among which Pseudo-Apuleius, Pseudo-Dioscorides, and Sextus Placitus figure prominently.

However, even here the list of classical texts from which material has been drawn is impressive—not the least because it is derived almost exclusively from the work of two writers: King Alfred and his anonymous contemporary the translator of Orosius's *History against the Pagans*, writers who have made substantial alterations and additions to their primary sources, 5th-century Latin works that themselves have drawn more or less heavily on classical texts.

In Alfred's Boethius some of this additional material can be traced to a version of the *Liber de viris illustribus*, possibly also Tacitus (*Annals*), Macrobius (*In somnium Scipionis*), Pliny (perhaps via Solinus) and Valerius Maximus, with mythological material from Virgil (*Aeneid* and *Georgies*), Servius on Virgil, and Ovid (*Metamorphoses*). In the case of the OE Orosius, details of military stratagems are derived from Livy, Valerius Maximus, Sallust, and Frontinus, and certain incidents in the life of Alexander the Great from Quintus Curtius. Also used is Pliny. Other possible sources include Velleius Paterculus, Eutropius, Florus, Festus, Solinus, Suetonius, and the *Liber de viris illustribus*. However, the style of translation is such that it is often not possible to determine which of a range of possible sources has in any given case been used—or indeed whether some of the material might have come from a lost commentary on the primary source, or even (as can be demonstrated with respect to a quotation from Ennius) from material interpolated in that primary

source. So, for instance, information about Theseus at Marathon may have been derived from either Pomponius Mela or the postclassical Lactantius Placidus (*Commentary on the Thebaid of Statius*), a handful of details concerning the Rape of the Sabines from Ovid's *Fasti*, either direct or via scholia (learned annotations) on Juvenal or on Lucan, information about the Amazons and about Nectanebus from Julius Valerius directly or via Jordanes or Servius (for the Amazons) and Fulgentius or Lucan scholia (for Nectanebus), while knowledge of Regulus's oath could come from a wide range of sources including Livy, the *Liber de viris illustribus*, Silius Italicus, Eutropius, and Augustine. Whatever the route, however, it is clear from those contexts, vernacular and Latin, that a range of material from classical sources was available and classical texts were being read in Anglo-Saxon England throughout the period after the Conversion and up to the Norman Conquest.

Middle English Period

The ME contribution to the classical tradition begins and nearly ends with Chaucer and Gower. From the 12th century, when the court of Henry II became a center of Latin culture, through the 14th, when "classicizing friars" at Oxford and Cambridge incorporated ancient mythology and moral philosophy into their sermons and commentaries, a tradition of classical learning was maintained. But early ME writing, though many of its practitioners certainly had some classical education, adapts itself to the cultural horizons of its audience and shows no sign of the influence of ancient literature. *The Owl and the Nightingale* (ca. 1200) deploys an ultimately classical rhetoric but is devoid of classical reference. Parallels, but no clear connection, have been discovered between the similes of La3amon's *Brut* (ca. 1200–25?) and those of the *Aeneid*. If the wolf and ram who swim side by side in the Flood narrative of *Cursor Mundi* 1785–86 (ca. 1300) recall the flood in Ovid's *Metamorphoses* 1.304, the allusion remains a solitary flowering.

Even poems on classical themes have nonclassical models. *Kyng Alisaunder* (early 14th century) echoes the learned Latin *Alexandreis* of Walter of Châtillon (ca. 1175), but its principal source is the Anglo-Norman *Roman de toute chevalerie* (late 12th century). The composer of *Sir Orfeo* (early 14th century) must have known Boethius's lyric on Orpheus and Eurydice, and his treatment of Orfeo's music probably borrows from Latin commentary on Boethius's *Consolation*, but his artistry consists largely in his transmutation of the story into the terms of Celtic mythology. To Langland's *Piers Plow-man* ancient culture contributes only scraps from the *Distichs* of Cato, a standard

primer text, and a single echo of Juvenal (B. 14.304; cf. Juvenal, *Satire* 10.22). Even the cultivated poet of *Pearl* and *Sir Gawain and the Green Knight* gives no clear evidence of borrowing from ancient sources, though traces of early Virgil commentary have been detected in the “historical” opening of *Sir Gawain*, and some of that poem’s reflections on the uncertainty of human life have been traced, perhaps via an intermediary source, to Seneca.

In this sparse setting the achievement of Chaucer and Gower is all the more impressive. Both addressed an educated audience and saw themselves as writing in the tradition of the ancient *auctores*, taking their cue from the French poets Jean de Meun and Guillaume de Machaut and in Chaucer’s case Boccaccio and Dante. Chaucer was one of the most learned English laymen of his day. His considerable knowledge of ancient philosophy is difficult to trace to particular sources beyond the omnipresent Boethius, but he knew thoroughly the major classical Latin poets and the commentary traditions associated with them. He was also steeped in medieval vernacular poetry, French and Italian, and his poems depend on an interplay between the classical and the medieval courtly tradition. Thus *The House of Fame* (ca. 1380?) incorporates into a Virgilian account of Aeneas and Dido a feminine perspective, derived from Ovid’s *Heroides*, that reflects the medieval tradition of adapting classical themes to the mode of romance. *Troilus and Criseyde* and the *Knight’s Tale* infuse the love stories of Boccaccio’s classicizing *Filostrato* and *Teseida* with a darker view of human experience that evokes Virgil and Statius. Virtually every classical reference in Chaucer requires recourse to an ancient text for its full interpretation, and this is true also for Gower, whose learning, if more conventional, is hardly less wide-ranging, and whose *Confessio Amantis* (1390) shows a deep appreciation of Ovid. Together the two poets created an English poetry capable of claiming a place in the European classical tradition.

Most 15th-century poetry shows little interest in this aspect of Chaucer and Gower. Despite the example of Chaucer’s *Troilus* the *Laud Troy Book* and *The Destruction of Troy* (both ca. 1400) ignore classical poetry (the *Laud* poem includes a vague citation of Statius’s *Achilleid*, a common school text). Their model is the Latin “Trojan History” of Guido delle Colonne (1287), itself a reworking of the *Roman de Troie* of Benoît de Sainte-Maure (ca. 1165) and ultimately of the late-antique writers “Dares Phrygius” and “Dictys Cretensis,” who claim to present pre-Homeric, warrior’s-eye accounts of the Trojan War, truer than those of Homer, Virgil, and Ovid. John Lydgate’s *Troy Book* (1412–20) likewise follows Guido, though Lydgate also emulates Chaucer’s *Troilus*, drawing covertly on Ovid for classicizing detail. His *Siege of Thebes* (ca. 1420–21) is based on the French *Roman de Thebes* rather than on Statius, but cites Seneca’s *Oedipus* and Martianus Capella.

Lydgate's appreciation of things classical grew over the course of his long career. Though the *Troy Book* follows Guido in repudiating the authority of ancient poetry and vehemently condemns the pagan pantheon (4.6948–90), *The Fall of Princes* (1431–38), based on Boccaccio, displays an appreciative interest in ancient religion and includes extended praise of Ovid and Virgil (4.64–98). Lydgate expands several stories with Ovidian material and incorporates Ovid's tale of Canace and Machareus.

The Fall of Princes also commends the devotion to “bookis of antiquite” of Lydgate's patron, Duke Humphrey of Gloucester (1.395–98), the best known of a number of bibliophiles whose support for classical studies provided an avenue for the entry of Italian humanism into England. His commissioning of Latin translations of the *Republic* of Plato and Aristotle's *Politics* attests a renewal of interest in ancient thought, as do the several vernacular versions of the compendium known as *The Diets and Sayings of the Philosophers* and Caxton's publication of a version of Cicero's *De amicitia* (*On Friendship*), though the latter, like all Caxton's “classics,” is based on an earlier medieval vernacularization. But poetry after Lydgate remains unresponsive to these developments until the end of the century, when the Scottish poet Gavin Douglas produces a translation of the *Aeneid* (1513) that has been called truer to Virgil than Dryden's. In John Skelton, a university man versed in the rudiments of Greek as well as in a full-fledged humanist Latin, we encounter a poet who, though wary of the extremes to which the humanist devotion to classical style might lead in both pedagogy and literary practice, takes the cultural ideals of humanism largely for granted and glories in the title of Poet Laureate conferred on him by both Oxford and Cambridge. Both Douglas and Skelton were acutely conscious of working in the tradition of Chaucer, and their work confirms his importance to the growth of an English classical tradition.

Literary Influences: French

The influence of French on ME literature is immense; it affected not only the kinds of writing that have survived but also the language they were written in. With the Norman Conquest (1066) and for at least the next two centuries French was the language of the nobility in England. During this time English continued to be spoken by the common people, but it seems that by the 13th century many in the middle class were comfortable with French as well. Inevitably French forms began to modify English pronunciation, vocabulary, and grammar.

Almost at once, however, linguistic and political pressure also began to alter the Norman French originally spoken in England. By the turn of the 13th century we hear of English children sent to France to rid them of their barbarous native French. After 1204, when England lost Normandy, the English nobility became increasingly insular: no one could hold lands in both countries after 1244. All these conditions favored the increasing use of English not only as a spoken but as a literary language; a large number of French words began to enter English at this time. By the second half of the 13th century most of the aristocracy spoke English; by the start of the 14th century it was the everyday language of almost everyone in England.

Yet French remained the official language of the court, parliament, law courts, public records, and town councils well into the 14th century, and in some cases beyond; it was also the international language of diplomacy, commerce, chivalry, and culture throughout the Middle Ages. Almost all the literature in ME that survives (an important qualification) reflects the influence of French models, either by simply translating them or by reacting to them.

Until 1350 ME writings were local and domestic; they were generally either religious and instructional or romances, songs, or chronicles meant to entertain. A large proportion of both kinds of extant texts have sources or analogues in French. The *Ancrene Wisse* (ca. 1215–22), for example, an early devotional treatise, exists in French and English versions so similar that it is

difficult to tell which was written first. The English version, which is now considered to be the original, is distinguished by the personality of its author; nevertheless, like most vernacular sermons and homiletic tracts addressed to English gentry, it was probably modeled on French and Latin exemplars. The debate poem *The Owl and the Nightingale* (ca. 1200) also shows the influence of French models not only in its form—it is the first English poem in French octosyllabic couplets—but also in its irony and witty rhetoric, which owe much to French debate poems. Even La3amon's *Brut* (ca. 1200–25?), despite its seemingly deliberate intention to continue the alliterative tradition of OE poetry and to avoid using French words, still draws on Wace's French translation of Geoffrey of Monmouth.

As for romances, even the earliest (several of which deal with events before the Conquest) are in French stanzaic and metrical forms and probably were adapted from Anglo-Norman originals. Similarly histories in English, such as Robert Manning's *Chronicle*, or *Story of England* (1338), take French chronicles as their models.

After 1350 the impulse to rely on French models continued unabated but began to jockey with an emerging awareness that the native tongue could support independent, sophisticated literature as well. Little survives that shows there was national pride in English as a language, and England still lacked a significant written literary tradition it could call its own. Anglo-Norman texts continued to be written in England throughout the 14th century; literature virtually meant French literature. But England had gone to war against France in 1337; the skirmishes and battles of the Hundred Years War would continue intermittently until 1453. To rouse national feeling Edward III claimed that the French wanted to invade England and destroy the English language (allegations already made by Edward I for similarly political purposes). The climate of the times thus licensed the ongoing translation of French models but also warranted their transformation into something that began to express English sensibilities in the native language.

At one end of this spectrum between translation and transformation are such texts as *Mandeville's Travels* (ca. 1357), which was written in French, copied into Anglo-French, and then translated into several English versions. At the other end stand the poems of the alliterative revival: a number of them in fact have French sources but are quite English in form and feeling. A figure like Gower occupies a middle position: he wrote in French (and Latin) as well as in English; his *Mirour de l'Omme* (ca. 1378?) returns the penitential tradition to the language from which most earlier English texts were translated. But the one author who best captures the impulses of his age, who embraced French literature as his own yet also established English as an independent literary language, is Chaucer.

Chaucer probably began his poetic career as translator of the *Roman de la Rose*; he may also have composed songs in French. His early poems (notably *The Book of the Duchess*) were heavily indebted to works by Machaut, Deschamps, Froissart, and other French poets, but by the time he wrote *The Parliament of Fowls* (ca. 1380?) Chaucer had produced a work that not only relied on French as well as Italian and Latin models but was also peculiarly English in its assumption of the audience's knowledge of the workings of parliament. The Prologue to *The Legend of Good Women* (ca. 1386?) again is French in its inspiration but new in its form: it may be the first narrative in English in decasyllabic couplets. Most of the 24 *Canterbury Tales* (ca. 1386–1400) are in some way associated with French literature; each of them, however, is narrated by a character who for all his or her ties to traditional French and Latin estates satire is discernibly English.

Chaucer's genius makes him exceptional in many respects, but his making of works that could rival French sophistication yet seem distinctly English does correspond to the temper of the times. Those who followed Chaucer in the 15th century praised him chiefly for ennobling the English language; not surprisingly, however, writers like Hoccleve and Lydgate continued to depend heavily on French models. Hoccleve's poems were in English, but French and Latin were still the languages in which he composed official documents. Lydgate's *Fall of Princes* (ca. 1431–39) is typical in that it translates a French translation of Boccaccio's *De casibus virorum illustrium*. Caxton's nostalgia for chivalry and courtliness led him to translate French romances (e.g., *Blanchardin and Eglantine* and *The Recuyell of the Histories of Troy*) and conduct books (e.g., *The Book of the Knight of the Tower*); John Bouchier, Lord Berners (ca. 1467–1533) continued the tradition into the 16th century with his translations of Froissart and *Arthur of Little Britain* (ca. 1514–25?). But it is really with Malory's *Morte Darthur* (ca. 1469–70), that we find for the last time in ME the amalgam of French sources and English sensibilities that characterizes the influence of one continental pedigree in England in its most complex form.

Literary Influences: Irish

The favorable circumstances of Ireland's geographical proximity, its well-documented historical and cultural connections with England, and its flourishing native literature (both vernacular and Latin) invite investigation of Irish influence on medieval English literature. So far the results have been inconclusive. An earlier approach that tended to attribute to Irish sources anything in OE literature judged exuberant, bizarre, or esoteric (and without alternative explanation) was followed by skepticism about Ireland's cultural achievements abroad and an emphasis on the shared Latin-Christian ("insular") culture of the two areas.

Old English

The stage for Irish influence was set by the mid-7th century with Irish missionaries acting as the primary agents of Christianity and literacy in

Northumbria and the west Midlands. Probably dating from the early 8th century are a Latin commentary on the Psalms, of Irish origin and with Old Irish glosses, written by a Northumbrian, Edilberict; and the “Penitential” associated with Theodore of Canterbury, which incorporated matter from “a little [penitential] book of the Irish.” Slightly later Bede drew on Irish *computistica* (works on calendar calculations), hagiography, and biblical exegesis. Although composed in Latin, these works provide a paradigm for the investigation of Irish influence on OE: the borrowing is usually anonymous or unacknowledged; it is censored by the authority of an English ecclesiastic; it is monastic in provenance; and it is effected through Latin rather than the vernacular. The possibility that the large corpus of Old and Middle Irish literature (ca. 600–1200) was directly accessible to the Anglo-Saxons seems remote. The scarcity of Old Irish loanwords in OE suggests a limited exchange between the two languages, as does the use of garbled Irish words in OE charms, implying efficacy through obscurity.

While in theory Irish influences might operate at any time, in practice certain periods and places were more conducive to such influence than others. Northumbria in the 7th and early 8th centuries would have provided an especially favorable environment, first with the presence of Irish missionaries (635–64), then with the migration of Northumbrian students to Ireland (ca. 650), and finally with the well-documented ties of King Aldfrith (685–705) with Ireland, both directly and via the monastic community of Iona. Another likely conduit would have been monasteries in Ireland with strong Anglo-Saxon representation, notable Rath Melsigi (mentioned by Bede but only recently identified) in the southeast of Ireland, and Mag-nEo (“Mayo of the Saxons”) in the west. The latter, founded ca. 670 by Northumbrian monks who had left with Bishop Coimán after the Synod of Whitby (664), still maintained contacts with Northumbria into the late 8th century.

Alfred’s Wessex offers another link with Ireland, as attested by Asser, his biographer, and the Anglo-Saxon Chronicle, both of which mention Irishmen at Alfred’s court. The OE prose translation of the first 50 psalms (now generally accepted as Alfred’s) relies heavily on Hiberno-Latin exegesis. Also documented, through the survival of two Irish Gospel books, are connections between Ireland and the court of Æthelstan. Finally, throughout most of the OE period, the presence of Irish people in England must be reckoned with. Some were teachers, such as Máelduib at Malmesbury (ca. 670) or Colcu at York (ca. 790); others were pilgrims on their way to the Continent who stopped off at the monasteries of Worcester, Glastonbury, Winchester, and Canterbury.

For ease of reference the numerous claims for Irish influence on OE literature are categorized (and selectively exemplified) as follows.

1. IDEAS

It is argued that Irish missionaries in Northumbria imparted to their converts their own enthusiasm for the vernacular as a medium of religious expression and thereby encouraged literacy in OE; that Irish theological interest in the possibility of salvation for non-Christians finds literary expression in *Beowulf* (through the concept of the natural good); that the Irish concept of exile for the sake of Christ underlies the meaning of *The Seafarer*.

2. LITERARY GENRES

Claims are made for Old Irish religious lyrics as literary models for Cædmon's Hymn and the OE elegies; for the Irish *lorica*, a litanic prayer to ward off evil, as a model for certain OE poems, such as *Solomon* and *Saturn I*.

3. WORKS, SECULAR AND ECCLESIASTICAL

These have been proposed as sources for a considerable corpus of OE poetry and prose, such as Cynewulf's *Fates of the Apostles*, certain OE homilies, and Ælfric's version of *De duodecim abusivis saeculi*. Purportedly the Old Irish saga *Tain Bó Fraich* was a primary source of *Beowulf*.

4. MOTIFS

Attributed to Irish sources are the concept of seven heavens, the three "victories" of the wind, the number of years Adam lived, and the story of the Flood carved on Grendel's sword and the watchman motif in *Beowulf*.

By the nature of the evidence that they require, claims 1 and 2 do not admit of ready proof, though where they shed significant interpretive light on an OE work (as with *The Seafarer*) they gain credibility. The prospects for claim 3 are better, since textual comparison is possible (though weakened by the exclusion of direct verbal correspondences), and when evidence exists that the putative Irish source was independently known in Anglo-Saxon England, as with *De duodecim abusivis saeculi*, near certainty can be achieved. Claim 4 now attracts the most scholarly attention, especially with the recent identification of a large corpus of Hiberno-Latin biblical exegesis, which is being examined (perhaps too closely) as a potential source for unexplained motifs in OE religious literature. To be convincing such identifications must on the English

side reveal peculiarities that can be explained only by reference to an originally Irish context.

Middle English

For this period evidence is meager. The demise of the Anglo-Saxon monasteries after the Norman Conquest also meant the loss of intellectual compatibility with Irish learning that had been so conducive to borrowing. Furthermore Norman rule encouraged the revival of claims by Canterbury and Winchester for control over the Irish church and, with the conquest of Ireland (1169), hostile stereotypes about “the wild Irish,” circumstances that made receptivity to Irish cultural influence unlikely. In any case Ireland no longer produced any influential Latin scholarship as it had in the earlier period.

Significantly, in the ME period, Ireland is presented not as a venerable center of learning but as a land of marvels and an entry to the otherworld. Stories on this theme that fascinated English audiences include *The Voyage of Brendan*, Sir Owain’s otherworld experiences at St. Patrick’s Purgatory, and *The Vision of Tundale*. Claims for immediate Irish sources for another genre of the marvelous, the Arthurian romance, specifically for *Sir Gawain and the Green Knight* and the *Wife of Bath’s Tale*, have not been substantiated; most likely the “Celtic” elements in such works have been mediated through French sources. In the ME hagiographical collections Irish saints with accompanying Irish motifs and background occasionally appear, but derived from Anglo-Latin originals. A genuine ME witness to Gaelic-Irish influence is the so-called “Kildare poems,” a collection of ME poems emanating from the Anglo-Irish colony in Ireland of the early 14th century.

Ideally claims for Irish influence on medieval English literature should be located within a plausible historical context of time and place, one that also reconciles textual history on both sides. But given the huge gaps in current knowledge of both literary cultures, these criteria will probably remain an ideal to be attempted rather than achieved.

Literary Influences: Italian

To speak of the influence of Italian literature on ME prose and poetry is to speak of Chaucer. Although the setting of some early ME religious lyrics to popular tunes followed the practice of Italian friars, and although the alliterative *Morte Arthure* mentions the "vernage [sweet white wine] of Venyce," Chaucer was the only English poet who knew vernacular works of Dante, Petrarch, and Boccaccio well. The fourteenth eclogue from Boccaccio's *Bucolicum carmen*, "Olympia," has been suggested as a source of *Pearl*. Hoccleve made use of Giles of Rome's *De regimine principum* in *The Regement of Princes* (1411), and John Tiptoft, earl of Worcester (1427–1470), translated

Buonaccorso's *Dialogus de vera nobilitate* (printed as *The Dialogue of True Nobility* by Caxton in 1481). But all these sources are Latin works; even Lydgate, who knew of Dante and Petrarch, knew them indirectly through the works of Chaucer and Boccaccio, and the Boccaccian works that Lydgate translated (with the help of French intermediaries) were Latin encyclopedias, not vernacular fictions.

Chaucer owes his unique knowledge to the good fortune of having visited Italy at least twice. Even before his sojourns an educated Englishman could have learned a good deal about Italy's people and history; a Londoner with ties to the court might well have heard about a text like Dante's *Divine Comedy*. England maintained economic, political, and intellectual contact with Italy throughout the Middle Ages. Merchants from northern Italy had traded with England since the 12th century; by the 14th a sizable number, mostly from Florence and Lucca, were active in the City of London (over 300 names have been noted in records from 1360 to 1390). During this time Genoese merchants were continuously present in Southampton. At the royal court there were numerous opportunities to meet Italian diplomats and soldiers. Churchmen and pilgrims had long traveled to both lands; after 1305 many English visited the papal court at Avignon, where Italian thought and culture were discussed.

Despite these ties, however, judging from the silence of other English poets, Italian literature's influence in England was at most subterranean. Even if, as seems likely, Chaucer had learned some Italian before he journeyed to Italy, until he actually had been in Genoa and Florence in 1372–73 and in Milan in 1378, and had acquired copies of Italian texts there, he was probably no more than curious about works he had heard of only in passing.

The literature Chaucer found in Italy deeply affected his poetry. But determining influence remains problematical, not least because we cannot tell how many more works by Dante, Petrarch, and Boccaccio Chaucer read than his fiction gives direct evidence of. Was Italian influence limited only to formal innovations—the decasyllabic line and perhaps the rime royal stanza—or did it inform the new subject matter and techniques of representation Chaucer would adopt in his own poetry? For beyond the interest in fame and pagan antiquity that all three Italian poets show, beyond Dante's way of making perceptible the philosophically abstract or spiritually transcendent, beyond Petrarch's lyric self-absorption and Boccaccio's attempt to marry courtly themes with popular traditions, each poet had a profoundly different idea of what poetry itself was. Did reading works insistently concerned with their own status as literature change Chaucer's own attitude toward poetry?

Chaucer's knowledge of the *dolce stil novo* ("sweet new style"; *Purgatorio* 24.57), for example, and its erudite exploration of the psychology of love comes from Dante. The texts Chaucer knew, however, criticize the kind of poetry

Dante wrote in the *Vita nuova*, the hallmark text of the *dolce stil novo* but one that Chaucer never alludes to. The *Convivio* severely qualifies the earlier poetry's philosophical pretensions, while in the *Comedy* Dante rejects all poetry that is not in a real sense written by God. When Dante's subject is poetry itself, his concrete, dramatic presentation of abstract processes or doctrine is inextricably part of a revisionary polemic that definitely would have interested Chaucer. But if Chaucer did not know the *Vita nuova*, how much of it did he implicitly understand?

Determining the effect of Boccaccio and Petrarch on Chaucer's conception of poetry is equally difficult, not only because both differ radically from Dante but also because Chaucer may have gained his impression of Petrarch's poetics only through Boccaccio's works. Direct evidence suggests that Chaucer knew just one sonnet from the *Canzoniere* (*Troilus* 1.400–20); from that alone he could not have gained any idea of the scope of Petrarch's obsessive desire to constitute reality entirely from within his lyric sequence rather than from without. Moreover Petrarch's fixation on Laura as poetic object leads naturally to Boccaccio's view that literature is essentially amoral, be it pornographic or theological. Boccaccio's position is adduced most often from the *Decameron*, which Chaucer probably did not know directly, but it is also articulated in early works Chaucer did use, such as the *Filostrato* and *Teseida*. Does Chaucer's perception that literature mediates between experience and meaning, between science and opinion, ultimately reflect his grappling with Dante's insistence that literature should become a transparency through which God may be seen, and Boccaccio's divorce of literature from its traditional rhetorical function of judging the rightness of actions? One cannot be sure; it nonetheless seems likely that, beyond the possibilities for representation it opened to him, Italian literature's greatest influence on Chaucer was its continuing meditation about poetry itself.

Literary Influences: Medieval Latin

The medieval Latin learned tradition powerfully shaped both the form and the substance of ME literature. From works of medieval Latin literature (themselves modeled on classical forms) by Boethius, Martianus Capella, Claudian, Prudentius, Fulgentius, "Theodulus" (*Ecloga Theoduli*), and in the 12th century by Alan of Lille and Bernardus Silvestris, writers in the vernacular borrowed literary forms (*satura*, debate, dialogue, consolation, apocalypse, vision, complaint); narrative structures (the psychological battle, the cosmological journey); and characters (allegorical personifications, such as Philosophy, Fortune, Wisdom, Nature, Reason, Genius). From Latin school commentaries on the classical authors Virgil, Cicero, Statius, Lucan, and Ovid and the medieval authors Boethius, Martianus, and "Theodulus," medieval poets learned allegorical moralizations for the myths of classical gods and heroes featured in their poetic fictions (e.g., Venus, Apollo, Jupiter, Orpheus, Hercules).

Most ME writers studied Latin grammar at school, where drill and memorization grounded literacy in a few important texts. Throughout the Middle Ages Latin was the universal language of learning and carried with it a literary tradition on which vernacular poets regularly drew. Some of the most

seminal mythological Latin works were contained in the 9th-century anthology known as the *Liber Catonianus* (later developing into a collection called the *Auctores octo*), from which Chaucer, Lydgate, Gower, and other ME poets may have learned their Latin grammar. The *Liber Catonianus* included the Latin *Iliad* (omitted by the 13th century, when the collection had become part of the grammar curriculum), the *Ecloga Theoduli*, Cato's *Distichs*, Avianus's *Fables*, the *Elegies* of Maximianus, Statius's *Achilleid*, and Claudian's *De raptu Proserpinae*.

Probably the most influential source for the transmission of medieval Latin literary theory and fabulous narrative was Macrobius's 5th-century commentary on Cicero's *Somnium Scipionis*, a work that imitated Plato's *Vision of Er* in its discussion of the afterlife of the soul. Macrobius established two paradigms that would be adopted by later writers—a classification of true and false dreams (1.3.1–11) and a definition of fabulous or fictional narrative as double-leveled (1.2.9–18). Of the truthful dreams the influential enigmatic dream (*somnium*)—which veils its truths with strange shapes—served as the model for what would become the vernacular literary dream vision. In addition Macrobius's Neoplatonic definition of mythological narrative as double-leveled provided the foundation for much medieval fiction: the philosopher, and later the poet, could use stories of the gods to veil truths about the soul from the eyes of base men—the veil, in short, of allegory.

The philosophical origins of the medieval use of allegory to compose fiction and of mythological imagery as a basis for characterization thus strongly emphasized matters noetic (pertaining to the mind or soul). “Allegory,” or “other-speaking,” suggests a nonliteral mode of understanding and discourse, as do the experiences of the soul released by the dreaming body. For this reason many medieval Latin fictions centered on dramas of the soul, as in Prudentius's 5th-century *Psychomachia* (*The Spiritual Battle*), an allegorical epic describing the war between the vices and virtues. Other allegories present different conflicts within the soul, such as those between Philosophy (linked with Virtue) and poetry (linked with Fortune) in Boethius's *Consolation of Philosophy*. Martianus Capella's *Marriage of Philology and Mercury* traces the soul's “journey” to wisdom, seen in Philology's (Learnings) ascent through the spheres to marry Mercury (Eloquence), with the personified liberal arts as handmaidens.

Both Martianus and Boethius promote a classical form known as *prosimetrum* (intermingled prose and meter) or *satura* (“mixed style”; literally a “stew”), blending philosophy and fiction as well as prose and poetry. This mixed style, which resulted partly from the diminished value given to poetry and fiction in the Platonic tradition, would be imitated in a number of 12th-century medieval Latin works, including Bernardus Silvestris's *Cosmographia*

and Alan of Lilies *De planctu Naturae*.

The Neoplatonic devaluation of the fleshly and earthly also affected the manner in which sacred and secular Latin texts were read, so that the literal meaning was understood as equivalent to the carnal level and the more figurative meaning equivalent to the spiritual level. In addition the devaluation of poetic fiction also encouraged the development of polyvalence in poetic texts, with the “carnal” letter of the text veiling its spiritual significations. This concept of polyvalent meaning combines with the notion of the soul drama in one of the most common forms of fabulous narrative in the Middle Ages: the allegorical vision with two or more speakers engaged in conversation, often in a way that can be interpreted as signifying an interior struggle, mental or psychological.

These narratives take several shapes, from the Platonic dialogue between an instructor and pupil (as transmitted by Cicero and Lucian); the debate or *disputatio* (derived from the pastoral eclogue and bolstered by the *Ecloga Theoduli* and later Peter Abelard’s scholastic *Sic et non*); and the multivoiced “parliament” or “assembly.” These discursive forms dominated learned Latin works of the 12th and 13th centuries and allowed for a wide variety of subject matter—for example, Bernardus’s *Cosmographia* (a cosmological epic journey describing the creation of the first human soul and body); Alan of Lilles *De planctu Naturae* (a complaint on human sexual and spiritual degeneration) and *Anticlaudianus* (an epic describing a celestial journey and a battle of virtues and vices); and Jean de Hanville’s *Architrenius* (a satiric complaint on the lust and vanity of the world that offers the journeying “Arch-Weeper” the prospect of marriage to Moderation).

This same philosophical concept and discursive method affected later ME narratives that depicted the authorial persona as ignorant, despairing, or grieving, like “Boethius” or “Alanus”—“Chaucer,” “John Gower,” “Will Langland.” Both the Latin and vernacular personas required magisterial instruction or divine consolation in the dialogic vision, whether from Latin authorities like Philosophy or Virgil or from Chaucer’s learned Eagle, the priest Genius, or various psychological faculties (Reason, Imaginatyf, Anima). Although many ME poems continued the genre of the dialogic allegorical vision—*Pearl*, Chaucer’s dream visions, the *Confessio Amantis*, *Piers Plowman*, *The Parliament of the Three Ages*, *The Kingis Quair*, *The Assembly of Gods*—others retained the scholastic flavor of the debate, as in *The Owl and the Nightingale*, *The Debate between the Body and Soul*, and *Winner and Waster*.

The Stoic tradition also influenced medieval Latin literary practice, thereby affecting vernacular literature as well. Greek Stoic philosophers had defended Homer by offering allegorical moralizations of the gods in his works; this classical practice was encouraged by medieval Latin scholars like Alan of Lille

and the French satiric poet Jean de Meun in his continuation of the *Roman de la Rose*. Informing both imagery and characterization, allegorized conceptions of the classical gods strongly shaped the mythological fictions of ME poets, especially Chaucer, Gower, Lydgate, Henryson, and Dunbar.

On a more particular level various medieval Latin works and forms provided source material for individual vernacular works. The Goliards, with their bawdy and satiric songs, contributed to a larger tradition of Latin satire and complaint that continued in the vernacular; the themes and imagery of Latin hymns are often reflected in vernacular religious lyrics; the Latin liturgy plays an important role in the development of medieval drama. The medieval Troy story was derived from early Latin accounts by “Dares Phrygius” and “Dictys Cretensis,” elaborated by Joseph of Exeter’s epic *Frigii Daretis Ilias*. These accounts, and their later French and Italian reflexes, linked Troy and Britain through Brutus, the eponymous founder of Britain and descendant of Aeneas; they thus appealed to writers of both Arthurian and Trojan narratives (e.g., *Sir Gawain and the Green Knight*, *Troilus and Criseyde*). Collections of saints’ legends like the *Legenda aurea* inspired Chaucer’s ironic *Legend of Good Women*, whose heroines were drawn from classical or mythological rather than hagiographical sources.

Other long Latin works that influenced ME literature to some extent include manuals of rhetoric like Geoffrey of Vinsauf’s *Poetria nova*; encyclopedias of science like the *Secreta secretorum*; political, philosophical, and pedagogical works like John of Salisbury’s *Policraticus* or *Metalogicon*; travel books like Gerald of Wales’s *journey to Wales*; and Andreas Capellanus’s codification of courtly love, *De arte honeste amandi*, a reworking of Ovid’s *Ars amatoria*.

Literary Influences: Scandinavian

When toward the end of the 1st century the English people first appear in the pages of history as Tacitus's *Anglii* (*Germania* 40), they are a small nation living at the base of the Jutland peninsula near the present-day city of Schleswig in northern Germany. Tacitus does not name the Danes, and it is not clear how they are to be distinguished at that time from the Anglii. If they were a separate people on the islands to the north and east of the Angles, the two cultures were closely related. Bede, our chief authority on the Germanic invasions of Britain (*Ecclesiastical History* 1.15–16), does not mention any Scandinavian peoples as participants in this conquest. It is likely, however, that some of them were in fact present. On the Continent cultural relations between the ancestors of the English and the Danish had been continuous from the time of Tacitus, and representatives of the two peoples probably served together as auxiliaries in the Roman armies in Britain during the 2nd and 3rd centuries.

The Scandinavian element in medieval English literature is nowhere more pervasive than in the epic poem *Beowulf* whose characters and events are located entirely in Denmark and Sweden. At many points the legendary-historical details of the poem accord with traditions that have been preserved

in other, albeit later, Scandinavian works, inviting our inquiry into the source of Scandinavian material in a work of English literature—material, especially, that is in some cases so allusive as to suggest the English audiences deep familiarity with it.

In the search for sources of literary influence on Anglo-Saxon England from Norway and Denmark the most likely candidates are not only the Vikings, who began raiding in England and settling there in large numbers from the 9th century onward. Literary and historical material from Scandinavia must have come to England with the first Germanic conquerors in the 5th century. Additional elements continued to derive from Scandinavians living in England, from the Viking settlements through the later Danish rule of England by Cnut (1016–35), Harold Harefoot (1035–40), and Harthacnut (1035–42), until the time that such identifiably Scandinavian families in England as those of Thurkill of Arden and Colswein of Lincoln fell from power in the 12th century (Stenton: 618). Both before and after their migration to Britain in the 5th century the English shared with the other Germanic nations not only their languages but also a common body of myth, legend, and oral poetic forms.

Memories of these legendary stories of the Germanic peoples were preserved not only in *Beowulf* but also in the poems *Deor* (mentioning Goths and Baltic tribes), *Widsith* (a catalogue of heroic peoples), *Waldere* (a Burgundian story), *The Fight at Finnsburg* (Frisians along the North Sea coast), *The Rune Poem* (gods and mythic heroes), and here and there in the short poems of the Exeter Book. These works are the oldest written form in which this orally disseminated Germanic material can be found, and it is remarkable that none of the heroic allusions in Anglo-Saxon poetry are to the English themselves.

The process by which oral-formulaic poetry was converted into written texts in England is not well understood, nor even the date at which the surviving texts may originally have been composed in writing. We know that in Scandinavia (mainly in Iceland) these texts did not begin taking written form until the late 12th and early 13th centuries. The English manuscript texts, on the other hand, are considerably older, dating from the 10th or early 11th centuries, antedating the Icelandic manuscripts by at least two centuries. We are unable to speak in the ordinary way, therefore, of the influence of Scandinavian literature on English. Except for some runic inscriptions we have no evidence that a Scandinavian language was ever written in medieval England—or, before the 12th century, in Scandinavia itself. In whatever way the English poets may have worked, they were not influenced by written literary versions of Scandinavian story. The similarities between Anglo-Saxon heroic poems and the earliest written narratives of Denmark and Norway, in such matters as place-names, family histories, historical events, and other

legendary, mythic, and poetic material, are best understood not as the influence of one work on another but rather as parallels and analogues, evidence of the survival of cognate traditions from a common Germanic ancestor.

Friedrich Klaeber's edition of *Beowulf* (3d ed., 1950) lists the principal Scandinavian parallels and analogues of the poem. They are also the works that might be cited to illustrate more general similarities between medieval English and Scandinavian literature in tone and ethical values. The most notable of them are the following:

Saxo Grammaticus, *Gesta Danorum* (*History of the Danes*), written ca. 1190–1210. This Latin work parallels much of the history of the Danes, Geats, Heathobards, Goths, and Swedes in *Beowulf*. It is especially interesting for its story of the Anglian king Offa, the only “Englishman” in *Beowulf*.

Several works by Snorri Sturluson (1178–1241), Iceland's greatest writer. The collection of histories of the kings of Norway called *Heimskringla* begins with *Ynglinga saga*, a mythical account of the origins of the Swedish royal family with the richest concentration of parallels to *Beowulf* (e.g., Scyld, Froda, Ohthere, Eadgils, Ongentheow). Snorri's *Saga of St. Olaf* in the same collection quotes two stanzas of *Bjarkamâl* a poem also known to Saxo but otherwise lost, on Bjarki, the figure answering to Beowulf in the Danish legends. In Snorri's *Edda* there are a number of *Beowulf* parallels, in both the *Gylfaginning* section (e.g., Heremod) and the *Skáldskaparmâl* (Scyld, Hrothulf, Healfdene, Froda).

Skjoldunga saga, a late-12th-century legendary history of the Danish royal family, similar in kind to Snorri's *Ynglinga saga* on the mythical Swedish kings but surviving only in an abstract made by the Icelandic scholar Arngrimur Jonsson in 1596. It contains an earlier version of the material in Saxo and in the next item.

The *Poetic Edda*, a 13th-century Icelandic collection of short mythic and legendary lays, about half of which are devoted to the Volsungs (Sigemund and Fitela in *Beowulf*). One poem, *Hyndluljóð*, refers to more than half a dozen of the heroes mentioned in *Beowulf*, and Hrothgar's brother Haiga is probably the hero Helgi in *Helgakviða Hundingsbana I* and *II*. *Volsunga saga*, a legendary saga written in Iceland ca. 1270, closely parallels several of the poems in the *Poetic Edda* on the Volsungs.

Hrólfs saga kraka, a legendary saga written in Iceland ca. 1400, telling the story of the Scyldings (Skjoldungar) after Hrothulf (Hrólfr) has succeeded Hrothgar (Hróarr) at Heorot (Leire). The Beowulf figure, Boðvarr Bjarki, appears in Hrólf's court, a generation later than he had appeared in *Beowulf*. Based on this saga and on *Skjoldunga saga* is *Bjarkarímur*, an Icelandic narrative poem from the 15th century.

Pibreks saga af Bern, a 14th-century compendium of legendary history probably compiled in Norway. Among many parallels are to be found the stories of Hama and Eormannic.

Grettis saga, an early-14th-century Icelandic family saga in which the story motifs rather than the history are analogs of *Beowulf* Grettir wrestles with a Grendel-like monster in an abandoned hall and also has an underwater encounter similar to Beowulf's.

The older view that *Beowulf* must have been composed as early as the 7th or 8th century because an English poet could not have been attracted to these ancient Scandinavian subjects during the period of the Viking raids (9th to 11th centuries) oversimplified the nature of relationships between English and Scandinavians, especially the nobility. For example, the Parker Manuscript of the Anglo-Saxon Chronicle for the year 991, after noting the presence of Olaf Tryggvason (the future king of Norway) at the Battle of Maldon and the death there of Ealdorman Byrhtnoth, states that "afterward peace was made with them [the Vikings] and the king [Æthelred II] stood sponsor to him [Olaf] afterward at his confirmation." By the time of the Domesday survey (1086) every region of England (even in the south and west) had families with Scandinavian names. The political and ethnic distinction between Scandinavians and Englishmen tended to disappear entirely in the presence of the French-speaking Normans. There is no reason for doubting that Scandinavian families in England were loyal subjects of the English kings in the 10th and 11th centuries, as English families were of Scandinavian kings.

The political assimilation of English and Scandinavians in this period was matched by an Anglo-Norse cultural style. Some evidence suggests that poets writing in English during this late Anglo-Saxon period were familiar with the language and conventions of Norse skaldic poetry. A type of Anglo-Saxon narrative, represented by *The Battle of Maldon* and by passages in both prose and verse in the Anglo-Saxon Chronicle, differed in subject matter from the old "pan-Germanic" material of *Beowulf* *Deor*, and *Widsith* by concerning itself with more recent and exclusively English events, many of which occurred in an Anglo-Scandinavian context. On this basis it may be thought of as "saga" narrative in contrast to the "epic" material of *Beowulf*. At one time a good deal of saga narrative apparently existed in English prose texts that were eventually lost. The early-12th-century *Gesta Herewardi saxonis*, for example, claims to be in part a translation of a now lost English work by Leofric, a follower of Hereward, the English hero who opposed the Normans in and around Ely. It has much in common with later Scandinavian outlaw stories. Traditional oral poetry also seems to have passed without written intermediary directly into 11th- and 12th-century Anglo-Latin historical prose. William of Malmesbury, Henry of Huntingdon, and other writers cite as their

authority the songs (*cantilenae*) about Anglo-Saxon kings and heroes that were still current when they wrote.

Late Anglo-Saxon history was interesting and eventful, involving energetic and ambitious leaders, and it is not surprising that it appealed to authors writing in Latin after the Norman Conquest. Like the older epic material these stories also have their parallels and analogs in later Scandinavian literature. The Icelandic *Kormks saga* (ca. 1250) mentions the founding of Scarborough and Flamborough in general agreement with an English tradition recorded by Robert Manning of Brunne, who gives the names of the founders as Scarthe (Skarði) and Flayn (Fleinn) in a story he claims to have derived from now lost English works by Thomas Kendal and “Master Edmond” (*Chronicle* 2.514). The Icelandic *Egils saga* (ca. 1240) includes a detailed and plausible account of Æthelstans victory over a combined force of Scots and Norwegian Vikings in a battle answering to *The Battle of Brunanburh* in the Anglo-Saxon Chronicle (937). Foster-father of King Harald Fairhairs son Håkon, Æthelstan was a figure of interest to writers of Norwegian history.

Events involving Scandinavians in England that were only briefly mentioned in the Chronicle sometimes received much more extended treatment in Anglo-Latin literature. The leaders of the Danish invasion of Northumbria in 866 are in Anglo-Latin sources called Inwaere (fvarr) and Hubba (Ubba) and are also credited with the martyrdom in 870 of King Edmund of East Anglia, an event familiar to English readers in Ælfrics translation of Abbo of Fleury's *Passio sancti Eadmundi*. Some parts of the story were probably borrowed from Danish oral traditions. And all of the traditions associated with Inwære and Hubba, together with their father, Ragnarr Loðbrok, are an amalgam of history and fantasy. The fullest written account of the killing of King Edmund is in Roger of Wendover's *Flores historiarum* (1235), where the two Vikings kill the king in the mistaken belief that he was responsible for the death of their father, the mysterious Danish Viking Lothbroc, a guest in Edmund's court. In a later, rich Scandinavian tradition Lothbroc was identified with the Reginheri (Ragnarr) who is said by contemporary Frankish histories to have sacked Paris in 845. Neither Reginheri nor the figure who combines Reginheri with Lothbroc, Ragnarr Loðbrók, found for the first time in the *fslendingabók* of Ari þorgilsson (ca. 1130), appears anywhere in surviving English tradition, although in Saxo Grammaticus and the Icelandic *Ragnars saga lofibrókar* (ca. 1300) Ragnarr Loðbrók is said to have been killed in a pit full of snakes in Northumbria by King Ælla, in retribution for which his sons mounted the attack mentioned by the Anglo-Saxon Chronicle in 866.

An historical personage of some importance, Siward Digri (“the Strong”), earl of Northumbria and Huntingdon, who defeated the Scottish king Macbeth

in 1054, appears in both the Anglo-Saxon Chronicle and in legendary sagas whose events parallel the Ragnar Loðbrók tradition (he receives from the god Óðinn a banner depicting a raven, through which the outcome of battle can be foretold), *Hrólfi saga kraka* (his father is the son of a bear), and *Volsunga saga* (he kills a dragon or drives it away from the Orkneys). The main textual witnesses of Siward's saga are two redactions of a Latin history of the earls of Huntingdon written in Croyland. Like the stories of Loðbrok and his sons, the Siward story reflects an Anglo-Scandinavian literary culture capable of producing legendary sagas generically similar to the *fornaldasögur* (sagas of antiquity) of 14th-century Iceland.

A soberer work of history, deriving from the political and military events of Anglo-Scandinavian England, is the *Encomium Emmae reginae*, written in the 1040s. Resembling a 13th-century Icelandic kings' saga, it is an account of the career of Cnut (Knútr), the great Danish king of England, which was written in praise of his wife, Emma, the daughter of Richard duke of Normandy. Emma became queen of England in 1002, first as the wife of Æthelred II (978–1016) and then of Cnut (1016–35). Two of her sons also became kings of England, Harthacnut (1035–42) and Edward the Confessor (1042–66).

After the Norman Conquest Anglo-Scandinavian traditions were preserved in French verse narratives as well as in Latin prose. The earliest of these was Geffrei Gaimar's *Estoire des Engleis* from shortly before 1140. The original work does not survive intact, the first part having been replaced by Wace's *Roman de Brut*. What remains is essentially a paraphrase of a lost version of the Anglo-Saxon Chronicle with interpolated legends and folklore, much of it from the areas of Danish and Norwegian settlement in the north of England. Gaimar's *Estoire* begins with a version of the story of Havelok, a legendary king of Lindsey, who in an independent version is the hero of the ME metrical romance *Havelok the Dane* (ca. 1280). Two other versions of this story, one an Anglo-Norman *lai* and the other an episode in the *Chronicle* of Robert Manning of Brunne, also seem to have been independently derived from a common tradition, which attracted allusions to historical people and places. Havelok's name, for example, has been thought to derive from Irish *Abloc*, a form of Norse *Óláfr*, and to refer to the famous Viking Olaf Cuarán (Sigtryggsson), king of Dublin. Much of the story takes place in Denmark and in Grimsby and Lincoln and is told in a language rich with Scandinavian loanwords.

Well into the ME period the effect on English literature of Scandinavian language, culture, law, and royal reign in England continued to be a matter of parallels and analogues, sometimes remarkably close ones, rather than of outright borrowing. Still largely a matter of oral tradition, such written records as we have of folk customs and beliefs, ballads, outlaw stories, fragmentary

epic survivals, and historical narratives based on 11th-century Anglo-Danish historical figures in the Anglo-Saxon Chronicle give ample evidence of a strong continuing Scandinavian presence in English life and literary imagination.

Literary Influences: Welsh

Despite geographical contiguity and a formidable literary tradition Welsh influence on medieval English literature is slight and tenuous. In this respect Ireland, the other major Celtic-speaking culture of the British Isles, provides a telling contrast. Whereas the Irish played a major role in the conversion of the Anglo-Saxons and consequently were well positioned to influence them, the Welsh church refused to work with those whom they regarded as the pagan usurpers of Britain. Nor did relations much improve after the Conversion, judging by the unfavorable references to the Welsh and Britons in the earliest Anglo-Latin hagiography (early 8th century), in Aldhelm, and in Bede. Welsh intransigence about the dating of Easter and related ecclesiastical matters undoubtedly explains much of this hostility. So does intermittent warfare between Wales and Mercia, which continued into the early 10th century. Nor did Wales during this period produce the vigorous learning that made Ireland well known abroad.

Old English

Given this background of cultural isolation and political hostility, it is not surprising that evidence of Welsh culture in Anglo-Saxon England does not emerge for two centuries. In the last quarter of the 9th century a political alliance between Wessex and southern Wales brought Asser, a Welsh monk from St. David's, and Welsh intellectual influence to King Alfred's court. But although Asser played a formative role in Alfred's plan of educational reform and wrote the king's biography in Latin, nothing Welsh has yet been detected in the OE translations associated with these reforms. In the 10th century there is some evidence (e.g., from St. Dunstan's *Classbook*) that the monastery at Glastonbury served as a conduit of Welsh (Latin) influence in Wessex.

In the absence of concrete textual evidence claims made for Welsh influence depend heavily on the theory of an oral substratum of British culture surviving in Anglo-Saxon England and influencing its literature. For example, noting the

British origins of Cædmon's name, some scholars have sought to explain his Hymn and poetic gifts by reference to this substratum. Others, arguing for striking similarities in atmosphere, tone, and motifs between the OE elegies and the Welsh poetic cycles of Llywarch Hen and Heledd (9th or 10th century), have proposed that the OE poems are ultimately of "Celtic inspiration." But to raise such claims above the level of mere analogue and literary parallel would require more information about the origins, development, and date of both Welsh and OE poetry than is currently available and probably ever achievable. Symptomatic of the problem of tracing Welsh influence is the studied vagueness of the term often used to describe it: "Celtic" may mean (depending on the needs of the argument) British, Welsh, Irish, or a putative ancestor of all three.

Middle English

During this period evidence for Welsh influence is equally hard to come by. Ironically Wales and the Matter of Wales (preeminently the legend of Arthur) were profoundly influential, but only through the agency of foreign literatures. The process began with Geoffrey of Monmouth's *Historia regum Britanniae* (*History of the Kings of Britain*), which aroused in England "romantic curiosity" about Wales as a repository of Arthurian lore. However, when England subsequently developed its own Arthurian literature, the sources and models were French not Welsh. Walter Map's *De nugis curialium* (*Courtiers Trifles*) and Gerald of Wales's Latin writings also helped to bring Wales to the attention of English audiences; at least one of Gerald's works was translated into ME. Another possible witness to Welsh influences is the Harley Lyrics (in BL Harley 2253), a collection of ME poems copied in Herefordshire, near the Welsh border, ca. 1330. The collection certainly contains a few Welsh words and possibly a poem modeled on a Welsh folksong; that it may also reflect the influence of Welsh and Irish metrics has recently been argued.

Liturgical Combs

It is unclear when combs were first used for liturgical purposes, but the earliest documentary evidence is provided toward the end of the 13th century. Bishops and priests were instructed to comb their hair before (and sometimes during) the celebration of mass, this practical action also symbolizing the ordering and tidying of the mind. But perhaps the most important occasion was that prescribed by the pontifical of the Roman curia during the consecration of a bishop, following his anointment.

The earliest surviving "liturgical" comb of English origin was found in the tomb of St. Cuthbert at Durham in 1827. Peter Lasko convincingly argues that it is a genuine relic of the saint (ca. A.D. 650–87)

Three highly decorated, double-sided ivory combs of the type traditionally associated with liturgical use can be dated by stylistic comparison with other media, particularly manuscripts. The pierced, foliate decoration of the British Museum comb (MLA 56.2–23, 29) is paralleled in the initials of late-11th-century Canterbury manuscripts (Zarnecki et al., 1984: cat. no. 184). The other combs in London (Victoria and Albert Museum A.27–1977; [fig. 86](#)) and Verdun (Musée de la Prinerie) are unusual in their elaborate and crowded narrative decoration, depicting scenes from the Infancy (London comb only) and Passion of Christ. The similarity between the stiff figure style and crowded composition of these combs and the illuminations of the St. Albans Psalter suggests that they were produced in that workshop, about 1120–30 (Lasko, 1972: 235; Zarnecki et al., 1984: cat. nos. 197, 198).

Fig. 86. Ivory liturgical comb (London, Victoria and Albert Museum A.27-1977), ca. 1120- 30. Reproduced by permission of the Board of Trustees of the Victoria and Albert Museum, London.

Inventories and texts indicate a large number of combs (some no doubt imported) that have been lost, particularly in the 13th and 14th centuries.

Liturgical Vessels

Pre-Conquest

Relatively little is known about eucharistic vessels in pre-Conquest England. Only two chalices survive, while the abundant literary references tend to be either laconic or perhaps formulaic. A few speak of vessels of precious metals and of jeweled or engraved chalices and patens, and during the 8th and 9th centuries the popes received rich gifts of vessels of Anglo-Saxon workmanship of distinctive style that were recorded in the *Liber pontificalis*. A large Anglo-Saxon chalice and its paten, presented by a royal benefactor, were preserved at Monte Cassino in early-medieval times. In addition to vessels made at home imports of altar vessels are attested: a chalice of onyx mounted on a stem in the form of a golden lion was found in the tomb of St. Cuthbert, and a Greek paten was presented to Chester-le-Street by King Æthelstan.

The appearance of the sumptuous altar vessels can only be guessed at. Recently it has been suggested that the well-known poem of Aldhelm referring to a jeweled vessel in a West Country monastery might refer to a vessel similar to the two great Irish eucharistic chalices of Ardagh and Derrynaflan. These Irish examples carry applique glass and filigree decoration, unlike contemporary European vessels, such as the lost chalice of Chelles, thought to have been from the atelier of St. Eligius (Wilson, 1992: 8–9).

The typological evidence of the two chalices from this period that do survive, one from a hoard of metalwork found at Trewhiddle (near St. Austell in Cornwall) and the other

Fig. 87. Ramsey Abbey censer (London, Victoria and Albert Museum M.268—1923). Reproduced by permission of the Board of Trustees of the Victoria and Albert Museum, London.

from a grave at Hexham Abbey in Yorkshire, suggests that some Anglo-Saxon chalices may have been in a distinctively insular rather than a continental tradition. The Trewhiddle Chalice is a composite piece made of three principal components: a domed foot with rim flange, a stem and knop in one piece of double-hourglass shape, and a broad cup gilt internally; all three components are riveted together. Incised decoration occurs on the outer surface, and there may at one time have been an applied rim, rivet holes for which occur just below the lip. It is 4.96 inches high and 4.57 inches in diameter at the rim. It

was found in 1774 in a hoard of Anglo-Saxon ornaments and coins together with a Celtic brooch and a scourge of knitted wire. The coins provide a date of deposition of about 868. A closely similar chalice was recently found at Lough Kinale in Ireland (Ryan, 1990: 292) together with a matching paten. The Hexham Chalice is made of bronze-gilt. It stands 2.56 inches high and is 2.44 inches in diameter. There is no independent dating evidence for the piece, but Elbern suggested that it might be 11th-century. The Hexham Chalice has the same tripartite structure as the Trewhiddle Chalice, with the addition of a beaded collar at the bowl-stem junction. A diminutive example, it was clearly intended for use in traveling or for deposition in a grave. The two surviving Anglo-Saxon chalices, in their use of a composite structure, having a large domed foot with rim flange, and in their rather squat proportions, seem to derive from a tradition in common with the Irish communion cups of the period.

Two other chalices have been regarded as having Anglo-Saxon connections—the Tassilo Chalice preserved at Kremsmünster in Austria and the so-called Lebuinus Chalice from Deventer now in Utrecht. The former is considered to have strong Anglo-Saxon influence in its animal and vinescroll decoration as well as its figurative iconography. The latter is traditionally associated with the Anglo-Saxon saint Leofwin but the chalice, made of carved ivory, is clearly a product of the Palace School at Aachen of about 800. Neither chalice shows any Anglo-Saxon or insular typological traits.

Of the other vessels necessary for the altar little is known. Situlae, or buckets for holy water, are mentioned in texts, but how these might be distinguished from secular examples is unknown. No paten survives, and while some of the imported silver plates from Sutton Hoo Mound I seem to have clear Christian overtones, as do the two spoons from the grave, the context would appear to rule out their liturgical function. Here we may have examples of religious motifs applied to secular objects for devotional or protective purposes. Whether they were understood as such by those who used them in 7th-century England is moot. The silver and bronze Ormside Bowl (fig. 97: see METALWORK, ANGLO-SAXON) may well have had a liturgical function (for the ablutions before the eucharist), but this is speculation. Despite frequent references to them, no ewer has been preserved. It has recently been suggested by Wamers that the distinctive Anglo-Saxon vessels, such as the Fejo Cup, may have been pyxes, but this too is speculative. There can be little doubt that Anglo-Saxon churchmen and pious laity endowed their churches with rich and imposing altar vessels and that these were highly regarded abroad—but the surviving material does not reflect the wealth that once existed.

Post-Conquest

Despite the destruction of most of the plate of the medieval English church at the Dissolution of the monasteries in 1537, enough pieces—grave chalices, chance finds of concealed objects, and a few that survived the attentions of Henry VIII's commissioners—have come down to us to enable the main lines of development to be sketched. Documentary evidence, such as inventories, and, from the earlier 14th century onward, statutes and records of the Company of Goldsmiths of London, fill in the details of the picture. Significant workshops existed in the Benedictine abbeys of Ely—where goldsmithing was hereditary in a single family from the mid-12th century to the early-14th—and St. Albans, and in London, where commissions from the provinces were executed. Hallmarking of silver was introduced in the early-14th century, but less than a third of surviving medieval altar plate is marked, and a much higher proportion of this marked plate was manufactured in the late-15th and early-16th centuries than earlier. The use of base metals for liturgical vessels was actively campaigned against by prelates up to the end of the 13th century, but it is likely that only impoverished churches lacked a silver chalice. In wealthy churches especially fine plate was reserved for important feast days; plainer vessels were designed for everyday use.

The typological development of English chalices in the period between the Norman Conquest and the Reformation seems clear. The earliest example to survive is that from the grave of Hubert Walter (archbishop of Canterbury 1193–1205). This small chalice has a shallow bowl, and a broad funnel-shaped stem ending in a round foot. The stem has decorative lobes with engraved scrollwork and foliage. The knop is gadrooned (i.e., fluted or notched). Simple chalices with similar hemispherical or sub-hemispherical bowls, funnel-shaped stem, and round foot, with round, polygonal, writhen, or lobed knops, seem to have been in vogue up to the late 13th century—a small example in Lincoln Cathedral was found in the tomb of Bishop Richard de Gravesend (1258–79) but there is some question that the chalice may have been old at the time of deposition. The silver-gilt Dolgelly Chalice, found with its paten on a hillside, is the most sumptuous of the type to survive—its elaborate lobed knop and stem and fine ornament testify to the skill of the craftsman, Nicholas of Hereford, whose name is recorded in an inscription on it. Similar chalices have been found at Borsa and Dragsmark, both in modern Sweden but in medieval times in a part of Norway where English influence was strong.

By the early-14th century a deeper, flared cup replaced the earlier shallow vessels and the practice of engraving on, or adding an applique crucifix, to the foot appears about this time—an early example was found in the grave of

William de Melton, archbishop of York (d. 1340). In the mid-14th century the round foot gives way to a form, hexagonal with incurved sides, that seems to be a response to the liturgical practice of laying the chalice on its side on the paten after mass. The earliest example may be that found with a paten during the early-19th century at Hamstall Ridware, Staffordshire. It has a shallow bowl, twisted knop, and faceted stem that continues the form of the foot.

Later pre-Reformation chalices are essentially variations on this theme, with slight modifications to the form of the bowl and, in some surviving examples, the freer use of figurative ornament and of decoration generally. In the late-15th century, for example, cast ornament was added to the points of the foot, and in the 16th century the sexfoil foot appears. The practice of forming the stem to continue the sides of the foot is in part replaced by the fashion for a domed foot. The later pre-Reformation chalices show a tendency toward more straight-sided cups.

Patens in this period fall into two types—those with a single central round depression or those with a double depression of which the inner one is multifoil. Both types seem to have been current from the beginning of the period. Patens, unlike chalices, carried figurative and other iconographical motifs from the outset. The paten from Hubert Walter's tomb has a single round depression with an Agnus Dei in the center and around it an invocation "Agnus dei qui tollit peccata mundi miserere nobis"; a rim inscription refers to a popular contemporary commentary on the symbolism of the altar, paten, chalice, and communion veil. The paten found with the Dolgelly Chalice has a sexfoil depression with an engraved Christ in Majesty in the center and evangelist symbols in the spandrels. The Manus Dei (Hand of God) and Agnus Dei were popular motifs for engraving on patens. Also popular were quotations from the Psalms, usually the opening lines, perhaps, as Oman believed, derived from breviary responses. *Fistulae* or *calami*, tubes of metal used for the partaking of communion wine, are attested in a number of records from the 11th and 13th centuries, but none survives. A small number of cruets for eucharistic wine and water have survived—a 14th-century example from White Castle, Gwent, is in the National Museum of Wales in Cardiff, and another from Ashby de la Zouche Castle is in the Victoria and Albert Museum, London. Both are of pewter. Undoubtedly the finest surviving ecclesiastical plate from medieval England are the censer and incense boat (figs. 87–88) found about 1850 by fisherman in Whittlesley Mere, Cambridgeshire, not far from Ramsey Abbey. The silver-gilt censers lower half takes the form of a hemispherical bowl on a round-footed pedestal; the upper half is in the shape of a six-sided tower with traceried windows. The incense boat is parcel-gilt silver and follows the usual form for vessels of this type. Ram s-head finials are taken to be an allusion to Ramsey Abbey. The pieces are probably mid-14th-

century in date.

Liturgy

An attempt to provide an adequate account of this subject would have to take as its purview the range of liturgical worship at, eventually, seventeen cathedrals, hundreds of religious houses, and upward of 10,000 parish churches, over a period of centuries—in a few cases (e.g., Canterbury Cathedral) more than 900 years. Instead this article aims to supply basic facts about the principal types of services and the books used for them and will be limited largely to the period from ca. 1100 on.

The services of Christian worship conducted in medieval England fall into three main categories. The mass (eucharist) was the central sacramental service, celebrated with great frequency—in many places daily, and in some great establishments several times a day. By the 12th century the principal book needed for the celebration of the mass was the *missal*, which contained not only the words said or sung by the celebrant but also (usually) the texts of the two scriptural lessons and of the four chants: elements that, along with the celebrant’s three or four variable prayers (*orationes*, earlier contained in the celebrant’s distinctive book, the *sacramentary*) were specific to each liturgical day or occasion. This made for quite a large book in itself, but where the mass was celebrated with music and special solemnity there could also be used separate codices containing the Epistles and Gospels (*epistolarium* and *evangeliarum* or *evangelistarum*) and the music as well as text of the chants (*graduale* or *antiphonale missarum*). The basic structure of the mass and the majority of the texts—especially the central prayer of consecration, the *Canon*—were uniform throughout not only England but also most of western Christendom in the high and late Middle Ages. This mass form, fundamentally Roman, was subject to local variations: often of ceremony, sometimes of texts, and to a considerable degree of the saints whose days were celebrated liturgically. Where such variations come to form an extensive and discrete whole, they are often called *uses*, or sometimes *rites*. In England the principal uses were those of Sarum (Salisbury), York, and Hereford, and manuscript and early printed missals of all three survive.

The regular nonsacramental service goes by various names, of which *divine office* and *daily office* are the commonest, and it consisted of prayers said or sung at specified times of day and night. These *hours* of prayer were officially eight in number: in the standard medieval terminology Matins (in the early Middle Ages called Nocturns or Vigils), Lauds (*laudes matutinae*, earlier called Matins), Prime, Terce, Sext, None, Vespers, and Compline. In theory all clerics of the order of subdeacon, deacon, or priest (including bishop) were obliged to say these services daily, and in monastic or multiclergy establishments they tended to be sung. When sung, these services would require a large chunk of the day and many books: psalter, capitulary, Bible, legendary, homiliary, and a collection of office chants and texts (*antiphonale* or *antiphonarium*) are the principal ones in question. For private or nonchoral recitation of the daily office the basic elements of each of these books could be abstracted and arranged into a compendium called the *breviary* or sometimes *portiforium*. This again tends to be a large book, especially a “choir breviary,” which will often contain some chant notation. To become genuinely portable the breviary needs to be split up, the commonest division being that of *pars hiemalis* (the winter half) and *pars aestivalis* (summer half) of the year. As with missals, breviaries and other books for the daily office are classified according to the use to which they belong, but with an important additional distinction: the daily office in monastic contexts had a somewhat different structure, especially for Matins, so that a monastic breviary has to be distinguished from a secular breviary (of whatever use) in a way not necessary for missals.

The third basic category of services is that performed only when occasion requires and therefore termed *occasional offices*. Most of these occasions are sacramental—baptism, penance, marriage, and unction—but other liturgical rites, like blessings of various sorts and the often elaborate services surrounding the burial of the dead, fall under this heading also. The priest’s book that contains these occasional services is called the *manual* or sometimes, confusingly, the *ritual*. By contrast the *pontifical* gathers up the services peculiar to a bishop: ordination, confirmation, consecrations of churches, even coronations of monarchs (just in case), and various blessings. As might be expected, it is often a splendid book. The blessings, especially those pronounced at mass by the bishop on solemn occasions, are sometimes detached into a separate volume called a *benedictional*; these become rare after the 11th century.

Instructions as to how the services are to be conducted and how the various items are to be selected and ordered are contained not only in the rubrics of service books themselves but also in separate volumes: *ordinal* and *customary* (*consuetudinary*) are the commonest of these, while the *processional* includes both instructions and texts for the numerous processions common in medieval

worship, especially the Sarum Rite. (The *book of hours*, or *ho rae*, is used in private devotion, not liturgical worship.)

The regular services—mass and the office—were performed day by day and week by week throughout a liturgical year that was always a complex combination of a temporal cycle (based ultimately on Easter, and thence Sunday by Sunday throughout the year, with different liturgical structures added by Advent and Christmastide) and a sanctoral cycle (based on fixed dates for a large number of saints' days and other set occasions like Dedication feasts or the Sarum Feast of Relics). The temporal cycle, reflected in the *proprium temporum* section in service books for mass and office, was largely set by, at the latest, the beginning of the 11th century. The two most important later elements are Trinity Sunday (the octave day of Pentecost, itself 50 days after Easter) and, from the late 13th century on, Corpus Christi, the following Thursday. But the sanctoral cycle, treated in the *proprium sanctorum* and *commune sanctorum* sections, was in a continual state of flux, with a variety of additions making the calendars of all the secular uses and of the principal religious orders densely crowded by the end of the Middle Ages.

Liturgy and Church Music, History of

Romano-British

The early history of Christianity in the British Isles is obscure. Its dissemination was probably due largely to the Roman conquest and colonization of lowland Britain that began in the mid-1st century. Romanization was, however, apparently not the only means whereby Christianity reached Britain. Writing ca. 200, Tertullian mentioned the reception of the faith in regions of Britain independent of Rome, by which he presumably meant the western mainland from Cornwall to north Wales (and perhaps parts of Ireland as well). Christianity would have reached these regions by way of the ancient trade routes of Celtic Europe. The Christianity of both Roman and Celtic Britain can hardly have avoided being heavily influenced by that of Gaul—the beginning of an important element in British church history that continued to operate throughout the Middle Ages—but there may also have been both direct and indirect influence from the Mediterranean and the East. The Roman withdrawal in the early 5th century apparently had relatively little immediate impact on the British church. However, the Anglo-Saxon invasions, which began in the mid-5th century, seem to have had a disastrous effect; wherever the pagan invaders settled, which eventually came to mean most of the area previously under Roman occupation, virtually all signs of organized Christianity disappeared.

Information about liturgical practices in Britain in these early centuries is meager. At first Romano-British and Celtic Christians probably worshiped in much the same way, observing the customs generally current in western Europe. These would have included a weekly communion service with prayers and scriptural readings preceding the eucharist itself, individual or communal prayer at the beginning and ending of the day (and perhaps at other times as well), and a considerable element of improvisation in the structure, content, and conduct of worship. In the 4th century, when Rome first tolerated and then adopted Christianity, worship in Britain is likely to have become more public and ceremonious and less improvisatory, as it certainly did on the Continent. Of the music sung in these services, which presumably included singing just as continental services did, nothing definite is known. The

western church did not begin to notate its plainchant until the 9th century, and it took a further two centuries for the notation to become melodically precise. It seems likely, however, that liturgical melodies may have been disseminated orally, as they indubitably were in later centuries. If this did happen, British congregations may have shared in the earliest traditions of western chant.

By the early 5th century the churches of western Europe had come to share a heritage of customs and material forming a core around which local traditions subsequently grew. Yet after the 5th century the practices of the Roman church increasingly diverged from those of other churches, mainly because—either through conservatism or due to deteriorating communications—Roman innovations were not generally adopted elsewhere. Only in the 8th and 9th centuries did Rome succeed in imposing its renovated customs on most of the western church, and even then some areas proved resistant and others were successful in retaining at least part of their own patrimony. Vestiges of the earlier common heritage survive in the family of liturgies commonly known as Gallican, which includes that of Merovingian Gaul itself, the Mozarabic Rite of Visigothic Spain, and the Milanese or Ambrosian Rite of northern Italy. Traditional Gallican liturgical practice differed from reformed Roman in many respects. In the mass, for example, there might be several prolix Collects rather than a single succinct one, the congregation was addressed more frequently, a prayer separated the Sanctus from the Words of Institution, and there was a complicated ritual for the Fraction. Except for the Milanese Rite little now remains of these Gallican liturgies apart from their texts, because their supplanting by the reformed Roman Rite came too early for their own music to have been fully notated. Such Gallican chants as have survived tend to be either far more ornate than their Roman counterparts, or much simpler.

Anglo-Saxon

Whether or not the famous meeting between the future Pope Gregory the Great (590–604) and Anglo-Saxon children in the slave markets of Rome ever took place—and there seems no good reason to reject the story—the decision to evangelize a heathen race was typical of a pope who considered it his duty to nourish and increase the flock that his predecessors had tended. Although Gregory planned the conversion of the Anglo-Saxons with care and good sense, he cannot have known much about the situation in Britain. In particular he seems not to have realized the extent to which the church had survived in Celtic Britain or have been aware that a few priests from Gaul were already

working among the Anglo-Saxons. In fact the first Roman mission, headed by St. Augustine of Canterbury, encountered Gaulish priests as soon as it arrived in Kent in 597, and it came into contact with Celtic Christianity shortly afterward. The complex problem of reconciling the differences between the Roman and non-Roman traditions took well over a century to solve.

The conversion of the Anglo-Saxon kingdoms was accomplished largely by the mid-7th century. It now became possible to confront the increasingly urgent question of relations between the Anglo-Saxon and Celtic churches. The issues were complicated, involving understandable political tensions and such religious issues as the differences between Roman and indigenous liturgical customs and methods of computing the date of Easter. A meeting between representatives of the two traditions held at Whitby, Yorkshire, in 664 opted to follow Roman customs, and these were henceforth observed throughout Anglo-Saxon England, although parts of Celtic Britain and Ireland took up to 100 years to accept them. The Synod of Whitby ushered in a century and a half of stability for the English church. Now firmly established, it was able to cultivate learning and the arts and develop its structure and institutions.

The end of this period of prosperity came in 835, when pagan Scandinavian raiders began regularly to attack England. No part of the country was safe from them, for they sailed up the rivers and raided inland on stolen horses. In 850–51 they began to winter in England, and their piracy turned to settlement. By 878 they had conquered all of the Anglo-Saxon kingdoms except for a small area of the southern kingdom of Wessex, where King Alfred (871–99) led a stubborn resistance. In 878 Alfred resoundingly defeated the invaders at Edington, Wiltshire; the treaty that followed partitioned the country between the two races, the newcomers keeping the north and Midlands and their leaders accepting baptism. The English military revival begun under Alfred continued for nearly a century under his successors. During the reign of Æthelred II (978–1016), however, the situation deteriorated again, to the extent that a Danish dynasty ruled England from 1016 until the Saxon line resumed with Edward the Confessor in 1042.

The half-century after 835 was catastrophic for the English church, not so much for the widespread looting and destruction of property so bitterly lamented by contemporaries as for the chronic disruption of ecclesiastical life. Monasticism suffered particularly severely and may be said to have come to a temporary end. Although the secular church seems generally to have maintained at least a semblance of continuity, in some parts of the country it, too, disappeared virtually without trace. Even in those religious communities that did survive the troubles of the times can hardly have failed to lower standards. Resuscitating the church was important to Alfred and his successors, who seem in this to have sought to emulate Carolingian monarchs,

such as Charlemagne and Louis the Pious. The leaders of the English church in the later 10th century—Dunstan, archbishop of Canterbury (d. 988), Oswald, archbishop of York (d. 992), and Æthelwold, bishop of Winchester (d. 984)—concentrated on reviving monasticism. They were helped by the existence of a powerful movement for monastic revival in contemporary France, led by the reformed Benedictine Abbey of Cluny in Burgundy, founded in 910. The Benedictine Abbey of Fleury or St. Benoit-sur-Loire near Orleans, itself reformed by Cluny ca. 930, was especially influential in England, supplying monks to repopulate English monasteries and training English novices for the same purpose. The most important document of the reform movement in England was the *Regularis concordia anglicae nationis monachorum sanctimonialiumque*. As its title—literally “The Harmonization of Rule of the Monks and Nuns of the English Nation”—implies, this was a set of precepts and regulations designed to ensure sound and uniform observance in religious houses. Issued by royal mandate ca. 970, it gives valuable information on contemporary liturgical practices and their background.

Anglo-Saxon churches seem to have been adequately and sometimes generously provided with service books and theological works. The earliest of these must have been manuscripts from Gaul or Italy brought in by missionaries. Some of the books that St. Augustine brought with him to England were apparently still kept behind the high altar of his abbey church in Canterbury until the Reformation; they had gained the status of relics. English churchmen traveling abroad also brought books home with them, although not all can have been as enthusiastic about this as Benedict Biscop (ca. 628–689), who equipped his monasteries at Wearmouth and Jarrow with magnificent libraries collected during no fewer than six visits to Rome. English scriptoria had begun to produce Bibles and service books by the later 7th century, and presumably the production of such articles tended to increase, except during the Danish raids. Throughout the Anglo-Saxon period, however, liturgical books continued to be imported. This involved a large element of chance and must have led to considerable liturgical variation according to the provenance of the imported books. The Lindisfarne Gospels were evidently copied from a Gospel book emanating from Naples; a Capuan mass book seems to have been circulating in northern England around 700; and the main part of the Leofric Missal is a 10th-century mass book from northeastern France.

Our knowledge of Anglo-Saxon liturgy is limited by several factors. Few sources remain from the early period, while the later ones can hardly be said to be numerous. Most of the surviving manuscripts contain only the material needed by the priest (the prayers and prefaces of mass, blessings, exorcisms, and so on), not the entire material needed for a service. The few manuscripts that include any of the choral items either give the texts alone, omitting

musical notation altogether, or use early types of notation that cannot now be read with certainty. In the absence of musical notation, which was devised only in the 9th century and remained ambiguous for another 200 years, plainchant melodies could be disseminated only by skilled musicians who could memorize them and teach them to other singers. There are several contemporary references to such singers: James the Deacon, a missionary in Northumbria in the 630s, is referred to as an expert singer; Putta, bishop of Rochester, is said to have taught chant after he retired in 676; in 678 Benedict Biscop brought John the arch-chanter from Rome to Northumbria to teach his monks Roman chant; much later a request from Æthelwold led the abbot of Corbie to send a party of monks to teach chant to their English brethren.

While Bede's statement that Gregorian (i.e., Roman) chant was introduced into and disseminated through England by Roman missionaries appears to be substantially correct and applicable also to liturgy in general, there must have been considerable diversity of practice and a sizable presence of non-Roman elements, caused by the survival of indigenous traditions and the adoption of newer Gallican customs. Anglo-Saxon liturgies seem to have had many Gallican characteristics, and some Gallican ceremonies (such as the anointing of the monarch during the coronation, the blessing of the paschal candle and the new fire, and the *Exultet*) survived in England until the Reformation. The overall shape of an early Anglo-Saxon mass would have been familiar to a modern traditionalist, although there were many divergences in detail. One of the main differences was that those liturgical items that were later reduced to a single psalm verse—the Introit, Gradual, Offertory, and Communion—still consisted of complete psalms, or as many verses of a psalm as were required to cover the necessary action, with an antiphon or responsory repeated after every verse. The Introit might be followed by a litany rather than a Kyrie; the latter, which was introduced by Pope Gregory as a substitute for the litany, took some time to catch on. Instead of a single concise Collect there might be two or three more rambling ones, as in the Gallican rites. Although the Epistle and Gospel were probably recited in Latin, there may sometimes have been a homily in the vernacular. Before the 9th century there would be no Sequence, for the form had yet to be invented, and no Credo, which became part of the Frankish mass only in 798 and was not taken up at Rome until 1014. The Preface leading into the Sanctus might change its text almost from day to day, again as in the Gallican rites. Even the Canon—the most sacrosanct and unchanging part of the mass—might contain variations in phrasing. The Agnus Dei did not become part of the mass until the early 8th century.

Our main sources for later Anglo-Saxon liturgy include the *Regularis concordia*, the Leofric Missal and a number of other roughly contemporary mass books, and several benedictionals containing collections of episcopal

blessings. The *Regularis concordia* describes the daily monastic routine in winter and summer and gives detailed liturgical instructions for certain important feast days. The daily schedule includes many features familiar from later liturgies: Nocturns (Matins) preceded by the *trina oratio* ("triple prayer"), Lauds followed by antiphons of the Holy Cross and the Virgin and saints honored in the church, Matins of All Saints and Lauds of the Dead in a side chapel, Prime at dawn, private reading until Terce, the morrow mass followed by Chapter, the conventual mass followed by Sext and None, the midday meal, Vespers, Collation, and Compline. Some ceremonies are set out in especial detail: the Purification, the imposition of ashes, the procession to the mother church on Palm Sunday, the Maundy and blessing of the new fire on Holy Thursday (the latter repeated on the two following days), the veneration of the Cross and the reproaches on Good Friday, and the placing of the Cross in the Easter sepulcher on Saturday. The Easter Day liturgy is climactic, the discovery of the Lord's resurrection being reenacted at the Easter sepulcher (now emptied of its cross) by the brethren in an early example of liturgical drama. Other interesting details include references to peals of bells, a ban on shaving during the first three weeks of Lent, instructions for the monk on duty in the cloister, and mention of the *tabula*—a wooden sounding board struck to summon the brethren, still used in Orthodox monasteries.

Given to Exeter Cathedral by Bishop Leofric (1050–72), the missal bearing his name consists of a 10th-century sacramentary from Lorraine (where Leofric was brought up), to which have been added a later Anglo-Saxon ecclesiastical calendar and a large amount of miscellaneous liturgical and historical material. Even though it gives incomplete information about the services of Leofric's day (its liturgical contents are limited to the items that the bishop himself would have recited when celebrating mass and carrying out other priestly and episcopal duties), the book displays many non-Roman characteristics. One of the most striking is the great number of proper prefaces; nearly every mass has its own preface, and there are about 300 altogether. Some of the prefaces and prayers show typical Gallican verbosity, where Rome prefers concision. The missal also contains numerous episcopal blessings to be given in mass after the Fraction (the breaking of the consecrated host): a feature of English, Gallican, and Mozarabic liturgies that entered post-Conquest English rites but was never taken up by Rome. There are several exorcisms, some of them lengthy, countering a hair-raising range of eventualities, including bodily diseases, witchcraft, necromancy, attacks by monsters, and diabolic possession. On a more mundane level several turns of phrase indicate that communion was given in both kinds (bread and wine).

A unique monument of late Anglo-Saxon liturgy is the musical source known as the Winchester Troper, dating from the late 10th century. A troper

contains tropes, which are expansions of existing plainchant items (such as the Introit and Gloria) through the addition of extra words, extra music, or both. Most tropes are monophonic, like the chants into which they fit. The practice of troping seems to have started somewhere around the lower Rhine about 800, as a means of adding to the liturgy without destroying existing liturgical structures. Troping quickly became popular in the Frankish Empire, where it flourished until about 1150, but it was never adopted by the Roman church; the existence of troping in England is yet another indication of the close ties between the English and Frankish churches. In addition to troped Introits, Kyries, and Glorias the Winchester Troper contains untroped items for the mass (Kyries, Glorias, Graduals, Alleluias, Tracts, and Sequences) and the divine office (invitatories, antiphons, and responsories). Sometimes described as a collection of two-part polyphonic music, it is more precisely a collection of melodies designed to create two-part polyphony when sung simultaneously with the plainchant melodies to which the texts were usually performed; presumably the chants themselves would have been sung from memory or read from another book. Luckily the plainchant melodies have survived in a slightly later manuscript, a troped gradual also from Winchester. However, the notation of both of these sources fails to indicate accurately the intervals of the melodies, so a completely accurate transcription cannot be guaranteed. While English musicologists are understandably proud of the Winchester Troper—the earliest known source of functional polyphony surviving from anywhere—it must be admitted that the music that it contains strongly resembles polyphony in slightly later northern French sources. It is at least possible that, like so many features of the late Anglo-Saxon church, the Winchester music was imported.

Post-Conquest

The Norman Conquest of England in 1066 brought the kingdom fully into the European mainstream, ensuring that it did not drift into isolation. In particular it forged close, multifarious, and enduring links between England and France. In peace and in war many Englishmen had business in France; whether their interests were diplomatic, military, ecclesiastical, or commercial, they could hardly remain impervious to the most sophisticated and influential culture of late-medieval Europe.

William and his successors thoroughly reorganized the English dioceses. Several cathedral churches were transferred to more populous or otherwise more convenient sites, two new dioceses were created, and the peculiar Anglo-

Saxon practice of making cathedral churches monastic was retained and extended. Although reliable figures are hard to establish, the parochial system seems to have expanded considerably in the two centuries after 1066. Relatively few new parish churches were founded, but chapels were built in large parishes for the convenience of people who lived a long way from the existing church, and some existing chapels were apparently elevated into parish churches. By 1300 there may have been about 9,500 parish churches in England. In addition to new construction a great deal of rebuilding was carried out, particularly during the second half of the 12th century, evidence of which can still be seen in many churches.

Monastic life expanded greatly in post-Conquest England, as it did throughout western Europe. The total number of English monasteries rose from some 60 in 1066 to around 700 in the early 13th century, reached a maximum of about 1,000 in the mid-14th century, and settled at approximately 900 after the Black Death. The monastic population increased from some 1,100 at the Conquest to a peak of about 18,000 immediately before the Black Death, falling back to around 12,000 in 1500. In 1066 the Benedictine Rule was observed in all English monasteries. Although Benedictine houses continued to be founded, much of the increased vitality of monastic life was due to the advent of new orders of monks observing reformed versions of the Benedictine Rule: the Cluniacs and (especially) the Cistercians. Also important were Augustinian, or Austin, canons, secular priests observing a communal regime loosely based on a rule written by Augustine of Hippo (d. 430). By the early 13th century the impetus of monastic expansion was almost spent, and the initiative passed to the new orders of mendicant friars, particularly the Dominicans and the Franciscans, who reached England in 1221 and 1224, respectively. Two other orders, the Carmelite and Austin friars, arrived a little later.

The foundation of parish churches and monasteries almost ceased after about 1350. The main growth areas of the church in the 14th and 15th centuries were chantries and colleges, which were founded mainly by royalty, the nobility, prelates, the greater gentry, and civic fraternities and guilds. A chantry was a foundation employing one or more priests to say masses in perpetuity for the souls of the patron and his nominees. Chantries varied greatly in size and wealth, from tiny chapels served by individual priests in parish churches to grand chapels served by groups of clerics in larger churches, and from extremely modest independent structures to imposing complexes of specially designed buildings. Colleges housing communities of nonmonastic religious had been a prominent feature of the Anglo-Saxon church, but they had declined during the post-Conquest period and some had even been converted into monasteries. Between the mid-14th century and the

Reformation they enjoyed a revival, their numbers doubling from about 75 in 1200 to about 150 in 1500. Late-medieval colleges had various functions. Many were chantries, but most of these had additional responsibilities, usually in education or other charitable work. The importance attached to maintaining high standards of professionalism in worship is evident in the careful provision made by many colleges for selecting musically skilled choirmen and training choristers; the remarkable musical achievement of late-medieval England was due in no small part to the contribution of these colleges.

During the later Middle Ages the leaders of society tended to make increasingly elaborate provision for religious worship within their own households. It had long been customary for a magnate to employ a domestic chaplain or two to conduct his services and assist with his administration. During the 14th and 15th centuries the numbers of chaplains employed in the greater households tended to increase, and they were often supplemented by singing men (often known as clerks of the chapel) and boy choristers, whose participation enhanced the ceremonial and musical impact of the liturgy. As so often, royalty set the example. Edward III set up sizable chapels within the royal palaces of Westminster and Windsor, and he may also have reorganized the royal household chapel, the body of religious attached to the royal household itself, which was certainly augmented by the Lancastrian kings. Although on one level these developments merely reflect the contemporary reliance on ostentation as a means of enhancing prestige, sometimes at least they may have been prompted by genuine personal piety. They may also have had a political purpose: an explicit rejection of the unadorned worship advocated by Wyclif and his followers.

The Norman prelates who took control of the English church after the Conquest seem generally to have replaced Anglo-Saxon liturgical customs and plainchant with the usages and chant of their own country. Although the scarcity of contemporary documents, particularly service books, obscures many details of this process, the broad pattern is clear: English monastic liturgies were revised following the examples of Cluny and the great abbeys of Normandy, such as Bee, Fécamp, and Jumièges, while the secular cathedrals and their dependent diocesan churches adopted liturgies modeled on those of Norman cathedrals, such as Bayeux, Evreux, and Rouen. These innovations must often have been repugnant to the English clergy, and they were sometimes physically resisted: in 1083 Abbot Turstins attempt to introduce the customs of Fécamp to Glastonbury provoked violence in the abbey choir itself.

The liturgical changes imposed on the secular cathedrals went hand-in-hand with thorough constitutional revision, defining the composition of the cathedral chapters and the duties and rights of their members and sometimes describing details of the daily nonliturgical routine. Before 1200 most of the

nine secular cathedrals (Chichester, Exeter, Hereford, Lichfield, Lincoln, London, Salisbury, Wells, and York) had already received new constitutions, which were subsequently brought up to date from time to time. The constitutional and liturgical traditions that made a religious community's formal conduct distinctive were known as its "use." Essentially only secular cathedrals and the religious orders had their own uses. Such uses were by no means confined to England: those of the religious orders were international, while virtually every cathedral in western Christendom could claim to have had its own use at one time or another, even though this might subsequently have been superseded by the more influential use of another institution. The use of a secular cathedral was followed as far as was practicable, and perhaps with minor variants reflecting local circumstances, by the secular churches of the diocese, while monastic and friary churches observed the use of their particular order, again possibly with small local variations.

One of the secular English uses, that of Salisbury, or Sarum, gradually became preminent. Salisbury's influence was at first mainly constitutional, later liturgical. Together with Lincoln and York Old Sarum had been in the vanguard of constitutional reform, issuing new statutes as early as the 1090s. During the 12th and 13th centuries several cathedrals, including Lincoln itself, Chichester, Lichfield, and Wells, incorporated some of Salisbury's constitutional provisions in their own statutes. During the 14th and 15th centuries it was the turn of Salisbury's liturgy to be disseminated. The liturgical changes made at Exeter by Bishop Grandisson (1327–69) were heavily influenced by Salisbury, as were those made at Hereford apparently by Bishop Trillek (1344–60). In 1391 Exeter adopted the Salisbury liturgy virtually entire, retaining only a few local customs; London did the same in 1414, as did Lichfield during the time of Bishop Heyworth (1420–47). Chichester, Lincoln, and Wells seem also to have accepted the Salisbury Use, although Lincoln may have retained some individual features. The secular use most resistant to Sarum influence was that of York, which remained independent until extinguished by the Reformation. Hereford nominally kept its independence until 1542, but it already contained numerous Salisbury elements. The Use of Salisbury was also observed in chantries, colleges, and private chapels, by Augustinian houses, and in those English dioceses with monastic cathedrals employing liturgies that would have been inappropriate in secular churches. It also spread to dioceses in Wales, Scotland, and Ireland, and—exceptionally—even farther afield to Braga in Portugal.

The liturgical changes that followed the Conquest chiefly entailed the substitution of Norman customs and material where these differed from those of the Anglo-Saxon church. Thus, for example, the nonstandard masses for major feasts, the masses for minor English saints, the alternative Collects, and

the multitudinous proper prefaces that occur in Anglo-Saxon missals are almost entirely absent from post-Conquest missals. An 11th-century missal from Canterbury (Cambridge, Corpus Christi College 270) shows interesting evidence of revision, in that most of the extra proper prefaces that it originally contained have been subsequently erased. The break with past practice was, however, far from complete. The Anglo-Saxon and Norman liturgies did, of course, have a great deal of material in common, which there was no need to change; some pre-Conquest liturgical items and practices seem to have been adopted by the Normans (but the scarcity of contemporary service books, particularly notated ones, makes these adoptions difficult to trace); and by no means every Anglo-Saxon saint disappeared from the calendar. Some ancient Gallican ceremonies, such as the blessing of the paschal candle and the new fire, presumably survived because the Normans were familiar with them in their own country.

After a short initial period of hostility (typified by Lan-franc's refusal to recognize the credentials of even so revered a figure as St. Dunstan) the Normans softened their attitude to Anglo-Saxon saints, whose feasts appear in some quantity in later medieval calendars and service books, even though they are generally given fairly low gradings. Salisbury, for instance, included about 25 such feasts, four of which were 15th-century additions. Some of the figures thus commemorated (such as Cuthbert, Edmund the Martyr, and Oswald) were of major stature, but others (such as Cuthburga and Kenelm) were less significant, and their survival is something of a mystery. As was common throughout Europe, individual dioceses and institutions might keep the anniversary of a local saint, as London commemorated St. Erkenwald and the monks of Much Wenlock remembered St. Milburga. The Normans and Angevins introduced and promoted some of their own saints, such as St. Romanus of Rouen and St. Julian of Le Mans. Other feasts were added from time to time, following either the canonization of a new saint (e.g., Thomas of Canterbury in 1173 and Hugh of Lincoln in 1220) or an official injunction relating to an existing one. Such injunctions might be international (as with the Visitation, extended to the whole church by Pope Urban VI), national (as with St. Anne, prescribed for England in 1382), provincial (as with St. Winefride, enjoined for the ecclesiastical province of Canterbury in 1398), or diocesan (as with the upgrading of St. Gabriel for Exeter in 1278). Despite the presence of sizable amounts of local material English liturgical calendars continued to have as their core the major feasts observed throughout western Christendom: those of Christ and his mother, the disciples and apostles, the doctors of the church, and the saints of the Roman martyrology.

In all essential aspects later medieval English liturgies resembled those performed wherever the Roman usage prevailed. Mass and the services of the

divine office had the same basic structure that they had everywhere; mass included the full and unvaried Roman Canon; the standard Collects, Secrets, and Postcommunions (and in many cases the standard plainchant propers) were used on most of the major feasts; the proper prefaces numbered no more than the nine sanctioned by the Roman church; and much if not most of the plainchant repertoire was truly international. Most of the points on which English uses differed both from continental uses and from each other—such as the grading of feasts, detailed points of ceremonial, the conduct of processions and special ceremonies, the choice of proper chants and readings for particular festivals, the repertoires of hymns, sequences, and ordinary chants, and the versions of individual chant melodies—were traditional and unexceptionable points of variance among uses. Rather than give an extensive list of such mundane divergencies it will be more illuminating to examine some individual features of English liturgical practice.

By the early 12th century troping was going out of fashion, and tropes largely disappeared from continental service books after about 1200. The English uses, however, seem to have retained an above-average number of tropes, although many were discarded. Those that survived were mainly tropes of the Ordinary of the mass. In the uses of Salisbury, York, and Hereford these came to be limited to a handful of Kyrie tropes or *prosulae*, such as *Dens creator* and *Rex genitor* (each, use having its own selection), a single Gloria trope *Spiritus et alme orphanorum*, a single Sanctus trope *Benedictus Mariae filius*, and a troped Prophecy sung in dialogue on Christmas Eve. Vestiges of much earlier troping techniques also survived in a few instances in which what had originally been tropes of responsories became independent items called proses, which had the poetic form of the sequence; the proses *O mater nostra* (for St. Katherine) and *Sospitati dedit aegros* (for St. Nicholas) are cases in point. Other now irrecoverable secular uses may have been more liberal in their use of tropes; a late-13th-century inventory from St. Paul's, London, mentions service books containing troped Epistles and at least one troped Agnus Dei. Some English monasteries apparently continued to employ tropes in considerable variety and quantity at least until the early 14th century.

Although processions formed a part of religious ceremonial throughout Christendom, they seem to have been particularly elaborate and impressive in England. They occurred regularly on Sundays and major feast days before high mass and after Vespers, also on some other days, such as Rogation Days, and for special purposes, such as the reception of a visiting dignitary. The members of the institution were arranged in a precise order, the details of which varied with the importance of the occasion. Processions were normally headed by a group of functionaries: virgers bearing wands, boys with holy water, processional crosses, tapers, and censers, a subdeacon and deacon carrying

precious copies of the Gospels, the officiating cleric and any singers with prominent solo roles; the rest of the community followed, two by two, in ascending order of seniority, and the bishop, abbot, or other chief dignitary and his attendants brought up the rear. Like its disposition the route of the procession varied according to the occasion. Lesser processions began in the choir, circuited the interior of the church, and returned to the choir; greater processions were extended to take in the cloisters and other parts of the site. On exceptional days, such as Palm Sunday, the procession might travel to a neighboring church or even subdivide and reunite. During a procession antiphons and responsories were sung, and halts or stations were made at predetermined points, where special prayers might be said.

In addition to mass and the canonical hours three types of additional devotion were widely performed in later medieval England: commemorations, memorials, and votive antiphons. Commemorations were complete offices of eight hours—Matins, Lauds, Prime, Terce, Sext, None, Vespers, and Compline—said in honor of a particular saint, usually the Virgin. They had originated as a monastic devotion to the Virgin in the 10th century, were taken up by secular institutions during the 11th and 12th, and began to be adopted by private individuals in the late 13th. The hours of the Virgin form the main content of the books of hours that constitute one of the most beautiful legacies of the later Middle Ages. In the English secular uses the office of the Virgin customarily replaced the ordinary daily office on Saturdays, and the daily offices of one or two other days were often replaced by a second commemoration, normally of the patron saint of the church (e.g., St. Chad at Lichfield and St. Andrew at Wells, but St. Thomas of Canterbury at Salisbury, where the Virgin herself was the patron saint). Memorials were compact services consisting of an antiphon, versicle, response, and collect, in honor of saints or appropriate to particular seasons, occasions, or causes. They were said after Lauds and Vespers, and several might be said in succession. The votive antiphon was originally an antiphon sung by itself, usually as a post-Compline devotion before the altar or image of a saint; the most popular texts in England included *Salve regina*, *Ave regina caelorum*, *Benedicta es caelorum regina*, and *Regina caeli laetare*. By the 14th century this devotion often expanded to take the shape of a full memorial with a versicle, response, and prayer following the antiphon. In this format it was frequently utilized by the founders of chantries, who typically required an antiphon to be sung and prayers said daily after Compline on behalf of themselves and their nominees. From modest beginnings in the 14th century the polyphonic votive antiphon became one of the grandest musical forms of late-medieval England, as the settings in the Eton Choirbook amply testify.

The cult of the Virgin flourished exceedingly in late-medieval England, as

the magnificent Lady Chapels of many churches demonstrate. In addition to commemorations, memorials, and votive antiphons votive masses were regularly said in her honor, at first mainly on Saturdays but from the 13th century onward usually every day. The Lady Mass, as the votive mass of the Virgin is usually known, had a different set of propers for the various seasons of the year, and the Kyrie, Alleluia, and Sequence might change from day to day. A great deal of late-medieval English polyphony was apparently intended for the Lady Mass, presumably to emphasize the honor in which she was held and to make the best use of the small group of skilled singers who commonly performed this mass. The fact that in some uses it was permissible to replace the Sequence of the Lady Mass with another musical item may also have stimulated composers to provide polyphonic substitutes.

Perhaps the most distinctive feature of later medieval English services was the large amount of polyphonic music that they might incorporate. The practice of singing parts of a service in polyphony instead of plainchant had probably been current in various parts of western Europe, including England, at least as early as the end of the 9th century. Sacred polyphony from 11th- and 12th-century France and England already shows considerable sophistication, and the achievements of Parisian church composers in the later 12th century have deservedly become famous. Much of this early sacred polyphony was liturgical: it set texts that formed an integral part of the liturgy. During the later 13th century, however, the attention of French composers shifted away from sacred to ceremonial and secular music, and they produced relatively little sacred polyphony for the next century and a half. English composers, on the other hand, continued to concentrate on sacred polyphony, either setting liturgical texts or creating pieces that could be added to or substituted for liturgical items. This activity is reflected in the provisions made by some uses (such as that of Exeter) for the singing of polyphony during services and also in frequent documentary references to the skills in reading and improvising polyphonic music required of ecclesiastical singers. The music in the Worcester Fragments and the Old Hall Manuscript bears impressive witness to the expertise of both composers and singers in the service of the late-medieval English church.

Local Government

English local government in the Middle Ages was a system of “self-government at the king's command.” Its essence lay in the reconciliation of the often divergent rhythms of local and national life.

Before the 10th century local communities had been almost entirely self-governing. Kings lacked the means to deal directly with their subjects, except at the highest level; those farther down were left, almost by default, to manage their own affairs. Order was maintained by a system of social control drawing on the complementary resources of kinship and lordship, and justice was dispensed by the owners—usually the lords—of the local courts. Beyond the performance of these tasks there was little that needed to be done.

What led to the development of a more formal structure of government was the strain placed on the body politic by the Viking onslaught of the 9th and 10th centuries. As the king's need for money and manpower became more acute, it became necessary to create a structure for the exaction of dues. This was satisfied in the 900s by the creation of some 30 or so shires, each under the direction of an official called the sheriff (shire-reeve). Those in Wessex were often based on preexisting folk groupings, as Somerset was on that of the “Somersaeten.” Those in the south and east were based on former kingdoms, such as Essex and Kent, now absorbed into Wessex, while those in the Midlands had no apparent ancestry at all: just arbitrary creations of administrative convenience, organized around important royal towns or *burhs* in the wake of Wessex's advance into Mercia.

At this time units of administration beneath the shire were also called into being. Known in the Midlands and south as hundreds and in the Danelaw as wapentakes, these, too, varied greatly in size and origin. Some of the larger ones may, like the Midland shires, have been arbitrary creations, but others probably had a lengthy prehistory as units for the collection of tribute or taxation in the age of the Mercian supremacy.

The lives of both hundred and shire were patterned by the regular holding

of courts. Hundred courts were convened every three weeks in some prominent open-air spot and attended by suitors who owed their attendance or suit as a service from land. Before the Conquest considerable judicial activity took place at these sessions; from the 12th century their judicial competence became concentrated in the twice-yearly frankpledge sessions, or “tours,” at which the sheriff inspected the tithing groups and heard reports of offenses that would later be dealt with by the justices.

Meetings of the shire court had originally been held less frequently—often no more than twice yearly—but by the 13th century they were generally held monthly. As in the hundreds attendance was required of those whose lands were burdened with the duty of attending. In their presence a variety of business was transacted, at first mainly judicial but later increasingly administrative and political. The judicial work was sharply reduced after 1215, when pleas of the crown were reserved to the judiciary. Thereafter, though the court retained a residual importance as the forum in which outlawries were promulgated, it was in other areas that its importance was to lie—in the election of representatives to parliament and the drafting of parliamentary petitions.

The presiding official at the shire court was the sheriff, who by the 12th century was the principal local agent of royal government. He collected the royal farms, called out the posse, enforced the king’s peace, and executed the ever-increasing number of writs issued in the king’s name. This formidable concentration of power inevitably raised problems of control that had to be addressed if the king was to maintain his authority. A solution was found in two ways: first by subjecting the sheriff to a measure of central supervision and second by transferring some of his duties to other officials.

Supervision was exercised in two areas, financial and judicial. From the reign of Henry I the sheriff was required to account twice yearly at the exchequer for the issues of his bailiwick—thus preventing him from creaming off money that should have gone to the king. In addition, from the reign of Henry I, he was subjected to searching inquiries by the itinerant eyre justices, dispatched on periodic visitations of the shires with a brief to stamp out crime and eliminate corruption. The transfer of some of his duties to new officials began a generation or two later, in the reign of Richard I. Responsibility for keeping the pleas of the crown and for holding inquests on sudden deaths by accident was assigned in 1194 to the coroners, of whom there were to be four in each county, three knights and a clerk.

In 1232 separate arrangements were made for the collection of feudal revenues. Two escheators were appointed in each county to account for the wardships and escheats (feudal windfalls) that fell in during minorities and in default of heirs, respectively. And finally, in the late 13th century, separate

arrangements were made for the keeping of the peace. The keepers were appointed in each shire with the duty of reporting breaches of the peace in their bailiwicks. When in the next century they also acquired the power of determining (i.e., trying) cases and were thereby transformed into the justices of the peace, they were well on the way to replacing the sheriff as chief agent of royal government in the localities.

The justices of the peace and the coroners are the best known of the new officials of the late Middle Ages. But there were others, such as the commissioners of array, who raised soldiers in time of war, and the commissioners of sewers, who inspected and made arrangements for the clearing of ditches. These men were all drawn from the ranks of the local gentry and, with the exception of the justices of the peace (and members of parliament), received no pay. To compensate themselves for inconvenience, and to make a small profit on the side, they inevitably succumbed to the temptations of corruption. But by the later 13th century, as exchequer supervision intensified, there was probably less profit in office holding. Its main attraction lay in the power that it gave the officeholder over his neighbors.

The system of local government developed in the late Middle Ages was one of the most sophisticated of its time. Local and national interests were reconciled with a degree of success rarely attained elsewhere. Only in the privileged enclaves known as franchises was kingly authority seriously compromised. Here the devolution of government to an important local lord obviously blunted its impact. Writs that the sheriff would otherwise have executed were now executed by the lord's bailiffs; fugitives whom he would have arrested were arrested instead by the lords constables. Given the extent of devolution involved, it might be supposed that power exercised by the king was substantially reduced. In fact this was far from being the case. The privileges of franchises were stated, by the king's justices, to involve responsibilities as well as immunities, and continued enjoyment of them depended on their effective exercise. If a bailiff failed to execute a writ delivered by the sheriff, the sheriff was commanded to disregard the exemption and enter the franchise. Privilege, as Helen Cam has shown, was insensibly being turned into obligation, exemption into burden. Under the vigorous direction of the Angevin kings franchises were integrated into a national system of local government, producing a structure at once uniform and devolved and characterized by the enforcement of common standards of behavior.

Lollards

The most famous and original English heretical movement between the conversion of the Anglo-Saxons and the Reformation of the 16th century. Traditionally the Lollards are seen as the followers of the English philosopher and theologian John Wyclif (ca. 1330–1384), spreading his teachings and surviving as a heretical sect between the late 14th century and the Reformation. There is a substratum of truth in this, but recent work has shown that the movement was more complex, comprising both a short-lived academic wing, which survived for a time in Oxford, and a popular, largely lay division, which looked for inspiration to Wyclif in some matters and derived other characteristics from more widespread and not necessarily heretical evangelical piety.

Indeed some of the early uses of the term "Lollard," generally taken to denote a mumblor of prayers, may not even have had the connotations of heretic. Many of the later Lollards were not academically trained, and it is hardly surprising that they were unable to appreciate the theological subtlety of Wyclif's thought. When they did derive inspiration from his teaching, it was generally in a simplified form.

Wyclif's influence on academic Lollardy must be understood as characteristic scholastic loyalty to a distinguished master. When he first fell foul of the church, he still had support from leading university figures who did not necessarily share his theological opinions but who resented the jurisdictional interference of the archbishop of Canterbury. As his teachings

became increasingly unorthodox, however, the university fell into line with the establishment; several of his earlier followers (most notably Philip Repington and Nicholas Hereford) made their peace with the authorities and pursued successful careers within the church.

Although his theological ideas were proscribed, there were still men in the arts faculty who were interested in his philosophical writings and who copied them into manuscripts without giving any attribution of authorship. These academic Lollards were also responsible for producing the English versions of the Bible and a heretical sermon cycle, and in the first decade of the 15th century there was a sufficient resurgence of heresy at Oxford for Archbishop Arundel to purge the university. This was successful; by the mid-15th century Lollardy had ceased to be an academic movement, as its last survivors died or were executed.

The survival of academic Lollardy outside the university was assisted by support from influential laymen, some of whom presented heretical priests to benefices of which they had the patronage. This protection gave opportunities to copy Lollard manuscripts and provided a defense against enquiring bishops. These patrons may not necessarily have shared all the views of their protégés, nor of the latter's inspiration, Wyclif, since their actions, including support for pilgrimages and crusades, runs counter to the expressed views of some Lollard theorists. In some cases the "Lollard Knights" may have been inspired by evangelical piety, in others perhaps by a desire to seize ecclesiastical property.

Church authorities, however, were only too prepared to regard as heretics those who sought church disendowment, even though their theological views cannot be ascertained. Some, most notably Sir John Oldcastle, an experienced knight and soldier and a close friend of Henry V, undoubtedly held unorthodox beliefs. As early as 1410 he was associated with the academic Lollard Richard Wyche, writing to one of the lay supporters of the Bohemian reformer Jan Hus on the same day as Wyche himself wrote to Hus. When Arundel prosecuted Oldcastle for heresy in 1413, he did not deny his beliefs and was condemned to death. He escaped and raised a rebellion in 1414, but though he drew support from a wide variety of areas his followers were few in number and easily overcome. Futile though the revolt was, it created considerable alarm among the secular authorities, fully echoed in the days chronicles.

Although the death penalty for heresy had been enacted in 1401, only two men went to the stake in Henry IV's reign. However, after Oldcastle's fiasco persecution was intensified. Most lay supporters were warned off by the association of Lollardy with treason, and no later leader commanded loyalty similar to Oldcastle's. Persecution eased off after the suppression of his rising and depended on the activity of individual bishops. This was seldom totally effective; in only one area, East Anglia, did a substantial Lollard community

disappear entirely after episcopal proceedings, those of Bishop Alnwick in 1428–30. Elsewhere the recurrence of trials at different periods demonstrates the survival of Lollard groups in Bristol, Coventry, the Chilterns, south Kent, and London. Channels of communication existed between different groups, and itinerant evangelists helped circulate the vernacular scriptures, the staple literature of the movement.

Most Lollards were lay, though one Berkshire parish priest was executed in 1508, and a parish priest of unchallenged orthodoxy was on friendly terms with men later condemned for heresy in Coventry. Socially most were drawn from the artisan class, although there was mercantile support in the towns and in southern Buckinghamshire patronage from the lesser landed class.

It is sometimes hard to identify the genuine Lollards; the boundaries between heresy and orthodoxy were indistinct, and the question was complicated by an anticlericalism often devoid of doctrinal deviation. Indeed the procedure of investigation employed by church authorities—interrogation on a series of doctrinal articles—may have imposed a spurious precision upon the confused ideas of some suspects. Bishops, however, do appear to have been more concerned with ascertaining the truth than with obtaining convictions at any price, as shown by the experiences of Margery Kempe, questioned and acquitted several times.

There were variations of belief among Lollard communities, and sometimes even within them, perhaps depending on the views of individual teachers, as in Norfolk in 1428–30. The possession of vernacular scripture texts is good proof of genuine heresy, and recurring beliefs include a denial of transubstantiation and hostility to pilgrimages and to the veneration of images. The Lollards were also strongly antipapal but had no monopoly in this. They differed, however, from much contemporary continental heresy in that traces of millenarian teaching are few.

Their skill in self-concealment makes it hard to estimate their numbers, and one should guard against overstressing their importance. In the century after Oldcastle's revolt the number of executions probably was below 100, that of abjurations below 1,000. Only in a few areas, notably south Buckinghamshire, were they more than a small, uninfluential minority in society. Nevertheless, the church's concern with suppressing them, however intermittently, suggests that they must be seen as a movement, not just as a series of isolated dissidents.

London

London (Londinium) had been a major urban center in Roman Britain. However, its decline in population and economic importance began even before the withdrawal of the Roman legions in the late 4th or early 5th century. All the evidence we have suggests that town life collapsed in London after the early 5th century. No longer a colonial capital, bolstered by networks of trade and authority, Londinium appears to have become depopulated and decayed within a relatively short period. Some small settlement may have survived, but its characteristics and function are unknown; the monumental remains of the Roman city must have ensured that the site’s identity was not lost.

By the end of the 6th century, when new patterns of kingdoms and hegemonies were starting to stabilize, London was within the kingdom of

Essex. Though Augustine's mission had intended to establish a metropolitan see in the old Roman capital, political realities determined its location in Christian Kent, at Canterbury.

Literary evidence for a 7th-century trading center in "London" may refer to the settlement of which archaeologists have found traces, situated to the west of the city walls. Occupation layers and small finds of the mid-Saxon period in the area of the Strand and Aldwych contrast with the featureless layers of dark earth that overlie the Roman settlement, within the walls, and the grey silt sealing the elaborate Roman quayside structures. If there was habitation within the walls at this date, as the 7th-century founding of the cathedral suggests, it can only have been on a limited scale. London was prosperous enough to attract Mercian interest in the 8th and early 9th centuries and was occupied by the Danish invaders in 871–72.

After recapturing London in 886 Alfred improved its defenses, refurbishing the walls and granting plots of land, probably because of its position only a few miles from the Danelaw frontier along the River Lea. The grid pattern of the medieval streets was probably initiated at this time. Later events in the Anglo-Danish struggle confirm that London was a strategic and valuable center; in the 10th and 11th centuries churches were founded, governing institutions—aldermen, wards, and assemblies—took shape, and foreign trade continued.

The Norman conquerors built the Tower and two smaller castles within the walls, and confirmed Westminster, the burial place of Edward the Confessor, as an important royal center. Over the next two centuries the city's wealth and importance to the crown were increased by the immigration of Jews and the concentration of minting activity. Trade with France expanded, foreign merchants came to the city. Gradually London, with Westminster, became the focus of much royal activity, ceremonial as well as governmental. The treasury was moved from Winchester to London in the 13th century, and chancery, the exchequer, and the king's courts settled at Westminster. Increasingly the crown turned to the London market, rather than to fairs, for wine, luxuries, and other imports. By 1200 the city was populous and prosperous, with over 100 parish churches and many great stone houses ([fig. 89a](#)).

the sheriffs' court dealt with minor assaults and trespass. The mayor and aldermen together formed the principal administrative council. Larger assemblies of citizens met to elect the mayor and approve taxation, and the 14th century saw the formalization of the Common Council, made up of men elected by the wards.

At the lower level the city was administered through the local meetings, or wardmotes, presided over by an alderman. London's population had continued to grow, probably largely through immigration, as the city's function as a great regional and national marketplace developed; by 1300 it may have exceeded 80,000, most of whom must have lived in the tightly packed area within the walls. The jurisdiction of the mayor and aldermen covered the walled city and the immediate suburb but not the villis of Westminster and Southwark.

The Black Death and subsequent plagues had an enormous impact on the population, cutting it by almost half. In the Poll Tax of 1377, 23,414 persons were assessed in the city, giving a total population for London, Westminster, and Southwark, at the most generous estimate, of 45,000–50,000. Rapid change in living conditions and expectations led to unrest among ordinary Londoners, while at the same time the city's rulers were divided. Foreign wars and changes in patterns of trade, complicated by the crown's exploitation of staple policies and foreign sources of finance, led to divergences of political and economic interests among the mercantile rulers and opened the way for factional struggles.

London merchants were seen as propping up the decadent regime of Edward III and backing Richard II's assertion of independence, so that London affairs were at the forefront in the conflicts of the Good Parliament of 1376, the Peasants' Revolt (which paralyzed the city for several days in June 1381), and the crisis of the Lords Appellant. For a brief period (1376–84) the dominance of the merchant groups in London government was challenged, with elections to the Common Council being made by the crafts, and aldermen allowed to hold office for one year only.

Fig. 89b. London in the 15th century. After C.L. Kingsford, Prejudice and Promise in XVth Century England (1925). Reprinted by permission of Frank Cass, Ltd.

By the end of the century the previous situation had been restored, although London government did perhaps become more broadly based in the 15th century with the growth in size and importance of the Common Council. In the deposition of Richard II and the Wars of the Roses London's support proved crucial to the successful seizure of power, but the city's leaders played a conservative part, tending to support the party in control (to which they might be committed in loans and Financial support) until the scales were already tipping to the other side.

In the 14th and 15th centuries Westminster developed into a sizable settlement, focusing on the abbey and royal palace. Service industries for travelers and temporary residents were especially important, and the retail of luxury goods developed. The houses of nobles and ecclesiastics along the Strand linked Westminster with the growing legal quarter to the west of the city. By contrast Southwark, now partly under the city's jurisdiction, was characterized by industrial production and by alien settlement, as to a lesser extent were the suburbs to the east and north (*fig. 89b*).

Though the city had a diminished and probably static population in the 15th century, its economy, based on overseas trade, remained relatively buoyant. The cloth export trade came to focus on London at the expense of other ports, helped by the growth of Antwerp as a major European market, and London merchants, especially members of the Mercers' Company, dominated the Merchant Adventurers' organization. By 1500 about 70 percent of England's

cloth exports and 45 percent of its wool were passing through the port of London. It is estimated that London's share of the national taxable wealth increased from 2 percent in 1334 to nearly 9 percent in 1515.

Mercantile wealth enriched the appearance and public life of the city. In the early 15th century Richard Whittington endowed a college of priests and founded an almshouse; other successful merchants made generous benefactions to their parish churches or to their guilds or companies. Some individuals built splendid residences like Crosby Hall. The city engaged in several public building programs, most notably the enlargement of Guildhall (1411-ca. 1430) and the new granary at Leadenhall in the 1440s. The pomp and status of the mayoralty increased, and London saw a succession of magnificent royal entries and processions for which no expense was spared.

Love, Nicholas (d. 1423/24)

Prior of Mount Grace Charterhouse in Yorkshire; author of *The Mirror of the Blessed Life of Jesus Christ*. Love’s *Mirror* is a translation and adaptation of the Pseudo-Bonaventuran *Meditationes vitae Christi* (early 14th century), an influential Franciscan collection of meditations on the life of Christ. Little is known of Love’s own life aside from his appointment as rector of Mount Grace and promotion to prior in 1410. Testamentary evidence confirms that he was still prior in 1415 but suggests that he may have been replaced by 1417.

According to a “Memorandum” in most manuscripts of the *Mirror* Love submitted his work to Archbishop Thomas Arundel for approbation around 1410, obeying the Lambeth Constitutions of 1409. Arundel licensed the translation and encouraged its publication “for the edification of the faithful and the confutation of heretics or Lollards.” Love’s alterations to the text—particularly his addition of a treatise on the eucharist—were often specifically anti-Wycliffite in aim.

The *Mirror* became an important piece in the ecclesiastical rearguard in the century preceding the Reformation. It survives in 49 complete manuscripts and fourteen fragments, extracts, or composite texts and was printed nine times between 1484 and 1530. Thomas More invoked it in arguing against the Lutheran Bible translator William Tyndale.

Lovelich, Henry (fl. ca. 1425?)

London businessman and author of two Arthurian poems: *The History of the Holy Grail*, the fullest English version of the early part of the Grail story, from Joseph of Arimathea to Lancelot’s grandfather; and *Merlin*, a presentation of Merlin as Grail prophet. These poems are translations from the French prose of the first two branches of the Vulgate Cycle, the *Estoire del Saint Graal* and the *Merlin*, in couplets of often lengthy four-stress lines. They are the sole contents of the unique manuscript, Cambridge, Corpus Christi College 80, which may have been executed at Lovelich’s direction. Folios containing the first fifth of the *History* are missing at the beginning, leaving 23,788 lines. *Merlin* consists of 27,852 lines, equivalent to about half the French account: the manuscript may be incomplete, or Lovelich may not have written more. He evidently translated the works at the urging of Sir Henry Barton, a fellow member of the London Company of Skinners and twice Lord Mayor, in his own mature years and some time before Bartons death in 1434. Although the writing is pedestrian, the undertaking provides an interesting comment on middle-class tastes and concerns of the time.

Lydgate, John (ca. 1370–1449)

The most prolific versifier of the 15th century. Lydgate was probably born in the village of Lydgate in Suffolk and apparently educated at the Benedictine monastery at Bury St. Edmunds, at which he was professed at the age of fifteen. He later studied at Oxford, probably at Gloucester Hall. He was ordained priest in the Benedictine order in 1397. In 1406 Prince Henry supported his return to study at Oxford. It was possibly while at Oxford that he wrote his translation of Aesop's *Fables*. His subsequent career suggests that he enjoyed Henry Vs patronage. In 1423, after Henry's death, Lydgate became prior of Hatfield Broadoak in Essex. But from 1426 to 1429 he was in Paris as part of the entourage of John duke of Bedford, regent of France. By 1433 he had returned to Bury. Most of his later works seem to have been written there. He received a royal annuity in 1439 and died ten years later.

Lydgate's earliest major work was probably his *Troy Book*, a translation of Guido delle Colonne's *Historia destruccionis Troiae* (30,117 lines in couplets), which was begun at the behest of Henry V in 1412 and completed in 1420. Its

composition appears to have been interrupted by the writing of *The Life of Our Lady*, ca. 1415–16 (5,932 lines, mostly in rime royal stanzas), written, he says, at Henry's "excitacioun." *The Siege of Thebes*, a history of the Theban legend, apparently based on a French source, was probably composed ca. 1420–21, as a continuation of Chaucer's *Canterbury Tales*. While in France in the late 1420s Lydgate probably wrote his translation of Deguileville's *Pilgrimage of the Life of Man* (24,832 lines in couplets) for Thomas Montacute, earl of Salisbury. Some of his shorter poems, including the *Danse Machabre*, also date from this time.

After his return to England in 1429 Lydgate wrote a number of celebratory verses for Henry VI's coronation. His *Lives of Sts. Edmund and Fremund* (3,508 lines in rime royal) was presented to the king in the 1430s, probably after the king's visit to Bury St. Edmunds in 1433–34. For the king's brother, Humphrey, duke of Gloucester, Lydgate wrote his longest work, *The Fall of Princes* (36,365 lines in rime royal), between ca. 1431 and 1438. It is a rendering of Laurent de Premierfait's French prose translation of Boccaccio's *De casibus virorum illustrium*. His last major works seem to have been his *Lives of Sts. Albon and Amphibel* (4,724 lines in rime royal), commissioned in 1439 by John Whethamstede, abbot of St. Albans, and a rime royal translation of the Pseudo-Aristotelian *Secreta secretorum*, left incomplete on his death and finished by Benedict Burgh. Other substantial poems attributed to Lydgate include a lengthy allegory, *Reason and Sensuality* (7,042 lines in couplets), and many shorter poems of doubtful canonicity.

In addition to these long poems there are numerous shorter ones on a variety of subjects. These include a popular dream vision, *The Temple of Glass*, and short verse narratives, such as his *Debate of the Horse Sheep and Goose* and *The Churl and the Bird*, several mummings, and a number of devotional lyrics. But the variety of Lydgate's poetic output resists concise summary: it ranges from his translation of Aesop to a treatise for laundresses and a dietary (instructions on healthy diet and behavior). By the most capacious estimates it runs to about 150,000 lines of verse. His sole prose work, *The Serpent of Division*, is a brief history of Rome.

This range of subject matter is reflected in the range of his patrons, which extended from royalty and nobility through a broad spectrum of English society, both religious and lay, male and female, individual and institutional. He was at the call of those who wished him to entertain, instruct, admonish, and propagandize on their behalf.

Lydgate stands crucially between Chaucer and the later evolution of English poetry. He wrote in the generation immediately after Chaucer's death and acknowledges Chaucer as his "master" in frequent lavish tributes. A number of his works are self-consciously conceived within a tradition of Chaucer's works

that is reflected in imitation at conceptual, stylistic, and verbal levels. Thus his *Troy Book* sets itself in relation to the subject matter of *Troilus and Criseyde*; *The Siege of Thebes* contains an imitation of the beginning of the General Prologue and extensive verbal borrowings from the *Knight's Tale*; *The Complaint of the Black Knight* and *The Temple of Glass* imitate Chaucer's dream visions, *The Book of the Duchess* and *The House of Fame*, respectively. Lydgate was to play an important role in the creation and dissemination of the Chaucer tradition, particularly through his own popularizing of Chaucerian style and subjects.

Lydgate's Chaucerian imitation is related to the most distinctive tendency in his art, its rhetorical amplification. His instinct was to elaborate his materials, often on a massive scale. The most striking—or notorious—example of this tendency is the opening sentence of his *Siege of Thebes*, which imitates the opening sentence of Chaucer's General Prologue. Lydgate's sentence extends Chaucer's from eighteen to 65 lines. Indeed much of Lydgate's amplification comes from a natural tendency nurtured by a careful reading of Chaucer, through which poetic hints of his "master" could be vastly expanded. Thus, out of suggestions in Chaucer's language, he created a distinctive aureate diction, a Latin-derived, polysyllabic language that often characterizes his "high style," particularly in his religious verse. At its least successful, in conjunction with elaboration of allusion and syntax, it could lead to the obscurity that has earned him the condemnation of many modern critics.

Lydgate's meter systematizes Chaucer's versification through a regular use of five types of iambic pentameter line. One particularly striking feature of this systematization is the frequent use of the "headless" line (one that lacks an initial stressed syllable). Lydgate's own development of Chaucer's metrics was the "broken-backed" line, in which stressed syllables clash across the caesura.

It was probably through his amplification and systematization of Chaucer's art that Lydgate gained his considerable reputation in the 15th and 16th centuries. Allusions in that period acclaim him as part of a great triumvirate of ME poets, together with Chaucer and Gower. And in simple quantitative terms, in numbers of surviving manuscripts, Lydgate was the most popular of all ME poets. His *Fall of Princes* survives in complete or selected forms in over 80 manuscripts, his *Life of Our Lady* in nearly 50, *The Siege of Thebes* in 30. Among Lydgate's shorter poems both his *Verses on the Kings of England* and his *Dietary* exist in over 50 copies. In addition many of his works were issued by the early printers, Caxton, Pynson, and de Worde, often more than once.

This massive dissemination of Lydgate's works during the later Middle Ages led to his wide-ranging influence on later writers and forms. *The Fall of Princes* shaped literary conceptions of tragedy in the early Renaissance. His mummings are important texts in the evolution of English drama. And the

works of (among others) Dunbar, Henryson, Douglas, Hawes, and Skelton, as well as many lesser figures, show the influence of his work in their writings, an influence that extended into the 17th century.

Lyrics

ME lyric by the broadest definition includes any short poem written in English between 1150 and the early part of the 16th century. Apart from a few songs by St. Godric (d. 1170) only tantalizing hints of a popular lyric tradition survive from the 12th century. The earliest of the fragmentary remains, “Merie sunge the muneches binnen [monks in] Ely,” is attributed (dubiously) to King Cnut in Thomas of Ely’s 12th-century *Historia Eliensis*. A mere handful of lyrics comes down from the period before 1250; perhaps about 100 extant lyrics were composed during the remainder of the 13th century. A much larger number of lyrics survive from the 14th century, and hundreds from the 15th, many of which are carols. Omitted from the present discussion are ballads (not to be confused with ballades), debate poems, and satires, which are treated separately in this book. The short poems outside of these groups may be classified roughly on the basis of content. The broadest division separates secular from religious lyrics, and though even this division is not absolute, the following anatomy will proceed as though it were.

The vast majority of extant lyrics, including the earliest, are religious. Predominant themes are the Passion of Christ, the joys of the Virgin Mary (particularly the Annunciation, Nativity, and Assumption), and death. Whether one describes these poems as meditative, hortatory, didactic, or monitory, and whether one traces their roots to the liturgy, to hymns, to sermons, or to biblical commentary, they clearly express an affective piety, one that appeals to the heart rather than to the head. Impetus for this kind of expression was given a boost with the advent of the friars (particularly Franciscans), who were in England by 1224. These self-styled minstrels of God (*joculatores Dei*) sought to arouse religious feeling in the laity by depicting the humanity of Jesus and Mary and the pathos of the human condition generally.

The Commonplace Book of Friar John Grimestone (fl. 1372) offers examples of such treatment, but perhaps its best illustration is found in a justly famous 13th-century poem:

Nou goth sonne vnder wod,—
 me reweth, marie, thi faire Rode.
 Nou goth sonne vnder tre,—
 me reweth, marie, thi sone and the.

The poet imagines not the king and queen of heaven but a mother and son.

Mary is not preternaturally beautiful but simply a woman of fair complexion (“Rode”). The poet expresses not awe but pity. The crucifixion of Christ is presented not as an event of profound theological import but as an instance of the vulnerability to which all human beings are liable, the onset of death.

This poem, one of the best of its kind, epitomizes the affective piety that characterizes many a religious lyric. It also exemplifies features of lyric style. Brevity and simplicity of utterance are keys to the poetic power of many medieval lyrics; long lyrics tend to be discursive and less forceful. Repetition, such as one sometimes finds in ballads, is also used to focus attention and thus to concentrate the emotional effect. The imagery and the diction are plain; the poet creates a scene, not a narrative, though there is a hint of action or passage of time in the setting of the sun. Finally one should observe that the poem appeals not only to the heart but also to the mind. Its verbal wit—wordplay on *sonne* (sun/son) and on *wod, tre*, and possibly *Rode* (cross)—infuses the literal imagery with theological content.

Many lyrics address their subject—Jesus, Mary, the Cross—as in prayer: in these the reader or listener identifies with the lyric voice or speaker. In some poems the audience does not “speak” but is spoken to (“Man, thus on rode I hyng for the”). The effect of intimacy is the same; the audience is part of a drama, one side of a conversation. The dramatic potential is more fully actualized in poems in which the audience does not participate but is a witness, as in lullabies sung by Mary to the infant Jesus or in laments addressed by her to the crucified Christ. These sometimes take the form of dialogues—Jesus, for example, will respond to Mary; in most instances the humanity of the speakers is emphasized and the affective piety arises from sympathy.

Other religious poems attenuate the dramatic effect, generally seeking to edify rather than arouse emotion. The first-person speaker of such poems is scarcely evident and in a few instances disappears altogether. This disappearance is a natural extension of the characteristic anonymity of the poetic “I.” Composers of medieval English lyrics tended not to stamp their work with personal impression; they cultivated rather a universal voice. Even when a poet can be identified—William Herebert, John Grimestone, Michael Kildare, Thomas of Hales (all friars), William of Shoreham, even Richard Rolle—a distinctive poetic voice does not emerge. From the late 14th century on authorial personalities and identifiable poetic styles begin to appear, in the work of such authors as Chaucer, Hoccleve, Lydgate, Dunbar, Henryson, and Skelton; also John Audelay and Walter Kennedy. But other authorial “identifications”—Jacob Ryman, H. Bowesper, John Hawghton, Reginald Pecock, Richard de Caistre, John Halsham, R. Stokys, Richard Spaldyng (in an acrostic)—attach to poems that remain stylistically “anonymous,” utterly like

the unclaimed lyrics of the medieval English tradition.

Nevertheless, late ME religious lyrics manifest a self-conscious literary style previously not much seen. The simple meters and diction of earlier verse persist, but a nearly unprecedented imitation of secular lyrics introduces more complicated metrical schemes (e.g., rime royal) and the new “aureate” diction (“O Radiant luminar of light eterminable”), abstract latinisms to gild the rhetoric of elevated matter. Borrowings from the secular lyric include such motifs as the exchange of hearts and description of female beauty (the Virgin Marys), the narrative framework of the *chanson d’aventure* (“Bi a wode as I gon ryde”), and even the rhetorical frame of a letter (“Goe, lytyll byll”). In a few poems the rhetoric is so thoroughly taken over that the religious theme virtually disappears (cf. “Trewloue trewe, on you I truste”).

The ambiguity of reference that makes problematical the distinction of religious from secular verse appears quite early. In “Myrie it is while sumer ilast” (13th century) the speaker’s winter and long night of woe may be literal or figurative: reference to harsh weather, to love languor, to the evanescence of life, or to spiritually necessary mortification of the flesh. In “Foweles in the frith” the natural world is a foil for one who walks in sorrow “for beste of bon and blod.” But celebrations of life in the world are also to be found. The best-known and earliest surviving example is “Sumer is icumen in,” one of the few English *reverdies*, or joyous descriptions of earth in springtime. Related to such a theme is, of course, the theme of love.

Unfortunately few secular lyrics on any theme survive from the 13th century. In addition to the three poems mentioned above one may count a love plaint (“Theh thet hi can wittes fule-wis” [“Though I know much that is full wise”]); two paradoxical definitions of love (“Loue is a selkud wodenesse [strange madness]” and “Loue is sofft, loue is swet”); the folkloric “Say me, viit in the brom” [“Tell me, creature in the broom-shrub”]; and a *chanson d’aventure* (“Nou sprinkes the sprai” [“Now the branch leafs out”]); and perhaps a few of the Harley Lyrics. Otherwise only fragments of secular lyrics remain, mostly in sermons where they are quoted to illustrate a point. From the 12th century we hear the refrain “Swete lemman dhin are” (“Sweet lover, [grant] your mercy”); the gnomic lines “euer is the eie to the wude leie [drawn] / therinne is thet ich luuie [the one I love]”; and a snatch of a popular song, “Atte wrastlinge mi lemman i ches [chose], / and atte ston-kasting i him for-les [lost].” From the 13th century comes “He [*read* I ne] may cume to mi lef [beloved] bute by the watere.” In addition to some of the Harley Lyrics a few bits and pieces survive from the first half of the 14th century, notably “Brid one brere” (possibly from the 13th century) and the Rawlinson lyrics, “Ich am of Irlaunde,” “Of euerykune tre,” “A1 nist [night] by the rose, rose,” “Maiden in the mor lay,” and “Dfronken] dronken.”

Because the evidence is so fragmentary, much of the early history of the ME secular lyric must be conjectured. How much of it is popular in origin? How much is literary? There can be no doubt that a popular tradition existed; it occasions the clerical diatribes that preserve some of the early fragments. And probability suggests that some English poets were influenced by the clerical, goliardic, and courtly traditions of verse. A debate poem of the 13th century, "The Thrush and the Nightingale," shows evidence of all three influences: it has learned allusions to Adam, Samson, Alexander, and Constantine; it offers spirited antifeminist satire; it adduces romance (Sir Gawain) and the love ethic of courtly poetry—*driwerie*, *hendinese*, *curteisie*. Similar evidence appears in a religious lyric, Friar Thomas of Hales's "Love Ron," written for a young woman to whom Christ is portrayed as a noble lover, a "soth lefmon."

Of particular interest is the relationship of the English love lyrics to continental models. The paucity of amorous verse—only the Harley Lyrics provide a substantial body of evidence—makes analysis difficult. But Anglo-Norman culture in 13th- and early-14th-century England clearly must have introduced to English poets the forms, motifs, and concepts of French *chansons d'amours*. It is even possible that the more complicated meters of the Harley poems owe a debt to Provençal troubadours, some of whom accompanied Eleanor of Aquitaine to England in the 12th century. Until more evidence comes to light, one can only speculate.

The early lyric tradition in England culminates in the Harley Lyrics (late 13th to early 14th century). The remainder of the 14th century produced few extant secular lyrics apart from those composed by Chaucer, who imitated contemporary French models, not the earlier styles that may have influenced previous writers. Following Machaut, Graunson, and Deschamps, Chaucer wrote in the metrical structures of the ballade, the rondel, and the virelai (his virelais do not survive), each originally, like the carol, a dance song. Among these *formes fixes* are "complaints" (rueful statements about the exigencies of love), poems praising his lady, philosophical lyrics, verse epistles, and an ABC to the Virgin Mary. The artificiality of the courtly pieces is offset by the wit and humor of the Envoys to Bukton and Scogan, the chiding of Adam Sciveyn, the *jeu d'esprit* "To Rosemounde," and the parodie "Merciles Beaute" and "Complaint of Chaucer to His Purse."

Chaucer's lyrics, of which many probably do not survive, are the foundation for the secular lyrics of the 15th century that pretend to some refinement. Noteworthy among these are poems associated with Charles of Orléans. But the courtly tradition degenerates after Chaucer, the verse becoming exceedingly artificial, sometimes serving merely as a vehicle for music. It is significant that the first Chaucer epigone, Thomas Hoccleve, wrote no courtly lyrics, only eight begging poems and three parodie rondeaux to Lady Money.

The parodies recall Chaucers “Complaint to His Purse”; the begging poems, like Chaucer’s, introduce personal references that give the “universal” voice typical of medieval lyric a different pitch, that of an individual, historical personage. Lydgate, another follower of Chaucer, wrote nearly 80 secular “lyrics,” including eight love lyrics, eight antifeminist satires, a begging poem, and numerous occasional, practical, and moralistic poems. The writing is competent, not as florid as that of Lydgate’s aureate religious lyrics, and it occasionally shows some sensitivity and wit. But in this verse Chaucers seed can scarcely be said to have flourished.

Perhaps because more verse survives from the 15th century, it preserves a variety not seen among earlier extant lyrics: mnemonic poems, charms, gnomic verse, epitaphs, poems about money, occasional verse, punctuation poems. The more engaging lyric poetry in the 15th century tends to be “popular” in tone: drinking and feasting songs, holly-and-ivy poems, minstrels’ verse; vulgar treatments of love, marriage, and sex, with double entendres. The vitality of the popular voice is eventually grafted onto the stock of learning, especially by the so-called Scottish Chaucerians writing at the end of the century. Only then does one find a truly inventive energy invigorating the conventions of late-medieval secular lyrics. Especially notable is Henryson’s “Robene and Makyne,” a pastourelle with an ironic *carpe diem* theme, precursor to Dunbar’s parodie portrayal of rustic lovers (“In secreit place”); also Henryson’s burlesque “Sum Practysis of Medecyne,” which anticipates the spirited vulgarity of language in Dunbar’s raucous poems. Dunbar’s verbal brilliance, however, coruscates in the high style as well as the low. Whereas Henryson opts for clarity and economy of expression, Dunbar takes the heavy gilt of Lydgate’s most ornate language and makes it sparkle.

The Englishman Skelton, Dunbar’s contemporary, seems also to have been drawn to more popular, less refined modes of writing. Initially working the vein of Lydgate’s aureation, in due course he gave it up for a rollicking style now known as Skeltonics. The poems in this idiosyncratic style, however, had little influence on subsequent verse. The songs and lyrics of the Tudor tradition, virtually untouched by Skelton or the Scots, grew from the conventional, impersonal verse of the 15th century. It was soon cultivated in the Petrarchan manner by Wyatt and Surrey, and with the advent of the Italian influence the ME lyric may be said to have come to an end.

M

Magna Carta (The Great Charter)

Issued by King John in June 1215 at Runnymede, in Surrey. In form the document is a royal charter, in Latin, granting privileges to “all the free men of our realm”: in fact it consists of concessions that the king made in hope of ending the baronial rebellion that had broken out against him in the autumn of 1214.

The Charter may be modeled in part on the coronation charter of Henry I. It was based largely on several lists of demands prepared by the king’s baronial opponents in the spring of 1215, though the Charter is often less radical than these antecedent drafts. The final versions relatively moderate tone has been credited by various scholars to several factors: the need of both sides to compromise to achieve an agreement; the influence and drafting habits of the royal scribes probably responsible for its actual wording; and the mediation of Archbishop Stephen Langton and, perhaps, William Marshal, earl of Pembroke, who was soon to be regent for John’s son, Henry III.

The motives of the drafters of the document have been interpreted very differently. At one extreme they are seen as foresighted and altruistic, desiring to establish liberty for all persons in England. At the other they are viewed as reactionary and selfish, attempting to roll back the tide of expanding royal power and restore good old days when the barons dominated government and law.

The history of the Charter is complicated. In July 1215 John requested that the pope quash it. Innocent III replied by issuing a papal bull, dated 24 August, in which Magna Carta is annulled on the grounds that the king had been coerced into sealing it. Civil war was already brewing, again, over questions of the interpretation and enforcement of the Charter and grew worse after the papal bull became known about the end of September. After John’s death in 1216, in an attempt to calm the situation, the regents for the young Henry III hastily re-issued the Charter, shorn of many clauses either relevant only to the situation of 1215 or offensive to the royalist position.

In 1217 the same authorities carefully edited the Charter and reissued it

again. The last reissue of Magna Carta, with relatively few changes, was made in 1225 by Henry III, now an adult, “spontaneously and of his own good will,” in return for the grant of a tax. In 1217 the clauses of the charter of 1215 concerning the forest law (clauses 44, 47–48) were expanded into a separate document, the Charter of the Forest. The name “Magna Carta,” the “Great Charter,” developed in the 13th century because the document so called is the longer of the two charters which, from 1217 on, have shared a common history.

Because Magna Carta was never again reissued, the text of 1225 remained the legally valid version; but both charters were confirmed, without changes in wording, over 50 times between 1237 and the early 15th century, sometimes in moments of political tension. The most significant confirmation occurred in 1297, when, in the “Confirmation of the Charters,” Edward I recognized Magna Carta and the Charter of the Forest as statutes.

After the first quarter of the 15th century the charters lost their role in political disputes; knowledge of them was preserved primarily in the context of legal cases, until, in the early 17th century, the parliamentary opponents of the Stuart monarchs revived Magna Carta as a symbol of the rights of Englishmen, which they saw themselves defending against royal attacks. The American colonists took Magna Carta as a touchstone of rights from these parliamentarians, especially Sir Edward Coke. The constitution of each state in the United States incorporates portions of Magna Carta in some form, and several provisions of the federal constitution derive directly or indirectly from it. In Great Britain the movement for law reform of the 19th and 20th centuries has resulted in the repeal of all but four clauses; only clauses (cl.) 1, 39, 40, and the general saving clause added in 1217, are still in force.

Given its genesis, the 1215 version can be read as an indictment of the conduct of royal government by John and, to some extent, of Henry II and Richard I. It can be presumed—and confirmed by comparison with the extant earlier drafts—that most of what John promised were concessions to the demands of his opponents; they therefore indicate what the barons did not like about the way the king had been running the country.

Two of these clauses have nonetheless been important throughout English and American history: clauses 39 and 40. In clause 40 the king promises not to sell, deny, or delay justice. In clause 39 he promises not to punish, in various specified ways, any free man “except by the lawful judgement of his peers or by the law of the land.” Despite a great deal of dispute about the exact meaning of those phrases in and after 1215 there is a clear line of development, recorded in 14th-century statutes, from “law of the land” to “due process of law.” The interpretation of “judgement of peers” as “trial by jury” is a more modern phenomenon, primarily of the 17th century. These two clauses, which together express a timeless ideal of impartial justice, are primarily responsible

for the reputation of Magna Carta as the foundation of liberties for citizens of countries deriving their political and legal traditions from medieval England.

Most of the clauses, however, are more specific to their 13th-century context. A good many are concerned primarily with abolishing detested practices by which John had tried to coerce or frighten the barons into obedience; the taking of hostages and charters (cl. 49, 58–59) and use of mercenaries as soldiers and royal officials (cl. 50–51). These all disappear from the document by the 1216 reissue. Others, most of which remain in the reissues, impose limits on the king's demands for various services from his feudal tenants: the amounts chargeable for reliefs are set (cl. 2); the exercise of the feudal incidents of wardship and marriage is regulated (cl. 3–6, 37); widows' rights are protected (cl. 7–8); consent is required for scutages—money paid to the king in lieu of providing knights for battle—and all feudal aids except for specific types (cl. 12, 14); increased and additional services are forbidden (cl. 16, 23, 29, 43); baronial custody of vacant baronial abbeys is confirmed (cl. 46). Clauses 15 and 60 require that the barons grant their own vassals the feudal concessions that the king has granted them.

Another sizable group of clauses, most of which, again, remain in the reissues, regulate the conduct of royal government: methods used to collect debts due the king (cl. 9–11, 26–27), royal profits from administrative districts (cl. 25), and purveyance, the acquisition of foodstuffs for the king's household (cl. 28, 30–31). Still others concern royal justice: the enforcement of clause 39 (cl. 52–53, 56–57), the qualifications of royal justices and other officials (cl. 45), aspects of the holding of royal courts (cl. 17–19, 24), unsupported accusations by royal administrators (cl. 38) and by women (cl. 54), the means of assessing judicial fines (cl. 20–22, 55), and royal rights over the lands of felons (cl. 32).

Praecipe, a writ that, the Charter alleges, might cause a “free man” to “lose his court,” is abolished (cl. 34), but the “writ of life and limb,” which enabled a person accused of felony to avoid trial by battle under certain circumstances, is to be available without charge (cl. 36). In addition the first clause confirms the liberties of the church, referring to concessions John had already made in 1214; several clauses make grants whose principal beneficiaries were merchants (cl. 13, 33, 41–42) or their customers (cl. 35).

The last three clauses (61–63) provide a general enforcement mechanism, pardon royal subjects for opposition to the king, and formally enact all that precedes. Of these clause 61 holds the greatest interest, for in it the drafters of the charter confront the problem of how to force the king to adhere to the document. The solution is that he grants the barons the right to choose 25 of their number to constitute a committee that operates by majority rule when all its members cannot agree. The committee is to oversee royal adherence to the document, to hear complaints of noncompliance by the king and his officials,

to remonstrate with the king about such failures, and, if necessary, to “distrain and distress us [the king] in every way they can, namely by seizing castles, lands and possessions, and in such other ways as they can, saving our person and those of our queen and our children, until, in their judgement, amends have been made.” Although this is not quite a license to wage war on the king, such disputes over the meaning and enforcement of the charter were exactly what led, in the months after its issuance, to the recurrence of armed struggle between the king and his opponents among the barons.

Magnificat

The Magnificat, or Song of the Blessed Virgin Mary (Luke 1:46–55), was invariably sung or said at the office of Vespers, preceded and followed by the appointed antiphon. In the Salisbury Rite, as in most others, it was chanted to a

more ornate version of the appropriate psalm tone, this and its ending being determined by the accompanying antiphon. The intonation was included in every verse, not just the first as in normal psalmody.

From the 14th century we find polyphonic settings of the Magnificat; English settings are the earliest known. It could also be sung in *faburden*, a form of three-part polyphony based on the chant and so simple that it could be improvised. The lowest part of such improvised polyphony (the *faburden proper*) could also be detached and used as the basis of more elaborate polyphonic settings, and this was indeed the usual method in the later Middle Ages in England. In at least one case, however, the so-called *faburden* is derived from the lowest voice of a notated 14th-century mensural setting, so that it is in fact, by definition, a “square.” Magnificat *faburdens* in general seem to inhabit the border between the derivatives of improvised and simple written polyphony.

The polyphonic Magnificat was widely cultivated in the 15th and early 16th centuries by such composers as Dunstable, Fayrfax, Ludford, Taverner, and Cornysh. It was usually, though not invariably, a setting of the even-numbered verses of the canticle and made use of the *faburden* of the chant. The procedure in such cases was not that of a *cantus firmus* but rather was motivic in technique. In these circumstances the identification of the tone on which the Magnificat is ultimately based (and to which the alternate verses must be sung) has occasionally proved difficult. But Taverner’s three settings are all directly built on the tone itself; and there is a *faburden* setting for organ of the odd-numbered verses (minus the intonation to the first verse) bearing the quaint title “The viij tune in c faut”—that is, it is derived from tone 8 transposed down a 5th.

Malmesbury Abbey

Of the Romanesque Benedictine abbey church of Malmesbury, in Wiltshire ([fig. 90](#)), which was probably commenced by Abbot Peter Moraunt (1140–58), the nave survives as the parish church albeit with the west front and three western bays only partially preserved. The west wall of the south transept remains to the top of the triforium, and the northeast crossing pier is extant with adjacent stumps of the north transept and the north side of the presbytery with its aisle. High rib vaults covered the presbytery and transepts, but the nave was originally wood-roofed, as evidenced by the continuation of the triple wall shafts to the top of the wall above the early-14th-century lierne vault. Rib vaults were used in the presbytery aisles and are still extant in the nave aisles and south porch. The elevation comprises a pointed main arcade on columnar piers, a round-headed false gallery, and a (remodeled) clerestory with wall passage.

Fig. 90. Malmesbury Abbey, nave interior. Courtesy RCHME, copyright Batsford.

Numerous motifs, including the pointed arches, beaded medallions around the clerestory windows, and arched corbels beneath the presbytery gallery

stringcourse, may be associated with Burgundy and possibly serve as a visual reminder of Peter Moraunt's earlier career as a monk at Cluny and prior of La Charité-sur-Loire. However, the detailing speaks of a West Country training for the master mason: the pointed arches on columnar piers were earlier used at Exeter Cathedral (after 1114), and beaded medallions appeared at Hereford Cathedral (after 1107–15) and on the triumphal arch and presbytery south windows at Llandaff Cathedral (after 1120). The rich articulation of the main arcade and gallery arches evolves from the nave of Gloucester Cathedral ([fig. 68](#): see GLOUCESTER CATHEDRAL; witness the twin soffit rolls and the label masks of the main arcade and the 90-degree chevron in the gallery. The triple shafts above the main-arcade capitals recall those in the dado arcade of Evesham Abbey gatehouse, while the dragon's-head label stops appear in pre-Conquest Deerhurst Priory.

The magnificent south porch is probably inspired by southwestern French models like Moissac, even though there seems to be no parallel either iconographically or stylistically with work in that region. Christ in Majesty, flanked by flying angels, occupies the small tympanum of the south doorway. The tympana of the side walls of the porch are carved on a large scale with apostles, while on the entrance arch to the porch five orders are enriched with stylized foliage patterns, and three medallions occupied with virtues and vices from the *Psychomachia*, and with Old and New Testament scenes. Iconographically the sources are Anglo-Saxon, while stylistically the figures belong with those inspired by Bishop Roger's work at Old Sarum, such as the Christ above the north doorway at Lullington (Somerset).

The richly arcaded west front of Malmesbury stands at the beginning of the tradition of the screen facade in English architecture, as at Wells ([fig. 122](#): see SCREEN FACADES) and Salisbury cathedrals. Details of the Malmesbury facade, like the alternation of continuous and noncontinuous orders of the west doorway, and continuous orders in blind arches, are also influential in the local West Country School of Gothic architecture.

Malory, Thomas (1414/18–1471)

One of the latest and most effective of the many medieval writers about King Arthur and his knights of the Round Table. In his book traditionally called *Le Morte Darthur* (*The Death of Arthur*) Malory gathers together the results of centuries of storytelling, mainly by medieval French authors. He synthesizes the narratives into one massive, varied book of the life, acts, and death of Arthur and his company. The wealth of incident, rich implications, and laconic style make his the only version of the huge number of medieval Arthurian tales in European languages that continues to be read directly and simply for pleasure by the modern reader. The main characters—King Arthur himself; Sir Lancelot, his best knight, but also lover of his queen, Guinevere; his sister's son the violent Sir Gawain; his incestuously begotten son and nephew Sir Mordred, who kills him; Merlin the magician—are at the center of a set of tales of wonders, bravery, love, joy, and tragedy. But Malory tells romance as history—the history of England said to be in the 5th century, but actually represented in terms of the feelings, strivings, ideals, betrayals, even the armor and the geography (e.g., Camelot is identified with Winchester) of Malory's own troubled 15th-century England. Malory's achievement is the source of many of the retellings of Arthurian story so common today in the United States and Britain.

Life

Identification of the Sir Thomas Malory who names himself as author of *Le Morte Darthur* has been controversial, but thanks to the work of P.J.C. Field and others it seems once more to be probable that he was the Sir Thomas Malory of Newbold Revel in Warwickshire. He was the son of a country gentleman, inherited his lands in 1433 or 1434, was knighted, and perhaps served as a soldier in France. In 1445 he became a member of parliament—a sign of gentry status, not of democratic election. He also became embroiled in

the factional disturbances of the times and was on numerous occasions in the next ten years accused of such violent crimes as ambush, rape, extortion, cattle stealing, theft of money, and prison breaking. He underwent a series of imprisonments and despite his escapes spent much time in jail. Some of the accusations, perhaps some of the violence, may have been politically motivated, for Malory supported various noblemen (including Warwick the “Kingmaker”) who contended for power during the Wars of the Roses, following now one king, the Lancastrian Henry VI, and now another, the Yorkist Edward IV.

After a period of freedom Malory spent the years 1468–70 in prison, where he wrote *Le Morte Darthur*. The book is full of violent adventure and concludes in civil war and Arthur’s death. But it is also deeply concerned with the high ideals of chivalry, with honor, loyalty, and goodness. It may seem that the book’s inherent nobility contrasts strangely with the apparent criminality of the author. But perhaps Malory saw himself in imagination as a modern Sir Lancelot fighting for and asserting his own and his lord’s rights against other “false recreant knights,” as he might have called them.

Text

Two versions of *Le Morte Darthur* survive, neither originating immediately from Malory’s hand. One is the edition printed by Caxton in 1485, reprinted 1498, 1529, 1557, circa 1578, again (somewhat changed) in 1634, then not again till 1816. In the later 19th century began the modern series of editions based on Caxton, including that notoriously illustrated by Aubrey Beardsley (1893–94). But in 1934 a manuscript of *Le Morte Darthur* now in the British Library (Add. 59678) was discovered in Winchester College; it was first edited in 1947 by Eugène Vinaver.

The Winchester manuscript contains a text slightly different from Caxton’s, including fuller versions of eight addresses by Malory to the reader, varying in length from a few sentences to the paragraph at the end of the whole book. They come at the end of substantial sections and are known as *explicit*s (*explicit*, “it is finished”). From these *explicit*s Vinaver deduced that, instead of one book, Malory wrote eight entirely separate romances. Their apparent separateness is enhanced in his edition by such typographical devices as capitals at the end of the sections for which there is no manuscript justification. Vinaver’s edition is thus confusingly entitled *The Works of Sir Thomas Malory*. Virtually all scholars and critics now reject this concept of totally separate works but do accept the episodic nature of the work even

within the eight main sections and the existence of a number of inevitable inconsistencies both between and within the main sections.

The Winchester manuscript is separated from Malory's own writing by at least one intermediate copy and lacks a few leaves at beginning and end. Although Caxton had the Winchester manuscript in his shop for a period of time, his own edition differs from it significantly. He edited the text by cutting it into 21 books comprising 507 chapters, adding a fine Prologue and chapter headings, reducing some of the *explicits*, shortening (to its advantage) the episode of the Roman War by almost half, and making some other minor verbal changes. By comparing the two versions we can reconstruct Malory's authentic text, which is now most nearly approached by Vinaver's edition.

The language of the Winchester manuscript and Caxton's edition is mainly standard mid-15th-century London English, with occasional northernisms. Being prose, it is easily modernized; the original, though old-fashioned and containing a few unfamiliar words, offers no difficulty apart from idiosyncratic spelling. As a narrative the story is engrossing, but it is not at all like a modern novel, and to read it as such is to court disappointment and misunderstanding.

Summary

Malory plunges straight into his story, telling of the begetting of Arthur by Uther Pendragon, king of all England, on the beautiful widow (as she has just unwittingly become) of the duke of Cornwall, Uther being magically transformed by Merlin into the duke's likeness so as to enter her bedroom. The laconic matter-of-fact style, concentrating on essentials, contrasts piquantly with the drama of passionate feeling and the magic. This contrast, much developed, is part of Malory's unending fascination. As his great story progresses, he makes less use of magic, though it is always an element of mystery in the background, suggesting a dimension beyond the material world and becoming prominent again near the end, with the return of Excalibur to the lake and the queens who carry off the dying Arthur.

We learn of Arthur's fostering, his acceptance as king by the miracle that he alone can draw a sword from a stone, and the gradual establishment of his power over dissident barons and neighboring kings. Merlin's magic helps. Arthur lusts after King Lot of Orkney's wife, Morgause, mother of Gawain and other heroic knights and, unknown to him, his own half-sister. On he begets Mordred, who will ultimately be his death. Arthur loves and marries Guinevere, though Merlin warns him that she and Lancelot will love each other. She brings with her the Round Table, which henceforth will denote the

elite company of knights in Arthur's court.

This first section thus sets the scene and establishes Arthur's supremacy, though with its account of wars it is a little less typical of Malory's mature style, which concentrates more on individual adventures. Malory is attempting to summarize his complex sources of French prose romance, turning them into a kind of history, and minor inconsistencies inevitably arise. This section also contains the tragic tale of the brothers Balin and Balan; with its concentration on individuals, its fated accidents, nobility of temper, deceit, dissension, and tragedy it is as stark and moving a story as any Icelandic saga.

But there are also stories of mystery, magic, adventure, betrayal, and mishap that end in triumph. Arthur gains the magic sword Excalibur from the Lady of the Lake. The noble concept of the High Order of Knighthood is affirmed, reinforced as it is by the oath, sworn by knights of the Round Table at the annual feast of Pentecost, never to do wrong, always to honor ladies, and so on.

Malory's *explicit* to the first main section refers to himself as a "knight-prisoner" and appears to suggest that he may not be able to continue to write. But the opening words of the second section echo this *explicit* so clearly as to make continuity certain. This next section is based mainly on a 14th-century English alliterative poem, the *Morte Arthure*, which makes Malory's own style more alliterative. It tells how Arthur rejects the obligation to pay tribute to the emperor of Rome and how he wages successful war right into Italy. Here Lancelot makes his first appearance as a brave young warrior.

The third main section moves into the area Malory has made his own for ever—the feats of individual knights wandering in search of adventure in strange forests and castles. The hero of this book is Lancelot himself, Malory's favorite knight, killing wicked knights, rescuing ladies, resisting seduction. He is rumored to be the lover of Queen Guinevere, which he denies, and Malory does not describe their love. It is a relatively short section, delightfully varied and vividly interesting in event, created from a cunning selection of incidents widely spaced in Malory's voluminous source, the French prose *Lancelot*.

Having now established both Arthur with his Round Table and Lancelot, the supreme example of chivalry, Malory turns in his fourth section to the story of another knight, significant to the whole history, exemplary in himself, and an adornment to the Round Table—Sir Gareth of Orkney, brother to Sir Gawain. The source is unknown. The story is based on the familiar general pattern of the Fair Unknown, who is a young hero, handsome, brave, and clever but unrecognized. He achieves success by defeating foes older and more experienced than he, winning his beloved, and establishing his identity and his place in society. This has been termed a version of the "family drama," common in fairy tale and romance. It also illustrates the Malorian themes of

bravery, noble bearing, and courtesy.

There follows the long section, over a third of the whole work, centered on the story of Tristram and Isolde, with so many other knights and adventures intermingled that it is impossible to summarize adequately. The ancient tragedy of Tristram's and Isolde's obsessive mutual infatuation had already been diluted by Malory's French sources, and at the end of Malory's version the lovers retire to adulterous bliss in Lancelot's castle of Joyous Gard. Tristram is here an adventurous knight similar and almost equal to Lancelot. He has a jesting companion, Sir Dinadan, who brings commonsensical skepticism to the craziness of knight-errantry but is a good knight of his hands for all that. King Mark, husband of Isolde, is portrayed as a treacherous villain. Only incidentally, in a later section, is Mark's murder of Tristram noted. This Tristram section, full of adventures, disguises, unexpected meetings, unexplained departures, and arbitrary battles, has all the mystery and excitement of romance. It is the part of Malory's work least like the world of plausible appearances of the novel.

A digression toward the end of the Tristram section tells how Lancelot was tricked into begetting Sir Galahad upon Elaine, daughter of Sir Pelles. This leads naturally to the sixth section, in which Sir Galahad, now a pure virginal young knight, comes to King Arthur's court. Miraculous events initiate the Quest of the Holy Grail. The Grail, according to Malory, is the dish from which Christ ate with the apostles on Easter, brought to England by Joseph of Arimathea and endowed with properties both holy and magical. Hermits exhort the knights in their quest, visions and allegories abound, though Malory greatly abbreviates the religious didacticism of his French source. Only Galahad, Percival, and Bors succeed in seeing the Grail; Galahad and Percival both die, passing beyond human ken, and Bors is the only successful Grail knight to return to Camelot. Lancelot is granted only a partial vision of the Grail. He is flawed by his love of Guinevere, but Malory changes the monastic spirit of the original, so that Lancelot remains in a sense the hero. Despite all the changes many beautiful and magical scenes remain, as in the appearance of the ship with Percival's sister.

The last two sections of *Le Morte Darthur*, the seventh and eighth, may be considered as one, for they tell of the supreme glory of the Round Table and its tragic end in a series of closely connected episodes. Malory's art is here at its greatest. He blends French and English sources, but what he makes, fleshed out with his own invention, is entirely his own and one of the great achievements of English literature. The core of the story is the continuing love between Lancelot and Guinevere, and the determination of some malcontents to trap them, so that King Arthur has to condemn them. Lancelot has to rescue the queen three times, and on one occasion he accidentally kills Sir Gareth, his

beloved friend, whom he had himself knighted. This joins Gareth's brother Gawain to Lancelot's enemies, and eventually Arthur is forced by Gawain to declare war on Lancelot.

During Arthur's absence at the war Mordred claims the throne and attempts to marry Guinevere. Ultimately, after Gawain has repented of his vengeful feud against Lancelot and died from wounds, Mordred confronts Arthur in battle. The bastard son and noble father kill each other in the desolation of the corpse-strewn battlefield. Arthur dies slowly by a "water-side." Excalibur is thrown into a lake and a hand mysteriously grasps it. Queens come in a boat to take Arthur to Avalon. It is an unforgettably eerie scene, rich in the ancient potent symbolism of the separation, dissolution, and healing power of death. Guinevere enters a nunnery; after a final interview with her Lancelot withdraws to a hermitage, and they die without meeting again.

No mere summary can convey the power, beauty, and pathos of these two sections. Much of the action is conveyed through brilliant terse dialogue, occasionally with a touch of grim or sarcastic humor. There is a wealth of incident in such episodes as Lancelot's rescues of Guinevere, or in the beautiful account of the Fair Maid of Ascolat (later spelled Astolat), who dies for love of Lancelot, or the moving story of Lancelot's healing of Sir Urry. The best knight in the world weeps in humility as he performs the miraculous cure, yet he is the one who causes the destruction of Arthur's Round Table.

Malory's imaginative world is narrow. It is composed only of Arthur, of good or bad knights, and a few desirable or treacherous ladies who, with two or three exceptions, are hardly more than ciphers. No ordinary concerns of life appear. Simple themes are illustrated by simple actions, performed by characters with few traits and virtually no inner life. Yet Malory's earnest concentration on fundamental issues of loyalty, love, and combat, guided by a complex system of honor, is intensely alive. The encounters, friendly or hostile, the wanderings, the seemingly arbitrary events combined with the sense of destiny, the comradeship and the betrayals, create a profound symbol of life that we can easily relate to. Malory's prose creates a sense of the man as in his essence he would be: no mere "narrator" but writing directly to us in the colloquial yet dignified manner of a brave and courteous country gentleman, on a subject that deeply matters to him, the history of Arthur, of England, of all of us.

Mandeville's Travels

A 14th-century account of the Near and the Far East. The English versions of the work, like those in eight other languages, are translations, the original having been written in French, probably around 1357, possibly on the Continent, by an unknown author. There is little specifically English or even French about the book, which is as heterogeneous as the world it describes, being at once a guide for genuine and vicarious pilgrims to Jerusalem and the Holy Land, a piece of crusading propaganda, a satire on the moral and political failings of Latin Christendom, an ethnogeography and natural history of northern Africa and Asia, an extended argument that natural law has given all peoples some knowledge of God, and a collection of tales and “diversities.”

Still *Mandeville's Travels* has at least one important connection with England: its claim to be the work of a certain John Mandeville, knight, born at St. Albans near London, who traveled the world for 34 years (1322–56) before returning home to write about “some part of the things that are there.” This claim found ready acceptance for five centuries, and the book came to occupy “a special place in English literature” (Bennett, 1954: 9). Only in the 19th century did scholars show both that the *Mandeville* author was not “the father of English prose” and that he may not have traveled at all. Following the common medieval practice of rewriting other works, he compiled his imaginative “memoirs” from numerous sources, among them William of Boldensele's pilgrimage itinerary (1336) and Odoric of Pordenone's account of the Far East (1330).

The compilation was so popular with European audiences that roughly 300 manuscripts have survived. Nor did its popularity wane with the invention of printing, the first editions appearing as early as the 1480s. Unraveling the complicated textual tradition has proved difficult, however. Scholars have shown that the French original gave rise to two independent scribal traditions, one continental, the other insular or “English.” The latter is represented by some 80 manuscripts, dating from 1390 on, all of which are considered

descendants of an Anglo-French version of the original: 3 Irish, 13 Latin, 21 or 22 French, and 44 English. The English manuscripts represent at least six separate versions of the *Travels*, including an abridgment, a metrical adaptation, and a stanzaic fragment.

Most numerous of these is the Defective version, so called because of a large gap in the text. Found in over 30 manuscripts and frequently printed from 1496 on, this version was the only English text available until 1725, when the unique Cotton version appeared (BL Cotton Titus C.xvi). In 1889 another unique manuscript was published, the Egerton version (BL Egerton 1982). Only the Cotton and the Egerton versions offer full texts, Cotton being closer to the Anglo-French source but less assured than Egerton. Partly because of its closeness to a French source, and partly because the Egerton version was not readily available until 1953, the Cotton text has become the most commonly cited English version. Hannas arguments for the Defective version as “the English *Mandeville*” have some merit, but it is worth remembering that there is no consensus on “what a Mandeville text should be” (Hanna, 1984: 123).

Mandeville's Travels opens with a prologue that sounds like a call for a crusade, but the book is far more than crusading propaganda. Intended for those who want to “hear speak of the Holy Land” and of the “many diverse lands... [and] diverse folk ... of diverse customs and laws,” the book considers the Near East in considerable detail (Cotton text, chs. 1–15) before turning to other lands, mainly in Asia (chs. 16–34). A useful visual analog to its world may be found in the encyclopedic medieval world maps, such as the Hereford and Ebstorf *mappaemundi* or the *Catalan Atlas*. The book is mostly organized as a descriptive itinerary (“and from there one goes to...”), using its roughly linear geographical tour as an opportunity for presenting information and telling an occasional tale. Subjects touched on include pilgrimage and travel routes, sites and relics in the Holy Land, different religious and social practices, languages and alphabets, geography, the Sultan of Egypt, the Great Khan, Prester John, curious flora and fauna, and monstrous races.

We hear little of “Sir John’s” own experiences as a traveler, yet one gets a distinct sense of his personality: faithful yet skeptical, pious yet curious, humble yet brazen, genial and humane yet mercenary (he claims to have fought for the Sultan of Egypt against the Bedouin and for the Great Khan against the King of Manzi). So striking is this almost Chaucerian narrator that many readers have been tempted to see him as a portrait of the author, though the matter is uncertain at best.

As a literary work *Mandeville's Travels* offers little out of the ordinary. A few internal cross-references show that it was constructed with some thought to the whole, but its form is largely a matter of convenience. This is also true of its paratactic prose style, which nevertheless has a certain charm and even a

compelling directness. For most modern readers the book's interest will lie in its curious content, not its style, and they will read the text as a "romance of travel" (Bennett, 1954: 39–53).

This may well have always been the case, but with one important difference where early readers are concerned: for them romance and history were not necessarily as distinct as we assume them to be, and Sir John's "romance" could easily have been read as true. In some Latin and French manuscripts, for example, it appears alongside Marco Polo's *Travels*, each presumably confirming the truth of the other. Also there are few adaptations like the Metrical version, which treats the *Travels* largely as a collection of stories and diversities. The surviving versions suggest that those texts offering more than entertainment were also more popular. Although it often appears alone in manuscripts, the *Travels* is sometimes found alongside other texts: *Piers Plowman* five times, the *Prick of Conscience*, and various religious texts in prose and verse. Here, one suspects, the book was being read for its concern with the state of Christendom, for its information about Christian history, and perhaps even as a devotional text. Nor was the book's early audience restricted to those who wanted entertainment, history, or piety. Cosmographers and explorers like Richard Hakluyt and Martin Frobisher turned to it for information; for them it was "a *summa* of travel lore" (Howard, 1971: 2). There is nothing else in ME quite like it, even among other geographical and travel writings.

Manning, Robert (fl. 1303–38)

Author of two long ME poems, *Handlyng Synne* and the *Chronicle*, or *Story of England*. Most of the facts about his life come from his own information in these works, especially in the prologues. He was a canon of the Gilbertine order, which had its main strength in Lincolnshire. He writes that he is “of Brunne,” that is, Bourne in south Lincolnshire. Around 1300 he was at Cambridge, where he met Robert Bruce; perhaps he was a student there at the Gilbertine house of St. Edmund’s Hall. He began *Handlyng Synne* in 1303 while at Sempringham, the mother house of the Gilbertines, a few miles north of Bourne. An independent record of 1327 notes him as a chaplain in Lincoln. It was apparently at Sixhills Priory, northwest of Lincoln, that he completed his *Chronicle* in 1338.

Handlyng Synne (Manning’s title means “Treating of Sin”) is based on an Anglo-Norman treatise, the *Manuel des péchés*, attributed to one William of Waddington. Almost 13,000 lines long, it is an aid to confession, directed at

“lewde men” (i.e., the laity), giving basic and practical guidance on church teaching, and structured around the Ten Commandments, the seven deadly sins, the sin of sacrilege, the seven sacraments, and the twelve rules and graces of confession. Manning writes in a straightforward style in four-stress couplets for those who like to listen to “talys and rymys,” so as to draw them away from foolish stories to spend their time more profitably. To this end the consequences of sinfulness are illustrated by a series of embedded tales, so that the structure of the work is akin to that of Gowers *Confessio Amantis*. Manning adds a number of local stories to his Anglo-Norman source, such as those of the sacrilegious Norfolk knight who was reproved by a villager for allowing his cattle to graze in the churchyard, and the Lincolnshire executors who took the testator’s money for themselves.

The point of the work is to show how “we handel synne every day,” and so for Manning sin is no abstract concept but a matter of everyday behavior. Sloth is the rich man who, unconcerned with Matins and other such “giblets” (extras), spends a leisurely Sunday sleeping late and playing chess. Pride is the desire to be called “lorde or syre,” “madame or lady”; it is the man’s delight in “ryche beddyng, yn hors, yn harneys,” and the woman’s delight in saffron wimples, covering yellow skin with yellow cloth—“yelugh under yelugh they hyde.” The message constantly repeated throughout *Handlyng Synne* is that sin is ever present and must be confessed to a priest. Salvation is possible only through the good offices of the church, which in response must be supported by the laity with bequests and payment for masses for the dead.

Handlyng Synne is preserved in whole or in part in nine manuscripts, of which the most complete are the three closely related texts in Bodleian Library, Bodley 415; Washington, D.C., Folger Library V.b.236; and BL Harley 1701, all from the earlier 15th century, as well as the later CUL Ii.4.9 and Yale University Osborn a.2.

The *Chronicle* falls into two parts, both based on works by Anglo-Norman writers. The first part, beginning with the flight of Aeneas from Troy and the settlement of Britain by his descendant Brutus, and ending with the reign of Cadwalader, is legendary, derived principally from the 12th-century *Romande Ærarby Wace*, with additional material from Bede, Geoffrey of Monmouth, and other sources. It consists of nearly 17,000 lines in four-stress couplets. The second part, which takes the account up to the death of Edward I in 1307, relies mainly on the Anglo-Norman *Chronicle* of Peter of Langtoft, with additional material from such historians as Aelred of Rievaulx and Henry of Huntingdon, the “romance” of Richard the Lionheart (probably in French), and some information Manning has collected from oral sources. This part contains over 8,300 lines in alexandrine couplets (six-stress lines), varied with occasional tail-rhyme stanzas and four-stress couplets.

The tone of Manning's *Chronicle* is nationalistic. Following Langtoft, Manning venomously denounces the Scots for their wars with Edward I and in virulent tail-rhyme stanzas exults in their defeat. He glories in the crusading exploits of King Richard and portrays Arthur's court as the summit of European civilization, while complaining that English readers have to go to French books for accounts of Arthur's adventures. He is particularly interested in local events and, knowing the English romance of *Havelok*, is puzzled because no authoritative historian has given an account of this Lincolnshire hero.

The *Chronicle* was written at the behest of Robert of Maltón, probably a Gilbertine from Malton Abbey in Yorkshire. One of the motives for the commission was presumably an attempt to mobilize sentiment against the Scots, since the Gilbertines together with the Lincolnshire population as a whole were financially heavily involved in the Scottish wars of the 1330s. Also expressed in the *Chronicle* is the bitter resentment felt by the English people at the serfdom imposed by their lords. Manning traces this back to the coming of the Normans, thereby aligning the Gilbertines with the local population with whom they lived in mutual dependence.

The *Chronicle* survives in two manuscripts, a somewhat abbreviated text of the later 14th century in Inner Temple Library Petyt 511, vol. 7, and a slightly revised, mid-15th-century version in Lambeth Palace Library 131. Both manuscripts are from Lincolnshire. A short fragment is also preserved in Bodl. Rawlinson D.913.

The *Meditations on the Supper of Our Lord*, a poem preserved together with *Handlyng Synne* in three manuscripts, used to be ascribed to Manning, but there is nothing to support this attribution.

Manor Courts and Court Rolls

Manor courts, also called leet courts and customary courts, performed a variety of functions, including many associated today with such disparate institutions as small-claims courts, licensing agencies, “neighborhood watch” programs, and town-council meetings. Presided over by the landlord’s steward, these courts were held in some villages every three to four weeks; elsewhere they met but once or twice a year.

As tenants who tilled the soil and raised livestock the peasants used manor courts to regulate their communal systems of agriculture. The court jurors, usually twelve in number, were local village residents. Their responsibility was to present their neighbors for such infractions as breaking fences or hedges, allowing livestock to wander onto sown fields, leaving refuse in public roadways, or polluting village streams.

The village jurors were also called upon to identify tenants who defaulted in obligations to the lord of the manor. For example, if peasants refused to

perform required work services on the landlord's demesne or transferred property without first surrendering their land into the lord's hands in court, a fine could be collected. The offenders identified by the jurors were fined, and the proceeds were collected and turned over to the landlord. The manor courts thus provided an institution that could be used by both peasant tenants and landlord to protect their respective interests.

The manor court provided a public record of contracts among local peasants and enforced them through jurors' presentments. For example, village property transfers, debt contracts, employment and family maintenance arrangements, whereby a parent surrendered property to a grown child in exchange for food and shelter, could all be included in the court's written rolls.

Jurors also enforced communal norms by fining individuals for a variety of offenses, varying from village to village and decade to decade. Sometimes the playing of games, such as tennis or cards, was prohibited. At times pre-marital sex was discouraged through the imposition of leyrwite fines (penalties for fornication, usually levied on unmarried women). Sometimes drunkenness, assault, and the theft of items under the value of twelve pence could result in a fine. Felonies were tried before royal judges and did not lie within manorial jurisdiction.

When the jurisdiction of the manor court included the view of frankpledge, the court enforced the obligations all adult men owed their monarch to associate themselves in a tithing group of at least ten members, responsible for each other's good behavior. The court might also be responsible for enforcing other royal regulations, such as the assizes of bread, ale, or victuals, which established standards of price and quality for goods sold in the village.

Finally the manor court organized the election of individuals to serve in a wide variety of official capacities associated with local government. Haywards, constables, ale tasters, and jurors, among others, were chosen, appointed, and sometimes fined for dereliction of duty.

Records of manorial court proceedings were written on strips of parchment or paper, then sewn together at the top edge and rolled up for convenient storage. Court clerks used a heavily abbreviated and formulaic Latin style until the 16th century, when English began to be used for some entries. The earliest surviving manor-court rolls date from the early 13th century, and many communities continued to record proceedings from their local courts until the early 20th century.

Manor-court records often reveal a consistent but flexible pattern in their order of business, as reminiscent of the minutes of a town meeting as of a judicial proceeding. For example, most of the entries in a series of Huntingdonshire manor rolls from the late 14th century were arranged in the following sequence. First came the list of jurors' names, followed by a notation

of the *capitagium* fine arising from the view of frankpledge, paid by those who chose not to attend the view. Next followed the names of those fined for failure to appear in court for other business, and then those presented by the ale tasters for violating the assize of ale. After the brewing fines came the list of fines collected from guilty parties in debt disputes, and then the jury presentments for assault, breaking the assizes of bread, for various agricultural trespasses, or for disputes over the raising of the hue and cry (the need to respond to the outcry with which felons were to be pursued). Frequently land transfers among the tenants were also recorded here. Finally entries recorded the election and swearing in of such officials as the ale tasters and constables.

Manor court rolls are of particular interest to historians for information about the social, economic, and demographic history of local peasant communities.

Manorialism (Manorial System)

The name historians give to the way in which medieval landlords exploited their estates and controlled rural communities. At the center of the system was the manor, the lowest unit of estate administration and local jurisdiction.

Although the institution itself goes back beyond 1066, the term “manor” appears to have been introduced by the Normans. Although two rather fragmentary pieces of earlier documentary evidence exist, the Domesday Book (1086) and a handful of 12th-century surveys of great estates are the first documents allowing more than a superficial view of the structure of manorial estates. However, it is only with the survival of large numbers of manorial account rolls and court rolls in the 13th century that the operation of the system and the activities of the landlords can be studied on a year-to-year basis and in depth.

Essentially a manor was a landed estate that provided its owner with his livelihood and at the same time conferred upon him jurisdiction over the population residing within its boundaries. It is this element of lordship that turned a landed estate into a manor; for an estate to be a manor it had to be held as a manor. The weakness of some definitions (as that of Kosminskii) is that they do not explicitly include lordship among the criteria employed.

Initially manors tended to be similar in type; in time considerable divergences from the early model—usually referred to as the “classical” manor—developed. In its classical form the manor always involved certain key elements. The land of the manor, apart from the uncultivated reserves, consisted of two parts: land directly cultivated for the landlord—his demesne, or home farm—and land in the hands of the tenants, held on a variety of tenures and for a variety of customary services and obligations.

Although persons of high social standing occasionally held land of somebody else’s manor, the vast majority of the manorial population consisted of the dependent peasantry. Tenurially speaking, tenants were classified as free or servile, according to whether they held by “free” service or “base” service. Some holdings were always regarded as free land, but it seems that from the 12th century onward customary holdings, held for cash rents only, also came to be regarded as “free.”

The main hallmark of servile (villein) holdings was their liability to heavy labor services on the demesne, particularly week work, which could be as heavy as five days a week throughout the year. Villein holdings were also subject to a payment known as “heriot,” usually consisting of the best beast, on the death of the tenant. The obligation to pay heriot came in time to be regarded a standard criterion of tenure in villeinage. In terms of personal status the population of the manor was also classified as free (*liberi*) or servile (*nativi, villani*), the latter condition being regarded as an inheritable trait.

The lord of the manor exercised jurisdiction over all those residing within

the confines of his manor, though the extent of authority was greater over persons of servile status or tenure than over persons of free status or tenure. In regions of dispersed settlement, or predominantly pastoral character, manorial control could be almost purely nominal; in areas of dense settlement, where manors often coincided with villages, it was real and direct.

What the landlord could or could not legitimately do; what was due to him, or from him to the population of the manor; what were the rights of the various categories of the manorial population—these were determined by the “custom of the manor.” At first this was unwritten, but with the appearance in the 12th century of manorial surveys, and in the 13th century of manorial court rolls, it was often committed to parchment, at least in some of its aspects. Undoubtedly some landlords did resort to arbitrary action in violation of what was right and proper according to the custom of the manor, though how frequent or widespread such arbitrary action was is a matter of controversy.

The manor was not an immutable, ossified institution. The theoretical structure of the system may have remained the same, but within that framework the way in which the landlords chose to exploit their estates changed with changing economic circumstances.

Two fundamental aspects of manorialism were particularly subject to change; the extent of demesne cultivation and, correspondingly, the extent to which labor services were exacted. When demesnes expanded, labor services tended to be more fully exacted; when demesnes contracted, labor services tended to be commuted into cash payments. Labor services also tended to be commuted when the tenantry was in the position to resist such demands, as was the case after the de-population caused by the Black Death of 1348–49 and the periodic outbreaks of the plague in the latter 14th century and throughout the 15th.

Looking at the broad sweep between 1086 and the end of the Middle Ages, we see a high degree of conformity in the way in which the landlords of the great estates—they are the ones we know most about—exploited their estates. The usual practice in the 11th and the 12th centuries was to opt for a fixed income by leasing the manors—“farming out” is the technical term—to a lessee (*firmarius*) for a fixed rent. With rising population and, from the late 12th century, rapidly rising prices of agricultural products the landlords took back their manors and not only resumed direct cultivation of demesnes but in most cases expanded them by reclaiming land from the wastes. This period of “high farming” ended for the most part in the late 13th and early 14th centuries.

Considerable contraction of arable cultivation occurred on some estates, such as those of the bishop of Winchester, and there is evidence to suggest that this may have been the result of overcultivation and soil exhaustion, though not all historians accept such an explanation. The concomitant of this

development (though other factors also played a part) was the progressive disappearance of labor services by way of commutation. The arrival of the plague in 1348–49 and its recurrences well into the 15th century brought difficult times for landlords, who suffered from vacant tenancies, lost rents, labor shortages, high costs, and, from about 1380 onward, low prices for their produce.

The cumulative effect of these difficulties led in the second half of the 14th century to a widespread and general contraction of manorial demesnes, followed—as early as the 1360s on some estates, much later on others—by the total withdrawal by the great landlords from direct involvement in arable cultivations. By about 1470 the demesnes of virtually all the great estates we can analyze were once again in the hands of the *firmarii*. When this happened, such labor services as had managed to survive were finally disposed of.

Some historians see the “disintegration” of the manorial system in these developments, but the word is misleading. Though two important elements of “classical” manorialism, the demesne and the labor service, did indeed disappear, the framework of manorial organization, the exploitation of remaining manorial resources, and, above all, manorial jurisdiction continued well beyond the traditional limits of the Middle Ages.

Manuscript Illumination, Anglo-Saxon

Early Period

Books and reading came to the Anglo-Saxons as part of the Mediterranean culture of Christianity. But although Anglo-Saxon manuscript art began as an import, it continuously merged foreign and native, participating in the formation of a medieval culture.

Christianity was brought to the Anglo-Saxons during the late-6th and 7th centuries from two sources: Ireland and Italy. Irish Christianity, preserving practices outdated in Italy, had been implanted into a tribal society from sub-Roman Britain. The Irish introduced an archaic tradition of book production rooted in provincial Britain's semiprofessional industry. Late-6th-century Rome sent theology and liturgy formed in an urban context under centralized ecclesiastical authority. Mediterranean book production had increased in sophistication, serving a large, wealthy audience literate in Latin and versed in Greco-Roman culture. The Irish converted Northumbria; the Roman mission converted the southern Anglo-Saxon kingdoms, or Southumbria, centering at Canterbury.

In the later 7th and 8th centuries two developments affected manuscript art. Mediterranean influence intensified with the arrival in 669 of Theodore of Tarsus, the new Greek-speaking archbishop of Canterbury, and Hadrian, an African who became abbot of St. Augustine's. Theodore's efforts for reform and education, along with those of such enthusiasts as Benedict Biscop and Wilfrid of York, ensured increasingly lavish book production. Mercian domination from the mid-8th century through the early-9th instigated another wave of foreign connections. Southumbrian ecclesiastics reacted to Mercian exploitation by developing ties with the Continent in an effort to minimize secular interference. Frequent contact between Charlemagne and Offa is evidence of their mutual interest. The resulting flow of Carolingian, Mediterranean, and eastern influences via Southumbria decisively changed the style of Anglo-Saxon art. The early Anglo-Saxon period ends in the mid-9th century after Mercian hegemony had loosened, concurrent with the rise of Wessex and arrival of the Viking armies.

Decoration of surviving manuscripts produced by the early Anglo-Saxons presents an art style sometimes called the "insular" or "Hiberno-Saxon" style. In 7th-century Northumbrian scriptoria late-antique manuscript art was transformed by fusion with Celtic and Anglo-Saxon traditions, the latter known today mainly from prestige metalwork objects, such as those found at Sutton

Hoo. Scriptoria may have existed at all major monastic sites, but just two Northumbrian luxury manuscripts, the Lindisfarne Gospels (BL Cotton Nero D.iv; [figs. 84–85](#): see LINDISFARNE GOSPELS) and the Codex Amiatinus (Florence, Biblioteca Medicea-Laurenziana Amiatinus 1; [fig. 143](#): see WEARMOUTH-JARROW AND THE CODEX AMIATINUS), can be linked solidly to their places of production, at Lindisfarne and Wearmouth-Jarrow. Two variations of Northumbrian monastic culture developed at these centers: at Lindisfarne a synthesis of Celtic, Anglo-Saxon, and Mediterranean; at Wearmouth-Jarrow a romanizing culture imitating Mediterranean forms. Inclusion of the books of Durrow (Dublin, Trinity College 57) and Kells (Dublin, Trinity College 58) as Northumbrian is not universally accepted, but such attribution attests to Northumbria's close cultural relationship to Ireland in the 7th and 8th centuries.

Italianate elements surface commonly in Northumbrian manuscripts. Only one surviving luxuriously decorated Northumbrian manuscript (Durham, Cathedral Library A.II. 10) likely predates the Synod of Whitby (664) and the advent of Theodore and Hadrian. On the other hand Mediterranean influence cannot have been the only stimulus underlying the achievement of Northumbrian book art, because even the most opulent 7th-century Italian manuscript decoration does not approach its richness and variety. The period's major source, Bede, is informative on neither the contribution of the Celtic churches nor the use of native art traditions in the new Christian context. Many questions remain to be answered by paleography and archaeology.

Southumbrian manuscripts in the early period reflect continued close interaction with the Continent. Figural style resembles late-antique styles and 6th- and 7th-century north Italian and early Byzantine examples. Fragments of a 6th-century illustrated Gospel book of Italian origin, the "Gospels of St. Augustine" (Cambridge, Corpus Christi College 286), offer concrete evidence of the Mediterranean artistic sources. Known to have arrived in England by the 8th century, the manuscript is traditionally associated with Augustine of Canterbury, who headed Pope Gregory's mission in 597. Treatments of the codex page, exemplified in the Stockholm Gospels (Stockholm, Royal Library A. 135; [fig. 133](#): see STOCKHOLM GOSPELS), duplicate Mediterranean luxury manuscript decoration, and much of the nonfigural decoration imitates Mediterranean forms, such as vine scrolls and illusionistic border patterns. Animal ornament in the manuscripts appears to parallel developments in Anglo-Saxon metalwork decoration. Trumpet spirals and pelta (shield-shaped) forms appear within separate parallel areas in borders of decorated pages or within the letters of the text, as seen in the Vespasian Psalter (BL Cotton Vespasian A.i; [fig. 141](#): see VESPASIAN PSALTER), the major early example. The Vespasian Psalter and the Leningrad Bede (Leningrad, Public Library Cod.

Q.v.18) provide examples of another probable native development, the historiated initial.

Manuscript art produced during the period of Mercian domination is characterized by vinelike interlace and fanciful animal forms remaining separate from interlace. Contours are looser, more softly curving than those of earlier insular decoration. Human figures, such as the evangelist portraits in the Barberini Gospels (Rome, Biblioteca Apostolica Barberini Lat. 570), display Italo-Byzantine influence in their naturalism. Capital letters with foliate and beast-head terminals are set within panels, as in the Tiberius Bede (BL Cotton Tiberius C.ii).

Earlier scholarship assumed that Canterbury produced nearly all these stylistically related manuscripts, calling them the “Canterbury group.” The term is now outdated, the importance of other centers, such as Lichfield, York, and Worcester, having been recognized. They are alternatively called the “Tiberius group,” after the Tiberius Bede. Their impressive style of textual presentation may represent a response to needs arising from contending, often litigious interests of Mercian overlords, local potentates, and ecclesiastics. It lent prestige to various texts, including charters, gospels, and devotional works such as the Book of Cerne (CUL LI. 1.10). The recent suggestion of a Mercian “writing area” defined by geography and unified cultural production as apart from political or ecclesiastical structures takes into account the multiple centers and interests that shaped this rich style.

Later Period

Late Anglo-Saxon manuscripts are generally considered to be those manuscripts produced between the late-9th century and the Norman Conquest of 1066. Manuscripts produced within this period are characterized by an innovative style and iconography that display an awareness of both continental developments and native traditions; a propagandistic as well as a didactic purpose; and a new bond to king and court. Because of the Scandinavian presence in the north it is largely a southern phenomenon, centered primarily on Canterbury and the monasteries associated with Winchester and the court.

King Alfred (871–99) succeeded in defending the kingdom of Wessex against the Scandinavian invaders and ensured a period of peace during which artistic and intellectual endeavors could flourish. The revival of book production at this time is traditionally linked to Alfred’s import of scholars from throughout the British Isles and the Continent, as well as to his personal patronage and

interest in learning, exemplified by his translation of Latin texts, including Gregory's *Pastoral Care*.

Stylistic innovation first becomes apparent in the marginal areas of the page: the decorated initials. Lush foliate patterns and naturalistic animal and human forms are added to the patterns of color and interlace that characterize 8th- and early-9th-century southern manuscripts. The dragons', birds', and dogs' heads sprouting or interspersed with foliate ornament drawn in brown ink in the ca. 900 copy of Aldhelm's *Devirginitate* (BL Royal 5.F.iii) are excellent examples of this early style. During the first half of the 10th century initials strike a beautiful balance between continental naturalism and native Anglo-Saxon concerns with dynamic movement and elegant surface patterns, as in the Junius Psalter (Bodl. Junius 27) produced at Winchester ca. 925–50. Francis Wormald divided late Anglo-Saxon initials into two types: Type I, letters formed by whole creatures; Type II, letters containing only the heads of animals. Wormald's basic division is still in use today.

Continental influence is also evident in the expanded use of full-page miniatures and the new monumental style of the figures they contain, as in the set of full-page miniatures added to the Galba Psalter (BL Cotton Galba A.xviii and Bodl. Rawlinson B.484, fol. 85) in the second quarter of the 10th century (fig. 66: see GALBA PSALTER). The manuscript is frequently linked with King Æthelstan, whose cosmopolitan court rivaled that of Charlemagne. Æthelstan appears on fol. 1 of a ca. 937 copy of Bede's lives of St. Cuthbert (Cambridge, Corpus Christi College 183) presenting the manuscript to the saint. This is the earliest surviving manuscript portrait of an Anglo-Saxon ruler. Its presentation of the king as equal in status to, and in direct communication with, the saint is an effective form of royal propaganda that would be adopted by later artists and patrons to glorify the kings and bishops associated with the monastic reform.

The first of the two great styles of late Anglo-Saxon illumination, the "Winchester style," developed in the second half of the 10th century. The name is misleading, as the style was by no means limited to Winchester. Its development can be linked to the introduction of the monastic reform by Dunstan at Glastonbury (940) and Æthelwold at Abingdon (954) and to royal support of the reform and its agenda. The New Minster Charter (BL Cotton Vespasian A.viii) produced at Winchester ca. 966 is the first great Winchester School manuscript. The frontispiece (fol. 2v) shows King Edgar between Mary and Peter offering the charter to Christ (fig. 101: see NEW MINSTER CHARTER). The combination of royal and religious imagery and Edgars stature within the miniature are typical of manuscripts associated with the reform.

The solidity of the figures, linear patterns of the drapery, lush acanthus trellis border, rich colors, and lavish use of gold are all characteristic of

Winchester-style manuscripts. The figure style, acanthus leaves, and striped backgrounds of the most lavish of these manuscripts (e.g., the Benedictional of Æthelwold [BL Add. 49598]) are derived from Carolingian art but are reinterpreted with an emphasis on movement, linear pattern, and shimmering surfaces that is wholly Anglo-Saxon.

The second major style of late Anglo-Saxon illumination is sometimes referred to as the “Utrecht style,” due to the profound influence of the Utrecht Psalter and other Carolingian Reims-style manuscripts on its development. It, too, is frequently linked with a particular locale—Canterbury—though it was popular throughout the south. The style is characterized by an elegant outline drawing technique with expressive figures, fluttering draperies, and shimmering colors; it is exemplified by the drawings in the ca. 1000 Harley Psalter (BL Harley 603; [fig. 71](#); see HARLEY PSALTER).

During the first half of the 11th century the Winchester and Utrecht styles were merged to produce a new style that combined the linear patterns and softer forms of “Utrecht” with the color washes, expressive brush strokes, and lavish borders of “Winchester.” A fine example of this style is the figure of Christ Triumphant on fol. 40 of a psalter of ca. 1036 (Bodl. Douce 296).

A great variety of manuscripts were illuminated in late Anglo-Saxon England. Gospel books, psalters, and books for use within the church were the most numerous types of manuscripts produced and the most likely to receive lavish decoration; however, Old Testament narratives and “scientific manuscripts” (herbals, *Marvels of the East*) also appear.

The period is also characterized by an iconographic inventiveness. The “disappearing” Christ Ascension, “horned” Moses, and beast-mouth of hell are among the late Anglo-Saxon creations. Even manuscripts that are direct copies of other manuscripts show a remarkable inventiveness and originality. The Harley Psalter, for example, the first surviving copy of the Utrecht Psalter made in England, introduces both stylistic and iconographic changes (e.g., the use of color and the addition of the tree-of-life cross) that are not derived from its model.

Late Anglo-Saxon manuscripts are characterized by a new and dynamic relationship between illustration and text. In the Bury Psalter (Rome, Vatican, Biblioteca Apostolica Reg. lat. 12) of ca. 1025–50 individual episodes or images from the Psalms are picked out for special emphasis and enacted by figures who tumble, climb, and battle with each other around and across the margins of the page. In such manuscripts as the ca. 1000 “Cædmon” Genesis (Bodl. Junius 11) or the four late-10th- or 11th-century copies of Prudentius’s *Psychomachia* produced in England, the artists departed in places from the textual description, causing us to stop and consider the relationship between text and drawing and indicating clearly that late Anglo-Saxon miniatures are

by no means simple illustrations of the words they accompany.

Manuscript Illumination, Gothic

The sources of the Gothic style in English painting lie in the “transitional”

period from ca. 1180 to 1220, during which there was a revival of classical forms, disseminated via Byzantine sources. This signaled a move away from the stylized decorativeness of Romanesque art toward greater naturalism. Solid, monumental figures replaced angular forms and linear schematic draperies. These humanizing tendencies have their origin in the more progressive painters of the Winchester Bible and are fully exemplified in the miniatures that preface the text in the Westminster Psalter, especially that of the Christ in Majesty. (Shelf marks for manuscripts discussed here and below appear at the end of the entry in the order in which they are discussed.)

This change in style was accompanied by a corresponding shift in patronage from the monastic to the aristocratic and an increased interest in didactic narrative illustration. The luxury psalter became the book for private devotion, and the bestiary and illustrated saints' lives became popular texts. Bede's life of St. Cuthbert, a "transitional" work, shows increased psychological communication between the figures, compared with some of the earlier biblical narratives. The monumental qualities of the Westminster Psalter and the Glossed Gospels in Trinity College, Cambridge, soon give way to softer, more elongated forms. This greater delicacy is apparent in the Creation scenes prefacing the Ashmole and Aberdeen bestiaries. Coupled with this greater elegance certain mannerisms, such as the jutting necks and exaggerated gestures, herald the arrival of the early Gothic style, which by ca. 1220 is fully evident in the prefatory miniatures in the two Peterborough psalters (Fitzwilliam Museum and Society of Antiquaries).

Skill in the tinted-drawing tradition is exquisitely expressed in the Guthlac Roll of ca. 1210, which shows some of the delicacy of the Ashmole Bestiary, though with less exaggerated gestures and elongation of form. The Glazier Psalter, produced in London around 1220, is a direct descendant of the monumental tendencies of the Westminster Psalter, although comparison of the Christ in Majesty figures in both manuscripts underlines the changes that have occurred in the 20 to 30 years that separate them. The figure is more attenuated, and the draperies, though still defining the form beneath, are more linear and decorative.

A less delicate, more solid rendition of form leading from the Westminster Psalter is apparent in a group of manuscripts produced in Oxford between ca. 1200 and 1220, such as the Munich and Arundel psalters of ca. 1200–10, BL Royal L.D.x and the Iona Psalter of ca. 1210, and the Huntingfield Psalter of ca. 1210–20. The rise in importance of Oxford as an artistic center may in part be explained by the rise of the university in that city. Although these books lack the mannerisms of the London-produced Glazier Psalter, the elongation of form evident in the Christ in Majesty of Royal L.D.x is a stylistic mediator between the earlier Westminster and later Glazier Psalter's representation of

the subject.

By 1250 the Oxford tradition is well established in the works of William de Brailes and his circle, who were operating in Catte Street, Oxford, between ca. 1230 and 1260. They bring to a climax the greater use of narrative engendered by the earlier miniature cycles prefacing psalters, while at the same time demonstrating a new interest in border decoration. These exclusively liturgical works, which include the earliest extant English book of hours (BL Add. 49999; [fig. 31](#): see BRAILES, WILLIAM DE), lead via the Salvin Hours and related works to the William of Devon group, again localizable to Oxford ca. 1260–70.

The de Brailes style is characterized by mostly small-scale figures, reduced for narrative expediency, pale faces, and calligraphically rendered features. There is some schematization of the draperies and a tendency to divide the picture space into compartments to accommodate the extensive narrative. The border decoration is confined mostly to dragon forms that extend from the initials and terminate in blocky foliage elements. In the William of Devon manuscripts the border has developed into distinctive horizontal, vertical, and diagonal platforms; the latter provide anchorage for a wide variety of birds, animals, and hybrids. The William of Devon group, which specialized in Bible illustration, shows strong northern French influence. By 1280 Oxford seems to have ceased as a center of manuscript production, with a possible shift toward London.

Narrative as a principal source of artistic expression is paramount in the lives of the saints and chronicles illustrated by the St. Albans monk Matthew Paris in the 1240s and 1250s ([fig. 95](#): see MATTHEW PARIS). Out of the monumental works of ca. 1200 Paris devised a precise and economical method of tinted line drawing of considerable directness. Certain examples, such as the heads in the chronicle in Corpus Christi College, Cambridge, and the Virgin and Child in the British Library chronicle, have an exquisite beauty and strong devotional quality. In his smaller-scale illustrations his technique is less formal and more lively. Paris was a highly competent imitator of the “court” school of Apocalypse illustration developed under the influence of the so-called Sarum Master. The Sarum Master brought the early Gothic phase to its full maturation in a group of manuscripts probably produced at Salisbury ca. 1250–60. His is an elegant, monumental style that follows a path of development leading from the Westminster Psalter, via the Glazier Psalter. It is more elongated, angular, and emotionally expressive than that of Matthew Paris; the draperies have fluttering edges and a tendency toward trough folds.

Fig. 91. Douce Apocalypse (Bodl. Douce180), fol. 23. Trumpeting angels. Reproduced by permission of the Bodleian Library, University of Oxford.

These stylistic characteristics are reflected in the earliest Apocalypses, such as Paris, BN fr. 403, which may be by the Sarum Master's hand. The popularity of the Apocalypse (approximately twenty extant examples were produced between ca. 1250 and 1275) was in part engendered by Joachim of Fiore's belief that the end of the world was imminent. Stylistically these picture books are of particular value in documenting the development away from the early Gothic style to a more fully developed form of Gothic, where the soft troughed forms of the Paris, Metz, and Tanner Apocalypses of 1250–55 develop into broader, more angular forms under influence from Parisian art. This style is fully expressed in the Lambeth ([fig. 154](#): see WOMEN AND THE ARTS), Gulbenkian, and Abingdon Apocalypses of ca. 1260–70. The Douce Apocalypse ([fig. 91](#)) shows a mature assimilation of these forms, devoid of the mannered interpretation of the broad-fold style of the Lambeth Apocalypse. It has been convincingly argued that these works were produced mostly by lay illuminators in London, Salisbury, and Oxford rather than in the "School of St. Albans" under Matthew Paris. It is some of these London works that most closely approximate the concept of a court school of illumination. A pivotal manuscript in the formation of this style is the life of St. Edward the Confessor in Cambridge University Library, produced in Westminster ca. 1255–60.

By ca. 1285 the angularity of the broad-fold drapery style had softened, and in London-produced works, such as the Windmill Psalter, Petrus Comestor, and the early material in the Alfonso Psalter (made for Edward Is son), the figures show greater solidity and modeling of the draperies. These courtly works have much in common with those of the Parisian miniaturist Master Honoré and point forward to the 14th century.

This style is reflected in the earliest hands of the Peter borough Psalter, begun around 1300, as well as in the Isabella Psalter and the Tickhill Psalter (fig. 106: see PSALTERS, GOTHIC) of 1300–10. The Tickhill group may have been produced in the York diocese, while the Peterborough Psalter and related works were probably produced in a Fenlands monastery. Comparatively restrained borders, in which the grotesque element is minimized and naturalistic representations of animal, bird, and plant life are emphasized, characterize these manuscripts. It is this more reserved approach that separates illumination of ca. 1285–1310 from the more robust, typically East Anglian border decoration that is a distinctive feature of manuscripts produced in the Norwich region, such as the Gorleston Psalter (fig. 57: see “EAST ANGLIAN SCHOOL”) of ca. 1310–20 and the main hand of the Ormesby Psalter (fig. 102: see ORMESBY PSALTER). The latter is also important in showing the first clear wave of Italian influence.

Fig. 92. Tiptoft Missal (The Pierpont Morgan Library, New York. M. 127), fol. 142. Elevation of the Host. Reproduced by permission of the Pierpont Morgan Library, New York.

One of the artists of the Gorleston Psalter, who also illuminated the Howard Psalter, appears to have been itinerant in the East Anglian region, executing portions of such manuscripts as the Harnhulle Psalter-Hours. This important manuscript links the Howard artist's style to a close imitator of the Queen Mary's Psalter artist, who executed commissions in East Anglia as well as London.

Whereas the main Ormesby illuminator seems to have worked mainly in a

monastic milieu, the Gorleston and Howard artists produced work for lay patrons. The approximately ten manuscripts of the central Queen Mary group, produced in London between ca. 1310 and 1333, testify to monastic and aristocratic, as well as scholarly, patronage. The final work in this series, a book of statutes now in Norwich Castle Museum, was illuminated by the Queen Mary Artist's only collaborator, the Ancient 6 Master, in 1333. It is stylistically related to the later italianate work in the Ormesby Psalter, a style also found in the Douai Psalter, the Gorleston Psalter Crucifixion page, and the St. Omer Psalter. This style of painting, with vigorous highlighting in white pigment and rather pointed figures, is now considered to date from between ca. 1330 and 1340, and not to the 1320s as previously argued.

London may have provided the arena for the origin and dissemination of the style associated with the prolific group of artists who produced the Milemete Treatise in Christ Church, Oxford, and the Pseudo-Aristotle in the British Library intended for presentation to Edward III by Walter de Milemete, the king's clerk, in 1326 or 1327. These artists have been identified in manuscripts with destinations other than London, such as a book of hours (Bodl. Douce 231) of the diocese of Lincoln, a number of liturgical books from East Anglia (the Tiptoft Missal [fig. 92], the Stowe Breviary, and the All Souls Psalter), and several historical volumes with Oxford and Cambridge connections; this raises the possibility that further "Milemete" workshops existed in these locations.

In the 1330s and 1340s, with the growing conformity to the Use of Sarum, localizing centers of artistic activity becomes more conjectural, with the result that "local" features are minimized. A group of manuscripts that fall into this vexed category are the Taymouth Hours, BL Egerton 2781, and the Vatican Hours, all three of which may have been produced in Oxford or Cambridge, or perhaps testify to a final blossoming of London as an artistic center in the 1330s and 1340s (before its apparent demise and revival as a major center in the 1370s).

The artist of the Fitzwarin Psalter may have begun his career in Oxford but, like a number of other illuminators, seems to have gravitated to Cambridge in the 1340s. The style of the Fitzwarin Psalter, in which there are mannerisms of pose and drapery, relates directly to that in the Dublin and Walters hours. More firmly localizable to Cambridge is the illuminator responsible for a Cambridge University Charter, the Brescia Psalter (which has an Ely diocese calendar), and the first campaign in the Vienna Bohun Psalter, curtailed by the Black Death of 1348–49.

The Black Death disrupted artistic activity, and few illuminators working before 1350 are identifiable in manuscripts produced after that date. This almost total collapse is supported by a unique situation that arose in the 1350s. Documentary and stylistic evidence indicate that the Bohun family, who had

previously patronized the Cambridge illuminators, set up their own workshop under the Austin Friar John de Tye in Pleshey Castle, Essex. This artist worked in a style that had evolved from East Anglian illumination of the first half of the 14th century, employing a rich repertoire of border forms on to which he grafted certain Italianate features, most notably the oval faces with narrow, slanting eyes. His only collaborator, although anonymous, can be identified in Flemish manuscripts of the 1340s. His figure style is less plastic and his borders distinctly rectilinear. The two illuminators collaborated from the mid-1350s to the early 1380s, producing the highest-quality work in England in this period. Codicologically and stylistically the Bohun manuscripts are complex, and reliance on these methods of analysis is paramount when internal evidence for dating is lacking. There are breaks in campaign in three of the major psalters (those in Vienna, the British Library, and Exeter College, Oxford), which are essential to consider when determining the initial, or eventual, owner of each manuscript, because in some cases a single book was worked on for successive generations of the same family.

The final campaign in the Exeter Bohun Psalter (figs. 61–62: see EXETER BOHUN PSALTER) suggests that by the late 1380s the two Bohun illuminators had died and the family was forced to use a London workshop to complete the psalter in the 1390s—the city having risen again in importance for illumination in the 1370s. The three artists in question, whose methods suggest a more commercial form of workshop practice, also worked in *Omne bonum* and the William of Nottingham Commentary on the Gospels, both written by a London scribe, James le Palmer. With the exception of one of these artists, whose fine style can be seen in a religious miscellany now in Hatfield House, their work is not of the highest quality.

At this time the Bohun family employed one of the illuminators (Rickert's Hand C) of the Carmelite Missal of the early 1400s. This artist, also responsible for the Edinburgh Psalter-Hours, employed a distinctive type of border decoration, characterized by slender gold bars, ornamented with an array of leaf and flower sprays, with interlace and gold berry forms. These borders, first seen in the Lytlington Missal and related manuscripts of the 1380s, and have an origin in three London-produced charters for Bristol of 1373. They became standard for the large body of manuscripts executed in London in the last quarter of the 14th century. The Belknap artist, one of the artists of the Lytlington Missal, made for Westminster Abbey in 1384, had a sizable *oeuvre* spanning three decades. His influence, and that of the Edinburgh Bohun Hand, extended into the first decade of the 15th century, even after the more innovative border and figure styles of the Carmelite Missal had been introduced from the Continent. Hand A in the missal probably came to England from the Low Countries. His style, characterized by elaborate

perspectival settings reminiscent of Broederlam's Dijon altarpiece of ca. 1390, realistic facial types, and softly modeled draperies, was to be the most influential of the foreign trends current in England ca. 1400–10.

English painting at this time entered the so-called International Gothic phase. A style close to that of Hand A in the Carmelite Missal is seen in the full-page miniature of the Annunciation in the Beaufort Hours, signed by Herman Scheerre, a Netherlandish artist who also worked in the Chichele Breviary, the Bedford Psalter-Hours, and other manuscripts ranging in date from ca. 1403/04 to ca. 1430.

A second illuminator in the Bedford book, whose style also relates closely to that of Hand A, was "Johannes," whose signature is found on one of the miniatures in a Marco Polo manuscript on which he worked with assistants. The Hours of "Elizabeth the Quene" is possibly his latest and finest work. In the work of Johannes and the artist who illuminated the only miniature in a *Troilus and Criseyde* manuscript the International Gothic style is fully absorbed by English illuminators.

Another illuminator working in the first quarter of the 15th century was John Siferwas, a Dominican friar, who painted a fine missal for the Benedictine Abbey of Sherborne sometime before 1406. The borders of this manuscript are full of naturalistic depictions of plants, animals, and birds reminiscent of the English countryside, but the figure style betrays German or Bohemian contacts. It is possible that he trained in London in the 1390s (his style holds much in common with *Liber regalis*, Hand B of the Carmelite Missal, and the Apocalypse paintings in the Westminster Chapter House) before settling in the West Country, where he carried out his commissions. The Pepysian sketchbook in Magdalene College, Cambridge, a rare survival from the Gothic period, has work in a related style.

The International style prevailed until the demise of the Scheerre and Johannes workshops in the 1430s, after which London declined as a center for high-quality illumination, though echoes of Scheerre's style continue in an inventive provincial school based at Bury St. Edmunds in the 1430s and 1440s. Manuscripts of this school are distinguished by the use of different pigments and a softer modeling of the border decoration, as in Cambridge, Fitzwilliam Museum 3–1979.

In London remnants of the International style are evident in one of the hands of the Warwick Hours. The other hand in this book has been identified as William Abell, active ca. 1440–65, who also painted some of the miniatures in the Beaufort Hours and the Abingdon Missal, which has a fine Crucifixion. His style is a conscious reaction against the International Gothic. It is linear, has abstract conventions, and denies perspective, but in its robust individuality it is also a reassertion of indigenous English qualities that had been suppressed

for well over a quarter of a century. Abell's works, which connect him with the City of London, consist of illustrated charters, statutes, heraldic manuscripts, and some literary works.

With few exceptions it can be concluded that after 1430 English illumination fell into an irrevocable decline. Foreign books, notably from Flanders, made for the English market became increasingly popular, and English illuminators were not sufficiently innovative or enterprising to compete. These books, commercially produced in large numbers, catered to the needs of a growing clientele, a situation dramatically contrasting with that which had prevailed in England in the early Gothic period.

Manuscript Illumination, Romanesque

The Romanesque period (ca. 1066–1190) witnessed a growth in both the number and variety of manuscripts produced as well as an apparent growth in literacy and an increased awareness of the presence of scribes, artists, and readers within manuscripts, in the form of signatures, colophons, “self-portraits,” donor portraits, and new page layouts designed for usability and the needs of the learned reader.

The period did not begin with a sudden change of style or even a change in the number or types of books produced. Manuscripts produced in the years immediately following the Conquest show a hardening of the dynamic Anglo-Saxon line and a solidifying of Anglo-Saxon forms, but the native taste for outline drawing and elegant surface patterns survived, as did a number of Anglo-Saxon iconographic innovations, such as the disappearing Christ and the beast-mouth of hell. This is due in part to the cosmopolitan nature of late Anglo-Saxon illumination, which incorporated Carolingian, Ottonian, and Byzantine influences, and in part to the dependence of 11th-century Norman illumination on Anglo-Saxon styles. In fact, until the 1120s, the Canterbury scriptoria, so active in the production of pre-Conquest manuscripts, continued

to be among the most active.

The change to a new Romanesque style began in the 12th century with the introduction of stronger, brighter colors and darker, heavier outlines. This was accompanied by the development of a new approach to depicting the human body, characterized by expressive poses, gestures, and faces, while stylized draperies were used to reveal the form of the body itself. The St. Albans Psalter (Hildesheim, St. Godehard) of 1120–35, and the Bury Bible (Cambridge, Corpus Christi College 2) illuminated ca. 1135, are both masterpieces of the new style, though they differ significantly in detail.

The St. Albans Psalter is remarkable for the number and quality of its full-page illustrations and historiated initials (211), as well as for its association with the recluse Christina of Markyate, for whom it was probably revised between 1120 and 1135. The artists of the St. Albans Psalter worked in a style influenced by Ottonian and northern French illumination. Figures are monumental and elongated, with expressive faces and straight profiles. The stylized draperies serve to reveal form through alternating areas of flat clinging fabric and gathered folds; a device that looks forward to the damp-fold style of the Bury Bible. Backgrounds consist of abstract areas of solid color and abbreviated architectural or landscape motifs.

The most skilled and influential of the St. Albans Psalter artists was the St. Alexis Master, named for a page illustrating scenes from the life of St. Alexis that was added when the psalter was revised. His figures are among the most lively and expressive, and it is his mastery of drapery and depiction of the human form that may have been most influential in the development of the damp-fold style. The Alexis Master is associated with four other manuscripts, and while his identity remains unknown, it is likely that he may have been a lay artist.

The damp-fold style was fully developed by another probable lay artist, Master Hugo, in the Bury Bible. Here the drapery clings to the body, as if wet at stomach, thigh, knee, and shin. The development of the style in this manuscript is attributed to the influence of Byzantine art (other Byzantine elements include dark, naturalistic faces with stern expressions and the use of linear patterns of light and dark for highlighting and shading). However, what begins in Byzantine art as an attempt at classical naturalism is transformed by Master Hugo and his successors into a stylistic device that both articulates form and satisfies the native taste for dynamic surface patterns. The damp-fold style was influential and remained popular until ca. 1170.

In the Winchester Psalter of ca. 1145–55 (BL Cotton Nero C.iv; [fig. 153](#): see WINCHESTER PSALTER) the decorative potential of the damp-fold style is clear. In this manuscript, rather than revealing naturalistic form, the damp-fold drapery dissolves figures into animated linear patterns. The poses and

expressions of the figures are also exaggerated, making this one of the most expressive of all English Romanesque manuscripts. The Winchester Psalter artists also borrowed heavily from the Anglo-Saxon tradition: the expanded introductory cycle of miniatures, the grotesque faces of many of the figures, the dynamic relationship between the spaces within and without the frame, such iconographic details as the beast-mouth of hell, and portions of the text all have their origins in Anglo-Saxon manuscript illumination (e.g., Bodl. Junius 11 and BL Cotton Tiberius C.vi).

The two miniatures on fols. 29 and 30, the death of the Virgin and the Virgin as queen of heaven, are in a startlingly different byzantinizing style characterized by monumental classicizing figures and full color. Their presence may be due to direct Byzantine influence or perhaps indirect Byzantine influence via Ottonian art.

Around 1170 a new style of illumination developed that was heavily influenced by the art of Paris and northern France. Due to its popularity in both France and England it became known as the "Channel style." Large and complex historiated or inhabited initials became smaller and consequently simpler; foliage became thinner; burnished-gold backgrounds and decorative patterns of white lines began to dominate. Darker and more naturalistic faces and more fully modeled forms also attest to a renewal of Byzantine influence. The Copenhagen Psalter (Copenhagen, Royal Library, Thott. 1432), created in northern England ca. 1170, is a fine example of this style. The change in style was accompanied by a change in format: books became smaller with smaller writing, while glosses were expanded so that they ran parallel to the text and were frequently introduced by their own decorative initial.

Romanesque manuscript illumination is not simply a matter of stylistic development; it is also the product of a new type of artist creating books for an expanded audience. The 12th century saw the rise of the lay artist working in monastic employ (e.g., Master Hugo and the Alexis Master). Moreover manuscripts were produced not just within monastic scriptoria but also within cathedral scriptoria and, probably, lay workshops. Certainly by the end of the century lay artists had come to dominate artistic production, and by the early-13th century they were incorporated into the guild system (although the earliest surviving evidence for a separate illuminator's guild dates from 1389).

The manuscripts produced were largely learned, usable books, frequently with glossed texts and often with glosses in more than one language (e.g., the Eadwine Psalter). In many manuscripts miniatures and historiated initials may be understood as forming an additional visual gloss or narrative rather than simply illustrating the verbal text (e.g., the St. Albans Psalter). Artists probably used pattern books and copied other manuscripts. Copying, however, was generally done with an eye to invention (as with the various copies of the

Utrecht Psalter) rather than as slavish imitation.

The most extensively illustrated type of manuscript was the Psalter. In the most lavish psalters the prefatory cycles of Old and New Testament miniatures developed by the Anglo-Saxons were expanded, while each psalm was accompanied by a miniature or historiated initial. During the 12th century specific subjects came to be associated with the major liturgical divisions of the Psalter (Pss. 1, 26, 38, 51, 52, 68, 80, 97, 101, 109); the author portrait of David, for example, became the standard illustration for Psalm 1. Great Bibles and saints' lives formed the next-most-significant group of extensively illustrated manuscripts. Scientific and medical manuscripts, bestiaries, chronicles, the writings of the Church Fathers, and the works of classical authors were also illustrated. In manuscripts of all types initials provided one of the major fields for innovative and imaginative illustrations. Romanesque initials, particularly those of the second quarter of the 12th century, are full of comic or grotesque scenes and clambering humans, animals, and hybrids that frequently look forward to the marginalia of English Gothic manuscripts.

Books were illuminated for a variety of patrons and purposes. Though it is safe to say that most manuscripts continued to be produced for liturgical or scholarly use within the confines of church and monastery, manuscripts may also have been produced for lay patrons. It is likely that some of the many psalters, particularly those including glosses or additions in the vernacular, may have been made for private patrons.

This was also a period in which a number of great libraries were built up and their contents catalogued. Complete or partial 12th-century catalogues survive from Abingdon (partial), Burton-on-Trent Abbey, Christ Church, Canterbury (partial), Durham Cathedral, Lincoln Cathedral, Peterborough Abbey, Reading Abbey, Rochester Cathedral, Waltham (partial), Whitby Abbey, and Worcester (partial). The catalogue of Reading Abbey records nearly 300 volumes, including four Bibles of two or three volumes each; a series of separate glossed books of the Bible (all but seven books of the Bible are mentioned); eighteen volumes of the writings of St. Augustine; works by Seneca, Virgil, Horace, and Juvenal; saints' lives; a two-volume breviary in a cloister chapel; four breviaries divided between the guest house, infirmary, and abbot's house; three volumes for reading at meals; three missals in the church, two in precious covers, and one for early morning service; seventeen small missals for use by the monks; fifteen graduais; six full processionals and seven smaller processionals; seven antiphonaries; three psalters for use by the novices; four psalters secured by chains in the church and infirmary; a variety of lectionaries, tropers, collectars, and other liturgical texts. While not all of these manuscripts would have been illuminated, the catalogue does give a glimpse into the variety, function, and distribution of books within the

Manuscripts of Polyphonic Music

The manuscript sources that transmit medieval English polyphonic music are fragmentary, with but three well-known exceptions, the Winchester Troper, W1, and the Old Hall Manuscript. Even these sources are incomplete. There are about 15 incomplete manuscripts from the 11th and 12th centuries, 65 fragments of the 13th, over 85 fragments of the 14th, and a similar number of insular sources of the 15th. They contain a polyphonic repertoire in excess of 700 individual works. Considerable evidence suggests that many large books of polyphony were produced in medieval England, with their number dramatically increasing during the 13th and 14th centuries, a circumstance that roughly parallels the *sur vital* pattern on the Continent.

In respect to size 173 polyphonic compositions in two parts are given in the late-10th-century manuscript known as the Winchester Troper. They carry texts from the foremass, both Ordinary and Proper, and for the divine office, invitatories and responsories in particular. At least one 13th-century music book, dismembered at Worcester Cathedral, contained more than 138 folios. One other sizable manuscript may have suffered the same fate at Worcester. A large codex from the same century (Cambridge, Corpus Christi College 8) had page numbers that reached to 558, and it is estimated that it originally contained over 200 works. For one large collection of 13th-century polyphony from Reading Abbey only a table of contents with titles has survived, in BL Harley 978. This index records 164 polyphonic compositions, including 37 Alleluias, 38 conducti, and 81 motets. At least five large-scale motet collections can be identified from English 14th-century fragments, among them Oxford, New College 362, with 90 folios originally, and Cambridge, Corpus Christi College 65, originally with 100 folios. The manuscripts Lincoln Cathedral Library 52, BL Add. 24198, and Bodleian Library, Bodley 652, were all alphabetically arranged motet collections whose contents may have reached to almost 100 pieces.

Other sources are difficult to classify and do not fall into the tidy compartments that have generally been applied to continental manuscript sources. Some appear to have been modest collections of liturgical polyphony jotted on previously used parchment, such as the *rotulus*, or roll, from the Public Record Office (E/149/7/23) or similar sized collections notated in a manuscript originally intended for this purpose, such as Norwich, Norfolk County Record Office, Flitcham 299. Other collections contain a mixture of motets and devotional compositions, such as New York, Pierpont Morgan Library M.978. The majority of sources appears never to have been part of a large music book and may well have been working copies of compositions destined either for personal use by a particular singer-composer or as working exemplars for works destined for inclusion in a more formal book. In a number of cases polyphonic compositions were added into music books originally devoted to plainsong, as is the case with CUL Add. 710.

Shaping some coherent picture of the actual number and makeup of the original sources is difficult, given this blizzard of fragments, especially from the 13th and 14th centuries. Many of them are badly damaged, and some even are palimpsest. Most never preserve enough information about the original parent source to make reconstruction even hypothetically possible. Equally troubling is the chronic lack of information from the fragments themselves that would provide information about the location of their production. In the 14th century no fragment exceeds fourteen folios, and almost none of them could be described as having been originally part of a sumptuous presentation

volume intended for royal or noble use, though important anthology collections were produced in scriptoria of considerable sophistication.

An example of this kind of manuscript is the late-13th-century collection of conducti, originally from Bury St. Edmunds, now preserved in Cambridge, Jesus College QB1. Here all of the hallmarks of a fine scriptorium are in evidence, such as the finely produced parchment, highly elaborate and finely decorated initials, and sophisticated musical notation. Some of the fragments also appear to have been working copies of a small, discrete mixed corpus notated on *rotuli* and/or parchment gatherings already once used, such as Berkeley Castle Select Roll 55. Musical sources like this were considered eminently discardable from the very beginning and survive to our time because of their value as carriers of important legal or economic information. More often, though, fragments survive simply because of the value assigned to their parchment, a product that could be readily used by the medieval bookbinder.

A significant proportion of the fragments has been recovered from bindings produced in the 15th century. The main contents of these manuscripts are virtually always unrelated to the music. The best-known example in this regard is a group of 62 leaves, most of which were recovered from bindings fabricated in the late 14th or early 15th century for manuscripts belonging to the Worcester Cathedral Library (the “Worcester fragments”). Other examples are known from Bury St. Edmunds, Norwich, Durham, Ely, Canterbury, and St. Albans. This apparent concentration of musical sources in the greater monastic houses may suggest that the music was composed there or, equally reasonably, that these large and sometimes wealthy institutions collected large libraries and undertook regular rebinding of their manuscripts, a process that required a constant supply of reusable parchment. Even though little direct evidence has been amassed concerning the production of these many music manuscripts, it is certainly appropriate to conclude that England had an active tradition of polyphonic composition and manuscript production from the 10th century right through to the end of the Middle Ages. The breadth, diversity, and beauty of this large body of polyphonic music are only now becoming known to the greater musical public through recent recordings, facsimiles, and performing editions.

Map, Walter (ca. 1130/35–1209/10)

Secular clerk who served Gilbert Foliot, bishop of London and Hereford, and King Henry II; appointed archdeacon of Oxford in 1196 or 1197.

Until the 19th century Map was considered the author of much of the best late-12th-century secular Latin verse and of a cycle of French romances. Modern scholars contend, however, that all Map's certainly authentic work is contained in his *De nugis curialium* (*Courtiers' Trifles*), a collection of witty, satiric tales and exempla, noteworthy for its vivid humor and erudite allusions to biblical, classical, and scholastic sources.

Marches of Scotland and Wales

The areas of the kingdom that bordered on Scotland and Wales required a concentration of military and juridical power in the hands of local magnates who could meet the threats of raid and invasion. These regions thus developed a special character and quasi-independence until their assimilation in Tudor times.

Scotland

The Scottish march had been the special purview of the Northumbrian earls under the house of Wessex. After the Norman Conquest the bishop of Durham assumed special military responsibilities, and the palatinate (semiregal) lordship of Durham became England's northern bastion. Edward I's Scottish campaigns and the Hundred Years War exacerbated the problem of the borders. Under Richard II a warden of the east march, centered on Berwick, and a warden of the west march, centered on Carlisle, were regularly appointed. Military power and generous exchequer subsidies caused these offices to be coveted by the two great rival northern families, the Nevilles and the Percys, and the inability of the crown to pay the subsidies was a source of grievance that fueled rebellion. As late as 1569 Lord Hunsdon could write that men of the north knew no other prince but a Percy or a Neville. The power of the wardens was weakened by Richard III, who had a personal interest in the region, and by the Tudor Council in the North, which replaced the wardens.

Wales

The Norman barons created a series of marcher lordships along the Welsh border and in south Wales to contain the Welsh and serve as bases for further conquest. The lords marcher enjoyed considerable independence, and a mixture of Welsh custom and English law known as the "custom of the march" grew up in these lordships. A group of marcher lords led by Richard de Clare brought the English presence to Ireland in Henry II's time. Edward I's conquest

of Wales did not end the marcher lordships. In the 14th and 15th centuries they fell into the hands of the great magnate families. The Despensers and the Mortimers were rival marcher lords in Edward II's reign. The tendency of the marches toward criminal disorder and civil strife continued in the Wars of the Roses. Edward IV attempted to check the problem in 1471 by the creation of a Council of the Marches of Wales, at Ludlow. By the Act of Union of 1536 some 135 marcher lordships were absorbed into the administrative structure of the kingdom.

Marginalia

“Marginalia” refers to the small animated scenes of humans, animals, and grotesques (imaginary hybrid monsters) that enliven the margins of Gothic manuscripts. Also known as drolleries, these scenes depict a wide range of subject matter that ranges from the sacred to the profane and from the mundane to the fantastic. Major categories of English marginalia include (1) scenes from daily life, such as domestic activities, peasant labor, sports and entertainment, and chivalric pursuits (fig. 93); (2) scenes of humans, animals, and grotesques parodying real-life situations often with a “world turned upside-down” theme (fig. 94); (3) religious subjects drawn from the Old and New Testaments, saints’ lives, the miracles of the Virgin, and contemporary religious practice; (4) scenes based on fables, popular legends, proverbs, and moralized anecdotes from sermons; (5) subjects taken from the bestiary; and (6) nonnarrative motifs, such as single grotesques, naturalistically rendered birds and animals, and heraldic devices.

Although Gothic marginalia can appear anywhere in the border, the *bas-de-page* (lower margin) held a privileged position. Cycles of iconographically related scenes were commonly placed in the *bas-de-page* of adjacent leaves in order to present continuous narrative sequences or thematic groupings of religious and secular subjects.

First appearing in fully developed form in the Rutland Psalter (BL Add. 62925) of ca. 1260, marginalia became widespread in English manuscript illumination toward the end of the 13th century. Distinguished by its variety and inventiveness, English marginalia achieved a peak of popularity during the 14th century and became one of the hallmarks of the East Anglian School and the manuscripts made for the Bohun family. A similar taste for marginal ornament also manifested itself at this time in misericord carvings and architectural detailing. By the end of the 14th century the popularity of marginalia had declined, and during the early 15th century it ceased to be a major element in English illumination. Although individual figures, animals, and other motifs continued to be included in manuscript borders for much of the century, the lively and imaginative vignettes that characterize 13th- and 14th-century marginalia no longer appeared.

Gothic marginalia occurs predominantly in religious texts, such as psalters and books of hours, while being largely absent from most secular books. Its purpose has proved difficult to ascertain. Although in some cases the marginalia illustrates the text or expands on other illustrations in the book, frequently no clear relationship can be established between the marginalia and the book as a whole. Marginalia is generally thought to have been intended to

amuse or divert the reader but may have also served as a mnemonic device to assist in memorizing the accompanying text. Particularly problematical are the exuberantly humorous, bawdy, or obscene compositions that sometimes fill the margins of devotional or liturgical texts. Revealing a freedom of artistic expression rarely encountered in other art forms, they provide a dramatic contrast to the religious content of the text. The juxtaposition of opposites may have been deliberately intended to provoke the reader's attention and to affirm the authority of the text through the marginalization of pictorial elements opposed to it.

Marie de France (fl. ca. 1160–1215)

The first known woman writer of vernacular narrative poetry in western Europe. Connected to the English court of Henry II and Eleanor of Aquitaine, where French was spoken, she wrote her three extant works in French. She translated *St. Patricks Purgatory* and her Aesopic *Fables* from Latin and English sources, respectively, but there is no known literary source for her best-known work, the *Lais*, twelve short romances treating problems of love and morality, sometimes with supernatural elements. Two of her *Lais* (*Lanval* and *LeFresne*) were translated into ME.

Marriage and Marriage Law

In the Middle Ages marriage came to be both a sacrament and a contract with important civil consequences. In Anglo-Saxon times marriage was viewed primarily as a private affair, though some kings intervened to issue laws assuring women a free choice of a spouse and regulating the law about adultery. Only gradually was the law of marriage brought under the rule of the church, and the exclusive jurisdiction of canon law was not established until the mid-12th century.

Making a marriage both valid and licit involved several considerations; both parties must be of age (twelve for females, fourteen for males), not too closely related by ties of consanguinity or affinity, not bound by vows of celibacy, nor forced to consent. While a valid marriage could be made in private (clandestinely), a licit marriage required the observance of the forms prescribed by the church, including calling of banns. Canonists in the 12th and 13th centuries debated about the essential nature of a valid marriage. Vicarius, an English civil-law writer, treated it as parallel to Roman law of purchase. However, the consent theories of Gratian, Peter Lombard, and Pope Alexander III (1159–81) prevailed, especially in the papal formulation.

Marriages were of two basic types. Present consent (*sponsalia de praesenti*)—"I take you as wife/husband"—created the bond of marriage. Future consent (*sponsalia de futuro*)—"I promise to take you as wife/husband"—if followed by carnal consummation, made a valid marriage. The complex rules of the church,

the tradition of clandestine marriage, and the reluctance of people to accept that marriage was not a private matter brought many cases before the ecclesiastical courts.

The most common matrimonial cause was the suit to enforce a marriage contract. Some “divorces”—essentially annulments—were granted. There were also judicial separations; in both these cases property settlements were made and child support, if necessary, was mandated by the church court. The English law of marriage was the medieval canon law. It survived the Reformation, to be altered by Lord Hardwicke’s marriage law in the 18th century.

Because marriage had important consequences for the land law, common-law courts often adjourned cases until a request for proof of a marriage was answered by the church courts. This cooperation between ecclesiastical and secular jurisdictions is graphically depicted by a mitred hat, such as bishops wear, drawn upon the margin of a royal court plea roll. Because illegitimacy was a bar to the inheritance of feudal property, many suits in common-law courts turned on proof from the canon-law court of the legitimacy of an heir.

A valid marriage was a requirement for receipt of dower, the widows right to one-third or one-half her late husband’s property. If defendants in common-law courts sought to deny a widow her dower on the ground that she had not been married to the man of whom she claimed dower, a request went from the royal court to the church court to certify the marriage. One advantage of suing in royal court was that it could seek such certification from the ecclesiastical court. A few persons tried to get out of providing dower by alleging that there had been a divorce; the same procedure was followed. The report from the church court as to the marriage was decisive.

Church courts had spiritual jurisdiction to punish men and women who committed adultery. Canon-law courts may not always have lived up to their ideal of making adultery an equal offense for both sexes, and in so far as it touched the law of real property, adultery was overwhelmingly the offense of a married woman. A statute of 13 Edward I (1284–85) barred an adulterous woman from the enjoyment of common-law dower unless she had been freely forgiven by her husband. In such cases, however, the ecclesiastical courts were not consulted. Instead recourse was made to the knowledgeable neighbors on the common-law jury. A widow suing for dower in 1301 was met with the defendant’s claim that she was an adulteress who had left his ancestor to live with her lover. The widow argued that her husband, two days before his death, had forgiven her. The lover, present in the court, supported her claim of reconciliation, as did the jury; she got her dower.

The free consent required to make marriage valid in the eyes of the church had temporal consequences; it contributed to limiting the influence of families and feudal lords on the choice of partners. Families naturally had a profound

interest in marriage; prominent families might betroth very young children, even though the marriage could be repudiated by either spouse upon reaching the age of consent. The settlements of land made at marriage show the freedom feudatories had to resettle estates to provide for children not apt to inherit under primogeniture.

The interest of the feudal lord came to be equivalent to the payment of a fine or forfeiture for refusal to marry at his behest: twice the value of the marriage for a self-determined marriage while still a ward. Widespread feudal disobedience over marriage demonstrates the willingness to pay for such free choice. A ward, of course, was the heir and could use his inheritance to pay for forfeiture of marriage. One ward, sued for forfeiture of marriage, succeeded in shifting the burden of the fine for his marriage onto his mother and stepfather. He said that, by alternating “threats” and “flattering speech,” they had forced him into a marriage against both his own wishes and those of his feudal lord. We do not know if the young man later tried to get out of the marriage in the church courts, but the verdict of the common-law jury in 1280 determined that the fine for his marriage came from his mother and stepfather.

Widows in the king’s gift were subject to control over their remarriage, but Magna Carta (cl. 8) allowed them the freedom *not* to marry again. The granting of dower came to be coupled with a promise not to marry without royal license. Some widows paid a fine in advance to be allowed to marry as they wished; some took a chance on a husband offered by the crown, knowing that they had the right to refuse; many widows flouted the law to marry without license and paid the fine, later, when it might be paid by the new husband. Dower lands could be seized by the king until the fine was paid, but the land was not lost permanently.

Lesser lords were eager to claim wardships and marriage of minor heirs, but they do not seem to have been able to collect from tenants’ widows when they remarried. Manorial lords collected a marriage fine, *merchet*, when daughters of servile tenants married, especially to freemen or peasants from other manors. Even though there was no official registration of marriages until the 19th century, public, private, and canonical documents contain a wealth of information about the important matter of marriage.

Martyrology, Old English

The term "martyrology" was often used of "calendars," or lists of names of saints (not only martyrs) recorded against their feast days. Bede added brief notes on each saint to produce the first "historical" or "narrative" martyrology. The OE *Martyrology* is such a "narrative" martyrology, originally created to include saints' days for the whole liturgical year but now extant in five fragmentary OE texts, some of considerable extent, and one 16th-century transcript of a partial entry for St. Patrick (17 March). Two manuscripts are of the late 9th century (BL Add. 23 211 and 40 165A), the others later (BL Cotton Julius A.x, ca. 1000, and Cambridge, Corpus Christi College 41 and 196, both 11th-century). Altogether the manuscripts present entries (or "notices") for nearly the entire year, apart from a large loss for most of February, beginning probably on 26 January, and smaller losses from 14–16 March inclusive and from 22–24 December inclusive. About 200 saints, or groups of saints, have "narrative notices," some running to about a modern printed page in length. There are also nineteen notices on such general feasts as Christmas and Ascension Day and nineteen calendar entries of names only.

This martyrology, the earliest in vernacular prose in Europe, is also one of

the earliest narrative prose texts in English, if not the earliest. Only one of the later manuscripts updates the information, and only for one item, so the texts represent a record of festivals celebrated in the composer's house sometime in the 9th century. Some scholars have suggested that it was written in Mercia, which is not unlikely; others have thought that it was a translation of a martyrology in Latin. Evidence is not conclusive for either opinion.

Relevant sections of martyrologies were read aloud at the monastic chapter office (a daily meeting of monks in a monastery) to recall the commemoration of saints for the following day and sometimes for sick brothers in the infirmary, but hints in this martyrology suggest that it was intended for private reading. Its learned composer created the sections in a variety of ways, following no rigid formula of presentation and taking information from a number of other books as well as from saints' legends. The writer was a fluent latinist in a period when knowledge of Latin was reputedly in decay and a good precis writer with an eye to retain an image and an ear for a snatch of dialogue. Unlike some continental Latin martyrologists of the 9th century he did not merely copy Bede's words and then add a little more but chose his own material to present a sequence of notices, which, although functional in purpose, is fascinatingly readable.

Marvels of the East, The

The Marvels, or *Wonders, of the East*, an account of fantastic oriental creatures, is an Anglo-Saxon contribution to the *mirabilia* genre, literature in which a traveler in foreign lands describes exotic sights in a letter home. In this case the creatures are mostly gigantic and anthropomorphic: *blemmyae* (headless people with eyes and a mouth in their chests), *cynocephali* (dog-headed people), *panotii* (people with ears large enough to cover their bodies), women thirteen feet tall with boar tusks and ox tails. Such monsters are ultimately drawn from Pliny and the Alexander legends, but the immediate source appears to be the Latin Letter of Farasmanes to Hadrian. The form may derive from a Greek original, since the *mirabilia* resemble Greek *periploi*, guidebooks for sailors and merchants. In *The Marvels*, however, little narrative context remains and only a few scholars have found literary merit in the work (e.g., Campbell, who approaches it from the perspective of the grotesque).

The Marvels survives in three early English manuscripts: as an Anglo-Saxon text in the *Beowulf* codex, BL Cotton Vitellius A.xv; as parallel Anglo-Saxon and Latin versions in Cotton Tiberius B.v; and as a Latin text in Bodleian Library, Bodley 614. All three manuscripts are illustrated, the Tiberius most elaborately, with 38 miniatures.

Of the three English manuscripts the Bodley and Tiberius are more closely related to each other than to the Vitellius: the Bodley and Tiberius manuscripts also contain maps, astronomical pictures, and other cosmographical items, while the compiler of the Vitellius manuscript may have been chiefly interested in monsters. Nevertheless, all three may derive from a common Anglo-Latin source.

Mass, Polyphonic Music for

ca. 900-ca. 1390

The clergy of France, Normandy, and the British Isles held in common a number of important outlets for musical creativity within the medieval liturgy, including the composition of new chants, the amplification of plainsongs with tropes, and the adornment of plainsongs with polyphony. The composition and performance of polyphony, though geographically widespread, was a specialized skill—the province of a few trained musicians principally working in the choirs of the greater Benedictine abbeys and cathedrals. Its practice was from the 9th to the 12th century mainly unwritten, relying on improvisation and memory in an oral tradition stabilized by only a few notated models. Its style ranged from the addition of a sober note-against-note counterpoint whose contour ran mainly parallel to that of the chant being decorated, to the florid, melismatic ornamentation by one or more solo singers of the slowly sung notes of a chant. The 12th and 13th centuries saw a shift toward notation

and fixity in ecclesiastical polyphony that brought, as an important consequence of musical literacy and a new reliance on the written note, a more rapid evolution of style and turnover of repertoire and an increased number of centers of performance.

From the 10th to the 13th century the repertoire of polyphony for mass and offices was primarily festal and Proper, that is, comprehensive in its coverage of major holidays and setting liturgical texts specific to the occasion. It was widely disseminated by a latinate clerical culture sharing common musical and educational roots, so it was to a fairly large degree uniform among the institutions in which it was cultivated, though subject to local additions and modifications. The only musical sources from the British Isles to survive more or less complete from this broad timespan, the Winchester tropers (late 10th century) and W1 (early 13th century), conveniently frame and characterize it. The Winchester organa (polyphonic settings of plainsongs) consist of a yearly cycle for the Old Minster of Alleluias and Tracts for the Temporale and Sanctorale (including the Common of Saints), plus shorter series of Introits and Sequences, Kyries and Glorias, office responsories, and other items. An artistic product of the Benedictine Reform, the Winchester tradition reflects at several removes the practices of northern France, especially at Fleury and Corbie. W1 contains a version of the late-12th-century Parisian *Magnus liber*, a yearly cycle of organa for Propers of the mass (Graduais and Alleluias) and offices (Vespers and Matins responsories) originally composed for Notre Dame, as well as local additions for the Augustinian Priory of St. Andrews, Scotland, for which the manuscript was copied in the 1230s.

The long tradition of composing cycles of polyphonic Propers for the mass and offices lost impetus in France in the 13th century with the canonization of the *Magnus liber*. Outside of versions of this collection there is virtually no evidence for any attention to mass Propers by French composers in this period. In 13th- and 14th-century England, however, composers continue to cultivate Proper cycles of an indigenous genre, the troped-chant setting of Alleluias.

A new wave of composition for the mass that began in the later 12th and early 13th centuries involves the provision of chant and polyphony for daily Lady Mass—a new votive service performed outside of choir with its own special complement of performers and a distinctive (lay) audience. Most significant in the light of the later history of polyphonic mass music is the new emphasis here on setting the fixed texts of the Ordinary of the mass (Kyrie, Gloria, Credo, Sanctus, Agnus, and *Ite/Deo gratias*, either with or without additional Latin trope texts) in addition to some Propers. Kyrie, Sanctus, Agnus, and *Ite/Deo gratias* were sung daily, with the addition of the Gloria on Saturdays and feasts and the Credo only on high feasts—a frequency of performance reflected directly in the proportional numbers of surviving

settings. Marian Propers were also set polyphonically, including troped-chant Alleluias (and there are isolated settings of Marian Introits, Gradual verses, and Tracts), but most novel is the English enrichment and diversification of the repertoire of Marian Sequences and Offertories.

Widespread continental adoption of the practice of setting mass Ordinaries (the invariable texts of the mass) lags significantly behind the English. Aside from some 13th-century activity on the Iberian peninsula, only isolated settings precede two northern French landmarks, the anonymously compiled mass for Tournai Cathedral of 1349 and a mass for Reims Cathedral by Guillaume de Machaut of the early 1360s. Both of these significantly parallel English practice in that they were intended for Marian devotional masses outside of choir and include settings of all six mass Ordinary texts.

In most locales the standard musical fare at daily Lady Mass would have been plainchant, and where polyphony was heard it would have been mainly in the form of one or two extemporized voices added to a plainchant. Written polyphony did not at first reach much higher in artistic ambition. Insular composers worked in a narrow stylistic range, principally writing note-against-note (discant) settings of troped and untroped chants in two or three voices notated in score; composing free settings of the liturgical texts in three voices, also notated in score; or constructing motetlike troped chant settings notated in parts with additional tropic texts. These simple ferial settings were also compiled into weekly, biweekly, or seasonal cycles by genre (seven Kyries, fourteen Sequences, etc.), a tradition whose first witness in a book of polyphony is the eleventh fascicle of W1. Though the early-13th-century repertoire contained settings of troped Sanctus and Agnus, a distinctive feature of the English mass repertoire enduring into the 14th century is settings of Latin-texted Kyries (including an extraordinary setting for St. Cuthbert, the *Kyrie Cuthbertê*) and Gloria tropes—troped chant settings of the Gloria trope *Regnum tuum solidum* with its prosulae *O rex glorie*, *Salve virgo virginum*, and *Decus virginum*, and the Marian Gloria trope *Spiritus et alme*. Belying the generally unpretentious character of these works is a masterly setting of *Spiritus et alme* for four voices probably composed by R. de Burgate, abbot of Reading, 1268–90 (Sanders, 1979: no. App. 15).

A significant development of the later 14th century was the establishment of personal household choirs by the great secular and ecclesiastical magnates, following the earlier lead of French and English monarchs. This movement provided new places, new occasions, and new forces for the performance of mass music and introduced a new emphasis on festal polyphony for mass as part of ostentatious display in court culture. One consequence is an increase in frequency of Gloria and Credo settings. More fundamentally we see composers elevating their ambitions in respect to the impressiveness of mass music,

leading to a new artfulness and complexity through the adoption of motet style, accompanied-song style, and canonic intricacies. The Old Hall Manuscript (ca. 1420) shows a systematic division in its mass music between more functional ferial settings in score, some of which may date back to the third quarter of the 14th century, and more elaborate display works and festal settings in parts.

ca. 1390-ca. 1485

Late-14th- and early-15th-century England witnessed a rise to prominence of secular institutions like the royal and other household chapels and a new wave of choral foundations. With these came a trend toward more elaborate and often ostentatious music, designed to demonstrate the excellence of a given establishment as much as to adorn the liturgy. Increasingly pride of place was given to music composed for the Ordinary of the mass, and about 400 to 500 separate movements survive, the majority from the first half of the 15th century. Of these some are self-standing and some grouped into pairs (Gloria-Credo or Sanctus-Agnus Dei); later full cycles predominate, these often with a preceding Kyrie, which might or might not include *prosulae*.

In tracing the development of Ordinary settings from the end of the 14th to the late 15th century it is convenient to divide the period into five phases, the exact limits of which need, on current knowledge, to be treated with caution: 1) ca. 1390-ca. 1415, representing the main body of the Old Hall Manuscript; 2) the second and third decades of the 15th century, including the later Old Hall works; 3) a period of far-reaching stylistic change, which occurred largely in the 1430s and perhaps the early 1440s; 4) a time of stabilization from the early 1440s to around the early 1460s; 5) a more problematic phase—probably beginning in the early to middle 1460s—from which little mass music remains.

Most of the surviving repertoire from the early years of the 15th century is preserved in the Old Hall Manuscript, which includes music by Bittering, Cooke, Excetre, Oliver, Power, Pycard, Queldryk, Tyes, and a number of other named composers, some of whom are known to have had associations with the Chapel Royal or one of the ducal chapels; also represented is one Roy Henry, possibly Henry V. The majority of pieces are individual settings of the Gloria, Credo, Sanctus, and Agnus Dei, though there are also a few *Deo gratias* substitutes. Only a handful of Kyries survive from this period, possibly because that section of Old Hall has been lost rather than because they never existed in the first place.

The range of styles is remarkable, from simple block-chord settings with

plainchant in the middle voice (so-called English discant) to highly florid pieces that must have required virtuoso singers. The idiom of the more elaborate settings matches most closely that of late-14th-century French music: lively rhythms driving short melodic phrases and a racy use of dissonance arising from the collision of independently moving voices. It is clear that ingenuity of artifice was highly valued, with many pieces using abstract structural techniques like isorhythm and canon, and some communicated through the most abstruse notational devices. A few settings, mainly of the Gloria and Credo, are paired by use of similar voice ranges, parallel structures, and so on.

A relative simplification of style occurs in the more composerly works of the later Old Hall repertoire, with a trend toward more florid melodic lines and longer phrases and away from self-consciously learned techniques. Apart from Cooke and Power composers featured here include Damett and Sturgeon, both members of the Chapel Royal.

To some extent English composers continued to produce individual and paired movements throughout the 15th century; however, around 1430—the exact date is uncertain—composers like Dunstable, Power, and Benet extended the idea of pairing into the compilation of full cycles. Not only were these unified through established practices like parallel structuring, often they also made common use of a plainsong *cantus firmus*, the choice of which was probably determined by the event for which the work was composed. It is the cyclic mass, and in particular the *cantus firmus* or tenor mass, that seems to have become the most highly regarded genre of the period and that superseded the isorhythmic motet as the chief vehicle for the celebration of great festive occasions.

With the rise of the new genre came also a radical change in musical taste, the new manner favoring smoother melodic lines, fluid rather than bouncy rhythms, and a more controlled use of dissonance. These, together with a closer attention to the interaction of voice parts, generated a completely new style that soon took over in England and, somewhat later, on the Continent.

In fact, in the absence of major insular manuscripts, most English music of the post-Old Hall period survives only in continental sources—often anonymously—and such sources were plainly crucial in the wider dissemination of the new style. They are, however, not without their problems: most notably copyists frequently suppressed the Kyries of English cycles, perhaps because the prosulae rendered them unsuitable outside Sarum usage.

A younger generation of composers including Frye, Bedingham, and Plummer—also, perhaps, the composer of the anonymous Caput Mass—dominated English music of the mid-15th century. Though masses for three voices (the most common layout for the early cycles) continued to be written,

a richer effect was increasingly sought by the addition of a fourth part; indeed fragments of five-voice *cantus firmus* masses survive, too, probably from the late 1450s or 1460s. Historically, though, it was the four-part *cantus firmus* mass that was adopted and developed by continental composers as the genre for their most prestigious sacred music.

Little remains from the period after about 1460–85, the greatest loss being that we have practically no mass music by the masters of the Eton Choirbook. This gap arises partly from the dearth of English sources and an evident collapse of interest in English music on the Continent; however, it may also reflect greater competition from other genres, especially the Marian antiphon. Be that as it may, inventories show evidence of lost volumes from the last quarter of the 15th century that contained masses in five, six, and even seven parts; this ambitious-sounding repertoire naturally looks forward to the 16th-century six-part festal mass. What little has survived shows considerable variety and ranges from the simple, so-called “playnsong” style of Turges’s mass in the Ritson Manuscript to the florid manner of some of the York masses.

Clearly, in the more austere 15th-century settings, adornment of the liturgy is limited enough. In the discant pieces, for example, musical structures are determined entirely by the chants of which they are the straightforward harmonizations, and these in turn are shaped by the words involved. With the greater elaboration of more complex music, however, composers rarely used the chants proper to the texts they were setting; instead, as we have already seen, a variety of abstract technical preoccupations took them far beyond the bare presentation of the liturgy. Indeed, even after such procedures as isorhythm and canon had fallen out of fashion, it long remained normal to compose within preordained formal schemes, these often being strict and largely independent of the structure of a given text. Most obviously such schemes involved the use of approximately parallel structures for the constituent movements of pairs or cyclic masses. However, in single movements, pairs, and cycles alike it was also common for musical structure to be governed by a system of numerical proportions. Sometimes, too, such proportions seem to have involved numerological symbolism, as has been found in the work of John Dunstable.

Not only could the structure of a text be secondary to musical consideration, the florid nature of many melodic lines suggests that propriety did not require clarity of word setting either. Indeed many settings of the Credo (sometimes also of the Gloria) even involved the singing of different portions of the text at the same time, perhaps following the precedent set by isorhythmic motets. This procedure, known as telescoping, was later replaced by the setting of abbreviated versions of the texts, in the case of the Credo usually omitting the

Holy Spirit articles.

It does not appear that polyphonic mass Propers were cultivated to the same extent as Ordinaries, and what survives suggests that they did not require the same elaboration of style. However, there survive a number of short, mainly unpretentious items, including Communion and a complete set of Alleluias for Lady Mass, Alleluias for other feasts, and settings of the *Benedicamus* and the *Laudes Deo* (the troped lesson for midnight mass of Christmas). Of particular interest is a group of pieces to be performed at the masses of Holy Week and Easter that are preserved in BL Egerton 3307, which also contains the only surviving polyphonic *Missa Brevis* of the period.

Matilda (ca. 1102–1167)

The eldest child of Henry I and Matilda of Scotland. Nothing is known of Matilda's life prior to her betrothal at age seven to Henry V, Holy Roman Emperor. She left for the Empire during Lent 1110, having just turned eight, and remained there for the next sixteen years, the last years of the Investiture Controversy. She was crowned queen upon her arrival in Mainz (25 July 1110) but was sent to Trier to be educated and did not begin her public life until January 1114, when she and Henry were married in Worms. Though she used the title empress until her death, its legitimacy is questionable because it was bestowed by an antipope (Rome, July 1117). The role of empress was more defined than that of contemporary English queens. She served as a formal intercessor and performed ceremonial duties, but she probably did not make decisions even when she was nominally in charge of Tuscany. Her success as empress is underscored by the memory of her in a German chronicle as "the good Matilda." When she became a childless widow in 1125, Matilda was called back to England. Her only legitimate sibling, William, had died (1120), and her

father's second wife, Adeliza, still had no children, so the 23-year-old empress arrived in England in 1126 to be placed in an unprecedented position as a female heir to the royal throne. In January 1127 the Christmas court swore allegiance (though not homage) to her as heir.

Matilda's second marriage, in 1128, was to Geoffrey Plantagenet (1113–1151), count of Anjou from 1129. The union was intended to guarantee a peaceful border between Normandy and Anjou, but within a year the couple was estranged and lived apart until 1131. At a great council in that year the decision was made that Matilda should return to her husband, most likely with the hope that she would produce a male heir. Only then did many swear or renew their oaths of fealty. She subsequently gave birth to three sons, Henry (the future Henry II) in 1133, Geoffrey in 1134, and William in 1136. Though she spent most of these years in Normandy with her father, she was involved in a border dispute with him when Henry I died on 1 December 1135.

The empress claimed both England and the duchy of Normandy as the designated heir but was challenged by her cousin Stephen of Blois. Stephen had hurried from his wife's territory of Boulogne to Winchester, where his brother was bishop, and quickly took control of the treasury, gained support of nobles and clergy, and was crowned on 22 December 1135. Civil war began in 1137 in both England and Normandy. Contemporary comment on the war between the two claimants to the throne and the behavior of some nobles who more than once switched allegiance has led this period to be mislabeled "the Anarchy." Matilda's supporters were defeated in England in 1138 (Battle of the Standard), while Matilda and Geoffrey quickly established themselves in Normandy, although it took five years to secure it. By 1139 the empress's forces, led by two of her half-brothers, Robert of Gloucester and Reginald of Dunstanville, and her uncle David, king of Scots, invaded England, posing a serious military challenge to Stephen, who was simultaneously alienating supporters. In February 1141 her forces defeated and captured Stephen at the Battle of Lincoln. In the following month Henry of Blois, as papal legate, publicly received her as "Lady of England and Normandy" (alternately termed "Lady of the English"), and the royal crown and treasure were handed over to her. It is unclear if the unusual title was meant to be temporary until her coronation as queen or to indicate that she ruled only until her son came of age. She arranged for a formal coronation and a seal was struck, but Londoners barred her entry into the city and eventually attacked, forcing her back to Oxford. Meanwhile her handling of a clerical appointment and her reluctance to reward defectors from Stephen's side caused her support to wane. Her forces were routed at Winchester later in 1141 and Robert of Gloucester was captured. When a prisoner exchange released both Robert and Stephen, it was clear to many supporters that the empress would never be crowned. She

remained in England, holding a few castles, until 1148, when she returned to Normandy and dropped the title “Lady of the English.” By the time of her departure Matilda’s fourteen-year-old son Henry had already attempted an invasion of England (ca. 1147), and he took over the fight for the throne. Matilda resided mainly in Rouen and appears to have counseled Henry. In 1153 Stephen accepted a negotiated peace, designating Henry as his heir. Following his 1154 coronation Henry II confirmed many of the grants Matilda had made, giving some permanence to her year as “Lady of the English.” The Empress continued to rule Normandy jointly with Henry or in his name and continued to advise him until her death on 10 September 1167. She was buried at Bec-Hellouin, where she also willed her jewels, many of which were imperial.

Contemporary chroniclers of the Anarchy, supporters of both Stephen and Matilda, criticized her manner, usually characterizing her as haughty or as a virago, lacking feminine qualities. After her death legends grew along these lines. Even in the 20th century most historians of the Anarchy have accepted these judgments and at most credited her with being a conduit of legitimacy from her father to her son. In spite of her unique life, and of being the only female claimant to the medieval English throne, no full-scale scholarly biography was published until 1992. Recent study of her charters, the chronicle accounts, and both the imperial and English phases of her life has led to a reassessment. Her recent biographer characterizes her as a careful and judicious ruler, who ruled Normandy and what she held in England in no way differently from her father or son, although her mistakes in 1141 were crucially ill-timed. Ultimately it was the expectations of a 12th-century nobility and clergy about the character of kings and women that prevented them from accepting a queen who acted as independently as a king.

Matter of Antiquity (or Rome)

The classical stories drawn upon by medieval historians and romance writers, including stories of Thebes (especially the events surrounding Oedipus and his kin), Troy (including the subsequent history of Aeneas and Rome), and Alexander the Great.

Troy and Thebes

The story of Troy is the West's most persistent secular narrative. Classical Trojan episodes are common in ME literature (e.g., in Chaucer's *House of Fame* and Gower's *Confessio Amantis*). In addition to these fictional treatments the Middle Ages possessed what it believed to be the true history of the Trojan War, based on the supposed eyewitness journals of two fictitious authors, "Dares the Phrygian" and "Dictys of Crete." Trojan history was of interest in Britain because the island was said to have been colonized by and named for Brutus, a descendant of Aeneas, the Trojan prince and founder of Rome. The Brutus tradition is evoked at the beginning of *Sir Gawain and the Green Knight*, and the "history" of the Trojan War forms the background to Chaucer's *Troilus and Criseyde*.

The crude Latin narratives of Dares (6th century A.D.?) and Dictys (4th century A.D.) were transformed by Benoît de Sainte-Maure into a lavish French poem, the *Roman de Troie* (ca. 1165). These materials, along with additions from the Latin prose *Excidium Troiae* and classical sources, lie behind the earliest full Troy narrative in ME, the anonymous *Siege of Troy* (ca. 1300–25), a vigorous northwest Midlands romance in about 1,000 rhymed couplets.

The principal poems about the Trojan War in ME derive directly from Guido delle Colonne's *Historia destructionis Troiae* (1287), a sober, learned reworking of Benoît in Latin prose that became the standard medieval history of Troy. Three complete English translations of Guido, which all take pains to preserve its presumed factual truth, were produced within a few years of one another,

perhaps in response to the popularity of Chaucer's *Troilus*. The most faithful is the northern *Destruction of Troy* (ca. 1400?), apparently by John Clerk of Whalley, whose skillful alliterative verse often overcomes Guido's intractable material. The anonymous *Laud Troy Book* (ca. 1400) is an energetic romance in four-stress couplets that glories in war and its chivalric heroes, especially Hector. The most ambitious and popular ME translation of Guido is John Lydgate's *Troy Book* (1412–20), whose learned and rhetorical additions extend the story to over 30,000 lines.

The brief *Prose Siege of Troy* (1425–50) is based on Lydgate (with some knowledge of Chaucer), and two anonymous 15th-century *Scottish Troy Fragments* were used to fill gaps in Scottish manuscripts of Lydgate's *Troy Book*. Caxton's long prose *Recuyell of the Historyes of Troye*, the first book printed in English (Bruges, ca. 1474), is a translation of the mid-15th-century *Receuil des histoires de Troyes*, much of whose strictly Trojan information derives from Guido's *Historia*.

The main events of the story of Thebes are set a generation or two before the Trojan War, and as a narrative subject Thebes was no less popular than Troy in classical and medieval continental literature. But the complete retelling of the story in ME (as opposed to the use of episodes by such writers as Gower and Chaucer, especially in *Troilus* and the *Knight's Tale*) had to await John Lydgate's *Siege of Thebes* (1420–22), which presents itself as a continuation of the *Canterbury Tales*. Perhaps because of its relative brevity (4,716 lines in rhymed couplets) it is Lydgate's finest narrative. A brief *Prose Siege of Thebes* derived from Lydgate was produced in the 15th century.

Alexander

In England, as throughout Europe, the legendary history of Alexander the Great was “so commune / That every wight that hath discrecioun / Hath herd somewhat or al of his fortune” (Chaucer, *MkT* 2631–33). Over 80 versions in more than twenty languages are known. However, the legend failed to engage the imaginations of English writers after the 15th century. The Alexander story lacked a Malory or, more to the point, a Caxton to print the best ME works on the subject—*Kyng Alisaunder* and *The Wars of Alexander*. Consequently the Alexander romance, once as popular as the Arthurian, had lost its English audience by 1500.

The Alexander romance in Britain is derivative, though often superior to its sources. Its major texts issue via translation or adaptation from Latin or French works, derived themselves at some remove from the Pseudo-Callisthenes, a

mediocre 3rd-century Greek prose romance, the source for dozens of versions in every European language. The British tradition reflects material adapted either from the 4th-century *Res gestae Alexandri magni* of Julius Valerius or from two different redactions of the *Historia de preliis Alexandri magni*, both elaborations of the mid-10th-century *Nativitas et victoria Alexandri magni*, translated from the Greek by the archpriest Leo of Naples. Thus Kyng Alisaunder (early 14th century) and the *Cassamus* fragment (15th century) are derived from Julius Valerius, by way of Thomas of Kent's 12th-century *Roman detoute chevalerie* and Jacques de Longuyon's *Voeux du paon* (ca. 1312), respectively. The *Historia de preliis* inspired the mid-14th- to mid-15th-century alliterative poems *Alisaunder*, *Alexander and Dindimus*, and *The Wars of Alexander*, as well as the *Thornton Prose Alexander* (1400–50). The 15th-century Scottish poems *The Buik of Alexander* and Sir Gilbert Hay's *Buik of King Alexander the Conquerour* adapt the *Fuerre de Gadres*, by a certain Eustache, and the *Voeux du paon*.

Anecdotal accounts of Alexander's life in collections like the *Gesta Romanorum* present Alexander as a *de casibus* tragic figure (a protagonist who falls from prosperity into woe) and as a negative exemplum of excessive pride. The longer narratives celebrate his magnanimity, generosity, and courage, inverting the moralizing comment on the ambition that propelled him to conquer the known world. The massive 15th-century Scottish poems, reflecting closer connections with French culture, are less historical and more concerned with courtly manners and love.

Kyng Alisaunder and *The Wars of Alexander*, though derived from different traditions, include similar elements: Anectanabus's seduction of Alexander's mother, Alexander's birth and childhood exploits, Philip's death, Alexander's challenge to Persian authority, his conquest of Egypt, Rome, the other Greek city states, the siege of Tyre, Darius's defeat and death, and Alexander's coronation as emperor of Persia. The first half of the common narrative line, up to the Persian conquest, though not free from fantastic elements like Anectanabus's appearance as a flying dragon or the man-eating horse Bucephalus, clearly exploits historical fact. More episodic, the second half details Alexander's conquest of Porus's Indian empire; exotic encounters with the Amazons, Gymnosophists, Brahmans, and apelike men; a visit to the Earthly Paradise and the Trees of the Sun and Moon; and the courtship of Candace, queen of Ethiopia. Although *The Wars of Alexander* betzks off before Alexander's death, *Kyng Alisaunder* continues to the end of his life and concludes with moralizations on his death by poisoning after his return to Babylon.

Matter of Britain

The name given to the great body of medieval romance devoted to stories of King Arthur and his knights. The term derives from the 12th-century French poet Jean Bodel’s classification of the subjects, or “matters,” of romance: “Ne

sont que.iii. matieres à nul home antandant / De France, et de Bretaigne, et de Rome la grant” (“There are but three matters that anyone knows—those of France, of Britain, and of Rome the great”; *Chanson des Saxons* 6–7). To Bodel’s three divisions modern critics have added a fourth, romances devoted to the Matter of England. More than all the stories about French, classical, and English heroes, however, those about the British Arthur provided the most popular subject for romance during the Middle Ages.

Considerable scholarly energy has been devoted to finding the source of the stories that were to form the Matter of Britain. The figure of Arthur himself seems to derive from both history and myth. The historical Arthur is generally agreed to have been a late-5th- to early-6th-century British commander who fought against the Saxons. Such a figure is mentioned by the 6th-century historian Gildas, with a more specific reference to Arthur following in Nennius’s *Historia Brittonum* (ca. 800). During the same period stories of Arthur also grew in Welsh legend and poetry. When Geoffrey of Monmouth combined historical “fact” with such Celtic fancy in his *Historia regum Britanniae* (ca. 1138), the resulting mixture proved explosive.

Attempts to explain the transmission of Arthurian stories to the Continent, their widespread popularity there, the rise of the romance form, and the eventual réintroduction of the “Matter of Britain” into the country of its origin have raised difficult questions for critics, and their varied answers to these questions occupy many articles and books. For complicated and sometimes disputed reasons ME Arthurian romances do not appear until the last half of the 13th century, but the numerous works composed during the 14th and 15th centuries are impressive in their number and variety.

In his essay in *Arthurian Literature in the Middle Ages* Ackerman calculates that about one-fourth of all surviving ME romances treat episodes belonging to the Matter of Britain. The *Manual* groups them by subject: “The Whole Life of Arthur,” “Merlin and the Youth of Arthur,” “Launcelot and the Last Years of Arthur,” “Gawain,” “Perceval,” “The Holy Grail,” “Tristram,” and “Arthur of Little Britain.” The whole cycle of Arthurian stories is thus covered in English, for the Matter of Britain had expanded to include the life and career of Merlin, the begetting and birth of Arthur, the youthful career of King Arthur, the relationship of Lancelot and Guinevere, the history of the Holy Grail, and the final disasters that resulted in King Arthur’s death. ME romances are also devoted to the knights who came to be associated with Arthur’s court, such as Perceval, Tristan, and, most popular, Gawain.

ME romances on these Arthurian subjects appear in rhyme, in alliterative lines, and in prose. Those in rhyme employ varied schemes, including couplets, six-, eight-, even eleven-line stanzas, and tail rhyme stanzas of several sorts. The romances in alliterative lines are products of the 14th-century Alliterative

Revival. Only one effort before Malory, a version of the Merlin story, is in prose. Notable works treating the Matter of Britain include Lazamon's *Brut*, the stanzaic *Morte Arthur*, the alliterative *Morte Arthure*, *Sir Gawain and the Green Knight*, Thomas Chestre's tail rhyme *Sir Launfal*, Geoffrey Chaucer's *Wife of Bath's Tale*, and Sir Thomas Malory's *Morte Darthur*.

Critics differ in their assessments of the quality of ME romances treating the Matter of Britain. Complicating their evaluations are questions about the relationship of these relatively late works to their sources. With few exceptions, notably the alliterative *Morte Arthure*, *Sir Gawain and the Green Knight*, and the works of Chaucer and Malory, ME versions of Arthurian stories have suffered (not always justly) by such comparisons, often dismissed as inept translations or hack reworkings of French originals. Questions about authorship also remain, as do uncertainties about the audience for which such stories were intended and the circumstances of their composition.

Despite stylistic defects these ME works demonstrate a love both of storytelling and of stories of action, heroes, and adventure. Considerable effort will no doubt be made to try to provide answers for the critical questions that remain, but the ME Arthurian romances remain widely popular, perhaps in spite of scholars and scholarly opinion.

Matter of England

The subject of a number of romances and related works, mostly anonymous, celebrating legendary heroes of England.

Horn is first celebrated in the Anglo-Norman *Romance of Horn* by Thomas

(ca. 1170). *King Horn*, from the London area (ca. 1270–80 or perhaps a bit earlier), may be the earliest extant English romance, if this place does not fall to *Floris and Blancheflour*. Driven from Suddene by Saracens who have killed his father the king, Horn overcomes various obstacles to marry Rimenhild of Westernesse and regain Suddene (the identity of which remains uncertain). *King Horn* survives in three manuscripts: CUL Gg. 4.27.2, Bodl. Laud Misc. 108, and BL Harley 2253. Other English accounts are *Horn Child* an incomplete, early-14th-century northern romance in the Auchinleck Manuscript (Edinburgh, National Library of Scotland Advocates' 19.2.1); several 19th-century versions of a ballad, *Hind Horn*; and the prose *King Ponthus*, probably from the London area (ca. 1400–50), found in both manuscript form and early-16th-century prints and translated from the French *Ponthus* attributed to Geoffrey IV de La Tour Landry.

Havelok's story is first recounted in the Anglo-Norman *Estoire des Engleis* by Gaimar (ca. 1135–40), then in the Anglo-French *Lai d Haveloc* (ca. 1200). The English poem *Havelok*, from Lincolnshire (ca. 1280–1300), survives in Bodl. Laud Misc. 108 and fragments. Havelok, heir to Denmark, is saved from a treacherous death and taken to England by the fisherman Grim, founder of Grimsby. Later, as a laborer in Lincoln, Havelok is forcibly married to Goldeboru, heir to England. Eventually they defeat their respective persecutors and regain both Denmark and England, Havelok taking the place of Goldeboru's father as the ideal king of England. Subsequent references to Havelok in chronicles, together with local traditions in Lincoln and Grimsby, further indicate his prominence in that community's self-awareness.

A 12th-century Anglo-Norman account of Bevis of Hampton was probably the archetype of the romances in continental French, English, and other European languages, as well as the extant 13th-century Anglo-Norman *Boeve de Haumtone*. The English *Bevis of Hampton*, from the Southampton area (ca. 1300), first appears in the Auchinleck Manuscript. As a result of treachery Bevis, heir to the earldom of Southampton, arrives in Armenia, whose Saracen princess, Josian, falls in love with him. She gives him a warhorse called Arundel, and after many adventures he regains Southampton, marries the now baptized Josian, and builds Arundel Castle, his deeds glorifying both places, as local traditions attest. After further adventures the two die in saintly fashion, leaving Bevis's old protector as earl, one son as king of Armenia, and the other as heir to the English king Edgar. The poem is also found in six other manuscripts of the 14th and 15th centuries and in 16th-century printed editions.

The 13th-century Anglo-Norman *Gui de Warewic* lies behind all other accounts of Guy of Warwick, legendary ancestor of the Beauchamps. An English *Guy of Warwick* was probably produced ca. 1300 in Warwickshire, but

extant texts vary in detail and provenance. The earliest, in the Auchinleck Manuscript, defective at beginning and end, runs to 12,000 lines. Guy of Wallingford loves Felice, daughter of the earl of Warwick, and after proving himself in adventures abroad returns to marry her. He then departs on a pilgrimage to atone for his life of fighting. After saving King Athelstan and England by defeating the African giant Colbrond, champion of the Danes, he goes to Warwick, where both he and Felice have a pious end. In the last part of the story, separately headed *Reinbrun* in this text, their son of this name is stolen away but eventually returns. *Guy* is also found in four other manuscripts of the 14th and 15th centuries and in 16th-century printed editions. The story of Guy was disseminated abroad less widely than that of Bevis, but in England it appeared in numerous adaptations down to the 19th century, including Lydgate's *Guy of Warwick*, the northern romance *Guy and Colbrond* (ca. 1500?), and historical writings. Chaucer alludes to Guy, Bevis, and Horn in *Sir Thopas*.

Three other extant romances may also be placed under this heading: the incomplete *Richard Coeur de Lyon*, from the London area (early 14th century), a romanticized account of the crusading king, found in the Auchinleck and six other manuscripts and two 16th-century printed editions; *Gamelyn*, from the east Midlands (ca. 1350–70), the story of an outlaw hero reinstated, found in 25 manuscripts of the *Canterbury Tales*; and *Athelston*, found in a single east Midlands manuscript (later 14th century), a fiction about the 10th-century king Æthelstan, *trouthe* and justice, and the infant St. Edmund of East Anglia.

The hero Wade survives as little more than a name, and the stories of Waldef and Hereward survive only in Anglo-Norman and Latin accounts, respectively.

Matter of France

The subject of several romances, mostly anonymous, based on the Charlemagne cycle of *chansons de geste*, including stories of Charlemagne, Roland, and other heroes, both French and Saracen.

The earliest extant works come from the east Midlands, where the most concentrated copying and adapting of the French materials themselves was undertaken in the Anglo-Norman period. These early-14th-century English poems include the incomplete *Otuel a Knight* and *Roland and Vernagu*; the second of these was evidently once the first part of a longer poem whose second part, *Otuel and Roland*, survives in a late-15th-century copy. Also in the *Otuel (Otinell)* group, but from the north, ca. 1400, are *Duke Roland and Sir Otuel of Spain* and *The Siege of Melayne*, which precedes *Duke Roland* in their common manuscript and probably constitutes a prelude to it.

Another group is focused on Ferumbras (Fierabras), like *Otuel* a converted Saracen: *Firumbras*, from the east Midlands, and *Sir Ferumbras*, from the southwest, both late-14th-century and incomplete; *The Sowdon of Baby Ion*, from the east Midlands, ca. 1400; and Caxtons prose translation *Charles the Great* (Westminster, 1485). The remaining works are the incomplete *Song of Roland*, from the east Midlands, ca. 1400; the Scottish *Taill of Rauf Coif 3ear*, ca. 1450–1500, the best of the poems though the least related to the Matter; Caxtons prose translation *The Four Sons of Aymon* (London, 1489–91); and Lord Berners's prose translation *The Book of Duke Huon of Bordeaux* (London, ca. 1534).

Despite the evident appeal of its lively action and piety the transported Matter of France seems not to have achieved the popularity of the matters of either Britain or England, but it undoubtedly had an important influence on the development of both.

Matthew Paris (ca. 1199–1259)

A monk at St. Albans from 1217 until his death in 1259, Matthew inherited the duties of historian from his predecessor in that capacity, Roger of Wendover, and continued work on Roger’s *Chronica majora*, to some extent rewriting but primarily extending and illustrating the text (Cambridge, Corpus Christi College 26 and 16, and BL Royal 14.C.vii, fols. 157–218). He also produced other Latin historical texts generally associated with the Chronicles (*Historia Anglorum*, BL Royal 14.C.vii, fols. 1–156; *Liber additamentorum*, BL Cotton Nero D.i; *Abbreviatio chronicorum*, BL Cotton Claudius D.vi) among others, and four saints’ lives in Anglo-Norman.

The great bulk of Matthew’s illustrative work in the his torical texts may be characterized as *signa*, abbreviated symbols that help readers find their way in the text and signal important events. In addition Matthew included itineraries, maps, illustrated genealogies, and the oldest preserved record of heraldic arms. Narrative illustrations are added to the histories but tend to take a minor part and assume a telegraphic, hurried, yet also vividly dramatic aspect. A few ftdl-page iconic illustrations (the Virgin and Child, the Veronica head of Christ) appended to the Chronicles are the only miniatures that could be considered polished works of art.

It is in his illustrated saints’ lives that Matthew fully explores the possibilities of narrative and, in the *Vie de seint Auban* in Dublin (Trinity College 177; [fig. 95](#)), produces his most artistically complex work. The Dublin

manuscript has been dated in the 1240s as Matthew's first attempt to illustrate the life of a saint and contains Latin versions of the lives, liturgical offices, and charters in addition to Matthew's Anglo-Norman text. The romance text is illustrated by framed miniatures across the top of the three-column page, and these continue above the Latin texts, after the romance text has ended, to detail the foundation of the monastery through the efforts of King Offa. Matthew worked in an accomplished but late version of the "Style 1200." His illustrations for the Dublin manuscript are done in line with some touches of color, primarily green, but also vermilion, blue, and ocher. Notes at the bottom of the pages in Matthew's hand give evidence that the iconography of the miniatures was carefully planned.

It would seem that similar planning would explain Matthew's involvement in the illustration of two other manuscripts of lives of saints. The *Life of St. Thomas of Canterbury* in Anglo-Norman (BL Loan 88) and the *Estoire de saint Aedward le rei* (CUL Ee.3.59) are executed in a different style from the Dublin manuscript but retain many of the features associated with Matthew, even compositions and the drawing of such details as ships and horses. All three manuscripts show an involvement with contemporary political concerns and were intended for an aristocratic audience: the life of Edward is dedicated to Queen Eleanor, and notes on the flyleaf of the Dublin manuscript detail its loan and that of other manuscripts of the lives of saints to aristocratic ladies.

Although Matthew made important innovations in format and narrative in illustrated lives of the saints that in turn influenced the illustration of Apocalypses and other English manuscripts, in general his work must be characterized as eccentric and isolated. He apparently worked apart from the scriptorium at St. Albans and produced his manuscripts as virtually a one-man effort, even writing his own fair copy. If he did plan the London and Cambridge manuscripts, he probably sent them off to London or Westminster for execution.

Matthew received a special commission as historian from Henry III and harbored many courtly prejudices, yet he lived in a monastery away from court and voiced some remarkably strong antiroyal opinions. Similarly he was a religious man who had little patience with the papacy. The unique form and visual content of his Chronicles, which he surely counted as his greatest achievement, had no successor and, as a recent scholar has lamented, have been little studied.

The most extensive examples in OE of a genre of wisdom literature consisting entirely of a series of proverbs or maxims. The genre can be found elsewhere in the medieval period in Norse, Irish, and Welsh and can be traced back to comparable classical and biblical collections. Such gnomic verse in OE is generally based on factual observation of what is (OE *bið*) or ethical observation of what ought to be (OE *sceal*), although the distinction between these categories is not always clear. Gnostic sentiments, found widely in OE verse, are particularly apparent in such poems as *Beowulf* and *The Wanderer*.

Maxims I is found in the Exeter Book and is divided in the manuscript into three sections, perhaps recalling the fact that, for Anglo-Saxons like Bede, the biblical wisdom books of Proverbs and Psalms were also considered tripartite structures. The opening section of *Maxims I* (lines 1–70) begins with a dialogue suggesting the kind of wisdom contest found elsewhere in OE (e.g., in *Solomon and Saturn*) and in Norse. The second section (71–137) begins with a series of maxims concerning phenomena, such as frost, fire, and ice, before considering the human world, including a famous passage on the joy of the Frisian wife welcoming her husband home from the sea. The section concludes with an explicit comparison of Woden, who created idols, and the true God, who created the world. The third section (137–204) contains reflection on the wandering life of the exile, the comfort of song, the dangers of human violence, and the need to be courageous in the face of adversity.

Unlike *Maxims I*, which is found in a purely poetic manuscript, *Maxims II* occurs in BL Cotton Tiberius B.i, a compendium that seems devoted to factual and historical matter, including the OE translation of Orosius's world history and a version of the Anglo-Saxon Chronicle. *Maxims II*, although shorter than *Maxims I*, seems to share a similar tripartite structure. The first section (lines 1–13) consists almost exclusively of factual maxims concerning what is (*bið*), the second section (14–57a) of sentiments considering what ought to be (*sceal*), while the third (57b–66) is not couched in gnomic terms at all. The opening words of each section seem structurally significant, as we move from king, to young prince, to God; from what is circumscribed by nature, to what is circumscribed by custom, to what cannot be circumscribed. Syntactic patterning underlines this larger structure, suggesting that *Maxims II* is a skillfully constructed work. It can be argued that each maxim is implicitly linked to its neighbor and that, far from being a haphazard list of commonplaces, *Maxims II* (like *Maxims I*) has a coherent organic structure.

Medical Manuscripts and Herbais

A selection of medical books was to be found in every medieval monastic library of any size, and it is possible with the help of library catalogues to reconstruct medieval medical practices. Diagnosis was by reading the pulse, examining the color of the patient’s urine, and astrology, which is why astrological texts are sometimes found bound with more conventional medical treatises, as in *Durham, Hunter 100*, written at Durham ca. 1100–20. Medications were prepared from herbs or occasionally from animal or mineral extracts. Caution with hot irons was used for sterilizing wounds but also in a manner similar to modern acupuncture. Diseases attributed to the blood were invariably treated by bloodletting with knives or leeches: in fact bloodletting was generally thought beneficial, even for the healthy, and monks were bled annually on days chosen as propitious by astrological means. Surgery was employed for wounds and the like, and for insanity, which was treated by trepanning the skull if medicines made with peonies failed to work. Manuscripts survive dealing with orthopedics, obstetrics, and dentistry.

Most of these texts were originally either classical treatises lost to the West but surviving in Arabic translations or themselves Arabic works. Many of the works attributed to Galen (ca. A.D. 130–200) and Hippocrates (ca. 460–ca. 377

B.C.), for example, were translated by Constantinus Africanus (ca. 1015–1087) into Latin alongside texts by Arab scholars. To these must be added later Greek texts, like Theophilus on urine and Philaretus on the pulse, both 7th-century compositions. Salerno, the oldest of the universities, was the center of western medicine until the 12th century, and physicians based there began to produce original texts as early as the 11th. The most celebrated of these was Roger of Salerno (fl. ca. 1170), whose *Summa de cirurgia* became a standard work. It is found in an Anglo-Norman French translation in Cambridge, Trinity College 0.1.20, produced in England ca. 1230–40 and illustrated with more than 50 marginal drawings ([fig. 96](#)).

Few medical texts were regularly illustrated. Herbáís were used to identify

plants and gave the diseases for which they were indicated. Accurate drawings would seem to be essential for herbáls, but in general illustrations were simply copied from one manuscript to another without consulting nature. Bodleian Library, Bodley 130, produced at Bury St. Edmunds ca. 1100, is an exception, and its lifelike drawings are accompanied by extracts from the two most popular medieval herbal texts, attributed to Dioscorides, a physician of the 1st century A.D., and Apuleius Barbarus, of whom nothing is known. Bodley 130 also includes the treatise on the medicinal properties of animals attributed to Sextus Placitus, a combination also found in the early-11 th-century treatise BL Cotton Vitellius C.iii.

BL Sloane 2839 of ca. 1100 and Hunter 100 both contain cautery drawings, showing where the hot iron is to be applied to treat various diseases. The former manuscript is illustrated with diagrammatic nudes; the latter with semiclad figures, sometimes in architectural settings; but in both cases the cautery points are as clearly marked as the stars on an astronomical constellation.

Medicine and Doctors

Medieval medical theory was based on the writings of the Greek physician Galen (ca. A.D. 130–200), whose works constituted an established body of thought from which most other ideas were derived. The bulk of his output, or at least that attributed to him, came to the West in the 12th century and exercised an enormous influence for the next three or four centuries. His belief

that health depended upon the equilibrium of the four “qualities” (hot, cold, dry, and moist) and that an imbalance in the bodily juices or humors (blood, phlegm, yellow bile, and black bile) could cause disease formed the bedrock of medical teaching in the universities, where study was almost entirely textual, without any real opportunity for examination of the human body, either alive or dead.

An edict of the Lateran Council of 1215, decreeing that persons in holy orders were henceforth debarred from the practice of surgery (i.e., of shedding blood), intensified the already academic nature of medicine, since almost all physicians at this date were clerics. Even such an apparently practical skill as urology (diagnosis through the analysis of urine samples) was initially learned from books; although it was not without importance once a physician began to practice, clinical observation took second place to astrological prediction.

Through the influence of Arab medicine, contemporaries not only believed that each house of the zodiac controlled a particular part of the body (Pisces, e.g., ruled the feet) but were also convinced that the likely outcome of disease or injury could be forecast by a careful study of the planets. Ex tremely elaborate prognostic charts and devices were employed to decide how the sick might best be treated (or, indeed, if it was worth treating them at all), and some doctors favored a similar method for establishing either the virginity or pregnancy of their female patients.

The main staples of surgical treatment were bloodletting (performed by a surgeon or a barber surgeon) and the administration of ferocious purges, both intended to restore a balance between the humors but often fatal in their effects. But in other respects, notably the emphasis placed upon moderation in diet and the use of herbal remedies, some benefit may have accrued to the patient.

Whereas physicians were held to rank between canon lawyers and practitioners of civil law, surgeons occupied a fairly low place in the social order. The medieval maxim that “physic is to surgery what geometry is to carpentry,” reflects a scale of values that saw surgeons as superior craftsmen rather than professional persons. Yet although English surgeons and barber surgeons formed themselves into craft guilds and rarely enjoyed the privilege of a university education, they did at least reap the benefits of a more pragmatic training.

Some surgeons, such as the celebrated John Arderne (fl. ca. 1370), who devised his own surgical instruments and perfected new operating techniques, scored remarkable successes in an age without anesthetics, antiseptics, or blood transfusion. The services of both physicians and surgeons were, however, expensive and thus unavailable to the majority of the population. For this reason doctors were often the victims of satire that ridiculed their “special love

of gold” and indifference to human suffering, while most ordinary people had to rely upon wise women, herbalists, and folk medicine. In many cases cures were undertaken in the home by women, whose wifely duties included nursing the sick and making up their own remedies.

Metalwork, Anglo-Saxon

Metalwork in the Anglo-Saxon period reflects the traditions of several cultural groups: the Angles, Saxons, and Jutes who invaded England in the 5th century as well as the resident Celtic Britons, who were driven into Cornwall, Wales, and Cumbria by the invaders.

Saxon metalwork is red and gold, owing to the lavish use of garnets, sliced and cut into complex shapes, and densely applied beaded gold filigree. Many examples come from the Jutish or Saxon kingdom of Kent, including the early-7th-century disc brooch from Kingston Down (National Museums and Galleries Merseyside, Liverpool Museum M6226). Disc brooches were a

common Anglo-Saxon type, their decoration organized around five bosses with an obvious cruciform design between or through them. The complex, purely geometric design of the Kingston Down Brooch is typical of the refined 7th-century Kentish work, with panels of finely beaded filigree set in a mosaic of garnet and blue glass, the effect further brightened by the gold-foil fields whose facets glitter through the translucent red garnets.

Anglian metalwork typically shows interlaced animals executed in a faceted casting technique called “chipcarving,” or *kerbschnittvork*. These are derived from the Scandinavian animal style known as “Style II” and are found on the early-7th-century great gold buckle from the Sutton Hoo ship burial in East Anglia, an early Anglian kingdom (London, British Museum MLA 1939, 10–10, 1). But the Angles and Saxons were already fusing their identities, as can be seen on the shoulder clasps from the same burial, whose Style II animals are executed in the Saxon technique of mosaic garnets and gold filigree. Included in the mosaic is *millefiori* glass, a technique that may have been learned from the Romans.

The burial also contained hanging bowls with *champlevé* enameled escutcheons showing geometric interconnecting spiral designs in reserved metal against a red ground. These seem to have been highly prized objects commissioned or imported from British craftsmen, and many examples have been found in Anglo-Saxon contexts and in Scandinavia.

This was the range of peoples and metalworking styles that existed when St. Augustine brought Christianity to Kent in 597. Soon afterward Christianity was also brought to the Anglo-Saxon kingdom of Northumbria, coming this time from Ireland and bringing with it an increased Celtic influence on art. With Christianity came a new demand for books, and it seems to have been this demand that caused these diverse arts to become fused in the “Hiberno-Saxon” or “Insular” style that first appeared in books like the Book of Durrow (Dublin, Trinity College A.4.5[57]), before passing quickly back to metalwork. The problem with this style is that the elements are so completely fused that there is no agreement as to where the style originated, and it is equally well represented in England and Ireland. Some of the finest examples of the style in metalwork are in fact Irish, such as the Tara Brooch and the Ardagh Chalice, where all the techniques and motifs come together in a harmonious and exciting way.

But Christian Northumbria was also concerned to imitate Mediterranean ideas. This can be seen in the Codex Amiatinus (Florence, Biblioteca Medicea-Laurenziana Amiatinus 1) and the Ruthwell and Bewcastle crosses, each with their naturalistic figurative decoration and complex plant trails mixed with native interlaced patterns. The same trend appears in metalwork in the fragmentary portable altar from St. Cuthberts Coffin (Dean and Chapter,

Durham Cathedral). This object is of hammered silver (also called embossed, or *repoussé*, work), a technique introduced from Mediterranean areas. Flere foliate designs of ultimately Mediterranean origin surround a cross filled with interlacing, whose faceted recesses recall the older technique of chipcarving where the pattern originated. Romanizing *repoussé* work continued into the 8th century with the Ormside Bowl (York, Yorkshire Museum 1990–35; [fig. 97](#)) and the Rupertus Cross (Bischofshofen parish church, Salzburg Diocesan Museum), on which the animals acquire a fabulous whimsical nature.

Meanwhile the original Hiberno-Saxon style was dying out. A late example is the 8th-century Coppergate Helmet (York, Castle Museum YORCM CA665), whose nose guard has a chipcarved pattern of interlaced beasts like those in the Lindisfarne Gospels (BL Cotton Nero D.iv). But chipcarving now begins to lose its crispness. The metalwork on the Gandersheim Casket (Braunschweig, Herzog Anton-Ulrich Museum MA58) is interlaced, but the designs are simplified and the recesses no longer faceted. And on the Witham pins (London, British Museum MLA 1856, 11–11, 4) several weakly faceted recesses are touched up with a punch, and others are rounded. The Lindisfarne Gospel-like beasts have been replaced by the short-snouted, winged, two-legged beasts also seen on the Gandersheim Casket, where they are likewise enmeshed in a net of interlace.

During the 7th to 8th centuries, mundane metalwork was also produced, and scholarly attention increasingly focuses on minor dress pins. These cheap, utilitarian objects are less useful chronological indicators than might have been hoped, since they are inherently archaic in nature and slow to reflect new artistic trends. But they do reflect an unofficial hierarchy of decoration. Thus most decoration consists of scratchy engraving, punching, and occasionally thin silvering or gilding. A relatively fine example is a gilt and engraved pin from Brandon in Suffolk (East Anglia), decorated with beasts like those on the Witham pins (Brandon Remembrance Playing Field Committee SAV BRD 018 8679). None of these techniques appears on more prestigious artifacts during this period.

Then, suddenly, Anglo-Saxon production seems to stop in all media. This has been attributed to the Scandinavians who arrived as marauding Vikings at the end of the 8th century and then settled in farms and cities as more or less obstreperous neighbors during the 9th and 10th centuries. These were artistically active people who supplied all their own needs for brooches, pendants, straptags, sword chapes, and horse trappings, as well as stone gravemarkers; and they decorated it all in their native styles.

The Scandinavians settled in the Midlands and East Anglia, and from these areas comes a series of silver disc brooches, similar in kind to 7th-century Anglo-Saxon examples, such as the Kingston Down Brooch. A hoard of six disc

brooches from Pentney in East Anglia (London, British Museum MLA 1980, 10–8, 1–6) is currently dated to the first third of the 9th century. The brooches are decorated with smooth metal bosses linked by beaded borders containing individual or paired animals with stippled bodies, the designs picked out with inlaid niello or emphasized by complex openwork. These brooches are usually seen as native Anglo-Saxon productions, but this seems unlikely for several reasons. Disc brooches had not apparently been used in England for 200 years, so these new silver ones are unlikely to be directly derived from the original gold-and-garnet Anglo-Saxon version. But Scandinavia's own continuing tradition of brooch production included disc brooches from the 9th century. Scandinavian disc brooches tend to be decorated with thick twisted wire and heavy granulation, but other Scandinavian brooch types had smooth metal bosses linked with beaded or patterned borders containing animals with stippled bodies; and niello and complex openwork are both common in Scandinavian metalwork. For all these reasons it seems likely that the bossed silver disc brooches of the 9th and 10th centuries are not local Anglo-Saxon productions but a new introduction from Scandinavia. Perhaps this is most clearly seen in the Strickland Brooch (London, British Museum MLA 1949, 7–2, 1), whose decoration includes beast heads closely related to the Scandinavian Borre style.

The evidence seems to suggest that the native Anglo-Saxon tradition did not survive the Vikings, although the Vikings themselves continued to produce the kind of work they were accustomed to have around them at home. Alfred the Great (871–99) reported that by his time England's treasures had been destroyed and the country was in a state of ignorance and degradation. His biographer, Asser, adds that Alfred rectified this by seeking out foreign scholars and craftsmen for his court. The Alfred Jewel (Oxford, Ashmolean Museum 1836, 371; [fig. 1](#): see ALFRED AND MINSTER LOVELL JEWELS) is thought to have been made for him. It is arranged around a beast head that looks Anglo-Saxon, but its heavy granulation, openwork, and engraving are all Scandinavian techniques, not hitherto known on prestigious metalwork in England. So it is possible that this is an attempt by a foreign (in this case, Scandinavian) craftsman to evoke or recreate a lost Anglo-Saxon tradition in metalwork.

The Fuller Brooch ([fig. 65](#); London, British Museum MLA 1952, 4–4, 1) may be another instance. This large niello and silver disc brooch is made with the techniques used for the contemporary disc brooches discussed above, but its iconography of the five senses is unique. In fact the figure of Sight is similar to the figure on the Alfred Jewel. So here again foreign techniques are apparently being used to suggest or create a contemporary Anglo-Saxon idiom. While not all scholars agree on this point, it should be noted that the combination of

Anglo-Saxon and Scandinavian features in late-9th- to 11th-century metalwork finds a literary parallel in *Beowulf*, a poem that combines Anglo-Saxon and Scandinavian traditions and that was produced for the same aristocratic audience as the metalwork discussed here.

During Alfred's reign the niello-and-silver technique spread into Anglo-Saxon areas, as seen in the hoards from Trehiddle in Alfred's kingdom of Wessex (London, British Museum MLA 1880, 4–10, 1–12, 14, 19; coin dated ca. 872–75) and Beeston Tor in Mercia (London, British Museum MLA 1925, 1–14, 1–6; coin dated ca. 874), and two inlaid silver plaques from an early-10th-century house-shaped shrine (London, British Museum MLA 1954) whose Scandinavian style is unmistakable, although it too often is attributed to Anglo-Saxon craftsmen.

The process of renewal may have continued under Æthelstan (924–39) in a series of knobby looking cast straptags, censers, and a spouted jug. The jug (London, British Museum MLA AF 3175) shows beasts whose nearest relatives are on the 8th-century Ormside Bowl, and the straptags show inhabited plant trails reminiscent of those on Northumbrian stone crosses. Again it seems possible that new techniques were being used to evoke or recreate a lost native tradition.

In 1016 the Scandinavian Cnut took the crown and was succeeded by his sons, Harold Harefoot and Harthacnut, and stepson, Edward the Confessor. At this date contemporary foreign documents comment on the excellence of "Anglo-Saxon" metalwork. These are sometimes cited to prove that high-quality native Anglo-Saxon metalwork continued to be produced, despite the fact that craftsmen worked for rulers who lived significant portions of their lives outside of Anglo-Saxon England. If true, the courageous spirit of these craftsmen who heroically preserved their Anglo-Saxon integrity in the face of foreign imperialism must be admired. Sadly no work survives, so it is worth reconsidering what those documents actually meant. Since Scandinavians had been living in England for 200 years by this time and intermarrying with the indigenous Anglo-Saxons, they probably identified themselves with their adopted country, rather as today's descendants of immigrants from all over the world consider themselves citizens of their adopted countries.

What did "Anglo-Saxon" metalwork look like in the 11th century? It can be argued that no native traditions survived at all, and it looked thoroughly Scandinavian. A large disc brooch from Sutton, Isle of Ely in East Anglia (London, British Museum MLA 1951, 11–1, 1), is of flat silver with the design picked out in niello. It is executed in a mixture of Scandinavian Mammen and Ringerike styles, with large beasts bordered by rudimentary acanthus foliage. The runic inscription on the back shows that it belonged to an Anglo-Saxon woman, which may support the idea that there was no longer much distinction

between Anglo-Saxon and Scandinavian.

There are also mounts in the Ringerike style, and a superb openwork disc brooch from Pitney in Somerset (Wessex/Mercia), which is cast in a good imitation of the Scandinavian Urnes style (London, British Museum MLA 1979, 11–1, 1). This sinuous and graceful style consists of entwined beasts, snakes, and noded tendrils. The streamlined animals have profile eyes with the point forward, giving them the unnerving effect of looking backward. “Anglo-Saxon” versions are often embellished with beading, as on the Pitney Brooch and many other 11 th-century mounts and plaques.

Other surviving metalwork consists of sheet silver with engraved designs picked out in gold and niello. The style used here owes nothing to earlier traditions of metalwork but has come from the 10th-century Winchester style of manuscript illumination, which continued to be practiced into the 11th century. Examples include the portable altar in the Cluny Museum (CL 11.459) and the Drahmal Cross (Brussels, Cathedral of St. Michael). There is not a beast or a plant trail anywhere on them. Instead alert human figures with fluttering, wind-blown draperies and excited gestures are engraved in a lively calligraphic style. In terms of iconography the combination of inscription and imagery on the Drahmal Cross is related to earlier Anglo-Saxon sculpture, such as the Ruthwell Cross (figs. 111–14: see RUTHWELL CROSS) or the Durham Cathedral cross-heads.

In the final analysis Anglo-Saxon metalwork is an elusive phenomenon, and perhaps in the strictest sense it can be found only between the 7th and 8th centuries. Thereafter it seems to have been an eclectic construct, increasingly incorporating foreign elements until the native features vanish altogether.

Metalwork, Gothic

Although we have numerous descriptions of English Gothic metalwork, and references to the metalworkers themselves from a variety of sources, relatively few actual works have survived. The Dissolution of the monasteries decimated the treasuries of the English church, while loss, reuse of metal, and the ravages of time have all contributed to losses in the secular realm. Nevertheless, fine metalworking was a prestige art, and England was renowned for its metalworkers, particularly for its goldsmiths.

In Anglo-Saxon times abbots and bishops were frequently also goldsmiths, and one of the most famous of these early artists, St. Dunstan (ca. 910–988), became the patron saint of the Company of Goldsmiths on its foundation in 1327. Fines against unlicensed goldsmiths indicate that they must have been organized into a powerful guild by the relatively early date of 1180. Quality control seems to have remained a concern in theory, if not in practice. Beginning in 1238 the City of London appointed six wardens from among the goldsmiths to ensure that silver was of sterling quality or better. In 1300 the hallmark, in the form of a leopard’s head, was introduced.

The majority of Gothic metalworkers were lay persons; many, however, were employed by the church, an arrangement that offered economic security for the smith and a secure supply of skilled craftsmen for the church or monastery—in fact many of these artists’ names are preserved in the monastic chronicles. In the mid-13th century Matthew Paris (himself an artist) recorded the employment of three artists, Master Walter of Colchester, his brother, and his nephew, at St. Albans. Walter is recorded as having made an altar frontal and two book covers for the church, as well as collaborating with Master Elias of Dereham on a shrine for the translation of Becket’s remains. None of these items has survived.

Between the 13th and 15th centuries metalworking moved out of the monasteries and into the cities, primarily London, although quality workshops existed in other cities as well. The move did nothing to lower the status of the craft, as a number of London’s mayors were also practicing goldsmiths.

The Ordinances of the Company of Goldsmiths reveal that in the period 1327–94 apprenticeship lasted ten years; in 1394 this was lowered to seven years. During apprenticeship workers were required to master a variety of skills, including figure drawing, modeling, design, carving, gem setting, enameling, forging, casting, and niello work. The fact that the metalworker had to be familiar with many of the techniques, and consequently styles, of illuminators and sculptors is likely to account at least in part for the similarities, particularly in figure style, among the media. While metalworkers were most renowned for their prestige items—church plate, jewelry, regalia—they also manufactured more mundane items, such as buckles, cups, and pendants for horse trappings. Molds and designs were frequently handed down from one metalworker to another; consequently the forms produced were not on the whole unusual, and the general trend throughout the period was toward traditionalism rather than innovation. For example, the ca. 1260 silver-gilt scepter of Richard of Cornwall (Aachen, Domschatz G51) is surmounted by a cast and chased dove, a scepter type that goes back at least as far as Edward the Confessor (1042–66). However, the picture may be partially skewed by the limited amount of material that survives; documentary sources do reveal that some unusual pieces were produced, such as the gold and jeweled peacocks made for Henry III in the 13th century.

Surviving evidence does indicate a change in the late-14th and 15th centuries, possibly due to the ravages of war and plague. Beginning in the second half of the 14th century all manner of metalwork from jewelry to funerary brasses became more intricate and luxurious. The change brought both prosperity and increasing specialization to English metalworkers.

Prestige items were made for the church, the court, and the increasingly powerful merchant class. Few fragments of the elaborate shrines, processional crosses, and liturgical vessels that we know to have been created have survived. A series of funerary chalices and patens from the graves of 13th- and 14th-century bishops does reflect the form if not the grandeur of the more elaborate altar vessels. The finest surviving liturgical vessels are the Ramsey Abbey censer and incense boat of ca. 1325 and ca. 1350 (London, Victoria and Albert Museum M.268–1923, M.269–1923; [figs. 87–88](#); see LITURGICAL VESSELS). The Book of Llandaf Christ in Majesty, made ca. 1250–65 (Aberystwyth, National Library of Wales 17110 E), may originally have been part of a retable or a large house-shaped shrine. The figure is hollow cast, engraved, and gilded, and its size (6.73 inches high) and quality would make it appropriate to either type of monument. The gentle facial expression and thick V-fold drapery are also seen in contemporary manuscripts, such as the Amesbury Psalter (Oxford, All Souls College 6; [fig. 2](#); see AMESBURY PSALTER).

The ca. 1367 Wykeham Crosier (Oxford, New College) is a fine example of

the late-14th-century trend toward ornate luxury objects (fig. 98). The crosier is silver-gilt with enamel panels and cast figures. The central architectural knop is supported by angels and decorated with figures of Christ, the Virgin, and apostles; below the feet of the angels a second architectural canopy contains figures of Christ, the Virgin, and male and female saints. The crosier head is decorated with enamel plaques containing angels playing musical instruments. A winged angel supports the crook, within which, a bearded man kneels before the Annunciation. It is unclear how many of the figures are original, as the crosier has been heavily reworked. The style of the architectural knop is close to that of the Eleanor crosses erected by Edward I for his dead queen.

Tin and lead, major English resources and exports, were used to make a variety of inexpensive or utilitarian items. One of the most interesting groups

of such items is the series of ampullae and badges produced as cheap souvenirs for pilgrims in the 13th and 14th centuries (fig. 99). The majority of these objects were made for pilgrims to Canterbury, although they were also produced for other sites such as Bury St. Edmunds and St. Albans. The Canterbury souvenirs are decorated with scenes from the life and miracles of St. Thomas and often include inscriptions referring to his miraculous ability to heal. As with the more prestigious items, both ampullae and badges became more intricate in the late-14th century.

Fig. 99. Pilgrim ampulla from Canterbury (Paris, Cluny Museum 18063). RMN Reproduced by permission.

Regalia and such unusual items as Henry III's jeweled peacocks were produced specifically for the court. Again little survives, with a few significant exceptions like the King John Cup (Borough Council of King's Lynn and West Norfolk) of ca. 1340 and a girdle of ca. 1350–1400 (Oxford, New College). The basic shape of the King John Cup, with its flaring foot, knob, and cup, is similar, though not identical, to that of contemporary chalices. Its decoration, however, is purely secular, consisting of enameled panels depicting elegantly dressed lords and ladies: some hawking or hunting, in addition to dogs, rabbits, and a fox. In both subject matter and style these scenes are close to those of contemporary manuscripts. Another standard courtly scene, a lady placing a helm on the head of a kneeling knight, decorates the center of the ca. 1335–45 Bermonsey Dish (St. Mary Magdalen, Bermondsey). The dish is silver, parcel-gilt with traces of enamel, and fragile; it may have been made purely as a display piece.

The New College, Oxford, Girdle, like Wykeham's Crosier, is a reflection of the luxurious tastes of the late 14th century. The girdle consists of alternating panels of green and white paste, crystals surrounded by pearls, and enamel panels decorated with monkeys, rabbits, and deer, all set in silver-gilt. The animals of the enamel panels are similar to those that appear in the margins of contemporary manuscripts and suggest that the girdle was a secular piece. There is no indication of whether it was designed for a man or a woman.

The silver, parcel-gilt Studley Bowl of ca. 1400 (London, Victoria and Albert Museum M.I-1914) is a fine and unusual piece. Both bowl and rim are decorated with a cross, followed by the alphabet and a set of common abbreviations. The decoration reflects the design of contemporary primers, and the bowl may have been intended for use by an aristocratic child.

Such items as silver plate, jewelry, seals, and memorial brasses were designed for the church, court, and the wealthy merchant classes. Memorial brasses in particular provide useful images of the structure of Gothic society, and England preserves more such brasses than any other European country.

Monumental memorial brasses have their origins in Mosan art (from the Meuse Valley), but during the second half of the 13th century English metalworkers developed the practice of inlaying sheets of brass, more properly called latten (an alloy of copper and tin), into marble. This method required less metal and thus opened the market up to a wider segment of society. The process began with the inlay of simple inscriptions (this was also the least expensive form of memorial); sometimes latten crosses were added (slightly more expensive); and finally monumental figure effigies were included (the most costly form of this type of tomb slab). The earliest surviving fragment of a monumental figure brass comes from the ca. 1287 tomb of Thomas de Cantilupe at Hereford Cathedral.

As with other forms of metalwork the London workshops formed the center of the industry, although workshops did flourish in other cities as well. The workshop of Adam of Corfe, established in London ca. 1300–10, manufactured a range of brasses in standard forms. The output of this workshop spans most of the 14th century.

Brasses of the 14th century fall into three stylistic phases: 1) ca. 1300–30: pristine design with static figures and clear, bold engraving; 2) ca. 1330–70: figural poses become more dynamic, engraving more refined, and architectural details, such as canopies, are added; 3) ca. 1370–1400: high-quality brasses worked to standard forms, but lacking the inventiveness of phase 2. The change around the mid-century to more ornate brasses should be understood as part of the trend toward increased luxury seen in all the arts at that time. Interestingly this phase also sees the introduction of symbols of family or personal history and lineage to the brasses, perhaps in response to the decimation of families by plague and war. A fine example of this type of brass is the 1375 brass of Robert of Wyvil, bishop of Salisbury (in Salisbury Cathedral). Wyvil appears within Sherborne Castle surrounded by shields and (originally) the four symbols of the evangelists. Rabbits appear in the abbreviated landscape before the castle, and Robert (Richard?) Shawell stands in the gateway. The brass refers to Wyvil's recovery of Sherborne Castle and Bere Chase (the landscape with rabbits) for Salisbury with the help of his champion Shawell. The brass also includes an inscription explaining the imagery.

The brasses of an unidentified late-14th-century merchant and his wife in the church of SS. Peter and Paul, North-leach, Gloucestershire, are fine examples of the standard late-14th-century slabs produced in London. The merchant stands on a woosack, symbol of his profession, while his wife stands with a lapdog, symbol of her loyalty to him, at her feet.

Seals, like brasses, varied in size, form, and complexity according to the wealth and social status of their user. An enormous corpus of seals survives, and some of the most interesting items are the seals of the merchant class. Two fine examples are the copper-alloy matrix decorated with a squirrel (London, Society of Antiquaries) and the gold-handled intaglio gem engraved with a woman's face in profile (London, British Museum MLA 81, 3–12, 1), both of ca. 1300. The British Museum seal is inscribed *CLAUSA SECRETA TEGO* ("I conceal secrets"; the Society of Antiquaries seal is inscribed *I CRAKE NUTIS SWETE*. Both imply that the enclosed letters are hidden secrets, probably love letters, certainly personal correspondence. The intaglio was certainly the seal of a woman; the squirrel matrix may have been as well, though this is less certain. In contemporary manuscripts (e.g., Bodl. Douce 366, fol. 131 [the Ormesby Psalter]) the squirrel appears as a typically female pet. It may also

have had a bawdy meaning as a symbol of the female genitalia. If that is its meaning here, the play on the idea of the hidden sweet, the letter, and the female body would be apt. Whatever its meaning it is a wonderful example of the humor and inventiveness that characterize so much of English Gothic art.

Metalwork and Enamels, Romanesque

The relatively small number of extant Romanesque metal objects constitutes only a tiny proportion of those originally produced by English metalworkers in the late-11th century and throughout the 12th. Both secular and ecclesiastical metalwork was frequently melted down and the raw materials reused during the Middle Ages. While changing fashions encouraged the refashioning or recycling of numerous secular objects, ecclesiastical pieces were sometimes destroyed for more pressing needs. The monks of Reading Abbey, Berkshire, for example, settled their accounts with Richard I by removing gold leaf from a reliquary housing the hand of St. James. The most catastrophic destruction of ecclesiastical metalwork occurred in the 16th and 17th centuries. The English Reformation and Revolution ensured that no Romanesque church treasury remained intact. The shrine of St. Cuthbert in Durham Cathedral alone yielded 1,578 ounces of precious metals when Henry VIII's commissioners dismantled it in 1537–38. Inventories of the 12th century testify to the abundance of metal objects produced during the period and reveal how great the losses have been.

Patrons of English Romanesque metalworkers fall into two main categories: secular and ecclesiastical. Late-11th- and 12th-century western Europe witnessed greater stability and hence prosperity than had been enjoyed since the disintegration of the Roman Empire. In this climate kings and nobles commissioned jewelry and domestic plate, while the church, increasing in authority and prestige, embarked on a large-scale rebuilding program. Numerous churches were erected, the majority of them monastic, prompting the production of a wide variety of metal furnishings, ranging from monumental doors and baptismal fonts to small liturgical vessels, such as reliquaries, chalices, and ciboria. Consecrated objects like these were frequently decorated with biblical scenes, Christian symbols, or typological schemes. They tend to have been carefully preserved and thus survive in greater numbers than their secular counterparts.

Continental metalworkers, based in established centers of their trade along the valleys of the Meuse and Rhine, dominated the production of metal objects during the Romanesque period, but extant pieces eloquently display the skill of their English counterparts. Various types of metalworker existed: those referred to as *aurifaber* were goldsmiths, working predominantly with precious metals, copper alloys, enamel, and gems. Others, such as smiths, worked solely with base metals. It is often difficult to establish the social status of goldsmiths during this period. Documentary evidence suggests that royal and noble patrons tended to employ secular craftsmen, whereas monastic patrons commissioned both lay and monastic metalworkers. Thus, in the

mid-12th century, the abbot of St. Albans Abbey instructed the monk Anketyl to begin a shrine for the remains of St. Alban, aided by Salaman of Ely, a lay assistant. Later in the 12th century the abbot of the same house employed two prestigious lay goldsmiths to embellish the shrine further: John of St. Albans and Master Baldwin. A lay goldsmith had complete freedom of movement compared with his monastic counterpart, and by the late 12th century such metalworkers were beginning to organize guilds to protect the rights and privileges of themselves and their customers.

The only surviving early-12th-century technical treatise on, among other things, the craft of metalworking, *De diversisartibus* (*On the Diverse Arts*), was composed by the German monk "Theophilus." Its principles and procedures, however, are essentially compatible with those practiced contemporaneously in England. The text confirms that many goldsmiths worked with materials other than metal. Just as Theophilus was conversant with fashioning metal, carving ivory, making stained glass, and painting on walls and in manuscripts, Master Hugo, working for the Abbey of Bury St. Edmunds, Suffolk, in the 1120s and 30s, cast a pair of bronze doors and possibly a bell, as well as carving a rood and illuminating the Bury Bible (Cambridge, Corpus Christi College 2). Such an interdisciplinary approach satisfactorily explains the intimate stylistic relations between metal objects and other media during the Romanesque period.

Fig. 100. The “Masters Plaque” (London, Victoria and Albert Museum M.209–1925). Last Judgment. Reproduced by permission of the Trustees of the Victoria and Albert Museum, London.

The Norman Conquest did not trigger instantaneous change. English

goldsmiths continued to work in the Anglo-Saxon, “Winchester School” tradition well into the 12th century. The Gloucester Candlestick (London, Victoria and Albert Museum M.7649–1861; [fig. 67](#): see GLOUCESTER CANDLESTICK), the only firmly dated piece of Romanesque English metalwork, was made between 1107 and 1113 for Abbot Peter and his monks at Gloucester. Its intricate design of intertwined foliage stems, human figures, fantastical grotesques, and dragons reflects the frenetic energy of the “Winchester School,” although the figures have become a little stiffer and more monumental. The work of this exceptional goldsmith imitates the initials in contemporary manuscripts from Christ Church, Canterbury, betraying the candlestick’s likely provenance.

By mid-century the general tendency to pattern draperies in the “damp-fold” style and elongate monumental figures into mannered poses is evident in goldsmiths’ work. The Masters Plaque (London, Victoria and Albert Museum M.209–1925; [fig. 100](#)), ca. 1150–60, once part of a larger object, shows the Last Judgment, with Christ Triumphant flanked by two angels surveying the torments of hell below. The draperies cling tightly to the vigorous figures’ shoulders, thighs, and calves in tear-shaped panels. Manuscript parallels to this style abound, as in the Lambeth Bible (London, Lambeth Palace Library 3), ca. 1150.

The softer, more fluid style that evolved toward the end of the 12th century in English painting and sculpture is also evident in metalwork. The expressive figures personifying the liberal arts on the copper-gilt and *champlevé* enamel casket (London, Victoria and Albert Museum M.7955–1862), ca. 1180–1200, are clothed in equally graceful draperies.

The techniques practiced by English Romanesque goldsmiths compare exactly with those discussed in Theophilus’s treatise. The majority of objects were either cast or hammered, that is, forged. Monumental pieces, such as the great bronze sanctuary knocker (Durham, Dean and Chapter) from Durham Cathedral, ca. 1180, or lead baptismal fonts, such as that in St. James’s Church, Lancaut, Gloucestershire, ca. 1130–40, were cast in molds of hollowed clay or carved stone. The ancient lost-wax, or *cire-perdu*, method was reserved for more intricate three-dimensional work demanding expert precision, for example, the Gloucester Candlestick or elaborate “architectural” censers (London, British Museum MLA 1919 II–II, 1; ca. 1150–75).

Other pieces, particularly such vessels as chalices and ciboria, were hammered or forged and then enriched with engraving, chasing, *repoussé*, or filigree work. The silver-gilt, mid-12th-century chalice and paten (Canterbury, Dean and Chapter) from the coffin of Archbishop Hubert Walter was forged and engraved. The silver-gilt ciborium, ca. 1200, of St. Maurice d’Agaune (Sion, Switzerland, Treasury of the Abbey of St. Maurice d’Agaune) was also forged

and then embellished with *repoussé scenes* set within medallions.

On a more monumental scale iron was forged or wrought to produce decorative hinges and grilles. The south door at All Saints Church in Staplehurst, Kent, retains the remnants of such work dating from the 12th and 13th centuries, with designs including a boat, four fish, a dragon, and other decorative elements. A 12th-century grille, erected to protect the shrine of St. Swithun, still stands in Winchester Cathedral.

Various techniques were employed to decorate objects. Both base metal and silver were frequently gilded, either partially (parcel-gilt) or completely, to lend an impression of luxury. Such treatment was particularly common during the 12th century when stocks of gold in western Europe were low. Niello, a black metal alloy made from melting silver, copper, and lead together with sulfur, was often rubbed into designs engraved on silver, as seen on the Masters Plaque and the St. Maurice d'Agaune Flask (Sion, Switzerland, Treasury of the Abbey of St. Maurice d'Agaune), ca. 1130–40.

Written sources also speak of goldsmiths' work set with cabochon polished precious and semiprecious gems, pastes, pearls, or antique cameos or intaglios (deemed appropriate despite their pagan subject matter). Both precious stones and antique gems were commonly believed to possess amuletic properties. Only a limited number of such objects survive from England, and many of these are pieces of jewelry. A 12th-century gold ring, set with an antique (Greco-Egyptian) intaglio engraved with *Chenoubis*, a lion-headed serpent-god surrounded by a sunburst and an identifying inscription (Canterbury, Dean and Chapter), was found in Archbishop Hubert Walter's tomb. Matthew Paris (d. 1259), the monk-chronicler of St. Albans Abbey, includes a short treatise on the rings and gems of the house in his *Liber additamentorum* (BL Cotton Nero D.i, fols. I46v–147). He illustrates and describes, among others, a pontifical ring with a central sapphire surrounded by pearls and garnets, given by Henry of Blois, bishop of Winchester (1129–71). The Lark Hill Hoard (London, Trustees of the British Museum), discovered at Lark Hill near Worcester in 1853 and datable to the 1170s from associated coin evidence, contains examples of secular rings set with crystals, amethysts, and pastes to simulate precious gems.

But the technique perhaps most utilized by the Romanesque goldsmith to embellish his work was enameling: the fusing of powdered, colored glass onto a metal base at high temperatures. Although the enamel itself was intrinsically inexpensive, the vibrant colors of the glass gave objects a spectacular appearance and ensured that they were highly prized. Enameling also facilitated the inclusion of colorful, clear narrative cycles and decorative schemes on small objects.

It is certain that enameled objects were produced in England during the

Anglo-Saxon period, but it seems likely that the technique most widely used during the 12th century, *champlevé*, was reimported into England from Mosan and Rhenish metalworking centers and from even farther afield in southwest France and northern Spain during the second quarter of the 12th century. *Champlevé*, the technique whereby a design is gouged out of a relatively thick metal base plate, usually pure copper, to a depth of .05 to .3 inches, provided an ideal way of compensating for the dearth of gold in 12th-century western Europe and producing enamels that visually emulated the Byzantine technique of *cloisonné enamel* on gold. The grounds of the gouged fields were keyed or roughened, to ensure that the enamel adhered to the metal. The fields were then filled with powdered glass colored by the addition of various metallic oxides. When fired to temperatures of 1650°F, the enamel fused into areas of solid, jewellike color that were polished to lie flush with the surface of the reserved metal, which was often gilded. In the majority of instances reserved figures were set against enameled grounds (following Rhenish practice), although this was not always the case.

A wide variety of high-quality liturgical and secular objects, produced between ca. 1160 and 1200, were decorated using this technique, although few survive. They include some complete pieces: caskets, such as the Boston Casket (Boston, Museum of Fine Arts 52, 1381, Helen and Alice Colburn Fund), ca. 1170, decorated with fantastical beasts and “blossom” foliage, and crosier-heads, such as the Whithorn Crosier (Edinburgh, National Museum of Scotland), ca. 1180–90. In addition a number of enameled plaques removed from their original settings survive. The most famous of these comprises seven plaques depicting scenes from the lives of Sts. Peter and Paul housed in five collections (Dijon, Musée des Beaux-Arts, Collection Trimolet nos. 1249 and 1250; Nuremberg, Germanisches Nationalmuseum KG.609; New York, Metropolitan Museum of Art 17.190.445; Lyon, Musée des Beaux Arts Objet d’Art D.79; London, Victoria and Albert Museum M.223–1874 and M.312–1926), ca. 1170–80. Their dimensions and style suggest that they belong together, and each rectangular copper plate has four corner pinholes indicating that they were originally attached to a now lost wooden core, perhaps of a large altarpiece or reliquary *châsse*. The figures and background elements are engraved on the reserved gilt metal, set against grounds enameled in purple, dark blue, turquoise, and dark green. They compare convincingly with contemporary English manuscripts.

Many of the extant English Romanesque enamels demonstrate clearly the debt English goldsmiths owed their continental contemporaries. Such links are not unexpected, since England’s political relations with European metalworking centers were particularly close during the 12th century. Limoges, for example, an important center of enamel production in 12th- and

13th-century France, was ruled by the English after Henry II married Eleanor of Aquitaine in 1152. Farther east Henry's family was allied with Duke Henry the Lion of Lower Saxony. It is difficult to prove conclusively that such diplomatic connections influenced metalworkers. Links established through trade provide more concrete evidence. By the late-11th century there were both German and Netherlandish colonies in London, and merchants from Cologne had established a guildhall there by the mid-12th century.

These connections, coupled with the portable and, hence, peripatetic nature of many metalwork objects, inevitably makes the localization of some pieces problematic. Some stylistic and technical evidence points to English patrons commissioning continental goldsmiths. The Henry of Blois Plaques (London, British Museum MLA 52, 3–27, 1; [fig. 72](#): see Henry of BLOIS PLAQUES), before 1171, were in all likelihood made for Henry of Blois, bishop of Winchester, by a Mosangoldsmith, although whether they were produced on the Continent or in England is impossible to establish. The reliquary casket showing scenes of the martyrdom and burial of St. Thomas Becket (New York, Metropolitan Museum of Art 17.190.520, gift of J. Pierpont Morgan, 1971), ca. 1173–80, presents a similar problem. Its purpose and subject matter indicate that it was intended for the English market, but the figure style is distinctively Rhenish. The Morgan, Balfour ([fig. 40](#): see CIBORIA), and Warwick ciboria (New York, Pierpont Morgan Library; London, Victoria and Albert Museum M. 159–1919 and M.1–1981), ca. 1150–75, provide more conclusive proof of a Mosan goldsmith working in an English workshop alongside English goldsmiths. Together with more technical evidence such examples demonstrate the intimate connections linking English metalworkers and their continental counterparts during the Romanesque period. Both they and their products need to be viewed within a European context.

Meters of Boethius

A series of poems based on the OE version of Boethius’s *Consolation of Philosophy*. These poems, which correspond somewhat to the *metra* (verse sections) of the original Latin, survive in one manuscript, BL Cotton Otho A.vi, and Junius’s modern transcription. Likely composed shortly after the completion of the OE Boethius, the *Meters* probably date to the late 9th century and certainly before 970, the approximate date of the manuscript.

In the manuscript, which also contains the OE translation of the *Consolation*, the *Meters* immediately follow the prose passages that they paraphrase; only modern editors gather them together to publish them as a separate text. Although the most recent edition (ed. Griffiths) felicitously presents the *Meters* alongside the matching prose passages drawn from the OE *Consolation* (Bodleian Library, Bodley 180), Krapp’s 1932 edition (in ASPR 5), taken with the corresponding prose of the Cottonian manuscript, remains the best representation of the OE verses.

Censuring the *Meters* as inferior poetry that merely adds poetical tags to the prose version, some scholars have wanted to distance them from Alfred, the only English king to enjoy the epithet “the Great.” The *Meters* have been criticized for their conspicuous lack of originality; even the most striking departure from the prose version—likening the universe to an egg—apparently stems from a Latin source. Lack of originality does not, however, signal a lack of ingenuity. The composer of these verses, whether Alfred or not, managed to turn prose into the different language of OE poetry and effectively fulfill the requirements of meter, alliteration, and poetic diction, while remaining faithful to a difficult and sometimes intractable philosophical treatise.

Michel of Northgate (fl. 1340)

Copyist and presumed author of *The Ayenbite of Inwit* (*The Remorse of Conscience*), a didactic religious work translated in 1340 into Kentish dialect from Friar Laurent's *Somme leroi* (ca. 1280); written mainly in prose, it survives in an autograph manuscript (BL Arundel 57). After entering the priesthood in 1296 Dan (i.e., "Master") Michel became a Benedictine monk of St. Augustine's, Canterbury. His scholarly bent is reflected in the 24 religious and scientific manuscripts he donated to the monastery library. Three of these manuscripts have been identified, containing primarily astronomical and arithmetical writings; Dan Michel appears to have copied most of one manuscript and a large part of another, and annotated the third.

Mills and Sources of Power

The use of water- or wind-driven mills to grind corn (grain) was one of the major technological innovations of the medieval period, since machinery was being used to increase the productivity of manpower. Bread grains could be ground into flour by hand querns, in the home, but where a manorial milling monopoly existed this home grinding often created conflicts between lords and tenants; it was also a time-consuming process. Manorial or privately owned mills were quicker and produced better flour.

It was the water mill, with either a horizontally or, more usually, a vertically mounted wheel driven by a stream passing over or under it, and with its power being transferred to the mill's stones and hoists by a series of cogs and barrel gears, that was most common in England. It was found in Roman Britain, and, if the technology disappeared in the Dark Ages, it was soon found again. There are charter references to water mills from the late 8th century.

From then to the Norman Conquest water mills were built in substantial numbers, no less than 6,082 being mentioned in the Domesday survey (1086). They represent a considerable capital investment, in the machinery, mill race, ponds, and sluices to maintain an even flow of water in flood and drought, and then in maintenance and repairs to gears and bearings and the dressing or recutting of the pattern of grooves in the grinding stones.

Not surprisingly, both before and particularly after the Conquest, it was mostly manorial lords who undertook that investment, notably in the 12th and 13th centuries, when a growing population meant more corn to be ground and more income to be drawn from culture—the fee paid by manorial tenants when they milled—and from rents for mills in cash and kind.

As Domesday shows, there were areas, particularly in eastern England, where, compared with the population, the number of water mills was small. Corn still had to be ground; revenues were there for the taking, but a new source of power was needed. So the wind was harnessed, by means of sails that drove the millstones on a lower rather than an upper floor. These sails had to be kept into the wind and the whole structure held upright, so it was mounted on a single massive post, braced by tie beams with the foundations buried in the soil, and the mill turned into the wind by means of a tail pole. Initial building costs were not high, but maintenance was, since a gale could topple the mill.

These post mills were found first in eastern England, where the technology seems to have developed locally, in the 1180s and 1190s. The main building period was in the mid-13th century, when profits outweighed costs. By 1300 there were at least 10,000 to 12,000 water and wind mills in England, though these numbers could not be sustained as the population and demand for grain fell. Private mills, where family labor bore some of the increased wage costs, were less severely affected, but it seems likely that the total number of mills was halved by the end of the 14th century.

Though the use of water and wind power to grind corn was a technological advance, some historians have taken the argument farther and argued that water power could be used for other purposes and that this led to an industrial revolution in the 13th century. It is difficult to sustain this argument. Water power was widely used in only one industry other than the milling of corn, clothmaking, where a water mill drove triphammers to pound newly woven cloth, immersed in troughs containing a mixture of water and fullers' earth to cleanse and felt it. These fulling mills reduced labor costs, which, as the theory runs, proved attractive to urban manufacturers and led to a relocation of the industry from town to countryside, where the mills were located on swift streams.

Fulling mills were expensive to build, offered lords far less return than corn mills, had insubstantial cost savings compared with those to be had from the use of cheaper country labor for spinning and weaving, and the greatest concentration of mills was to be found in south Wales, never a major cloth-producing region. Therefore the argument for an industrial revolution will not stand scrutiny. The area where water power might have increased productivity substantially was in iron and steel manufacture, to work bellows to produce a

fiercer blast for the furnace, making smelting simpler and more efficient. But, again, the capital investment does not appear to have been forthcoming, and there was no industrial revolution based on water power.

Minstrels and Minstrelsy

Pre-Conquest

In the OE period considerable literary evidence refers to professional musical performers and performances. The principal bardic figures are the *scop* and *gleoman*, both of whom are singers of *gesta* (i.e., heroic, epic verse) whose musical activities are sometimes associated with harp music. Though in some literary contexts these names may be broadly emblematic of musical activity, a distinction can be drawn between them, although the differentiation of roles may have greater historical validity for the 7th century than for the 10th, by which time in practice their functions may have been indistinguishable.

The *scop* was a serious and respected member of the community, a maker and performer of poetry attached to the court of the ruling king or chief. His function was to perform on the field of battle and on ceremonial occasions that possessed strong ritual connotations, singing incitements to battle, eulogies of the ruler and his ancestors, and elegies for departed members of the community. The normal public performance of such heroic, epic narrative poetry was musical, but precisely in what manner—whether recited, chanted, or fully sung—we simply do not know (though modern theories and controversies abound). The *gleoman* was of a lower class, an itinerant

professional entertainer who was paid for individual performances. The term is generic, encompassing not only singing but harping and piping, juggling, clowning, acting, and dancing. He would sing his convivial songs (and heroic narratives as well) simply to entertain on the street or indoors by the fire in halls and taverns.

The harp (OE *hearpe*) was the quintessential string instrument of the Anglo-Saxons. Its remains have been found in the burial at Sutton Hoo and at other 7th- and 8th-century grave sites, clearly demonstrating the esteem it carried among high levels of society. But its popularity was widespread; it was played by amateurs from cowherds to kings, and accounts of St. Dunstan refer to his reputation as a harper. The term *hearpe* might be used generically to encompass other string instruments (such as the fiddle-type rebec and the lute-type *crwth*), just as the verb *hearpan* could be used to encompass all indoor music making. When more specific in applicability, *hearpe* referred in the 7th and 8th centuries to a quadrangular kind of lyre (such as that found at Sutton Hoo), while from the 9th century on it more probably indicated a kind of pillar harp. Both apparently were strung with gut or horsehair and tuned diatonically. The harp was used for solo instrumental playing as well as to accompany the voice. The degree to which it may have been used for vocal accompaniment, the song repertoires so accompanied (especially epic narrative), and the rhythmic-melodic accompanimental style that would have been used are open questions subject to much modern speculation.

Post-Conquest

After the Norman Conquest there is increasing information about the king's minstrels and, eventually, those of other nobles. William I's minstrel-herald, Taillefer, encouraged the Norman army at Hastings by juggling with his sword and singing the song of Roland, but he was killed in the battle. A successor—Beric, the king's "joculator"—is named in Domesday Book (1086). The singer of heroic epics was perhaps the usual type of minstrel in the Norman period: what relation this apparently oral tradition bore to that of written courtly song is arguable. It will, however, be remembered that Richard I (1189–99) was himself a *trouvère* and presumably encouraged the courtly art of song.

Throughout the later Middle Ages the king's harper was usually one of his closest servants, but the king's household included other minstrels of various kinds. Toward the end of his reign Edward I (1272–1307) apparently employed four trumpeters, a nakerer, a taborer, eight harpers, and at least three other *bas* (soft instrument) minstrels. In addition his household included three or four

vigiles and other servants capable of making minstrelsy. These numbers are conservative, and they do not take account of the households of the queen, the Prince of Wales, and the king's younger sons, all of which included minstrels. Edward I and later kings also increased the available minstrelsy by employing visiting minstrels on an *ad hoc* basis, sometimes for days, sometimes for months.

The word "minstrel" in these circumstances clearly had two distinct meanings. Those whose names appeared in the household lists as "the king's minstrels" (*ministralli regis*) were basically singers and instrumentalists whose main function was that of entertainment or the music associated with ceremonial: their occasional use for diplomacy, espionage, or the carrying of letters was dependent on the social freedom demanded by their minstrelsy. On the other hand those capable of making minstrelsy included several whose primary function was something else—the waferers, *vigiles*, and sometimes such employees as grooms of the chamber or huntsmen who had a talent for minstrelsy. "Minstrelsy" is itself difficult to define in these circumstances, although it seems likely to have been an entertainment that was primarily or at least substantially musical.

The king's payments for such entertainment were large. In the latter part of his reign Edward I spent an average of £25 per year on casual gifts for minstrelsy. Special occasions might raise the annual sum by £40 or more, as Princess Elizabeth's wedding did in 25 Edward I (1296–97); and the 34th year of his reign (1305–06) cost him a total of £224 14s. 8d, of which £170 10i. 8d. was spent on minstrelsy at the Pentecost feast (when the Prince of Wales was knighted) and the weddings of two favorite nobles. Later monarchs generally tried to lower the level of expenditure on minstrelsy, but without notable success. These expenses, in any case, were additional to the daily payments made to minstrels at court. Most royal minstrels, as squires of the household, took 7 ½d. per day, while the *vigiles* and junior minstrels took 4 ½d. Minstrels were not required at court throughout the year, although a nucleus was always needed: so although some minstrels spent as much as 160 to 200 days in court, most were in residence for fewer than 100 days in the year.

When not in court the royal minstrels could live at home and work as necessary. A single minstrel could earn 3s. *Ad.* from a town or noble, while 6s. 8d. was a normal gift to a group of royal minstrels. The gifts made to the minstrels of other nobles were smaller but also substantial, and until the late 15th century (by which time many places had their own bands of waits) towns tended to be generous to local minstrels as well.

Less is known about the minstrels working in towns and villages than of those wearing a nobleman's livery. The secular celebrations connected with such events as weddings and mayoral elections always gave work to local

minstrels. But the fulltime professionals, at least, also needed to travel, and a patronal festival at a large abbey, such as Durham, or a major festival celebrated in a city like York, attracted minstrels year after year. Often the records show that the same minstrels returned.

The maintenance of law and order required some control to be exercised over this itinerant minstrel population, which always included a criminal element. A system of licensing, undertaken at fair times, when the largest number of minstrels would be present, was operating by the beginning of the 13th century. Evidence exists for minstrel courts at Chester, Newcastle-under-Lyme, Tutbury, and Beverley. These controls were probably implemented by the kings of heralds and minstrels, at least until the late 14th century. Thereafter the herald kings seem not to have been minstrels as well, and the minstrel courts generally became disorganized. In the late 15th century the minstrel courts began to take on the appearance, and apparently the functions also, of guilds: it is in the latter form that the Chester and Tutbury controls survived beyond the 15th century and the Beverley court was revived in the mid-16th.

Most minstrelsy was by a single entertainer: it is clear that harpers and others were able to provide acceptable entertainment alone. Harpers were probably often *gestours*, singers of epic stories, while the fiddle, too, could be used to accompany a song. Song titles known to us are “The Song of Colbrond” (presumably part of the story of Guy of Warwick), “Queen Emma Delivered from the Plowshares,” “The Seven Martyred Sleepers,” and “Greysteil.” It is impossible to know what relation these bear to the surviving texts.

Minstrels also performed in consort: one plucked and one bowed stringed instrument, a pair of fiddles, two trumpets (with or without nakers), and two or three shawms with a trumpet are all known as apparently standard combinations. Again, as the repertoire was transmitted aurally, it is difficult to show any relationship between their music and the surviving notated sources. That minstrelsy was a rich and varied facet of life in medieval England, however, the documentary and iconographic sources leave us in no doubt.

Mints and Minting

Minting in England was always in the control of its kings. This is different from the situation in France and the German-Italian Empire, where the coinage of the monarch was in competition with that of a variety of secular lords, ecclesiastics, and urban communes. Though the English king always

maintained the power to set the standards and appearance of the coinage, the actual minting was often dispersed and put under the administration of officials with varying degrees of control and profit.

Little is known about the organization of English minting before the 8th century; many of the early coinages cannot be assigned to specific kingdoms. In the late 8th and 9th centuries four mints appear to have operated more or less continuously; Canterbury, London, Rochester (after about 810), and at an unknown site in East Anglia. These mints produced coins in the names of Kentish, Mercian, West Saxon, and East Anglian kings, as well as for some bishops (an exception to the general royal control). A mint at York served the Northumbrian kings and, after some interruption, the Viking rulers. A large number of moneyers are named on the coins of this era, many of whom served successive kings of different dynasties at a given mint.

Additional mints appear to have been opened in the late 9th and early 10th centuries, though seldom identified on the coins. In his decree of Grateley Æthelstan of Wessex (924–39) specified that certain mints in his realm (Canterbury, Rochester, London, Winchester, Lewes, Southampton, Wareham, Exeter, and Shaftesbury) were to have more than one moneyer each, while all other boroughs would have one; a total of 35 mints are identified on his coins. By the turn of the millennium as many as 75 mints were in operation, and a system of periodic design changes and recoinages was in place. Dies were distributed from central engraving workshops, and standards and types were uniform throughout the kingdom.

The system of borough mints and centralized die cutting and control was maintained after the Conquest, as was the practice of periodic recoinages. Under the Norman kings, however, the coinage declined in standards of content and appearance, and the number of mints decreased. The civil war in Stephens reign undermined the unity of English minting, with the appearance, for the only time in English history, of baronial issues. In his monetary reform of 1158 Henry II issued coins from 30 mints. By the time of his 1180 recoinage only eleven mints were in operation. After this date the coinage was unchanged for seven decades; recoinage was ordered only for pieces that had lost weight through wear or clipping. Though the great recoinage of 1248–50 involved about twenty mints, by the end of the reign of Edward I (1307) most minting was done in London.

As the coining became concentrated in London, and the mint moved from the City to the Tower, an administrative system developed that would last well into the modern period. The actual running of the mint was in the hands of a master, often of continental origin, who contracted to mint coins of prescribed standards at a stated rate of profit. As he was responsible for the entire coinage of the kingdom, mint masters' names were no longer put on the coins. The

actual production was done by workers who specialized in one of four operations (melters, sizers, blanchers, and strikers) and who were paid according to the amount of bullion processed. The size of the productive staff varied with the quantity of coinage produced.

The king controlled the minting through various officials whom he paid directly. Chief among these were the warden and the keeper of the exchange, sometimes the same individual. At some periods merchants could bring plate and foreign coins directly to the mint; at other times they had to deal through the keeper of the exchange. The quality of the coinage was overseen by the “trial of the pyx.” One penny out of each £10 produced was deposited in a special box (the pyx), whose contents were assayed four times a year in the presence of the barons of the exchequer and compared with standards of fineness and weight. Secret (“privy”) marks in the form of special letter forms and punctuation allowed the identification of the mint master under whom a given coin was issued.

The proliferation of denominations and the inception of minting in gold in the middle of the 14th century brought little change to the operation of the mint; usually only gold or silver was coined at a given time. A major change was the operation of the English mint at Calais, which between 1347 and 1452 rivaled and often exceeded the production of the Tower mint. The most striking aspect of English minting in the later Middle Ages is the marked decline in the amount of metal (both silver and gold) coined after about 1362, which can be interpreted as a result of an English trade deficit and as part of the overall contraction of the European supply of bullion.

Mirk, John (fl. ca. 1382-ca. 1414?)

Augustinian canon of Lilleshall Abbey in Shropshire; best known for his *Festial* (ca. 1382–90), a collection of ME Temporale and Sanctorale sermons much indebted to Jacobus de Voragine's *Legenda aurea* (ca. 1263–67). The *Festial* gave 15th-century England what probably became its most influential sermon cycle. Mirk wrote two other extant works: his ME verse *Instructions for Parish Priests*, a practical guide to conducting the liturgy and teaching the laity, and his Latin *Manuale sacerdotis* (ca. 1414?), a more reflective work aimed at promoting in parish priests the right attitude to their vocation.

The dates of Mirk's birth and death are unknown, and his works are the sole source of information on him. However, their thrust makes it clear that he was closely in touch with the ethos of his order and its pastoral involvement at the grass roots of society (the Augustinian canons, unusual among religious, often exercised cure of souls). By the time he wrote the *Manuale* he had been elected prior of his community. His *Festial* is stoutly orthodox, sometimes sensational, stocked full with exempla to delight and instruct the "lewed folk"; it offers a good example of one type of preaching to which many late-medieval men and women were exposed.

Misericords

The misericord is a hinged choirstall seat that, when tipped up, gives support to the clergy, who according to the Rule of St. Benedict were required to stand during the divine offices, consisting of the eight canonical hours.

The term "misericord" is first mentioned in the 11th-century *Constitutiones* of Hirsau (Germany), and the earliest misericords with carvings on their undersides are from the 13th century (e.g., Exeter Cathedral, ca. 1250). Although situated in the sacred choir, the subject matter on misericords is predominandy secular and at times obscene; their position low down and underneath human bottoms allowing for license, comparable to the marginal spaces in manuscripts. Proverbs, games, fables, romances, daily life, the "labors of the months," professions, and a vast repertoire of hybrid and mythological creatures, as well as real animals and plants, are illustrated. Most popular are scenes of the devious fox and of woman as virago, while scenes based on the scriptures are few (e.g., in Worcester Cathedral). However, the apparently humorous stories often have moral implications, inspired by sermons, and the animals are frequently derived from bestiaries that ascribed moral meanings to them. In the 13th century the motifs were simple, and the foliage was of trefoil or cinquefoil pattern (e.g., Salisbury Cathedral); this gradually changed to a naturalistic type in the early 14th century (seen in Winchester Cathedral), and is found fully developed in Wells Cathedral, ca. 1330–40. The motifs developed parallel to contemporary stone carvings and manuscript illuminations in style and iconography and by the beginning of the 14th century came to be closely related to marginal drolleries in manuscripts. The Renaissance style came to fruition in the misericords of Kings College Chapel, Cambridge (1533–38).

In England, unlike other countries, misericords have subsidiary carvings, called supporters, emanating from either side of the seat ledge. The subject matter is thus able to spill over into the supporters, which resulted in an expansion of the narrative, as in agricultural scenes in Lincoln Cathedral misericords.

Misericords were carved under the direction of a master carver, and there is evidence of William Bromflet and his assistants working on the Ripon Minster choirstalls 1489–94, but generally carvers are not recorded. Similarities in style and iconography among sets of misericords point to the movement of carvers

and the use of common models, as demonstrated by the connections between the misericords of Lincoln Cathedral (1370s), Chester Cathedral (1380s), and Nantwich Parish Church (1390s), or those of Manchester Cathedral (ca. 1506) and Beverley Minster (1520–24). At the end of the 15th and the beginning of the 16th centuries in particular Flemish carvers are found working abroad, as at St. George's Chapel at Windsor Castle and Westminster Abbey, London. The dissemination of patterns in the 14th and much of the 15th centuries was through sketchbooks and manuscripts; prints were available from the second half of the 15th century. The carvers of Ripon Cathedral first made use of German engravings. They were followed by the carvers of Henry VU's Chapel in Westminster Abbey, who copied Albrecht Dürer, Israhel van Meckenem, and the Master bxg.

Modus tenendi parliamentum

The only surviving medieval treatise on the organization and operation of parliament. Its purpose, date of composition, and provenance have all provoked scholarly debate. The text is composed of some 26 short Latin chapters, detailing the anonymous author's conception of an ideal parliament, set in the time of Edward the Confessor, rather than his analysis of

contemporary parliamentary realities. The significance of the treatise is centered on the importance of the representative character of parliament. Chapter 23 asserts that in granting money to the crown representatives of the communities are more important than the lords; it declares that there can be no parliament without such representatives. The *Modus* became controversial in Tudor-Stuart times, as it was used to support the ancient and independent privileges of parliamentary representatives and the myth of the Norman Yoke—that is, the idea that primitive Anglo-Saxon freedom and free society had been crushed by the Normans at the time of William I. A copy of the *Modus* is found in the *Lords Journal* of 1510.

The tract appears to have been written during the politically troubled 1320s, which would link its representative sentiments to the Statute of York (1322). Although it may have had a political purpose, it served as a guide for lawyers in defining the ideal parliament. Two major versions of the text survive. One is found in collections of common and statute law used by common lawyers; the second is in collections used by civil lawyers involved with the courts of chivalry. There is a French version, derived from a compilation of the two Latin texts. A version was also prepared in Ireland with features peculiar to the Irish parliament. It has been argued that the Irish version is the original and that the English versions date to the political troubles of Richard II's reign. This is, however, a minority view. A fragment of a Scottish version of the *Modus* also survives.

Monarchy and Kingship

As a form of government and social organization, monarchy emerged in the provinces of Britannia after the withdrawal of the Roman legions ca. 410. In the following millennium its character in what became England significantly changed, but at no time was monarchy abandoned. To begin with there were many monarchies, ruled by *reges* (kings) practicing kingship in territories called kingdoms.

Only in the early 10th century did a monarchy, based on Wessex (and to some extent Mercia) successfully claim the allegiance of all the English. This monarchy owed much to foreigners: to Roman ideas of government as well as Celtic antecedents; to early Germanic settlers—Angles, Saxons, Jutes, and Franks—as well as Danes and Norsemen (from the late 9th century); to Normans and Angevins (in the 11th and 12th centuries); to Carolingian practice, and, above all, to Christian influences following Augustines mission (597).

The monarchy's place in society gradually broadened to become the bedrock of political and social life and the embodiment of statehood and—well before the end of the Middle Ages—the nation. It enjoyed practical authority of government and administration, and it legitimized a social hierarchy at whose pinnacle it stood. Using the metaphor of the body, John of Salisbury (d. 1180) said, “The place of the head in the body of the Commonwealth is filled by the prince, who is subject only to God and to those who exercise His office and represent Him on earth, even as in the human body the head is quickened and governed by the soul.” In the next three centuries Englishmen were inclined to place monarchs even higher, with God alone as their superior.

From an early date the powers of monarchy were matched with duties: to defend, administer, and judge. Some monarchs were incompetent or foolish, others were tyrannical, and many were unpopular; critics and opponents, even rebels, abounded. What is remarkable is that the institution of monarchy nevertheless became more sophisticated and developed its own ideology, so that it survived the reigns of unsatisfactory kings.

Right to the end of the Middle Ages kings were sometimes removed violently (six times between 1399 and 1485: Richard II, Henry VI, Edward IV, Henry VI, Edward V, and Richard III), though the justifications became increasingly contrived and tortuous. From time to time the monarchy was assailed by political, social, and religious forces; its economic resources and the ambitions of its kings within the British Isles and in western Europe taxed its capacity. By 1500 all these factors had molded a monarchy that transcended the person of the king, controlled a compact and centralized kingdom with

extensive dominions beyond its frontiers, and could withstand depositions, minorities, and dynastic disputes.

Three major phases in the development of the medieval monarchy may be identified. But for the Vikings and their defeat of every English kingdom save Wessex, a unitary kingdom might not have emerged in England, at least not in the 10th century. Edgar (d. 975) called himself *Albionis Imperator Augustus* (Augustus: Emperor of England), and the kingdom's strength was such that it kept its identity when absorbed into the Baltic "empire" of Cnut (d. 1035) and conquered by William of Normandy in 1066. In each case the conqueror acquired a richer and better organized dominion and a more sophisticated monarchy than his own.

Close reciprocal relations with the church were symbolized by ceremonies of anointing and consecration, and the ritual of Edgar's coronation (973) is still at the heart of the ceremony. Christian kingship enhanced regal authority, promoted monarchical stability, and highlighted the concept of "royal blood" (with implications for hereditary succession). The struggle against the Vikings also elaborated systems of military service, taxation and coinage, administration via *burhs* and hundreds, and royal lawgiving. And these developments underline the importance of nobles and a settled capital, which, until the 12th century, was Winchester.

When England was part of larger continental "empires" (1066–1216), its monarchy shifted inevitably into a new phase, emphasizing the powers and status of kings and the kingly office but also demonstrating the need for cooperation with subjects (especially nobles). Relations with the church remained valuable, but reform movements produced conflict and under John (in 1213) the submission of England to the papacy in fiefdom. Adapting Anglo-Saxon law and administration to Danish and French rule was not easy, but it enhanced royal authority and kings' capacity to exploit their kingdom.

The ideology of monarchy developed further, combining coronation with charters of liberties that expressed the prerogatives and duties of monarch and subject. But to record is to invite complaint, and it required Magna Carta (1215) to attempt to bring John to heel. By the 13th century the monarchy was no longer the Wessex monarchy writ large. The overseas commitments of its kings made English government more settled; the capital moved to Westminster, and a noble-dominated society geared for royal war was buttressed by tighter economic, social, and financial arrangements based on obligation and service. The civil wars of Stephen's reign showed the dangers of dynastic dispute; but when John died (1216), Henry III could succeed him at the age of nine, the first minor since the Norman Conquest.

In its third phase, from the mid-13th century on, the monarchy was able, despite its paradoxes, to embark on unprecedented conquests in the British

Isles and France, creating dominions organized from England. Henceforth the monarchy was thoroughly English, its kings regarding their English realm as their first priority and as an independent, sovereign “empire.” Even certain papal claims were rejected, but without forfeiting the essential Christian quality of monarchy. The mystical character of kingship received new emphasis: “Not all the water in the rough rude sea / Can wash the balm off from an anointed king,” as Shakespeare plausibly made Richard II say.

At the same time the king's subjects required sensitive handling, especially when parliament emerged as a forum for criticism in the mid-13th century, and kings waged lengthy and expensive wars (from Edward I on). Significant limitations were imposed, tempering the authoritarianism of the 11th and 12th centuries. Moreover, although the convention of hereditary succession (it was not a principle) was usually upheld, noble ambition, fears, or exasperation could set it aside, and more kings were deposed in the 15th century than at any other time. Yet no one attacked monarchy itself or proposed an alternative to hereditary succession.

By 1500 there was a delicate balance between hereditary monarchy in the male line and political pragmatism; between the king as an earthly officer and a semipriest; between his prerogatives and majesty, and customary limitations on his power. Several kings struck the wrong balance and suffered for it, but the monarchy remained inviolable.

Monasticism and the Benedictine Order

St. Benedict of Nursia codified his monastic Rule around the middle of the 6th century. Though this came to be regarded as the premier monastic *ordo* (rule for community life) of the Middle Ages, it was for long in competition with others, such as those of Benedict's contemporary Caesarius of Arles, and with those from the alternative, Celtic tradition that flourished along the Atlantic seaboard and in France and Germany for some centuries. Benedict's Rule was itself derivative, owing much to ascetic customs and regulations for cenobitic communities (that is, for those living together in a common life) in the late Roman Empire.

The earliest surviving manuscript of the Rule is from ca. 750 and was for use in a monastery in Anglo-Saxon England. However, the earliest monasteries established in post-Roman Britain—the first being St. Augustine's, Canterbury, founded ca. 598 by the mission sent by Pope Gregory—were not strictly speaking Benedictine, though their way of life was broadly similar. The monasteries of northern England associated with Aidan and other charismatic founders represented Celtic, not Italian, monasticism. Until the latter part of the 7th century monasticism in England was distinguished by heterogeneity and eclecticism. The most important monastic figure in England, Benedict Biscop, who founded Wearmouth and Jarrow (where Bede was a monk), though heavily influenced by Benedictine customs, built a rule that borrowed from many traditions. Of more significance for the coming primacy of Benedict's Rule were the activities of Wilfrid in the north and the Italian Hadrian, abbot of St. Augustine's, Canterbury.

The late 7th and 8th centuries witnessed the rapid growth of monastic foundations, both large and small, and increasingly subject to the Benedictine Rule. Many were founded by royal families or great lords, endowed with vast estates that were the basis of their economic prosperity until the Dissolution in the 1530s. Of particular importance were three groups of foundations: in the west Midlands, a group including Worcester, Evesham, and Pershore, owing much to the patronage of the Mercian kings, especially Offa; in East Anglia, where Peterborough, Ely, and Crowland were the largest foundations; and the monasteries of the kingdom of Wessex, including the Old Minster at

Winchester and Glastonbury. This period also saw the foundation of the two greatest medieval Benedictine houses, Westminster and St. Albans.

This golden age was dramatically interrupted by the Viking invasions that began in ca. 787 and lasted for over a century. Monasteries represented rich and easy plunder. By the beginning of Alfred's reign (871) the monasteries of the north and east had been destroyed or abandoned, and conditions were little better in the south and west. Monastic life and learning had been devastated, both by the Vikings and by lay lords to whom the monks had turned for protection. Lay control of monasteries may have had a longer and more harmful effect than the raids. Many houses were now colonized by secular clerics, and it has been suggested that only St. Augustine's, Canterbury, continued unbroken Benedictine observance during this period.

Recovery began under the kings of Wessex, notably Alfred, Edward the Elder, and Æthelstan. The Wessex dynasty was responsible for the refoundation of many monasteries, as well as the establishment of new ones, including the New Minster, Winchester. They also founded a group of Benedictine nunneries. Communities of religious women had not been unknown, often being organized as double houses for women and men, under the overall control of an abbess. The most notable of these was Hild of Whitby in the 7th century, but these were mostly in areas of Celtic influence. The new nunneries, such as Romsey and Shaftesbury, were wealthy and exclusively aristocratic, often ruled by a female representative of the royal house.

By the mid-10th century a monastic group, led by the moderate Dunstan, archbishop of Canterbury, the more radical Æthelwold, bishop of Winchester, and Oswald, bishop of Worcester, with the active support of King Edgar, began a far-reaching reform of English Benedictinism designed to give the monasteries greater freedom from secular control and to reassert ascetic values. This reflected trends in continental Europe, where the Abbey of Cluny in Burgundy, founded in 909, stressed independence from both lay and episcopal control, and a group of abbeys in Lorraine, led by Gorze, looked for reform along the lines promoted by Benedict of Aniane early in the 9th century, in which a sympathetic lay power could take an active part. Cluny was to become the most influential expression of Benedictine monasticism for the next 200 years, while the reforms of Gorze provided a model for English reform culminating in 970 with the *Regularis concordia*, an attempt to impose uniformity of observance in all English Benedictine communities.

The 10th-century reform led to the refoundation of a number of dormant monasteries, like Glastonbury and Abingdon, as well as the foundation of new ones, such as Ramsey. On the death of Edgar (975) an antimonastic reaction set in and some gains were lost. The state of monasticism between Edgar's death and the Conquest has been much debated. It has been seen as "decadent" and

“backward” in comparison with other parts of western Europe, isolated from new trends in monastic observance emanating from Cluny and elsewhere. The return of political instability at the end of the 10th century affected some of the monasteries. Nevertheless, such monasteries as Winchester or Sherborne were important centers of artistic and literary production, bishops were generally recruited from monastic communities, and important houses, such as Bury St. Edmunds, were founded.

The Conquest changed the direction of English monasticism. Since ca. 1000 the dukes of Normandy and their leading magnates had founded a number of Benedictine abbeys in the duchy. The presence of the Cluniac William of Volpiano, at the invitation of Duke Richard II, had a beneficial effect on monasticism, and such houses as Fecamp, Mont St. Michel, and Jumièges became leading reformed houses. Anglo-Norman magnates often granted these monasteries extensive estates in England, the sites of daughter houses (known as “alien priories”), dependent upon the Norman house and often colonized by Norman monks. Despite logistic and disciplinary problems many of these survived until the Dissolution, though during the wars with France some were seized by the crown and granted to other abbeys or to endow new educational establishments, such as Winchester or Eton colleges. Others achieved independent status.

A few new abbeys were founded in post-Conquest England. The most famous was Battle, established by William I on the spot where Harold had been killed in 1066. Other important new abbeys were Shrewsbury and Chester, founded by the end of the 12th century. The first Cluniac priory was founded in England, due to the patronage of William of Warenne, at Lewes, Sussex; others quickly followed. The Normans also affected the long-established Anglo-Saxon abbeys. Two successive archbishops of Canterbury, Lanfranc and Anselm, had been monks of Bee in Normandy, and under their influence many English abbeys were organized and reformed in accordance with Norman practices. Lanfranc issued “Constitutions” for Christ Church, Canterbury, copied and imitated elsewhere, and Norman abbots were appointed in place of Anglo-Saxons.

Undoubtedly the most significant Benedictine development at the time was the monastic colonization of the north, resulting in the refoundation of Whitby Abbey and the creation of St. Mary’s Abbey at York and the monastic community at Durham Cathedral. This movement, patronized by local magnates as well as by the archbishop of York and bishop of Durham, foreshadowed the great expansion of the “new orders” in the following generation.

The emergence of reformed Benedictine communities, notably the Cistercians, as a reaction to the perceived laxity and affluence of many older

Benedictine houses as well as of the Augustinian and other orders, which represent a return to older “apostolic” and eremitical ideals, ensured new and powerful competition during the first half of the 12th century. Comparatively few new Benedictine abbeys were founded; they had ceased to be fashionable and were expensive to endow at a time of pressure on economic resources, particularly land. Nevertheless, great Benedictine abbeys, such as St. Albans, long continued as centers of artistic and scholarly activity; their buildings were in the forefront of architectural innovation and splendor, and (particularly in the south) they dominated local economies.

New threats to their preeminence came from various quarters during the 13th century. The emergence of the universities ended their virtual monopoly of academic studies. The friars proved successful rivals, both for the benefactions of the faithful and as patrons of learning. It was increasingly rare for bishops to be recruited from the Black Monks (the Benedictines), and their influence in ecclesiastical politics waned. Virtually no new Benedictine abbeys were founded after ca. 1200, except for collegiate foundations in Oxford and Cambridge.

The later Middle Ages was a period of slow decline. The falling away in monastic and spiritual fervor of the Black Monks has probably been exaggerated, particularly by polemicists. Many of the larger abbeys were able to survive the harsh economic climate that affected great landholders after the Black Death with relatively little pain. But the overwhelming impression of the Benedictine abbeys in the years before the Dissolution of the 1530s is of small communities in difficulties that in extreme cases led to their dissolution; however, the greater abbeys—with their large quota of paying long-term guests and lay servants, their abbots of high social status with a place in parliament and usually now living apart from their community in sumptuous lodgings, and the monks themselves—remained well fed and affluent, centuries removed from their roots in Anglo-Saxon England.

Moral and Religious Instruction

An astonishing variety of ME texts could be classified as works of moral and religious instruction, for the genre must be one of the most comprehensive in the language. Its audience was equally wide-ranging—male and female, clerical and lay, learned and unlearned, young and old. The literary status of the texts also varies: most are translations, usually from French or Latin; many are compilations of passages recycled from other, longer texts; some have no obvious immediate source. But none is “original” in any modern sense: in the Middle Ages it was impossible to write an original treatise about sin.

All later medieval works of religious instruction owe their origin, directly or indirectly, to the same stimulus: the Fourth Lateran Council of 1215, which decreed that at least once a year Christians of both sexes should confess to, and receive communion from, their parish priest. The council thereby stimulated—consciously or not—the first program of mass education that the West, and possibly the world, had ever seen. In response to this decree, *Omnis utriusque sexus*, a large number of treatises was produced all over Europe, at first in Latin for a clerical audience, but very quickly in the vernaculars (in England both Anglo-Norman and ME) for the laity, women religious, and the less educated parish clergy.

Subsequent episcopal decrees in England, culminating in the Lambeth Statutes of 1281, laid down a basic catechetical program that varied in fullness and detail but always included a knowledge (in the vernacular) of the Lord’s

Prayer and Apostles' Creed, an understanding of the sacrament of penance (confession), and of the seven deadly sins. The treatises composed in response to these requirements are either comprehensive, attempting to cover all the catechetical topics (e.g., *Memoriale credendum* [IPMEP 448]), or more selective, concentrating on a single topic such as the Ten Commandments (e.g., *Dives and Pauper* [IPMEP 156]), the five senses or wits (e.g., *Tractatus de quinque sensibus*, derived from *Ancrene Wisse* [IPMEP 507]), or the seven deadly sins (e.g., Richard Lavynham's *Little Treatise* [IPMEP 789]).

Most use a straightforward didactic mode of exposition and argument, often with such mnemonic devices as short verses or numbered lists. Some use an allegorical fiction as a framework (e.g., *The Abbey of the Holy Ghost* [IPMEP 39], *The Pilgrimage of the Life of the Manhood* [IPMEP 781]—both translations of Anglo-Norman or Old French texts—and *The Desert of Religion* [IMEV 672]). Most of the earlier texts are written in verse, which until the 15th century was the dominant medium for practical instruction, probably because it was easier to remember than prose: for example, Robert Manning's early-14th-century *Handlyng Synne* (IMEV 778), a translation of the late-13th-century Anglo-Norman poem *Manuel despéchés*; William of Nassington's immensely popular *Speculum Vitae* (IMEV 245), derived like many others from Friar Laurent's *Somme le roi*, a French prose text compiled ca. 1280 for Philip III of France; and *An ABC of Devotion* (IMEV 664) found in the register of Godstow Nunnery.

Some texts were composed for specific audiences: *A Book to a Mother* (IPMEP 767) was written by a priest for his widowed mother; the mid-15th-century *Disce mori*, which in spite of a title meaning "Learn to Die" covers all the standard topics of instruction, was written for Dame Alice, a woman in religious orders. *The Pater Noster of Richard Hermit* (IPMEP 150), a long exposition of the Lord's Prayer, and *The Cleansing of Mans Soul*, a comprehensive treatment of the sacrament of penance, were both written for nuns. Peter Idley's mid-15th-century instructions to his son (IMEV 1540), books 2 and 3 of which rework *Handlyng Synne*, is a text written for children. *Ignorancia sacerdotum*, which derives from *Disce mori*, and the ME translation of the mainly Latin compilation *Speculumchristiani* (IPMEP 6) were both written for priests.

The varied transformations of a single source can briefly be demonstrated by the manifestations of the *Somme le roi* in ME: there are ten surviving translations, of which the best known are Michel of Northgate's *Ayenbite of Inwit* (IPMEP 55), completed in 1340; the late-14th-century *Book of Vices and Virtues* (IPMEP 668); and *The Ryal Book* (IPMEP 824), dated 1484. But there are many other texts, such as the *Speculum Vitae*, *A Mirror to Lewed Men and Women* (IPMEP 209), *Jacob's Well* (IPMEP 817), and Caxtons *Doctrinal of Sapience* (IPMEP 7AS), that also use it.

It may be thought that such texts make unrewarding reading. Far from it: they contain much information about medieval mentalities, especially attitudes toward sexuality, analyses of deviance, and so on. In addition their influence on better-known, more “literary” ME texts is immense. It is arguable that *Ancrene Wisse*, for instance, is nothing but an elaboration, adapted for a specific audience, of the standard catechetical topics (Barratt, 1987: 16); much of *Piers Plowman* is incomprehensible without the background of these texts. Even if the *Canterbury Tales* is not in fact structured on the seven deadly sins, as was once argued, Chaucer himself produced in the *Parsons Tale* (IPMEP 529) a typical work of religious instruction, based ultimately on two Latin compilations although its direct source seems to have been French. In the *Melibee* (IPMEP 18) he introduces a lengthy work of moral instruction by invoking the catechetical topic of the five senses. But the influence can be even more far-reaching: a full appreciation of the dilemma of the hero in *Sir Gawain and the Green Knight*; or of Sir Lancelot in Malory’s *Morte Darthur*, is available only to an audience whose moral sensibilities have been finely honed by the subtle analysis of human behavior, the so-called casuistry, inculcated by the best examples of the genre.

Morte Arthur, Stanzaic

A verse romance of the mid- to late 14th century, narrating in rapid succession a series of accidents, conflicts, and betrayals leading inexorably to the death of King Arthur and the destruction of his kingdom.

Questions about date and authorship remain, complicated by the circumstances of the poem’s transmission. Critics generally agree that the unknown 14th-century poet composed the original in a north Midlands dialect, but the work has been preserved in a single 15th-century text made by two scribes, each writing in different dialects, their copy incorporated into the 16th-century commonplace book of a London mercer, John Colyns (BL Harley 2252, fols. 86–133). This unique text is incomplete: some 3,969 lines survive, but an entire leaf of the manuscript is missing and occasional irregularities in the stanza lengths may indicate still other lost lines.

Because of the tight narrative structuring such losses are not critical to following the romance’s story of the final catastrophes that envelop Arthur’s kingdom. The poem focuses on Lancelot’s love for Arthur’s queen, here called Gaynor, and on the tragic consequences of the couple’s divided loyalties. The action begins in a court already poisoned by suspicion. The lovers’ efforts to allay these suspicions result in disaster: the Maid of Ascolot’s hopeless love for Lancelot, Gaynor’s unreasoning jealousy, the queens condemnation for murder, her rescue by Lancelot, the lovers’ betrayal, Lancelot’s unwitting murder of Gawain’s brothers, Gawain’s implacable quest for vengeance, and Mordred’s treachery. Arthur grimly faces the battles he knows will end both

his kingdom and his life. Receiving his death wound, he returns Excalibur to the sea and departs for Avalon. The poem concludes with the lovers' final parting and eventual death.

The stanzaic *Morte Arthur* has long been compared with the roughly contemporary and justly praised alliterative *Morte Arthure*, but it has suffered from the comparison. Recent critical evaluation has aimed at restoring its reputation. Although clearly aimed at a less sophisticated audience than that intended for the alliterative *Morte*, the episodes have been carefully adapted by the poet, resulting in a tightly constructed and thematically coherent narrative. The quiet and detached narrative voice contributes to the poem's swift pace and its almost elegiac tone. The occasional dismissal of the poem's "minstrel" style ignores the poet's choice of a demanding eight-line stanza (unique among ME romances) rhyming abababab, each stanza thus requiring two sets of four rhyme words. The poet incorporates long passages of dialogue into the quickly moving narrative. Alliteration and stanza linking also contribute to the poem's stylistic complexity.

Critical attention has emphasized the poem's place in the development of the Arthurian romance. The stanzaic *Morte Arthur* has as its source the French prose *Mort Artu*, but the English poet has skillfully reshaped the interlaced episodes of this source. More important, the 14th-century poem is perhaps most valued because it was used by Thomas Malory as a source for "The Book of Sir Launcelot and Queen Guinevere" and "The Most Piteous Tale of the Morte Arthur Saunz Guerdon."

Morte Arthure, Alliterative

One of the great works of the Alliterative Revival, written ca. 1400. It recounts in 4,346 lines King Arthurs triumph over the Roman emperor Lucius Iberius and near-coronation as emperor himself before his own rule collapses by treachery. Like many Arthurian romances it opens with a feast that is disrupted by a challenger, a senator from Rome come to call Arthur and the Round Table to account for their conquests of Roman lands. In the campaign that follows not only are great victories won in pitched battle, ambush, and siege but there are also single combats, one between Arthur and a cannibalistic giant, another between Sir Gawain and a Greek knight-errant. At the height of his success, expecting within a week to be crowned emperor by the pope, Arthur has a dream of Fortune’s wheel and the Nine Worthies that warns him of impending disaster; the next day he learns that in his absence from Britain his nephew Mordred has usurped both his throne and his wife. Returning hurriedly, Arthurs army manages to defeat the rebels in battle but Arthur himself and most of his Round Table are slain. The narrative ends with a majestic but somber funeral.

Though the poem survives in a unique source, the well-known Thornton Manuscript from Yorkshire (Lincoln Cathedral Library 91), its influence can be seen in later romance, particularly in Sir Thomas Malory’s “Tale of Arthur and Lucius” (Caxton’s book 5). It was composed in a northeast Midlands dialect by an unknown author, whose inferrable traits include wide experience of the world; reading in English, French, Latin, and perhaps Italian; and familiarity with the language of law, diplomacy, and bureaucracy, with military and naval theory and practice, and with travel routes abroad, court ceremonial, and fashionable cookery.

The poem is a romance only in the widest sense of the word, as a work about knights and chivalry with some elements of quest-romance structure. At the same time it partakes of enough of the characteristics of *chanson degeste*, in its central focus on war, conquest, and doomed heroism, to be called an epic; it also has characteristics of medieval tragedy, particularly the use of Fortune's wheel as a pivotal image. The problem of genre is partly a result of the poet's choice of source materials; primary sources are the Arthurian chronicles of Geoffrey of Monmouth, Wace, Lazamon, and Manning, but to these he added structures, ideas, images, and language from a variety of romances and other texts, including the Old French *Mort Artu* and the English alliterative *Siege of Jerusalem* and *Parliament of the Three Ages*.

Genre is less problematic than interpretation. Some have argued that Arthur should be seen as a great hero who falls simply by the action of Fortune's wheel and treachery from the man he trusts most; others would judge him as a conqueror corrupted by success and pride, whose actions become evil and result in evil for himself and his nation as for others. The poet's view of war seems ambivalent: on the one hand battle descriptions are full of the sharply observed detail, knowledgeable commentary, and partisan enthusiasm of a participant; on the other hand few medieval works express sharper criticism of the warrior athirst for personal honor without regard to military and political objectives or of the destructive effects of war on the bystander. A further complication is the poem's apparent commentary on its times; the contemporary issues of war, leadership, neglectful rule and usurpation, religious schism and failed crusade, all seem reflected in this work of the 15th century's turn.

The *Morte Arthure's* author shared with other alliterative poets a highly rhetorical style and the impulse to recreate sources and traditional materials with fresh and vivid language and concrete details, particularly in passages of description and dialogue. The poem's style has some unusual features as well, most notably the repeated grouping of two to ten lines by the use of a single alliterating sound. This habit provides the framework for a good deal of experimentation with unconventional alliterative patterns and for the maximum exploitation of formulaic techniques. It also offers wide scope for the poet's fondness for wordplay and makes full use of his extraordinary lexical resources. For this poet, with technical terms from a number of fields and many unusual or even unique borrowings from French and Old Norse, was one of the most innovative users of the English language before Shakespeare.

Mortmain (Dead Hand)

On the death of a vassal feudal lands yielded valuable incidents (financial perquisites): wardship (the holding of a minor heir's property), marriage (the control of his or her marriage), and relief (the fee paid to recover the fief upon coming of age). But if the land were vested in a “dead hand”—a corporation, such as the church, that never married or died—these fiscal perquisites could never be collected.

Most grants to the church were in free alms (*frankalmoi-gne*); the only service required in return was prayer. Because the usual service from and value of the fee were diminished or jeopardized, there was a move to restrict alienations made in mortmain. Such restraints, first mentioned in the early 13th century, were among the complaints of the barons against Henry III, embodied in the Provisions of Westminster of 1259 (chapter 14).

The famous 1279 Statute of Mortmain, which bears the title “Of Religious Men” (*De viris religiosis*), claimed that despite ordinances the clergy had been entering fees without the license and will of the chief lord. They had been appropriating and buying land as well as receiving it as a gift. The statute forbade such amortizing of land under pain of forfeiture. The forfeited land would go to the lord of the fee. If the lesser lords neglected the matter, the forfeiture went to the crown. Further regulations and reinforcement came in the 1285 statute of Westminster II and the 1290 statute *Quia emptores*.

None of these pronouncements mentioned exemption from the penalty for amortization by means of a crown license. And yet licenses to give land in mortmain began in 1280. In 1291–92 a statute offered a royal writ to launch an inquisition to determine the loss to the king or other lord if land be given to the church. While a statute of 1297 discussed fines for licenses, Magna Carta of 1297, cl. 36, repeated the ban on fraudulent gifts in mortmain.

Mortmain was important to feudal lords for two reasons: they were troubled about the erosion of their earthly seigniories and also worried about restraint upon their ability to make gifts to the church to “purchase paradise.” The crown had similar concerns, as well as the intermittent desire to contain the power of the church, placate the nobility, control alienation, and raise revenue by selling licenses. Mortmain is also of interest to historians: it illustrates the important issues regarding the alienability of feudal tenures and the power of the crown *vis-à-vis* lesser lords. It has been seen as the beginning of the attempt to control the church. The licenses granted by Edward I suggest not merely a revenue-raising device but an early example of the royal ability to grant exemption from the operation of a statute (a point recognized by the 17th-century parliamentary patriot Sir Edward Coke).

The granting of licenses can be connected to increased need for money in wartime; the licenses with reasons for amortizing are crucial indicators of the spiritual or philanthropic concerns of the donors. No land was to be amortized without an inquisition *ad quod damnum* (“to what damage”), conducted by the minor royal official known as the “escheator,” to determine who would lose if the lands were so granted.

Because the process involved in securing a license from the king was often extended, and the time between fixing the cost of the license and payment considerable, it became customary to employ a device whereby the land was

granted, without fraud, to lay nominees. However, it became common to allow the arrangement to stand indefinitely without a license. While the statute of 1391 forbade this, the practice formed an important stage in the development of the law of trusts. The motivation behind the statutes concerning mortmain and the royal enterprise as to the selling of exemption by license are still being debated by historians.

Morton, Robert (14307–1497?)

Composer documented as a "chappellain angloix" at the Burgundian court chapel choir from 1457 to June 1475, though until 1471 he occupied the relatively humble position of "clerc" within that institution. He was certainly a priest by 1460; and he was still alive in March 1479, when he resigned the parish of Goutswaard Koorndijk in the diocese of Utrecht. There seems a good case for identifying him with the Robert Morton who had studied at Oxford, later becoming master of the rolls (January 1479) and bishop of Worcester (1486–97), under the patronage of his brother, Cardinal John Morton. His Burgundian career coincides with the years when the family was in political difficulties; his disappearance from the continental records just precedes the real political career of Bishop Robert Morton, and it coincides with a

diplomatic visit to Burgundy by the newly reestablished John Morton.

Twelve songs are ascribed to Morton. Four are of contested authorship. But the other eight, all setting French rondeau texts, include two of the most widely copied and quoted songs of their generation: *Le souvenir de vous me tue* (fourteen sources) and *N'aray je jamais mieulx quej'ay* (fifteen sources). His *Il sera pour vous combatu*, built over the famous *Uhomme armé* tune and perhaps one of the earliest known settings of it, pokes fun at a colleague in the Burgundian choir, Simon Le Breton, possibly on the occasion of his retirement in 1464. The anonymous rondeau *La plus grant chiere quejamais* describes a visit to Cambrai by Morton and another famous song composer, Hayne van Ghizeghem.

Morton's music appears in none of the few surviving English song sources, but it is in continental manuscripts copied as far afield as Florence, Naples, the Loire Valley, and Poland. The theorist Tinctoris praised Morton as one of the most famous composers of his day.

Motet

The most significant and intensely cultivated genre of polyphonic music in England and France during the 13th and early 14th centuries (the name is perpetuated in music composed in an evolving tradition down to the present day). The motet at its inception was a Parisian development of the years just after 1200, the product of a fruitful collaboration between Perotin, precentor of the Cathedral of Notre Dame, and Philip, chancellor of the University of Paris. The early motet, in which text was added to the upper voice or voices of a discant clausula, was the only long-lived outcome of experiments that involved writing texts for other progressive, melismatic polyphony as well, including the caudae of conductus and the melismas of organum. English contributions to the earliest layers of the 13th-century motet repertoire may be unrecoverable, but by ca. 1240–50 a distinct corpus emerges in insular sources that is markedly different in many respects from French approaches. From that time down to the end of the medieval period the newly composed French and English motet repertoires are of comparable size, and their traditions richly cross-fertilize.

The medieval motet is a short part song for a small group of soloists, singing one to a line. It is most frequently composed for two rhythmically and melodically independent upper voices over a slower moving, melismatic, and rhythmically patterned bottom voice, the tenor. Characteristic of the motet is polytextuality, wherein each of the upper voices has its own text. In performance the motet projects a polyphony not only of melodies but also of lyrics, and composers exploit a hierarchical organization both of musical lines and of texts, playing with sound and sense.

The first motets had sacred Latin words, but in the Parisian tradition these were supplanted by French secular texts around 1225, which were in turn supplanted by secular Latin lyrics of a political or celebratory nature after about 1310 (with the exception of the motets of Machaut, which mainly set courtly French love poetry). Outside of Paris, and especially in England, however, motets retained both their religious orientation and the Latin language.

With their dense thicket of lyrics and their sophisticated, ingenious musical designs motets were not for the common folk but rather for cultivated men and those who seek intricacy in art, as we are told directly by Johannes de Grocheio, writing in Paris around 1300. The French motet became a kind of refined chamber music for aristocrats, bureaucrats, clergy, and university students, before taking on in the 14th century a more public (propagandistic or ceremonial) role. In England, on the other hand, the motet remained principally a sacred genre—its performance context, presumably, was in one of those places in the late-medieval liturgy that was most flexible, especially as an interpolation after the Sanctus or a substitution for the *Ite missa est* at mass, or

as a Deo gratias substitute in the offices. Only in a handful of the largest and wealthiest monastic or secular choral establishments would the performance of motets have been regularly undertaken, and then only by a small number of talented individuals—the “precentor et qui cum eo erunt” (“the precentor and those who will be with him”) or “certe organiste” (“certain singers of polyphony”) as the ordinals say, or the “thre or foure proude & lecherous lorellis” out of a choir of 40 or 50 as described with some hostility by Wyclif. Motets might be copied from time to time onto flyleaves or into private commonplace books, but they were usually collected into large, well-ordered manuscripts. In striking contrast to the well-preserved sources of French motets no integral, large-scale motet codex survives from England before ca. 1500, though scattered remains of earlier books turn up with some frequency.

English motet production falls into three periods distinguished by the forms of notation and musical construction employed: ca. 1240–90, ca. 1290–1360, and ca. 1360–1450. From the first period around 100 pieces survive, mostly fragmentary; in addition there are textual incipits for 81, mostly otherwise unknown, in the surviving index to a lost book of polyphony (BL Harley 978, fols. I60v–I61). They are notated in separate parts (thus to be distinguished from the layout in score that was otherwise prevalent in England) and mostly written in English mensural notation. Fewer than half are built upon a tenor *cantus firmus* consisting of two or more statements of a segment of plainchant, on the French model. The greater number are constructed over a *pes*, a voice of tenor function that is either freely composed or perhaps drawn from the popular sphere, often featuring strict or varied *ostinati*. *Pes* motets are further distinguished according to whether the *pes* consists of multiple statements of one short idea (up to nine, eleven, or even thirteen times) or a chain of differing ideas (usually between three and six) repeated in pairs, and whether tenor repetition engenders voice exchange between the upper parts. While most early insular motets are polytextual, a significant minority set a single text, or alternate in the presentation of two texts. This repertoire, in particular the freely composed voice-exchange motets, has melodic, rhythmic, harmonic, textural, and structural affinities with contemporaneous English repertoires of conductus and rondellus in score notation. These in turn are influenced by the motet: late-13th-century examples are sometimes polytextual, or written in parts. The troped chant setting also adopted many features of the motet at the end of the century.

From the second period perhaps 125 motets survive. Abandoning English mensural notation, their notation at first follows the continental fashions of Franco of Cologne and Petrus de Cruce, but by the second or third decade of the 14th century composers turned to new English notations. A striking feature of the motets of the era 1290–1360 is their restriction to a small number of

well-defined formal types employing strict and varied voice exchange, strophic repetition with variation, refrains, and various kinds of recondite numerical disposition of phrase and section lengths, especially involving isoperiodicity (equal but staggered phrases in all voices) and rhythmic patterning in the upper voices. Large-scale collections of these motets apparently provided compositions for all major feasts of the church year (Sanctorale and Temporale, Proper and Common). One remarkable specimen composed before 1326 that survives only as an extended fragment, *Rotaversatilis* (on St. Katherine of Alexandria), has five lengthy sections of voice exchange that stand in the relative proportions of 12:8:4:9:6. Known only from a 15th-century book index is a treatise on the construction of this piece, entitled *Modus componendi rotam versatilem*.

At least 70 English pieces survive from the period of the final flowering of the medieval motet, ca. 1360–1450. These later works adopt French Ars Nova notation and abandon English structural approaches for the kinds of isorhythmic designs in three and four voices developed by Philippe de Vitry and Guillaume de Machaut, leading eventually to the classic tripartite isorhythmic motets with proportional diminution by John Dunstable, John Benet, and their contemporaries. Among a handful of exceptions are insular motet types in Ars Nova notation and hybrids with individualistic, insular responses to French influence in details of counterpoint and structure. (There are also many unique variations on isorhythmic design in the motet-style mass movements of the Fountains fragments and the Old Hall Manuscript.) Our view of the main line of development of the English and “Anglo-French” motet in the second half of the 14th century is undergoing major revision at present with the discovery of an English source for the motet *Sub arturo plebs vallata* and the dating of this piece to the early 1370s shortly before the death of its composer, Johannes Alanus (John Aleyn). The remarkable technical virtuosity and ingenuity of *Sub arturo* and related English works, some of which were discovered only in the 1980s, and the revelation of strong ties between English and continental traditions of “musicians’ motets” (including *Sub arturo*, the anonymous *Musicorum collegio*, and an insular version of *Apollinis eclipsatur*), imply direct contact and a spirit of friendly competition across the Channel.

Aside from the “musicians’ motets” and a few secular pieces imported from the Continent the English motet repertoire of the 14th and 15th centuries remained sacred in its orientation, now with an almost exclusive focus on Mary and the saints. Apparently no longer written in sufficient numbers to provide motets for all major feasts, the motet seems to have come to play a more occasional, perhaps ceremonial, role. For instance, it has been suggested that motets on St. George and Mary by Damett, Cooke, and Sturgeon in the Old Hall Manuscript (nos. 111, 112, 113) might have been performed at the

reception of Henry V in London after the English victory at Agincourt. And John Dunstable's motets on St. Alban and St. Germanus form part of his demonstrable links to the Benedictine Abbey of St. Albans. One exceptional late example, the anonymous *O potores exquisiti* (from BL Egerton 3307), sets the text of an old goliardic drinking song.

Following the precedent of some 15th-century continental manuscripts, modern scholars also refer to English polyphonic settings of cantilenas and antiphons from the 1420s and beyond as motets.

Music: History and Theory

History

Writing the history of music in medieval England is a difficult undertaking, as it would be for any cultural or geographic region in an era so distant from us in time, so alien in its customs and modes of thought, and so fragmented and incomplete in its evidentiary record. The practice of music poses particular problems in that it took place mostly in a notationless culture, and its instruments were fragile, circumstances drastically curtailing the number and kinds of artifacts that could survive. In this field the historian who wishes to depict the panoramic landscape—or, better, soundscape—of musical activity must have a full grasp of the information provided us by the few extant musical scores, the iconography of music, and literary references; an ethnologist's knowledge of the nonmedieval and nonwestern cultures that might be appropriately compared with that of ancient Britain; and the boldness of imagination to unite these into a descriptive anthropology of the full range of musical activity that might once have been practiced there. (This is admittedly idealistic; no modern account is so ambitious in its diachronic or synchronic sweep.) Histories of medieval English music have been further handicapped by the unjust prejudice that England is (or was prior to the late 19th century) “the land without music” and by the preoccupation of musicologists over the last 150 years with the musical achievements of medieval France. It has only been with a spate of new scholarship after the Second World War that the significant dimensions, the vigor, and the creativity of medieval English musical life have begun to emerge with full clarity.

One point of entry into music is linguistic, for those who sang, spoke, and wrote in Anglo-Saxon or Middle English, French or Anglo-Norman, and Latin formed distinct if sometimes overlapping music cultures in Britain with their own histories, genres, and dynamics of change. Each of these cultures will be briefly taken up in turn below.

With respect to the English language no songs survive with accompanying musical notation prior to Godric's sacred songs of the mid-12th century. Thus we do not know the tune of Cædmon's Hymn or have the formulas to which the oral predecessors to narrative poetry like *Beowulf* were intoned. At least

some of the more elite sung texts were preserved in literary form; what was sung for dancing, or in the tavern, or out in the fields is entirely lost. Indeed music of the lower levels of English-speaking society remains virtually inaccessible to the historian throughout the remainder of the Middle Ages. But there are always reminders of its presence. For instance, William Fitz Stephen, Thomas Becket's clerk, chronicles how when Becket was in France in the late 1150s on royal business as chancellor of the English king, his household would process into French towns on their route with 250 footmen in the vanguard, "singing English songs as was the English custom." Gerald of Wales reports around 1200 that a kind of folk polyphony was sung by the Welsh and by the English of Northumberland and says the southern English people generally did not perform this way, implying that their music was mainly monophonic. Later two surviving motets of ca. 1300 use tenors based on English songs, and a number of the Latin hymns of the Red Book of Ossory, written ca. 1320–60 by the English Franciscan Richard Ledrede, bishop of Ossory, are evidently sacred contrafacts of secular songs, some of which are identified by a vernacular English textual tag indicating the more familiar words by which the tune and rhythm would be known. Though the reinvigoration of English as a literary language began in the later 12th and 13th centuries, it never became an important vehicle for the motet or for aristocratic songs of courtly love, and though the narrative romance and ballad were sung, no medieval melodies are extant. Just one known sacred motet and one conductus fragment set English texts, and the few English lyrics surviving with melodies before ca. 1400 have pious, devotional subject matter. The polyphonic repertoire of the Winchester Songbook, and English part songs and carols of the 15th century, even when clearly in a popular vein ("Tappster, drinker, fille another ale"), were the entertainment music of an educated, mainly clerical elite. An outstanding research question concerns the degree to which the distinctive melodic, rhythmic, harmonic-contrapuntal, and formal features of insular church music, both monophonic and polyphonic, may bear the influence of local folk or popular idioms of English speakers. It may be, for instance, that the unique and artful "Sumer is icumen in" has its roots in the kind of part song described by Gerald of Wales.

The contribution of French speakers in the realm of vernacular music is equally difficult to trace. From the time of the Conquest the Normans introduced their own traditions of secular music making, culminating in the brilliant court culture of Henry II and Eleanor of Aquitaine. While not nearly as much lyric repertoire survives from the courts of the later Plantagenets, trouvères and minstrels enjoyed the patronage of the aristocracy well into the 15th century. As on the Continent the vogue for courtly song began to be seen among the middle classes; in the late 13th century the traders of the London

Guildhall established a *puy*; a literary-musical social organization, one of whose songs still survives on a leaf in the Public Record Office (E 163/22/1/2). A handful of motets and conducti set Anglo-Norman texts, mainly sacred in content, while a few motet tenors draw on a coarser range of popular lyrics. The court remained francophile throughout the 14th century, as exemplified by the men of letters, artists, and musicians in the circle of Edward III's queen, Philippa of Hainault, and it is not surprising to read in Chaucer's *Parliament of Fowls* (ca. 1382) that when birds sang a "roundel" (i.e., rondeau), "the note, I trowe, maked was in Fraunce" (lines 673–92). But in the later 14th and 15th centuries there were native composers who set not only English lyrics but also original French texts in the fixed forms of virelai, rondeau, and ballade. Again questions about musical interchange and crossinfluence here are easy to frame but hard to answer.

The culture whose music we know best is that of the church and of the educated clerics, whether in ecclesiastical or government service, whose *lingua franca* was Latin. The principal music of this culture, day in and day out, was liturgical chant. The nature and extent of development of the chant are hard to assess in Roman and early Anglo-Saxon Britain, but we can be sure the primary influences were the tradition of Rome itself and the Gallican and Hiberno-Celtic chant dialects. Regular religious life was virtually extinguished by the 9th-century Viking invasions. Its restoration in the later 9th and 10th centuries, driven by the powerful force of Benedictine monasticism, implanted the hybrid Franco-Roman dialect known as Gregorian chant, especially as it was sung at northern French houses, such as Fleury, Corbie, and St. Denis. After 1066 Norman influences, especially reflecting the practices of Cluny and Bee, had a powerful effect upon pre-Conquest chant traditions. Within the Gregorian musical tradition, which the later medieval British church shared with most of western Christendom, there was much scope for small-scale divergences in liturgy, ceremonial, chant selection, and melodic dialect; if these deviations became pronounced enough, one might come to recognize a distinctive local "use." The most famous and influential of these to develop in medieval England was the Use of Salisbury (or Sarum). A corollary to the development of the chant concerns the choral establishments constituted to sing it, first in monasteries and then in communities of secular clergy. Their expansion and transformation up through the 15th century established an English church-choir tradition that is still admired and functioning today.

Never static, the 9th-century nucleus of liturgy and Gregorian chant grew steadily by a process of accretion that was halted in England only by the turmoil of the 16th century. Englishmen contributed amply to the development of new liturgical feasts, new offices, votive observances, commemorations, and processions; in addition to the composition of texts and music for these new

services, new plainchants also included individual antiphons, conducti, sequences, offertories, and hymns, and a wealth of tropes and prosulae. A few examples will serve to indicate this activity; the subject is relatively underexplored, and only recently has it become the subject of intense scholarly interest.

In the Anglo-Saxon period, for instance, St. Dunstan (ca. 910–988) reputedly composed the melody for the Kyrie *Rexsplendens*; and Winchester became a center of the cultivation of plainchant tropes and polyphony. (Like some other 10th-century monastic churches the Old Minster also possessed a famous organ.) A rich repertoire of hymns, sequences, and full offices for Anglo-Saxon saints continued to be augmented even after the Norman Conquest. A later work, and probably the most influential office ever written in England, the Office for Thomas of Canterbury by Abbot Benedict of Peterborough (ca. 1180), was rapidly and widely disseminated across all of Europe. Archbishop Stephen Langtons popular Pentecost sequence, *Veni sancti spiritus*, achieved equally universal distribution. Of more local fame, although equally indicative of the continued composition of plainchant down to the end of the Middle Ages, are the offices, commemorations, and individual antiphons, hymns, and sequences for later English saints and near-saints, including such likely and unlikely candidates as Osmund, Simon de Montfort, Thomas of Hereford, and Thomas of Lancaster.

From the 9th century on the liturgy was also augmented regularly by polyphonic organa and, beginning ca. 1200, by a rich and distinctive body of Latin-texted sacred motets and polyphony for the mass and office that decisively parts company from continental practices. This insular music made a significant impact on the Continent in the 15th century, when it was influential in a decisive shift in genres and compositional approaches that is taken by historians to mark the beginning of the Renaissance in music.

Outside of the choir churchmen, clerks, and scholars were not averse to turning their musical talents and fluency in Latin to the ends of edification and entertainment. Their nonliturgical Latin song is known by numerous and diverse names—carmen, versus, ritmus, conductus, cantio, cantilena, modus, planctus, hymn, sequence, carol—and encompasses lyric poetry of a wide range of subjects. Most songs survive, stripped of their melodies, in text anthologies and florilegia, but for some there are musical settings; these vary tremendously in style, form, and aesthetic intent. The Older Cambridge Songbook of the mid-11th century, and the Younger Cambridge Songbook of the late 12th or early 13th century, with its affinities to the famous *Carmina burana*, are but two of the better-known secular collections. To this worldly repertoire we may add mention of such devotional songs as the widespread *Dulcis Jesu memona* and *Angelus ad virginem*, the pious songs of Ledrede's

Red Book of Ossory, and the Latin and macaronic (i.e., multilingual) carols of the late 14th and 15th centuries.

Dance music and instrumental music were ubiquitous and should loom large in any properly balanced social history of music, though a dearth of sounding music survives for them. The harp, the fiddle, the pipe-and-tabor, the organ, and many other kinds of instruments are attested by archaeological finds, medieval pictorial images, sculpture in wood and stone, and written accounts. Documentation for dance, especially for the communal karole, is also plentiful, and it is even possible to deduce certain information about choreography and dance meters from iconography and the accentual lyrics of vocal dance songs. The slender remains of medieval English instrumental dance music (atypical by definition, since they are notated) include a monophonic dance with a polyphonic coda in Bodl, Douce 138; three textless, two-voice compositions in BL Harley 978; and keyboard intabulations of estampies in the Robertsbridge Codex (BL Add. 28550). All are from the 13th and 14th centuries and exhibit a marked metricism in rhythmic language within highly repetitive forms. The Robertsbridge Codex also has intabulations of two continental Latin motets and a Latin-texted English cantilena. The role of instruments in the accompaniment of solo song is an area of active modern speculation and experimentation by scholars and performers.

Theory

Medieval musical theory encompasses the wide variety of topics addressed by medieval writers on music, including both more abstract theoretical subject matter (*musica theórica* or *speculativa*) and practical topics (*musica practica*), ranging from discussions of the origins and definitions of music, the etymology of the word “music” and the names of notes, intervals, and scales, to rhythmic and metrics, the construction and tuning of organ pipes, and the composition of chants and motets. Speculative music theory was a mathematical, ultimately Pythagorean discipline through which music earned its place in the medieval quadrivium next to arithmetic, geometry, and astronomy. It concerned itself with the tonal system, intervals, scales, tuning, and species of consonance and dissonance. At its heart was the arithmetic theory of proportions of intervals and their demonstration by the division of the monochord. Practical music theory in the West originated in the 9th century and was concerned with topics of direct application to the learning, singing, and composing of ecclesiastical chant. Its topics included psalm tones and liturgical modes, modal assignment, tonal behaviors in chant, and

techniques for sightsinging that involved the gamut, hexachords, mutation, and the Guidonian hand. With the rise of polyphony practical theory turned its attention to discant and counterpoint and to *musica mensurabilis*, including discussions of systems of rhythmic notation and the genres of mensural (mainly polyphonic) music.

In the earlier Middle Ages the two strands of music theory were regarded as distinct, with more regard accorded the learned *musicus*, who had mastered *musica theórica*, than the workaday *cantor*, whose field was *musica practica*. In the later Middle Ages these two theoretical traditions were linked as complementary parts of a single field in which the major treatises combined both with varied emphasis; quadrivial music education in the schools and at university came to possess a practical as well as a theoretical component, just as arithmetic had its practical side in abacus and computus. Variety in topic and emphasis speaks to the nature of the audience for music theory. Much of it was destined for the instruction of boys [*juvenes, pueruli, adolescentes*) in the rudiments of music, while some represents the elite discourse between *musici*. The Englishman Johannes Hanboys says that he writes (ca. 1370) for *compositores et cantores* ("composers and singers"), most likely meaning working professionals. Latin was the language for music theory until the 14th century, when vernacular treatises begin to appear in English, French, and Italian.

No contributions by Englishmen played a central role in the international development of medieval music theory, but there was a notably vigorous local tradition of dissemination and innovation. Much traditional material about music dating back to late classical antiquity circulated in copies or ab stracts of treatises from the early Christian era, preeminently the *De institutione musica* of Boethius (ca. 500) and also such works as Augustine's *De musica* and the encyclopedias of Cassiodorus and Isidore. Later continental treatises of the 9th through the 11th centuries enjoyed similarly wide distribution and influence in England, including the Enchiriadis treatises and works by Aurelian, (Pseudo)-Odo, Guido, and Berno. Also particularly well represented in English sources are the late-13th-century tradition of Franco of Cologne and the Parisian Ars Nova treatises of Jehan de Murs (Johannes de Muris) from the first half of the 14th century.

The individuals who copied, compiled, or on occasion authored theoretical treatises were mainly monastic cantors and precentors, the officials responsible for the monastic library and education as well as musical performance. A thin yet unbroken line of such theorist-precentor-cantors known to us by name can be traced from the 10th to the 16th century. In the Anglo-Saxon and early Norman periods the great monastic cathedrals at Winchester and Canterbury were centers of musical creation and scholarship. William of Malmesbury

attributes to Wulfstan the cantor of Winchester (fl. ca. 980–1010) an opus *De tonorum armonia* that has not survived. Osbern of Canterbury (fl. ca. 1070–89), monk and precentor at Christ Church during the tenure of Archbishop Lanfranc and, like Wulfstan, an important author of accounts of the lives and miracles of English saints, wrote two surviving music treatises, *De vocum consonantiis* and *De re musica*. The tradition of musical learning at Canterbury can be extended into the mid-12th century through the figure of Theinred, a monk and precentor of the Benedictine priory at Dover, which was a dependency of Christ Church, Canterbury. Theinred is probably the learned and respected monk, a grammarian and phonetician, who is mentioned by John of Salisbury in his *Metalogicon* of 1159, which was written at Canterbury while John was in the *familia* of Archbishop Theobald. Theinred's surviving theory treatise, *De legitimisordinibus pentachordorum et tetrachordorum*, is addressed to Aluredus of Canterbury, and its final line ("Explicit informacio juvenum") indicates it to have been intended for the youths being educated in the cathedrals care.

The English theorist known to modern musicology as Anonymous IV (fl. ca. 1275) is our chief informant about Parisian and English practices of the late 12th and earlier 13th centuries in his *De mensuris et discantu*; he may have been a monk (and perhaps precentor) of the great abbey at Bury St. Edmunds. A direct contemporary is W. de Wycombe, a monk of Reading who is known to have worked as a scribe for four years in the later 1270s or 1280s at Leominster Priory, where he rose to the position of precentor. Wycombe has left a list of the materials he copied at Leominster, including music and music theory, and he is probably to be identified as the author of a cycle of 37 polyphonic Alleluia settings, some of which are preserved among the late-13th-century repertoire. Contemporary with these Benedictines, but enjoying a different career, was the English priest Amerus, who served as a clerk in the *familia* of the Italian Cardinal Ottobuono in Rome, where he may also have been a member of the papal Schola Cantorum and teacher of the young singers there. In 1271, while in Italy, Amerus compiled a music treatise, the *Practicaartis musicae*, intended for the education of boys, which circulated both on the Continent and in England.

With the rise of the universities and secular choral establishments in England new career paths for theorists and new venues for the teaching and writing of theory started to emerge. The Benedictine tradition began to intersect with that of the universities in the figure of Walter Odington (fl. 1298–1316), a monk of Evesham who was an important scholar at Oxford in the early 14th century. Odington wrote complete treatises on each of the subjects of the quadrivium, including music (the *Summa de speculatione musicae*); his other works include a popular alchemical treatise. Many later

14th-century English music treatises are heavily indebted to Odingtons and are charged with the language and patterns of argument of the schools. One of the most substantial, the anonymous *Quatuorprincipalia*, is also particularly indebted to the Frenchmen Jehan de Murs and Philippe de Vitry in its fourth section, on *musica mensurabilis*. This treatise exists in two versions; multiple copies of the longer still survive, including one made in 1351 at Oxford by the Franciscan friar John of Tewkesbury (who may indeed be its author), which he returned to the Franciscans at Oxford in 1388. Late in the 14th century Thomas Walsingham (d. ca. 1422), the great historical chronicler who was precentor and *scripturarius* (chief scribe) at St. Albans, wrote a treatise on notation, the *Regulae de musica mensurabili*; Richard Cutell, a minor canon at St. Pauls, London, in the 1390s, has left us a vernacular treatise on counterpoint; and a Frater G. de Anglia copied Latin music treatises at Pavia in 1391.

From the 15th century the major figure is John Hothby (ca. 1410–1487), a peripatetic English Carmelite monk, composer, and prolific music theorist, who enjoyed a career in Florence in the 1450s and 1460s, followed by employment at the Cathedral of St. Martin in Lucca from the endowment of its polyphonic choir in 1467 until his recall to England by Henry VII in 1486. His numerous treatises appear in both continental and English manuscripts. The composer Leonel Power's surviving treatise is a plain vernacular teaching manual aimed at the education of boys in simple improvised counterpoint; it probably dates from his years as master of the Lady Chapel choir at Canterbury Cathedral (1439–45). Other theorists known to us by name were principally compilers. John Wylde, precentor (or perhaps preceptor) of the Abbey of the Holy Cross at Waltham, made an important collection of treatises, now BL Lansdowne 763 (ca. 1450). John Tucke, bachelor of arts and fellow of New College, Oxford, compiled and edited around 1500 the manuscript now BL Add. 10366. And a copy of Tucke's manuscript, now London, Lambeth Palace 466, was completed in 1526 by William Chelle, precentor of Hereford Cathedral, who had taken his B.A. at Oxford in 1524.

Some distinctive English contributions and specific references to local practice deserve brief notice here. In the realm of *musica speculativa*, for example, Theinred of Dover's theory of species is a novel theoretical justification of chromatically altered tones. An unorthodox Guidonian Greater Perfect System that amalgamates modern musical systems with those of antiquity is advocated by Roger Caperon in his *Commentum super cantum* (a work most likely of the 13th century but possibly from the 15th), which attracted the attention of the later 15th-century Spanish theorist Ramos da Pareia. A greater tolerance of the third and sixth as consonances than is countenanced by mainstream theory can be discerned in the works of Theinred, Anonymous IV, and Walter Odington; it is also a point made about

the English in the *Musica* (1357) of the Dutch priest and music theorist Johannes Boen (d. 1367), who had attended Oxford around the middle of the century.

Concerning musical notation the *Regule* (1326) of Robertus de Handlo and the *Summa* of Johannes Hanboys (ca. 1370) together provide a detailed picture of the evolution from the Ars Antiqua to the Ars Nova both in England and on the Continent, with information on distinctive insular notational practices and the contributions of other English authorities, including Robertus de Brunham, Robertus Trowell, and W. de Doncastre. Hanboys may have worked within the circle of an elite company of musicians named in the motet *Sub arturoplebs* who served Edward III and the Black Prince in the middle years of the century. Insular treatises of the late 14th and 15th centuries in Latin and Middle English discuss distinctive local techniques for improvised counterpoint—discant and faburden—according to the doctrine of “sights”; this kind of counterpoint is also the subject of passages in the *Depreceptis artis musicae* of the later 15th-century Italian theorist Guiilelmus Monachus headed “Ad habendum... cognitionem modi Anglicorum” and “Incipiunt regulae contrapuncti anglicorum.” As a last tantalizing example of *musica practica* we can cite a 15th-century index to the manuscript BL Royal 12.C.vi that lists a now lost treatise, *De modocomponendi rotam versatilem*, which evidently described the means of construction of the extraordinary early-14th-century English voice-exchange motet *Rota versatilis*, a work that itself survives only in fragments.

Writings on music were not solely the provenance of professional musicians. Music was a topic of discussion in other related disciplines and sciences, as in the works of Robert Grosseteste, Roger Bacon, and Robert Kilwardby. It is surveyed, too, by the encyclopedist Bartholomaeus Anglicus.

Peter M. Lefferts

Bibliography

There is need for a comprehensive monograph on medieval English music; the standard work, Harrisons *Music in Medieval Britain*, is by now out of date, due in no small part to later specialized research by Harrison himself. No current textbook surveying the music of the Middle Ages deals adequately with the topic. The best available treatment at length is by Caldwell (1991), who devotes over 200 pages to the period before 1450, with many music examples and an emphasis on musical style; for reliable shorter, chapter-length surveys for the general reader see Lefferts (1990) and the essays by

Musical Instruments

Literary and iconographic evidence testifies to the use of musical instruments for a wide variety of functions both public and private during the Middle Ages. They accompanied the telling of tales and the recitation of poetry; announced important people and events; provided music for singing, dancing, and dining, enlivening large banquets and small gatherings; added pomp to official ceremonies; accompanied armies into battle; and served during sacred church services and private devotion.

It is not possible to discuss musical instruments in medieval England as essentially different from those used on the Continent during the same period; most of them were in use broadly throughout Europe. But the various geographical areas did differ somewhat in their preference for certain instruments, and there are several variants that can be identified as particular to the British Isles. The number of different shapes, sizes, and sound colors of musical instruments during the Middle Ages was large—the result of the combination of numerous cultural influences from all over the known world and a lack of interest in standardizing many of the types of instruments. Indeed, although certain of the ceremonial instruments do show signs of uniformity, paintings and sculptures from the period provide ample evidence that instrument makers delighted in the variety of designs for the minor—and sometimes major—features of the bowed and plucked instruments.

In order to discuss instruments here it is useful to refer to them in terms of “families”—plucked strings, woodwinds, etc.—even though that type of classification is from a later period. People of the Middle Ages thought of the instruments as belonging to two basic groups according to volume: *haut* and *bas*, or, as Chaucer referred to them, “loude and soft minstralcye.” Those instruments with loud or shrill sound, *haut*, were considered separate from those whose sound was soft, *bas*, and it was in these groups that they were played. Various combinations were possible within each group, but at no point would the instruments of one of these groups perform in the company of the other. In general the loud instruments were those used out of doors, with the military, or for those festive occasions where loud sounds added to the excitement, such as weddings, tournaments, or large feasts. In this group were the trumpets (both folded and straight), drums called *nakers* (a pair of small kettledrums that usually hung from the waist) and *tabors* (large field drums), bagpipes (often called *cornemuse*), cymbals, and the double-reed instruments known as *shawms* or *shalmyes* (predecessor of the modern oboe). The soft instruments were those that would generally accompany songs—a large variety of bowed and plucked instruments, the softer-sounding woodwinds, keyboards,

and the voice itself.

The loud instruments were played individually on some occasions, but they are more often found in groups. Trumpets and shawms were often played in pairs, but groups of four or six were not unusual, and on some extraordinary ceremonial occasions the chroniclers record dozens. They were found grouped in ensembles of similar instruments or mixed together. Chaucer describes one such gathering in *The House of Fame*:

Many thousand tymes twelve,
That maden lowde mynstralcies
In cornemuse and shalemyes,
And many other maner pipe.

1216–19

A similar group, including drums, accompanies a battle scene in the *Knight's Tale*:

Pypes, trompes, nakers, clariounes,
That in the bataille blowne bloody sounes.

2511–12

Another reference to the same instruments is found in a ballad about defeat of the Scots at Halidon Hill in 1333:

This was don with merrie sowne
With pipis, trompes and tabers thereto
And loude clarionis thei blew also.

And at the vigil in the abbey church of Westminster preceding the feast for the knightening of Edward of Carnarvon, Prince of Wales, on 22 May 1306, the monks were unable to hear the singing of the Jubilatio from one side of the choir to the other because of the sound outside caused by trumpets and people shouting.

The scenes quoted above depict the loud instruments performing a function that we would not consider actually “musical”; it would be better described as noise making (even though the ballad describes it as a “merry sound”). But this was definitely one of the functions of these musical instruments during the Middle Ages, and one that they still perform to some extent. Their use in the military included signals by individual trumpets and drums to coordinate movements of the soldiers during battle and large group performance for the purpose of rallying and inspiring the troops to charge the enemy and at the same time as an attempt to frighten their opponents. But these same instruments had far more potential than simply making noise—the shawms and bagpipes could play the entire musical scale, and the trumpets and drums

were capable of sophisticated fanfares and musical sounds when not being used in this manner. We know of the shawms and bagpipes as commonly used as instruments for dance music and to provide general musical background on festive occasions, including civic celebrations and private weddings. On these occasions they were played either alone or in ensembles of two or three.

The 10th-century mention of “reodpiper” in the supplement to Ælfric’s *Saxon Vocabulary* is the earliest literary reference we have to instruments that employ a reed, although it is not clear whether this refers to a shawm or a bagpipe—or to both. Manuscript illuminations depict both instruments in northern Europe by the late 9th century and document their continued use from that time. Throughout Europe both instruments kept their associations with festive music making and military functions during the late Middle Ages. Bagpipes were particularly popular in the British Isles, especially their use in large numbers with the military.

Shawms and trumpets also served as signal instruments in civic situations. They were played by watchmen from the towers and at the gates of towns and castles and were known as “waits.” By the 15th century this duty had been expanded to include nocturnal street patrols and became exclusively the duty of shawm players; the instrument they played was so closely identified with this function in England that often it was referred to as a “wait pipe.” The signaling cannot be thought of as musical, but the duties of these players eventually included the performance of music on social and formal occasions, and so at some point the positions were filled by people with musical ability. Sometime in the late 15th century a trombone was added to the waits ensemble, and by the middle of the 16th century in England (several decades earlier on the Continent) the civic waits are known to have performed both publicly and privately for dancing and other types of entertainment, eventually adding to their abilities the performance on a number of the soft instruments and even singing.

As the duties of waits became more and more the responsibility of shawm players in the late Middle Ages, the trumpeters’ role became that of serving as symbols of civic authority, announcing the comings and goings of rulers when they acted in an official capacity. The trumpets were adorned with banners that displayed the emblem of their employers, and the repertoire was a set of sophisticated fanfarelike calls. As late as the 16th century the two groups of instruments, shawms and trumpets, were still combined for special ceremonial occasions, such as the one recorded for the visit of Cardinal Wolsey to St. Pauls in 1527, where “the Lord Cardinali began Te Deum the which was solemnlie songen with the King’s trumpetts and shalmes as well English men as Venetians.”

The soft instruments served for all other occasions. The most popular of

these, especially in the British Isles, were the instruments of the harp family that were the favorite instrument of the nobles and minstrels. At the 1306 knighting of the Prince of Wales, for example, among the hundreds of minstrels recorded as present, players of the harp-type instruments outnumber all others. St. Dunstan (ca. 910–988) is referred to as a harper, and in *Apollonius of Tyre*, from the mid-11th century, a woman accompanies her voice with a harp: “Then she sent out and ordered her harp to be fetched; and as soon as she began to harp she mingled the harp’s sound and her pleasing voice together.”

The importance of the harp in the early Middle Ages and its place as a treasured possession are attested to by the fact that the remains of instruments of this family have been found in several graves from the 7th and 8th centuries, including that at Sutton Hoo. The 7th-century poem *Widsith* describes a singer of heroic songs as singing to the harp: “Thonne wit Scilling sciran reorde / for uncrum sigedryhtne song ahofan, / hlude bi hearpan hleothor swinsade” (“When Scilling and I with clear voice raised the song before our victorious lord—loud to the harp the song made music.”) And *Beowulf* also records a harp in a scene that includes singing and storytelling: “There was singing and merriment. An aged Scylding of great experience told tales of long ago. At times one bold in battle drew sweetness from the harp, the joy-wood; at times one wrought a measure true and sad; at times the large-hearted king told a wondrous story in fitting fashion.”

In all of the above quotes the word “harp” is used, but contemporary reference is also found to “lyre” as interchangeable. Both instruments were performed in the same manner, plucked with fingers, but distinction is made in the later centuries between the two instruments according to shape (lyres are rectangular, meaning that all the strings are the same length; harps are triangular, allowing for strings of different lengths), and number of strings (lyres have five to eight; early harps have the same number but grow to 24 or 25 by the end of the 14th century). In the earlier centuries, however, literary references do not always make a distinction (e.g., describing someone who “harpes with his lyre”), and in literature and iconographic representations they would appear to serve identical functions: accompaniment to singing and reciting, and music for dancing. In Ireland, Scotland, and Wales the harp/lyre was also often referred to as a “cruit” (crot, crwth) or “rote” (hrotta, rotta, rotte), words that sometimes were applied indiscriminately to all bowed and plucked instruments. Chaucer says of the Friar:

Wel koude he synge and pleyen on a rote;...
And in his harpyng, whan that he hadde songe,
His eyen twynkled in his heed aryght
As doon the sterres in the frosty nyght

In common use in the British Isles beginning sometime after the 10th century were instruments plucked with a quill or plectrum that were called gittern, mandore, citole, lute—all versions of fretted plucked instruments having different shapes, string material (wire or gut), and resonance chambers but serving the same function as those of the harp family—song accompaniment and dance. All of them are found in a variety of secular situations, although the gittern is more frequently associated with ribald singing in taverns or barbershops.

From approximately the same time we know of the psaltery and dulcimer, instruments resembling a modern zither and descending from the Arabic *qnun*, with strings (eight to 24) stretched across a soundbox and either plucked with fingers or plectrum (psaltery) or hammered with wooden sticks (dulcimer). The best-known reference to the psaltery is Chaucers poor scholar Nicholas, who employed it for private devotion:

And al above ther lay a gay sautrie,
On which he made a-nyghtes melodie
So swetely that all the chambre rong;
And Angelus ad virginem he song.

MilT 3213–16

The bowed strings include large and small instruments with flat or rounded sides, flat or rounded backs, with and without fingerboard and frets, and having from three to five strings, variously named crowd (Welsh *crwth*), rebec (rubebe, ribible), and fiddle. The earliest known references are from the 11th century, and several versions are depicted in the 14th-century nave carvings in Beverley Minster, Yorkshire (along with many of the other instruments named above and below). In Chaucer's *Miller's Tale*, Absolon, the parish clerk, plays both rebec and gittern, one while dancing, the other when visiting alehouses:

In twenty manere koude he trippe and daunce
After the scole of Oxenforde tho,
And with his legges casten to and fro,
And pleyen songes on a smal rubible;
Therto he song som tyme a loud quynnyble;
And as wel koude he pleye on a giterne.
In al the toun nas brewhous ne tavernne
That he ne visited with his solas.

3328–35

By the late 15th century the viol family, a set of trebis, tenor, and bass bowed instruments with frets and six strings, was introduced into the British Isles,

and during the 16th century the viol became a favorite instrument for ensemble performance. It was one of the favorite instruments of Henry VIII, and beginning in his reign there developed a large and sophisticated repertoire of music for viol consorts (sets of three to six instruments) written by English composers.

Soft wind instruments included the recorder, often referred to as a flute, known in the British Isles from as early as the 12th century. It is frequently associated with dance music in literature and iconography but was adaptable to all types of secular music and is often depicted with a variety of other soft instruments. During the Middle Ages only instruments of approximately the alto range are found, but during the late 15th century both larger and smaller sizes were developed. The transverse flute is also seen in early paintings, occasionally with the military, but it does not seem to have been as popular as the recorder for music making until the 16th century. A one-handed pipe, played along with a small tabor, is also found from the same period. This is almost always found in association with dance music and usually in solo performance.

Organs are known in England from as early as the 10th century in conjunction with the church. According to the description by the monk Wulstan (d. 963), Bishop Elphege of Winchester built an enormous organ that had 400 pipes and needed 70 blowers and two players. Until the end of the 14th century the principal purpose of organs was to supply loud sound at the appropriate places in church services; their use after that time in conjunction with singing was to alternate with the choir, not accompaniment, a function that organs did not assume until the late 15th century. According to the Chronicle of St. Albans, during the 1396 reception of Abbot John Moote the Te Deum was solemnly sung by the community with "the organ alternating." A small portable instrument (called a portative organ), playable by a single person who would finger the keys with one hand and pump a small bellows with the other, is known from as early as the 14th century. It served for both private devotion and for secular music and is often depicted in the company of other soft instruments as part of a small ensemble of three or four performers, usually including a singer.

A keyboard instrument called the echiquier, which may have employed the clavichord mechanism of striking the strings, or the harpsichord device of plucking strings, is known in English records from as early as the late 14th century, although the reference is not clear. Clavichords and harpsichords grew in popularity in England especially during the 16th century. Because of its extremely soft sound the clavichord was useful only for solo performance, but the harpsichord was popular as a solo or ensemble instrument and became one of the principal instruments both for private and public music making. Various

shapes of the harpsichord (triangular or rectangular) were referred to as virginal or spinet.

The popularity of many of the musical instruments changed during the late Middle Ages as the general taste for music changed more and more in the direction of polyphonic music (music in several parts). Certain of the instruments were best suited for monophonic performance (melody only), and those lost popularity with the musically educated population and were relegated more or less to music of the lower classes (e.g., the bagpipe and certain members of the plucked and bowed string families that were not adaptable for polyphonic performance). Other instruments were modified to fit the requirements of the new repertoire (e.g., lute, harp), and new sets and sizes of instruments with larger ranges were developed (e.g., the viol, violin, and lute families). Instruments that could play multiple lines, such as organ, harpsichord, and lute became the most useful of all for the upper classes, who were captivated by composed polyphony to the near exclusion of most of the earlier type of repertoire and the instruments that traditionally played it.

Mystical and Devotional Writings, Middle English

The terms “mysticism,” “contemplation,” and “devotion” are difficult to distinguish, in part for theological and in part for social and cultural reasons. Within the Christian tradition all three terms refer to a set of exercises and phenomena that are fundamentally related in that they all derive from a single act of the individual human will to conform itself as fully as possible to the divine—an act of will that, whatever its resultant gifts (visions, revelations, sensual warmth, etc.), derives from a single special grace of God. In the following discussion, however, we will distinguish between mysticism, as the exercise and experience of conformity with the Godhead directly, and devotion, as the exercise and experience of conformity with the will of God as manifested in the humanity of Christ or in the lives of the saints. The term “contemplation” will refer to the activity by which one seeks to attain this conformity, rather than the experience itself; this activity may be either mystical or devotional in its immediate end.

To understand the kinds of mystical and devotional writing found in ME it is important to set that writing within the contemplative tradition of western medieval Christianity. In that tradition a number of modes or genres of contemplative literature can be distinguished, varying according to their method or focus. The first of these is the monastic mode of contemplation, based on the verbal association of scriptural texts. A second mode, employed most prominently by Anselm of Canterbury (1033–1109) and his followers, may be characterized as “Isidorean” or rhetorical. The third major mode, usually characterized as “Franciscan,” employs the powers of the imagination to recreate the events of the life of Christ and the saints. A fourth mode or genre, deriving in some ways from the third, consists of visions and revelations of Jesus, Mary, and the saints. Works in this genre were often, although not exclusively, written by women, as were two related genres: collections of the lives of contemporary holy women and didactic visions centered on a female personification of Love, or *Minne* (the last three genres were all more common on the Continent than in England). A seventh contemplative genre comprises works of introspective meditation; and an eighth, works in the negative, “Dionysian” school of mysticism.

The most important form of contemplation in the early Middle Ages was the tradition of “rumination” on the text of the Bible, a tradition that developed within Benedictine monasticism. The sources of this tradition lie both in the patristic tradition of commentary on scripture and in the liturgical chanting of

the biblical text enjoined by the Benedictine Rule upon the monastic communities as “the work of God” (*opus Dei*). This gave rise to the exercise of “reading, meditation, and prayer” that dominates monastic contemplative literature. As Jean Leclercq has pointed out, the fact that reading was normally a physical or communal activity in the Middle Ages (reading was normally done aloud, or at least subvocalized, but almost never in total silence) meant that the common description of meditative reading as the “rumination” or “chewing” of scripture was more literally grounded than we often realize. Further, the constant reinforcement of the verbal memory of the scriptural text by liturgical practice and rumination resulted in the mental association of texts clustered around similar key words and phrases. It is from this tradition that the practice of commenting on the “four senses” of scripture (literal, historical, allegorical, and anagogical) derived.

Although it occurs relatively late in the medieval monastic tradition, the best-known and most striking example of this contemplative exercise may be found in the *Sermons on the Song of Songs* by Bernard of Clairvaux (1090/91–1153). There are no true examples of this form of contemplation in English literature in the Middle Ages, although what is often termed “biblical *imitatio*” in the Latin works of Richard Rolle (d. 1349) derives at least in part from it. The primary reason for this lack is that monastic contemplation depended on the words of the Vulgate Bible, so that many verbal associations that seem appropriate in Latin simply do not work in the vernacular. In fact one argument against the translation of the Bible into the vernacular is that it would render this entire tradition of scriptural contemplation and commentary invalid.

A second important tradition in contemplative writing in the early and high Middle Ages is that which we have here termed “Isidorean.” The definition comes from a passage of the *Pansiana poetna* of John of Garland (ca. 1195-ca. 1272), where he defines the “four curial styles” of prose writing. According to John the “Isidorean style” features balanced clauses with similar, usually rhyming, endings; they appear to have equal numbers of syllables, although they may not in fact. The effect is a nearly chantlike cadence of repetitive short clauses. The *Soliloquies* of Augustine of Hippo (354–430) are, as John notes, the primary example of this form of contemplative writing in the western European tradition; Augustine also employs the style in the *Confessions*. Isidore of Seville (ca. 560–636) used this style in his *Synonyma* (whence John of Garland derived its name); but its most influential practitioner was Anselm of Canterbury. Through the Latin meditations of Anselm and those associated with his name, the Isidorean tradition of meditative writing was introduced to England. The early-13th-century English *Wooing of Our Lord* and its cognate tracts are written in this style, as is the later *Talking of the Love of God*, which

derives in part from two of the tracts of the “Wooing Group.” In his introduction the author-compiler of the *Talking* quotes (without acknowledgment) from Anselm’s letter sending a copy of his meditations to Countess Matilda, thus suggesting his awareness of the source of his own type of meditational writing. Richard Rolle’s tendency to rhetorical repetition and alliteration (particularly in his Latin work, the *Melos amoris*) may also derive in part from this tradition, but his use of it is idiosyncratic.

The third contemplative mode, in which the subject imagines himself or herself actually present at the great events of the life of Christ, also grew up within the monastic setting. In his *Sermons on the Song of Songs* Bernard of Clairvaux describes such contemplation as the “carnal” love of the humanity of Christ: a kind of love that is lower than the “spiritual” love of his divinity or of the Godhead itself. For Bernard and other monastic writers this mode of contemplation is enjoined upon “carnal-minded” men, and upon novices who were only recently converted from the world. Women religious were usually considered the spiritual equivalent of such “carnal-minded” men, or of novices—and meditation on the life of Christ was the usual exercise prescribed in treatises written for the spiritual guidance of women. A particularly important example in England was the 12th-century Aelred of Rievaulx’s *Rule of Life for a Recluse*, which was twice translated into ME, and drawn upon by the author of the *Ancrene Wisse* (ca. 1215–22). Aelred’s *Rule*, originally written for his sister, describes three kinds of meditation: on things past, things present, and things to come. The “meditation on things past” incorporates a set of imaginative exercises based on the events of the Gospel story.

This form of meditation became particularly prominent in the later Middle Ages because of its adoption by Francis of Assisi (1182?–1226) and his followers. The imaginative, verbal, and representational recreation of the scene of Christ’s birth in Bethlehem or of his Passion and death (as in the Christmas crèche or Francis’s vision of the crucified Christ when he received the stigmata) figures prominently in Francis’s personal spirituality, as well as in the sermons and treatises by or attributed to him and his followers. The two most important works in this tradition, both anonymous although commonly attributed to St. Bonaventure (1221–1274), were the 13th-century *Stimulus amoris* and the early-14th-century *Meditationes vitae Christi*. Both of these works were translated into ME: the former as *The Pricking of Love*, attributed to Walter Hilton (d. 1396); the latter as Nicholas Love’s *Mirror of the Blessed Life of Jesus Christ* (ca. 1410). The primary impetus of Franciscan spirituality in England in the Middle Ages seems, however, not to have been in the translation of the major Franciscan texts into English (in which the order itself appears to have played virtually no role) but in the incorporation of the Franciscan form of meditation into the English lyric. It is unclear whether the

prominence of affective lyrics representing the birth and the passion of Jesus was due entirely to the influence of the Franciscan order. It may also have resulted from the confluence of Franciscan spirituality and native English devotional traditions or be at least partly derived from the importance of Franciscan-style meditations in the experiences and widely circulated writings of Richard Rolle.

The highest point of the Franciscan type of contemplation is reached when the subject, no longer consciously focusing the imagination on the Gospel story, is granted the spiritual vision of Christ, Mary, or the saints and angels. Descriptions of this type of visionary experience had existed before the Franciscan movement (as in the revelations of the 12th-century seer Hildegard of Bingen); but they become particularly prominent among women in the 13th and 14th centuries. In these writings, too, the latent eroticism of the allegorized Song of Songs, interpreted as the description of the contemplative's union with God (see Bernard's sermons), often transforms itself into the marriage of Christ and his bride. These collections of revelations were often not written by the subjects themselves but dictated (often in the vernacular) to religious sisters or spiritual advisers who wrote them down and translated them into Latin.

Many of these revelations are intensely personal documents; many are devoted to filling in details of the lives of Jesus and Mary that the Gospels had not mentioned; and many, equally, were of great public importance, both politically and culturally. By invoking the authority of their visions Catherine of Siena (1347–1380) and Birgitta (Bridget) of Sweden (1303–1373), in particular, played an important role in returning the papacy to Rome from Avignon in the late 14th century. Both Birgitta's *Revelations* and Catherine's *Dialogue* were translated into ME: the latter as the *Orchard of Sion*, made for the nuns of the only English house of the order founded by Birgitta. A similar collection of revelations translated into English in the early 15th century was the *Book of Ghostly Grace* of Mechtild of Hackeborn. Two original ME works were also written in this genre: the late-14th-century *Revelations* of Julian of Norwich and *The Book of Margery Kempe* (ca. 1438).

The collections of revelations of late-medieval women visionaries were often at least semiautobiographical in nature (as with Julian and Margery) or included biographical sections written by others. On the Continent lives of visionary nuns and women saints were also collected in this period: *The Book of Margery Kempe* may in fact more closely resemble this genre, although its length is more like that of the greater collections of revelations. Three lives of 13th-century Rhineland mystics (Elizabeth of Spalbeek, Christina Mirabilis, and Mary of Oignies), together with a life of Catherine of Siena by her contemporary Stephen of Siena, were also translated together into ME. These two genres of visionary literature (revelations and lives) do not seem to have

been prominent in England, since none survives in more than a single medieval manuscript, although Julian of Norwich's *Revelations* is found in a few postmedieval manuscripts and Margery Kempe's *Book* appears in an early printed extract.

A related genre of medieval visionary literature comprises the works of what is called "Love-" or "*Minne*-mysticism," often written by beguines (members of irregular communities of women, as opposed to the traditional women's religious orders). The primary works in this tradition were the letters and poems of Hadewijch of Brabant (fl. second quarter of the 13th century), the *Mirouer des simples âmes* (*Mirror of Simple Souls*) of Marguerite Porete (d. 1310), and the revelations of Mechtild of Magdeburg (ca. 1212–1282?). The devotion of these writers is focused on Love itself, conceived as a feminine personification. There seems to have been almost no interest in this kind of mysticism in England: Marguerite's *Mirouer* was the only work of this genre translated into ME, and even it circulated only in a single translation, with explanatory additions to defuse its "dangerous" teachings, apparently only among the theologically sophisticated 15th-century Carthusians.

Two final genres of contemplative literature in the Middle Ages were primarily didactic in aim—advising readers who were dedicated to the life of devotion or mystical growth rather than recording the experiences of the authors. The first of these emphasizes moral and psychological introspection and is related to the "meditation on things present" in Aelred's *Rule*; like that *Rule* works in this tradition tended to be written for nuns or women recluses. Because of this audience most of the works in this genre were written in the vernacular rather than Latin. The most important continental writers of this tradition were the 13th- and 14th-century mystics Meister Eckhart, Johannes Tauler, and Heinrich Suso (all German Dominicans) and Jan van Ruusbroec: Suso's *Horologium* and Ruusbroecs *Geestelijke Bruilocht* were extracted in the ME *Seven Points of True Love and Everlasting Wisdom* and *The Chastising of God's Children*; Ruusbroecs *Van den blinckenden Steen* was translated as *The Treatise of Perfection of the Sons of God*. The most important ME works in this genre are those of Walter Hilton.

The second specifically didactic genre of contemplative writings in the Middle Ages comprises the tradition of the Pseudo-Dionysius. We do not know the actual identity of the writer (presumably a late-4th- or 5th-century Syrian) who identified himself as the "Dionysius the Areopagite" of Acts 17:22–34, but the tracts that bear his name are the *locus classicus* of the "negative way" of mysticism in the western tradition. This form of mysticism began from the observation of the ultimate unknowability of God and proceeded by denying the use of the human imagination or intellect in contemplation. The will alone could find unity with God, in love. Among the most important works in this

genre were those of the anonymous late-14th-century English author of *The Cloud of Unknowing*, also known for his translations of the *Mystictheologia* (*Deonise Hid Diuinite*) of the Pseudo-Dionysius and the *Benjamin minor* of Richard of St. Victor (d. 1173), among other works.

Except for a few of Rolles Latin and English works, Hiltons English works, and the ME translations of Pseudo-Bonaventure, Suso, and (to a lesser extent) Ruusbroec mystical literature does not seem to have achieved any real popularity in late-medieval England. Rolle does appear to have significantly influenced the course of both religious and popular devotion in the 14th and 15th centuries. The relative popularity of Hilton, of the Pseudo-Bonaventuran *Stimulus amoHs* and Nicholas Love's *Mirror*, and of the extracted versions of Suso and Ruusbroec seems rather to have been the result of 15th-century London burghers adopting works originally written for more religious, contemplative audiences as appropriate for their own devotional life. Few English mystical or devotional writers had any influence outside of England: a number of Rolles Latin writings circulated on the Continent; Hiltons *Scale of Perfection* survives in a contemporary Latin translation in a few late-medieval manuscripts belonging to continental Carthusian houses; the *Cloud* was twice translated into Latin (once by an English Carthusian) but appears to have been unknown on the Continent. But this is the norm for vernacular writing: besides Hiltons *Scale* the only piece of ME literature that we know reached the Continent is John Gower's *Confessio Amantis*, which survives in a single copy of a Spanish translation.

N

Names

Personal Names

The OE personal-name system not only lacked familial surnames but involved a baptismal-name stock virtually unrelated to the modern English one.

As among all Germanic people each individual bore a single distinctive name, or “idionym.” Idionyms were formed chiefly by the paired permutation of conventional elements or “themes,” carrying “heroic” meanings; gender was marked by specialization of second-element or “deuterothemes” (e.g., masc. *Æthelwulfy Leofgar*; fem. *Leofgifu, Wulfflæd*). Family connection might be underlined by theme repetition (e.g., Wulfstan, son of Æthelstan and Wulfgifu). Alternative styles included “monothematic” names based on single themes, “short forms” based on simplified stems, and descriptive forms or “original nicknames.”

From the 870s a further name stock was introduced by the Vikings in the north and east. This stock, although related to the OE one, differed not only through operation of the standard sound changes but also through the favoring of different themes (e.g., *Ketil-1-ketill*) and of nickname formation. Soon many families were using OE and Anglo-Scandinavian (AS) forms side by side. A few Continental West Germanic (CWG) names were also adopted, fruits of ecclesiastical and mercantile contacts. Yet, despite so ample a name vocabulary, by the late 11th century much repetition had set in with disproportionate reliance on a few items.

Within a generation of the Norman Conquest baptismal names characteristic of the continental settlers were appearing among the native English. Within 200 years these had all but ousted the older names, constituting a stock almost that of modern English. This consisted mainly of CWG forms, etymologically similar to OE ones, in addition to names taken from biblical characters and saints, both sorts often being adopted in gallicized forms (e.g., *Aubri* < CWG *Alberic* = OE *Ælfric*; *Maud* < Old French *Mahaut* <

CWG *Mahthildis*; *Adam*, *Isabel* = *Elizabeth*). Again, as on the Continent, certain items became disproportionately favored, notably *John* and *William*. Variety was maintained by recourse to diminutives, some native, some from French or Flemish.

The crucial change taking place during the Middle English (ME) period was the development of familial surnames. In OE usage an idionym was occasionally supplemented by a descriptive phrase or “by-name,” usually postposed, but only when distinction was needed between individuals identically named. Such by-names fall into four categories: familial (“son of X,” “widow of X”), local (“from Winchester,” “beside the well”), occupational (“the dairymaid,” “the smith”), and characteristic (“the red-haired,” “the stammerer”).

As certain baptismal names became disproportionately favored, so by-naming spread. In promoting its use administrative needs were backed by the example of the immigrant nobility, most of whom had from the start sported by-names. Although first used mainly for identifying individuals, bynames soon passed from father to heir and thus, by degrees, evolved into set hereditary family names. Although this process was under way in the 12th century, it was completed, throughout the country, only in the 17th century.

Medieval by-names therefore survive as modern surnames. Furthermore, except for a few items (e.g., *Edith*, *Edward*) retaining currency as baptismal names, the only guise in which OE and AS idionyms are preserved is as originally patronymic or matronymic surnames (e.g., *Arkel* < AS *Amke*[*ti*]*ll*; *Gunnell* < AS fem. *Gunnild*; *Wooldndge* < OE *Wulfric*; and so on).

Place-Names

The history of English place-naming begins with the Germanic settlement of southern Britain, ca. 450. Names and name elements that the settlers took over from the partly romanized Britons referred to Roman cities (e.g., *Winchester* < OE *Wintanceaster* < Romano-British *Venta* [*Belgarum*]); others to rivers and other natural features (e.g., *Avon* < British *auon*, “river,” *Creech* < *cruc*, “hill”). Such names and name elements were integrated into the newcomers’ own system.

OE place-names normally began as descriptive or possessory noun-phrases based upon current terms, usually with cognates in the other Germanic languages to denote types either of settlement or of topographical feature (“generics”). Those denoting settlement types (“habitative generics”) were based on roots variously meaning “abode” (e.g., *ham*, cf. German *Heim*), “enclosure” (e.g., *tun*, cf. OE *tynan*, “to fence”), “defensible place” (e.g., *burg*,

dative *byrig*, cf. OE *beorgan*, “to protect”), or “site” (e.g., *stede*, *stoc*, *stotu*, cf. OE *standan* and German *stehen*).

A generic of either sort might stand alone (e.g., *Bury* < OE dative *byrig* and *Leigh* < OE *leah*, “woodland clearing”); but more often it was prefixed by a “specific,” either an adjective, another substantive in an adjectival role, or the genitive of a personal or tribal name.

A tribal name (or “-ingas form”) sometimes stood alone (e.g., *Hastings*<*Hastingas*, *Reading*< OE dative plural *Readingum*). The reason why a modern form sometimes, as shown, derives from an OE dative is that in context a place-name was usually governed by a preposition, such as OE *at*, *ini on*, or *to*. Because of tendencies to treat toponymies as virtually a branch of archaeology, that is, a source of clues to prehistoric settlement, much recent research has focused upon possible chronological stratification of the various modes of formation.

The Scandinavians who from the 870s settled north and east of Wading Street partly modified local place-name patterns to fit their own related but distinctive usages, forming many fresh names on their characteristic habitative generic, *-by*. In some districts Scandinavian speech habits were dominant enough to affect the phonological development of such OE names as the colonists adopted. Intensities of Scandinavian settlement and usage vary, apparently according to durations of Scandinavian hegemony in the areas concerned. They run from slight, in the southeast Midlands, to overwhelming, in parts of Lincolnshire and Yorkshire.

“Major” English place-names (i.e., ones referring to chief landscape features or to settlements of at least village size) were mostly fixed well before being recorded in Domesday Book (1086) and have since undergone only phonological change. The impact of the Norman Conquest upon English toponymy was limited; French coinages were rare, being mostly names for castles and manor houses; few OE names were supplanted. For major names, the main innovations of the ME period, involved the sporadic use of so-called “(manorial) affixes” for distinguishing between neighboring places of like names (e.g., *Halicon Bumpstead* beside *Steeple Bumpstead*, *Deeping St. James* beside *Market Deeping*, and so on). More significant was the growth of “minor names,” that is, field names and street names, whose proliferation reflects the increasing size and complexity of rural as well as urban settlements.

Nature (*Kynde*) in Middle English Literature

Certain ME works give considerable prominence to the idea of the natural; personifications of Nature or *Kynde* are frequent, but less emphatic invocation of nature, *kynde*, and cognate terms is also widespread, with many writers using naturalness as a moral norm.

Testimony to the goodness of the natural could be found in such influential writers as Augustine and Boethius and in medieval theories of natural law. The law of nature is frequently understood as the law of reason, by which human beings have a natural knowledge of the moral law. It came to be identified with the moral stipulations of the Old (Mosaic) Law and the Gospel, taken to require love of God and neighbor. However, the law of nature was also seen as the law of animal impulse, an idea that renders the natural morally problematic and affects some ME literature.

In *Piers Plowman* Langland makes extensive use of the idea of the natural. He finds *kynde wit*, or natural understanding, a powerful force for good, but he also displays its inadequacies in relation to Christian revelation and God's grace. (Many writers oppose God's graceful provision to what is available in the natural course of things.) Langland believes that the natural can urge toward sin in the sexual sphere. But he exploits the relationship between the natural and Christian love (implicit by Langland's time in the semantic range of *kynde* and its derivatives, regardless of other factors) to make naturalness a prime moral desideratum. To be unnatural is to sin against the Holy Ghost (*Piers Plowman* B. 17.198–298). It would also seem to be against the nature of God the Father, who, in his aspect as Creator of the world and of such natural processes as generation, disease, and death, is actually designated *Kynde* (B.9.25–29, 20.80–108).

Usually, however, vernacular writers follow the tradition established by 12th-century Latin authors and represent Nature as a female power subordinate to God, responsible for the processes, particularly the generative processes, of the mutable sublunary world. In *The Parliament of Fowls* Chaucer presents such a Nature, offering her initially as a benign figure who orders the world harmoniously. She stands at the center of an apparently positive vision of sexual love. But the female eagles' refusal to mate stimulates doubts as to whether Nature does order sexual love satisfactorily. She tellingly concedes that she is not Reason and may in fact be closer to Venus, in whose temple love is imaged as distressful and decadent. A divided literary inheritance may help produce Chaucer's figure: in *The Complaint of Nature* Alan of Lille aligns Reason and Nature; in Jean de Meuns' continuation of the *Roman de la Rose* we find a Nature so concerned to see procreation take place that she aligns herself

with a Venus of whose ethos Reason disapproves.

Consciousness of a distance between Nature and Reason is evident in Gowers *Confessio Amantis*. Nature presides over impulse, and *kynde* is frequently used to designate the nonrational, animal side of man. Though Nature and *kynde* can sponsor right moral action, mans natural sexuality can urge him forcefully toward wrong action. The natural sexual urge should be restrained by Reason, but it is not clear that Nature's anarchic power in the sexual sphere can in the regular course of things be finally subdued.

The uncomfortable power of *kynde* in the amatory sphere is registered in Chaucer's *Troilus and Criseyde*. Against suggestions in the text that the law of *kynde* operates benignly, by constraining Troilus to love, stands Criseyde's betrayal of Troilus and the narrator's repudiation of earthly love and recommendation of love of Christ at the poem's close. Chaucer also probes the idea of nature in *The Book of the Duchess* and the *Physicians Tale*, and in spite of the former's association of Nature with the virtue of moderation and the latter's affirmation of Nature's superlative creative ability (both traditional features of Nature) the possibility that Nature's influence over human life may not be entirely satisfactory is raised in each.

After the 14th century the Nature figure is more frequently found in comfortable association with Reason as a force for good and less often subjected to questioning or criticism on moral grounds (see *Reason and Sensuality*, perhaps by Lydgate, and Medwall's *Nature*). But *The Assembly of the Gods*, which has Nature in "her carnall myght" (line 1381) aligned against Reason, shows that consciousness of a different kind of Nature remains, even if the moral ambivalence of the idea is only occasionally exploited in post-14th-century medieval literature (see, e.g., Dunbars *The Merle and the Nyghtingal* J).

Navy and Naval Power

English history owes much to the influence of geography. As an island Britain was isolated from the affairs of Europe until the seas were readily bridged by vessels capable of crossing the English Channel and North Sea. These waters present great hazards, illustrated best by the numerous vessels wrecked there. The first efforts to control the seas around Britain were to build vessels that could withstand their winds and waves. Only later would conflict between warring sides at sea be a concern.

The early Celtic settlers came in early craft of which we have little record: oared vessels without mast or sail. The Romans introduced naval power to Britain and frequent travel to the Continent, following their invasions of 55 B.C. and A.D. 43. For four centuries they moved men and material to and from Britain, establishing their power on sea as well as on land. However, they faced opposition from Germanic peoples along the northwest coast of Europe who raided sporadically. A defensive system of lookouts and warning signals was developed, directed by the Count of the Saxon Shore.

Following Roman withdrawal in the early 5th century, the Angles and

Saxons overran Britain, wresting it from the Celtic Britons. They maintained regular communication with their homelands across the North Sea, using large oared ships to cross the open waters. They may have used sailing ships. Trade goods came to Britain from Gaul, Italy, Spain, Scandinavia, and beyond, while tin, gold, and other commodities were exported. A trade developed that contributed to the prosperity of Anglo-Saxon England. Unfortunately this made the Anglo-Saxons a target of the Vikings, who began their attacks in the late 8th century. Although most of the conflicts were waged on land, it was the unique ability of the Viking longships to cross the North Sea and—with their shallow drafts—to sail up rivers to such cities as York that ensured their success. The Anglo-Saxons countered with a navy of their own, first organized by Alfred the Great. He almost lost Britain to the Danes, but through surprising victories on land and at sea the Danes were defeated.

The Anglo-Saxon era ended in 1066, with the successful amphibious attacks of the Normans. Sailing in singlemasted Viking-style ships large enough to carry horses, the Normans won a great victory at Hastings. As Norman occupation followed, the Channel became a highway for the transport of men and equipment. The Anglo-Norman rulers expanded their control in Britain to Wales and Scotland. Under Henry II this rule expanded to Ireland and on the Continent included his family lands of Normandy, Anjou, Maine, and the lands of Queen Eleanor of Aquitaine. The northern seas were dominated by this Angevin Empire. But no great standing royal navy was developed, perhaps because after the Viking era they feared no maritime rivals. They depended upon the Cinque Ports (Hastings, Romney, Hythe, Dover, and Sandwich) to supply ships when needed in return for special favors.

Richard I organized a large fleet from England and the Continent to sail to the eastern Mediterranean on the Third Crusade. His fleets won victories over the Muslims. Throughout the 13th century Anglo-French conflict led to intermittent war at sea. John and Henry III built galleys to pursue the war against France in a vain effort to recover Normandy and hold their other territories. The French response was to accelerate privateering (raids by private vessels, supported by the crown) and to build an arsenal to construct galleys at Rouen.

Edward I responded with his own program of shipbuilding in the 1290s. He reorganized the naval establishment, ashore and on the sea, and instituted the formal office of admiral. But the number of ships built by medieval kings was always relatively small, and most ships were impressed from the local seaports. In 1297, for example, Edward raised a fleet of 305 ships, mainly from merchant shipping, and about 5,800 sailors. The fleet enabled him to complete his conquest of Wales and Scotland, as well as to resist the French. He carried over 9,000 troops into France in the 1290s. Of course medieval knights required

horses, which had to be transported in ships as well.

Hostilities between France and England erupted in the Hundred Years War (1337–1453), which immediately involved English naval forces. A French fleet raided the south coast of England and preyed on English shipping. The French, aided by Genoese and Castilian mariners, assembled an invasion fleet at Sluys. Edward III took the initiative and boldly sailed his own fleet to Sluys, where he defeated the combined forces in 1340. In 1347 he raised an armada of some 738 ships and 15,000 seamen to transport 2,000 soldiers to besiege Calais. Aided by his son Edward, the Black Prince, he fought again at sea off Winchelsea in 1350 in an engagement known as the *Espagnols sur Mer*, where he won a victory over the Castilians. Records indicate that Edward built about 50 vessels between 1340 and 1360. Most of them were large sailing vessels, cogs, rather than oared galleys. He suffered a loss in 1372 off La Rochelle when the Castilians destroyed an English fleet. At Edward's death in 1377 many of the royal ships were sold off to pay his debts. Attempts to assemble and maintain any sort of royal naval force languished.

After initial successes in the Hundred Years War the English suffered defeat and domestic upheaval. But the need for a naval force was revived in the early 15th century, again because of Anglo-French hostility. Henry V opened a new initiative in the Hundred Years War and took the war to the Continent. He rebuilt the English fleet, which remained a force at sea for the next two decades. His expeditionary forces won a victory at Agincourt in 1415, and later his fleet enabled him to capture King James I of Scotland at sea and end that monarch's attempts to ally with the French.

Piracy and privateering diminished under the influence of Henry's fleet, and English ships could safely sail the northern seas and into the Mediterranean. English merchant ships began to call regularly at Portugal, Sicily, Norway, and Denmark. The major trade routes of wool and cloth to and from Flanders, and the delivery of wine from Bordeaux to England, flourished because of the protection afforded by the navy. However, the war again turned against the English after the 1430s. French victories forced their withdrawal from Bordeaux in 1453. After 116 years of fighting the English retained only the port city of Calais, because it could be supplied by sea. Furthermore the Hanseatic League restricted English trade into its waters, and there was no longer a navy capable of protecting merchant shipping. Under Henry VI the fleet was once again disbanded and the king's ships sold.

Medieval English kings were never systematic in their efforts to build and maintain a royal navy. While some such efforts were calculated attempts to prepare for aggressive warfare, most were sporadic responses to emergencies prompted by threats from abroad. Navies were expensive to build and to maintain, and in an age of chivalry most fighting was done by mounted

knights, not mariners aboard ships.

Some, however, did recognize the value of a standing navy. The anonymous author of *The Libel of English Policy*, a pronaval treatise written in 1437, advised his countrymen to control the seas around Britain and espoused a kind of mercantilism as an answer to economic and maritime troubles. But little was done to remedy things until after 1485, when Henry VII began a program of shipbuilding that set England upon a new maritime course that would bring her future greatness.

Neville Family

The ancestor of the Nevilles was duly rewarded after 1066 with lands in Lincolnshire. However, Alan de Neville, who became chief justice of royal forests and led the first general inspection of forest boundaries and royal rights (the general forest eyre of 1166), was the first of the family to emerge from obscurity. In the next generation Hugh de Neville became chief justice of the forests under John and is listed in the preamble to Magna Carta as one of

Johns supporters. Through marriage he became founder of the Essex branch of the family. His cousin Geoffrey was royal chamberlain, and other Nevilles were sheriffs, justices, and other lesser officials. In the next reign Ralph de Neville, known by that name in spite of his illegitimacy, became chancellor and bishop of Chichester and helped several of his kinsmen to positions. The house he built in London gave its name to Chancery Lane.

Lands attained through marriages provided the foundation for northern branches of the family in Yorkshire and Durham, where castles held by the Nevilles were located: Raby, Middleham, Sheriff Hutton, and Brancepeth. In the 14th century Nevilles helped Edward I and Edward II fight against the Scots. As wardens of the marches the Nevilles and the Percys ruled northern England by the later 14th century. In 1397 Richard II created Richard Neville earl of Westmorland. However, Alexander Neville, archbishop of York, was forced to leave England when Richard was deposed.

The most famous member of the family was Richard Neville, earl of Warwick in 1449, after his marriage to Anne Beauchamp. Later writers dubbed him “Warwick the Kingmaker” for his role in supporting the Lancastrian Henry VI, then his Yorkist rival Edward IV, and finally switching back to Henry VI. He was aided by his brother George, archbishop of York and royal chancellor, his brother John, earl of Northumberland, and other Nevilles. As leader of the Lancastrian cause he was defeated and killed at the Battle of Barnet in 1471.

New Minster Charter

The New Minster Charter (BL Cotton Vespasian A.viii) is a slender codex

produced at Winchester after 964. Drafted by Bishop Æthelwold in the opening stages of the monastic reform, shortly after the New Minster had been forcibly converted to a reformed Benedictine community, the charter confirms the new regime. Beyond this the polemical text sets forth King Edgars plan for his own spiritual renewal as a model for that of his flock. These intentions are set within broader contexts of salvation history and eschatological hopes. The charter was witnessed by the royal family and Dunstan and Æthelwold.

Fig. 101. New Minster Charter (BL Vespasian A.viii), fol. 2v. King Edgar offers the charter to Christ. Reproduced by permission of the British Library, London.

Written entirely in gold, the codex contains a frontispiece miniature that is the first known charter illustration (fig. 101). Flanked by the New Minster's patron saints, the Virgin Mary and St. Peter, King Edgar proffers the charter to

Christ, enthroned above him in a mandorla carried by angels. The miniature draws on insular traditions for intercessory imagery and adapts it to the specific circumstances of the charter by placing the king between the two chief insular intercessors. Mary bears the cross making possible man's salvation, and the palm branch of victory for those who are saved, while Peter bears the key to the kingdom of heaven. These attributes convey visually the king's hopes, expressed verbally in the charter he presents to Christ. The miniature is often cited as the earliest surviving example of developed "Winchester School" painting. The frame of parallel golden bars supports an acanthus "tree" whose segmented sections and blossom terminals recall those of the earlier St. Cuthbert Maniple from Winchester. The stocky figures of the Virgin and Peter echo earlier Winchester figures in the Galba Psalter (fig. 66: see GALBA PSALTER), and their arrangement on the page, touching the frame, forms a patterned trellis against the vellum, hearkening back ultimately to the pre-Carolingian art of the Lindisfarne Gospel evangelist portraits. However, the drapery of all the figures is dynamic and energized, with flaring trumpet folds and curvilinear patterns characteristic of "Winchester School" art of the later 10th century.

Norman Conquest

King Edward the Confessor died in January 1066, leaving the throne of England to his brother-in-law, Harold Godwinson; but Edward's cousin William, duke of the French province of Normandy, also claimed the throne. After elaborate preparations William invaded England in late September. His army met Harold's at the Battle of Hastings on 14 October, and Harold's death in the battle gave victory to William, who was crowned king of England in Westminster Abbey on Christmas Day and has since been known as William the Conqueror (William I).

The grounds on which each contender claimed the throne as Edward's successor were problematic, for neither was a member by blood of the Anglo-Saxon royal family, which had previously been the all-important criterion for kingship. Harold's sister Edith (Eadgyth) was Edward's wife, and Williams great-aunt Emma, daughter of Duke Richard I of Normandy, was Edward's mother. A third claimant, Harald Hardrada, king of Norway, asserted a right to the English throne in 1066 on the basis of an alleged treaty between his predecessor Magnus and the Danish king of England, Harthacnut, whereby the survivor of the two was to succeed to the others kingdom.

The most mysterious aspect of the events of 1066 is why the obvious heir to the throne was overlooked: this was Edgar Atheling, grandson of Edward's elder half-brother Edmund Ironside, who had briefly succeeded his and Edward's father, Æthelred the Unready, as king in 1016. Edgar Atheling was only in his middle teens in 1066, but earlier Anglo-Saxon kings had inherited the throne at comparable ages. Perhaps the weakness of personality that later characterized Edgar was already evident and induced Edward to overlook his great-nephew.

Norman propagandists later claimed that Edward had promised William the throne as early as the early 1050s, because of their relationship and in gratitude for the protection that Normandy had afforded him during the rule of the Danish kings between 1016 and 1042. One version of the Anglo-Saxon Chronicle says that William visited England in 1051, at which time, according to the Norman account of events, the promise was made to him in person. The Normans also interpreted the expedition that Harold Godwinson made to the Continent in about 1064 as a mission on which Edward had sent Harold to

confirm the promise. They said that, while he was with William in Normandy, Harold had taken an oath to support Williams succession in England.

Whether Edward ever made a promise to William or not he clearly thought at later times of other possible heirs. In the mid-1050s, for example, he recalled his nephew Edward Atheling (son of Edmund Ironside and father of Edgar Atheling), from Hungary, and this Edward might well have been designated heir had he not died in 1057, shortly after his arrival in England. Moreover there is no doubt that on his deathbed Edward the Confessor did name Harold Godwinson to succeed him, and such a designation was valid in current English practice. Even the Norman sources do not deny the designation. If they address the issue directly, they accuse Harold of perjury for breaking his oath to support William's right to the crown, rather than of usurpation of the throne.

In short William had no real right to the throne. The rich kingdom of England simply presented an attractive prize, and a fortunate but coincidental vacuum of power in France left William without serious worries about the security of Normandy if he and most of the military force of the duchy departed on an extended foreign adventure.

The expedition was nonetheless risky and might well have turned out disastrously had not events played out in ways that favored William. He was ready to attempt the crossing of the Channel by the middle of August, but unfavorable winds kept the fleet from sailing for six weeks, during which the most he could do was to sail north along the French coast to St. Valéry-sur-Somme, from which the crossing to England was shorter than it was from farther south. Although this delay irked William, it worked to his advantage in two ways. First, Harold had called out the defensive peasant army of the southern shires to guard the coasts and prevent a successful Norman landing, but the logistics of supplying this large force and the peasants' need to harvest their crops caused him to disband this force on 8 September and to retire with his bodyguard of crack troops to London. Second, by the time of Williams crossing, Harold had been drawn away to the north of England by Harald Hardradas attempt to take England for himself, in which he was aided by Harold Godwinsons disloyal brother Tostig. Armies led by Harald Hardrada and Tostig joined in the north of England in mid-September and defeated the local defensive forces at Fulford on 20 September. On hearing of Hardradas arrival Harold marched north, arriving so quickly that he was able to meet the enemy in battle at Stamford Bridge near York on 25 September and score a great victory. Both Hardrada and Tostig were killed in the battle, and the northern threat was ended.

Therefore, when William finally was able to cross the Channel on the night of 27–28 September, he landed at Pevensey unopposed even by a containing

force, with his principal rival far to the north. He was able to disembark his forces at leisure, establish a sizable beachhead centered on Hastings, arrange the provisioning of his army, and begin ravaging the countryside, perhaps with the intent of drawing Harold into battle. Harold moved south in response, stopping for only a few days at London.

Harold reached Hastings during the night of 13–14 October, and news of his arrival enabled William to attack in the morning before the Anglo-Saxon troops were ready. Despite Williams surprise attack and the exhaustion of Harold's elite troops, the outcome of the battle was by no means a foregone conclusion until Harold was killed on the field. After his death, however, the battle turned into a rout. Despite subsequent rebellions and attacks by two kings of Denmark, Swein Estrithson and Cnut IV, who claimed the kingdom as heirs of Cnut the Great, England remained Norman from that day forward.

Of all the great events that have shaped the course of human history the Norman Conquest of England ranks as one of the least inevitable. Nonetheless, its effects were profound. Because the Conquest was not followed by a mass immigration of Normans, its direct effects were primarily on matters with which the upper classes of medieval society were most concerned: government, law, and culture. Probably no more than several thousand French warriors acquired land in England as a result of the Conquest, but they replaced the Anglo-Saxon nobility almost completely. These Frenchmen were primarily Normans; because William had recruited his invasion force as widely as he could, the new lords also included significant numbers of men from Brittany and Flanders and a scattering from farther afield. Most were already endowed with land in their homelands, which they did not give up when they acquired land in England. Hence, for a number of generations, the post-Conquest English ruling class remained French in its orientation, as did the royal family. As a result England became much more thoroughly involved, diplomatically and militarily, in continental affairs than it had been before 1066, including an ongoing war between Normandy and the kingdom of France: a war that can be seen as lasting, with interruptions and modifications, down to the defeat of Napoleon in 1815.

The English upper class remained primarily French-speaking and French in culture for several centuries after 1066, with significant effects on literature, architecture, art, and the language itself. English acquired both a simpler structure than most modern languages and a second, romance-based terminology that makes its vocabulary larger and more nuanced than that of most other languages. The new French lords of England also introduced feudal tenure, with which they were familiar in their continental homes; this method of holding land in return for military and other honorable services profoundly affected the development of the English common law and of English

constitutional ideas and practices. They built many castles. As Norman settlers in England began to move into Wales, Scotland, and eventually Ireland,' they carried many of these governmental, legal, and cultural developments with them.

By the end of the reign of William the Conqueror not only the cream of lay society but also the leaders of the church were continental, primarily French, in origin. William secured a papal deposition of the last Anglo-Saxon archbishop of Canterbury in 1070 and replaced him with Lanfranc, an Italian who had long been a prominent cleric in Normandy. After 1080 only one Anglo-Saxon prelate was left, Wulfstan, bishop of Worcester (d. 1095). Anglo-Saxon abbots and abbesses, when they died, were normally replaced by relatives or protégés of French lords; lesser church dignities were also rapidly monopolized by the conquerors. As a result the English church was brought, not always easily, into closer conformity with continental norms than it had known before 1066.

Some hundreds of French townsmen came to England in the wake of the Conquest, settling in the larger boroughs, often in their own enclaves; but they supplemented rather than replaced the native English burgesses. Their presence and connections meant that England became more involved in trade with the Continent. It also acquired its first population of Jews, who formed part of this bourgeois migration. No peasant is known to have migrated from the Continent to England as a result of the Conquest, however; the effects on the peasantry were thus less immediate, less direct, and probably less dramatic than the effects on the other elements of the population.

It is true that large numbers of northern peasants were killed or greatly harmed by the harrying of the north; and peasants in various parts of the country were burdened by the imposition on them of a code of rules, the forest law, whose purpose was to protect the "great game," the deer and boar whose hunting the Norman kings reserved to themselves. Nonetheless, most of the post-Conquest developments in the social, economic, and legal status of the peasants appear to be continuations of trends that began before the Conquest, including the disappearance of slavery and the generalization of serfdom.

Normandy

The counties of Normandy pertaining to the archbishopric of Rouen extend over approximately the same region that previously had comprised the Roman province of *Lugdunensissecunda*. Authority to rule these counties as an agent of the king of *Francia occidentalis* was delegated in 911 by Charles the Simple to a Viking chief named Rollo, through a treaty made at St. Clair-sur-Epte.

During the next century and a half Rollos descendants, who made their capital at Rouen and often worked closely with the archbishops—conversion to Christianity having been a requirement in 911—struggled to assert authority over the rest of Normandy. In this lengthy but largely successful process the counts of Rouen gradually emerged as dukes of the Normans.

Administratively and culturally Rollo’s descendants and their Viking followers were rapidly assimilated into the Romanic world of post-Carolingian Francia. Their Scandinavian language was replaced by an early form of French. Christianity gradually took hold after the initial conversion, probably more formal than spiritual, and Carolingian administrative practices dominated the region. By the second generation even the Norman duke had to learn Norse as a second language; assimilation had come so far by the second half of the 11th century that the duke had no fleet. However, until ca. 1025, the Norman rulers maintained Rouen as an open city for Viking raiders and benefited greatly in an economic sense by providing necessities at high prices to the pirates.

The importance of Normandy in English history dates from well before Williams victory at Hastings and the conquest of 1066 that made England part of a trans-Channel Norman Empire. Yet the momentous events of 1066 and the subsequent rule of England by Normans far overshadowed the past and raises serious questions concerning Norman influence on the development of English

institutions. Among the most controversial of these matters are the introduction of "feudalism," a putative revolution in the military, massive changes in the Anglo-Saxon church, the nature and development of economic connections between England and the Continent, and intellectual developments.

These questions remain controversial after generations of scholarship. What is emerging today is a consensus that late Anglo-Saxon England, like contemporary Normandy, was a Carolingian-type state that itself owed much to later Roman institutions. The putative Germanic character of both Anglo-Saxon England and the Carolingian Empire are being vigorously downplayed, despite the linguistic realities of the former, as is the Nordic (Germanic) character of the Normans. In addition "feudalism," however defined, is also being regarded as an unhelpful way of characterizing the system of Norman aristocratic tenures and military organization in the pre-1066 period. The peculiarities of the Anglo-Saxon church, once highlighted by scholars, now receive less attention than the church's adaptation of the continental norms.

In short Anglo-Saxon England and Normandy are seen as more similar to each other and to the successor states of the Carolingian Empire that had once been a part of the Roman Empire, and thus the peculiar impact of the Norman Conquest upon England is being given less attention than was once the case.

The Norman Empire, created by Duke William through the unification of his continental holdings with England, did not, in its first phase, outlive the Conqueror. William established his eldest son, Robert Curthose, as duke, in keeping with arrangements made even before the conquest of England, while William Rufus, his second son, was made king of England. The idea of the empire, still exemplified by a Norman aristocracy that also held extensive lands in England, was alive and a source of inspiration to both sons to strive, throughout their respective careers, to reestablish the unity created by their father. However, it was not until William II was succeeded by his younger brother, Henry, as king of England that the empire was recreated, with the military defeat and life imprisonment of Duke Robert.

When Henry I died (1135), a civil war, known as the Anarchy, broke out between the claimants to the throne, Henry's daughter, Matilda, and his nephew Stephen. Peace came when Matilda's oldest son, Henry Plantagenet, was accepted by all parties as king of England, Henry II, in 1154. During the war Henry's father, Geoffrey of Anjou, had conquered Normandy; it thus became part of the Angevin Empire as one of Henry's possessions. Henry's administrative and legal reforms affected Normandy, as other parts of the Angevin Empire; in 1171 he carried out an inquest into knights' fees and in 1174 issued what amounted to major legislation on criminal matters in Normandy, much as he was doing in England.

Although Normandy benefited in economic matters from being part of the Angevin Empire, a subject still in need of basic research, the duchy's primary political role was as the front line of the Angevin kings' aggressive policy toward the Capetian kings of France. Under Henry's successors, Richard and especially John, the Norman military establishment became one of the most effective fighting forces on the Continent. However, the weak military leadership of John saw the fall of Chateau Gaillard and the loss of Normandy in 1204. The disasters of this year led directly to the collapse of the Angevin Empire and the dissolution of the direct bonds between England and Normandy.

Norwich

In spite of much recent excavation the early history of Norwich remains obscure. It seems to have developed from a group of settlements at what may have been an ancient junction of river and land routes at the confluence of the rivers Wensum and Yare. By the 10th century it had its own mint, and Domesday Book shows that in 1086 it was one of the largest boroughs in England, with a population between 5,000 and 10,000.

The Conquest brought great changes, both in the destruction of houses to make way for the castle and in the development to the west of the "French Borough," absorbed during the following century. In the 1090s the building of

the great monastic cathedral brought a new element to the topography of the city. The county of Norwich was administered from the castle, the diocese of Norwich from the cathedral; thus the city was the regional capital, though its importance lay primarily in its commercial and industrial role. With its good communications by river and road it was the market for the agricultural products of the rich and populous farming region of east Norfolk and also, by the 14th century, for the large amounts of worsted cloth produced in the villages and small towns of eastern Norfolk, as well as in Norwich itself.

Norwich was also a major manufacturing town, with particularly flourishing cloth, leather, iron, and building industries. More than 100 trades and crafts were represented among the Norwich freemen of the 14th century. On the eve of the Black Death it was one of the half-dozen richest towns in England; its population may have reached 20,000, and its buildings occupied an increasing part of the walled area, though open spaces continued to be an important part of its topography. It possessed some 60 parish churches, four friaries, and other religious colleges and hospitals, as well as the great cathedral priory, whose privileges frequently caused conflict with the city. Like similar towns Norwich had received royal charters granting wide power of self-government, and it returned members, usually its own leading citizens, to all parliaments.

The Black Death struck Norwich hard; though its population was probably more than halved, the continued prosperity of many inhabitants is shown not only by the great civic buildings of the 15th century but also by the extensive rebuilding of parish churches and friaries and probably by a substantial renewal of housing. Its leading citizens were wealthy and ambitious enough to purchase major new charters from the crown, giving Norwich county status, with its own mayor and sheriffs. The early 15th century saw dissension among the citizens, and the charters were twice temporarily revoked, but the 1450s saw a new era of internal stability, with control increasingly in the hands of an elite group of richer merchants. A disastrous fire and some decline in the worsted industry did not prevent Norwich from still being among the six wealthiest English towns on the eve of the Reformation.

Norwich Cathedral

After the Conquest the see of East Anglia was moved from North Elmham to Thetford and then, in 1094, to Norwich. Bishop Herbert de Losinga (1096–1119) built the cathedral as far as the altar of the Holy Cross—the fifth bay of the nave. It was completed by Bishop Eborard (1121–45).

The vast length of the church conforms to the post-Conquest revival of the great early Christian basilicas of Rome, as at Winchester (1079). Norwich has a fourteen-bay nave and a four-bay presbytery with the best-preserved Romanesque apse-ambulatory scheme in England. The two-cell, angled radiating chapels may follow French examples like Mehunsur-Yèvre (ca. 1050) near Bourges, although the Norwich chapels are different in having two stories. The aisles have round-headed dado arcades and groin vaults throughout. The transepts are aisleless with two-story chapels to the east and superposed wall passages with large windows on the terminal and west walls that presage the early Gothic of northern France. In the nave, and formerly in the presbytery, the three-story elevation of main arcade, gallery, and clerestory with wall passage derives from St. Étienne at Caen.

Rich articulation was used from the first: all arches are molded, and paired or single half-shafts create strong bay divisions at major and minor piers, respectively. The major piers of the nave arcade and all the gallery piers have the inner order carried on triple parallel shafts, a possible adaptation of the Anglo-Saxon crossing at Great Paxton (Huntingdonshire). The third and fifth piers in the nave have incised spiral decoration as in the presbytery and transepts at Durham Cathedral. They mark the altar of the Holy Cross. The crossing tower is patterned with a regularized version of Anglo-Saxon stripwork (cf. Earls Barton, Northamptonshire).

Norwich Cathedral profoundly influenced architecture in East Anglia, as in the monastic churches at Binham, Wymondham, Castle Acre, and Peterborough (now cathedral), the castle at Castle Rising, and numerous parish churches, including Great Dunham and Attleborough (Norfolk).

Notation of Plainsong

The history of insular musical notation before 980 is obscure; we are confronted not only by a lack of examples of notated music but also by an almost total lack of insular service books, so that it is difficult to tell whether such books might have been prepared for musical notation or not. A type of musical notation recognized as insular appears in more than 100 manuscript sources of the late 10th and the 11th centuries; many of these sources may be linked with such major ecclesiastical centers as Worcester, Exeter, Sherborne, Canterbury, Durham, and Winchester. While it is possible that knowledge of musical notation reached England from France during the 9th century, it was apparently not until after the mid-10th century, when the Benedictine revival occasioned numerous contacts between England and the Continent, that music writing became established in England. Several insular manuscripts of the 10th century have contemporary notation, and they show the use at this period of two neumatic systems. One system—closely related to northern and central French notations, particularly those of Corbie and Fleury—was to set the pattern for the great majority of 11th-century insular notations (late-10th-century examples include Rouen, Bibliothèque Municipale 368, 369); the other type, related to notations of Breton provenance, appears mainly confined to

sources originating in southwest England (e.g., the Sherborne Pontifical, now Paris, BN lat. 943). The breadth of notational detail in one of the Winchester tropers (Cambridge, Corpus Christi College 473) indicates that the practice of notating music was well established, at least at Winchester, by the year 1000.

During the second half of the 11th century, in such houses as those at Canterbury, Norman neume forms (i.e., symbols used in notating plainchant) began to infiltrate and sometimes to dominate insular notations (as in the Canterbury Gradual: Durham, University Library Cosin V.V.6). Some examples of the insular and Norman notations of this period betray attempts to infuse the essentially adiastematic (unheighted) notation with more exact pitch characteristics. And by the last years of the century notation on a stave had arrived (e.g., in BL Harley 3908, from Canterbury). In some centers, such as Worcester, however, the old adiastematic insular neumes continued to be used right up to the end of the 11th century.

Insular neumes (of the French rather than the Breton type) are characterized by parallel ascending and descending strokes on a vertical or almost vertical axis; their perpendicularity is quite distinctive when compared with French forms, which tend to lean more to the right. The range of insular neume forms is large, including many cursive and liquescent variations, as well as one neume used specifically in the notation of polyphony. Insular notators also commonly used significative letters to indicate details of intervallic structure or length of a note. Few insular sources show precise diastemata before the beginning of the 12th century; on the other hand few are purely adiastematic. Many examples of insular music script are, like the text script with which they appear, highly calligraphic (e.g., the Winchester Troper [Bodleian Library, Bodley 775] and the Caligula [Cotton] Troper [BL Cotton Caligula A.xiv]).

Notation of Polyphonic Music

From the late-10th-century neumes of the Winchester organa to the early 13th-century square notation of WL, insular polyphonic music used for its notation virtually unmodified the graphic forms developed in the context of liturgical monophony. Earlier dialects of plainchant neumes can help to localize manuscripts, but the turn to square notation in the 12th century has a leveling and universalizing effect that presents difficulties for the analysis of the date and provenance of later sources of polyphony. For example, in regard to the 35 Latin songs in the well-known “Later Cambridge Songbook” (CUL Ff.i.17 [1]), thirteen of which are polyphonic, there is still no consensus about whether they were copied in the late 12th or early 13th century and whether in England or on the Continent. Slightly later text and music hands (again—French or simply French-trained?) narrow the date but are similarly unhelpful about establishing a place of manufacture for WL, whose flourished initials, however, point to an insular provenance (perhaps even at the Augustinian cathedral priory of St. Andrews, Scotland, for which the book was undoubtedly commissioned).

In the first half of the 13th century, as a corollary to the emergence of distinctive insular musical genres and rhythmic-harmonic language, English musicians began to develop their own notational dialects for polyphony. The most important of these, referred to as English mensural notation, uses a lozenge rather than a square to represent the breve, on which the beat falls. English mensural notation was used to indicate varieties of the first, second, and third rhythmic modes and also binary mensuration. It most characteristically employed paired breves that are to be read unequally in trochaic rhythm (two beats—one beat). By the turn of the 14th century it was supplanted by French notation, with its square breve and lozenge-shaped semibreve, following the influential Parisian precepts of Franco of Cologne (*Ars cantus mensurabilis*, ca. 1280) and Petrus de Cruce. Some English compositions of this era follow an anti-Franconian tradition in respect to the subdivision of the breve by two identical but mensurally unequal semibreves, in which the first of the pair, rather than the second, is the longer of the two.

The next period of notational invention was in the second and third decades of the 14th century, when, in developments paralleled in France by the work of Jehan de Murs (Johannes de Muris) and Philippe de Vitry, and in Italy by Marchetto da Padua, English musicians explored new rhythmic idioms and invented new notational systems. The most individualistic of these were the circle-stem complex of mensurations and English ternary breve-semibreve notation. Important innovators whom we know by name include Robertus de Handlo, Johannes de Garlandia, W. de Doncastre, Frater Robertus de Brunham, Robertus Trowell, and Johannes Han-boys. By the last quarter of the century, however, the English had fully assimilated French Ars Nova practices, retaining only a few idiosyncrasies from their own “new art,” including certain rest shapes and the use of the *cauda hirundinis* (literally “swallow-tail,” describing the appearance of the note) to indicate alteration. An innovation of around 1400 that was to have universal significance was the use in some sources of black void (i.e., a black outline around a white interior) instead of solid black notation, a change that swept the rest of northern Europe from about 1420, with the start of the great influx of English mass music onto the Continent in the second and third quarters of the 15th century. Further peculiarities of English notation and custom with which continental scribes of this era had to contend, and which in turn influenced continental composers and scribal practices, involved mainly the tempo and proportional relationships of note values when certain mensurations were performed simultaneously or successively.

A phenomenon of the second half of the 15th century was the emergence of simplified notations, paralleling the shift from soloistic ensembles to larger choral forces for the performance of sacred polyphony. Heavily represented in these choirs were singers inexperienced in the complexities of mensural notation, because their responsibilities had not previously extended beyond plainsong. Simplified notations addressing this problem were of two basic types. In one each pitch symbol has the same value, denoting one beat; the notation may be confined to a single rhythmic figure, such as a long or a breve or a simple vertical stroke (hence “stroke notation”), or use various rhythmic figures or contemporary plainsong notation without mensural differentiation. In the other type there were two symbols, denoting two values, one twice as long as the other; the shorter was a black breve, while the longer was a black breve with two descending tails (a “strene note,” hence “strene notation”). Use of these simplified notations declined sharply after 1500, as generations of English choristers grew up who were familiar with mensural music.

Nowell, Laurence (d. 1569 or soon after)

Antiquary, linguist, and cartographer who continued the Tudor recovery of the heritage of medieval England begun by John Bale (1495–1563), John Leland (ca. 1506–1552), and Robert Talbot (ca. 1505–1558). For long confused by scholars with his namesake and cousin the dean of Lichfield (d. 1576), Nowell was the son of Alexander and Grace Nowell of Whalley, Lancashire; his date of birth is unknown. Having spent much of the 1550s in France and Italy, studying in Paris and acting as tutor to young Englishmen abroad, by 1562 Nowell had joined the household of Queen Elizabeth's secretary of state Sir William Cecil (1520–1598), where he acted as tutor to Cecil's ward the young earl of Oxford. Nowell accomplished his most productive antiquarian work during the ensuing five years. In 1567 he departed for the Continent to pursue his studies, leaving his books and papers in the hands of his friend the lawyer and antiquary William Lambarde (1536–1601). He died in unknown circumstances some time after reaching Leipzig in August 1569.

Although Nowell published nothing, he energetically transcribed numerous sources for the history of medieval Britain, including the Anglo-Saxon Chronicle, the OE translation of Bede's *Ecclesiastical History*, the *Historia minor* of Matthew Paris, the *Polychronicon* of Ranulf Higden, Gerald of Wales's *Description of Wales* and *Itinerary through Wales*, and materials for the history of Ireland. Among his surviving transcriptions are BL Add. 43703–43710, Cotton Domitian A.xviii, and Cotton Vespasian A.v. These transcriptions, which were studied and copied by his contemporaries, reveal that Nowell often excerpted from his sources those specific passages that related to British topography. In his concern with historical topography Nowell advanced the work begun by Leland and prepared the way for the great county histories of England, of which Lambarde's *Perambulation of Kent* (1576) was the first. The same concern characterizes Nowell's maps. Those in Cotton Domitian A.xviii represent the different regions of England, with place-names entered in OE. Another (BL Add. 62540, fol. 3v) whimsically includes a self-portrait in which Nowell despondently holds his empty purse within view of his patron Cecil.

Nowell is now esteemed chiefly for his contribution to the recovery of the OE language. Here his work encompassed not only transcriptions—including copies of the Anglo-Saxon laws used by Lambarde for his edition of 1568, the *Archaionomia*—but also an OE dictionary of some 6,000 entries finally published in 1952. Independent from yet associated with the Anglo-Saxon studies of the circle of Archbishop Matthew Parker (1504–1575), Nowell alone among his contemporaries showed an interest in OE poetic texts: he was the owner of the *Beowulf* manuscript (Cotton Vitellius A.xv, fols. 94–209) and annotated the Exeter Book of OE poetry (Exeter Cathedral Library 3501). In his OE studies as in his wider antiquarian work he broke new ground and laid the

foundations for future achievements.

Nuns and Nunneries

Although the life of the nun demanded a particular form of religious dedication, women of all ages became nuns for a variety of reasons. Most wanted to follow the traditional dedication of "bride of Christ," whether out of a sense of vocation or an aversion to marriage. Many young girls were placed in nunneries by their families as a gift to the church on their behalf. Other patrons found places for their female relatives, particularly those born outside

wedlock. Widows, not all of them old but seeking to escape remarriage, came to the nunnery to find comfort and succor. Some women found the male-dominated society of their time irksome and wished to seek some form of independence through joining the practice of the religious life and finding Christ's "easy yoke" more bearable.

Male influence, however, could not be totally removed from the convent. Men still had essential roles, whether as the local bishop or as the chaplain who administered the eucharist, dispensed pastoral care, heard confessions, and buried the dead. Not all the women who wished to become nuns were able to do so; the lack of a place to which to go was often a major obstacle. In addition women needed private resources to support themselves in an environment where self-sufficiency was not really possible. With fees or dowries being payable upon entry in a convent, nuns came generally from those social groups that could afford to pay.

Formal houses for women came into existence in Europe in the early 6th century. In Gaul and the Iberian Peninsula the institution of the double monastery enabled the necessary ministrations of the clergy to be more easily performed. In such houses women lived with men, but in strictly separated communities within the same enclosure, directed by one head—usually the abbess—and using a common church for the liturgical offices. With the Christianization of the Anglo-Saxon kingdoms the example of the double monastery was introduced from Gaul by nuns who had trained at Chelles and Jouarre.

English double monasteries reached their zenith in the 7th and 8th centuries, under a series of outstanding abbesses of royal or aristocratic blood. The most celebrated was Hild (614–680), related to the royal lines of both Northumbria and East Anglia. Born a heathen, she had been brought to the faith in 627 by Paulinus, Rome's first missionary to Northumbria. Aidan, bishop of Lindisfarne, in 649 appointed her abbess of Hartlepool, where Hild developed her own interpretation of the monastic life, based on the *Regula mixta* as practiced by Benedict Biscop (ca. 628–689) at the nearby male community of Wearmouth-Jarrow. The double community at Whitby that she founded in 657 followed the example of the primitive church; its members held everything in common and led the simple life. Archaeological excavations at Whitby have revealed a group of small cells "for praying and reading," while loom weights found in the same area suggest that the nuns also engaged in spinning and weaving.

The outstanding reputation of Hild's communities at Hartlepool and Whitby made them places of serious Christian monastic life and of education at a period when monasteries were beginning to play a major intellectual role in the newly literate society. Standards of female literacy in the double houses

were remarkable. Aldhelm of Malmesbury's prose work *De virginitate*, addressed to Abbess Hildelith and her community at Barking, took for granted that the nuns could both read and appreciate the style of his complex Latin. The strength and enthusiasm of Anglo-Saxon nuns played a remarkable role in the intellectual renaissance of the early 8th century. They excelled in the production of books for personal study and for the training of others, especially relating to the education and conversion of the heathen. The degree of freedom and independence that these English nuns enjoyed, the influence they were able to exert, and the confidence they inspired in those they counseled and advised is a tribute to the strength of the monastic tradition in which they were trained.

The early double communities dwindled and disappeared, suddenly, as at Whitby, burned in 867 by the Danes, or else more slowly, reflecting a society in which the male element was becoming dominant. Alfred, realizing the need, founded a nunnery at Shaftesbury and placed his daughter Æthelgifu there as abbess. Other houses came under royal protection, showing that even noble women had need of protection to enable them to overcome the apparent decline in esteem for the female version of the religious life. Indeed the attitude seems to have prevailed that the prayers of women were somehow less effective than those of men, and it seems certain that nunneries were not founded in sufficient numbers to satisfy the growing demand for places within their cloisters. At the Conquest, therefore, only nine fully organized nunneries remained in England; six were concentrated in Wessex.

After the Conquest the picture changes, with strong social pressures to create more opportunities for women. Although by 1100 the number of nunneries had only doubled, by 1250 more than 130 new female foundations had come into existence, some 24 being founded in Yorkshire alone between ca. 1125 and ca. 1200. While charter and other written evidence for the growth of English nunneries at this early period is fragmentary, it is clear that there was a sudden influx of women demanding to enter the religious life. In England this demand took various distinct routes: the grouping of religious women around a recluse, forming the nucleus of a convent; the incorporation of nunneries into existing or new orders; and a return to the institution of the double monastery. One early-13th-century source, the *Mappa mundi*, attempted a stark classification of the religious life of nuns according to the color of their habits.

Several nunneries in post-Conquest England grew out of the close association between a recluse and her followers. This movement toward the more community-based, or cenobitic, lifestyle is no more clearly described than at St. Albans in the *Life of Christina of Markyate* (ca. 1140), though other small groups of female recluses formed the nuclei of the convents of

Crabhouse in Norfolk, Kilburn in Middlesex, and Ches-hunt and Flamstead in Hertfordshire.

Most nunneries founded after the Conquest were poor. The poverty of many of these impelled the abbesses to receive more inmates than they could afford, and with this poverty came a downgrading in their educational status. It was often made worse in that the nuns had difficulty in finding educated men to advise them. The prioress of Ankerwyke despaired of understanding an official mandate she had received and returned it, complaining that she did not understand it herself, and neither was there any man of skill who could show her what to do.

The 12th century brought complex relationships with the new male orders. Several English nunneries claimed to have links with the new order of Cîteaux, despite strong resistance from the General Chapter that lasted until 1213. Women seem to have been attracted as much by Cistercian austerity and fervor as by the valuable exemptions and privileges, not just from tithes but also from episcopal control, enjoyed by the male houses. Two convents with the status of abbey, Marham in Norfolk, founded in 1249, and Tarrant in Dorset, mentioned as Cistercian in 1233, were formally incorporated into the order. But of the numerous other aspirants many merely imitated Cistercian customs without any official recognition.

One group of nuns was able both to imitate the Cistercians and to return to the model of the old double monastery. The community of Sempringham was founded in 1131 by Gilbert, a Lincolnshire priest, to care for and teach seven local girls. These “handmaidens of God” were enclosed by the bishop of Lincoln in cells against the wall of the parish church. There they were segregated from the world, consecrated to virginity, and reserved for their bridegroom, Christ. At first, as with anchoresses, all necessities of life were passed through the windows of the cells by female lay servants. Later these took the habit as lay sisters, while lay brothers were added on Cistercian lines.

With the foundation of a second house at Haverholme in 1139 Gilbert was forced to address the problem of regulating a community of women that also contained men. In 1147 he went to Cîteaux to seek admittance for his nuns to the Cistercian order. Although this request was refused, the rule of life he drew up had the support of St. Bernard himself. Gilbert founded an order with a clear constitutional framework that provided men, both canons and lay brothers, to care for the needs of nuns, plus an organization to link the houses and provide for their mutual support. That he did this so successfully is shown by the 1,500 cloistered nuns in England by 1200, and by many small foundations, localized in Lincolnshire and Yorkshire.

Another later successful foundation for women was made in the name of Birgitta (Bridget) of Sweden (1303–1373), whose Order of the Holy Savior was

better known in England as the Brigettines. In the 15th century the order spread from the mother house at Vadstena in Sweden and drew royal support. Henry V's foundation at Syon soon became one of the richest and most respected nunneries in England. The special devotion of the nuns to the wounds of Christ, their observance of the canonical hours, and their meditation and reception of vernacular sermons by the brothers added to the order's considerable and well-deserved reputation.

By 1450 there were about 140 female communities in England, containing just over 2,000 nuns. Most of the houses were small and impoverished, in contrast with the many well-endowed male houses. Two-thirds of all nunneries had gross incomes of less than £100 a year, while the income of one-third fell even below £50 a year. The low incomes were matched by their small size. After 1350 only nine houses are known to have had communities of more than 30 nuns. The small scale of endowments reflected the religious and social aspirations of the local founders. They aspired to the status of patron and sought perpetual prayers for themselves and their families; the desire to fund a nunnery may, on many occasions, have outstripped their ability to make an adequate endowment.

While convents gained small bequests, dowries, and annuities, the greater part of their revenue was derived from lands, rents, and sales of produce. Rents from distant properties were hard to collect and might run well in arrears. Even as landholders engaged in economic activities, convents were supervised and overseen by men. The local bishop, at his visitation for their spiritual welfare, also inspected their lands. Little was to change, and by the Dissolution the two largest and wealthiest houses were Shaftesbury in Dorset, with 57 nuns, and Syon, near London, with 52. At the other end of the scale were the Yorkshire houses of Marrick and Nunburnholme with twenty and six nuns, respectively, and incomes of £100 and £10.

O

Offa (r. 757–96)

King of Mercia in 757, after ousting another claimant. By the time of his death on 28 July 796 Offa also held sway over Sussex, Kent, and East Anglia. His daughters married rulers of Wessex and Northumbria, thus extending his sphere of influence. He clashed with the Welsh, which probably led him to construct the dike that bears his name. Running along much of the nearly 150 miles of the Welsh frontier, from the Severn estuary to a few miles south of the Dee estuary, Offa's Dyke is the longest earthwork in Britain. It could have been planned in one season and completed in the next; if this was indeed so, it is testimony to the organizational and coercive power that made him the leading English ruler of his day.

Offa utilized the church to enhance his power. He persuaded Pope Hadrian to sanction the creation of a new archdiocese at Lichfield in 787, only a few miles from his palace at Tamworth, thus effectively neutralizing the hostile archbishop of Canterbury. Probably imitating Charlemagne, he had his son, Ecgrith, consecrated as his successor in 787, the first royal anointing in English history.

Offa seems to have had extensive trade contacts with the Carolingian realm, which in turn appears to have made monetary reform possible. His silver penny, influenced by a Carolingian model, was the basis of the English coinage until the reign of Henry III. He appreciated the coin's potential for symbolism; many bear his name and a finely wrought effigy, and some even carry the likeness of his wife, Cynethryth, a practice drawn either from Byzantine Italy or even late-imperial Rome.

The poems *Beowulf* and *Widsith*, a tribute list known as "The Tribal Hidage"—even the origin of a system of burghal defense later associated with Alfred the Great of Wessex—have been associated with Offa. Much more research will be needed, however, before a balanced assessment of the cultural and social contributions of his reign can be made.

Though his achievements did not long survive him, he was regarded as a great figure in the Middle Ages. Alfred claimed to have adopted and modified

his laws; a sword reputed to be his was still treasured two centuries after his death; a 14th-century *Life* was composed by the monks of St. Albans, who revered him as their founder. An imitator rather than an innovator; his image of greatness derived from his longevity, ruthlessness, and astute ability to exploit the imagery of rulership. Apart from the little evidence of his power survives; the Mercian archives are lost, as is his burial place. His palace at Tamworth probably lies under the parish churchyard and so cannot be excavated.

Offices, New Liturgical

When established for universal use, proper offices for such feasts as Trinity Sunday and Corpus Christi were added to English rites, as they were elsewhere. Also, as in most countries of western Europe, new national saints and feasts were added to the calendar prolifically. Many were provided with complete proper texts and chants for Matins, Lauds, Vespers, and, less often, for the other hours. Proper hymns were sometimes included. The composition of new or adapted texts and chants for the antiphons, responsories, and verses were thus one of the chief occupations of ecclesiastical poets and composers. Normally the poet and composer was the same individual, probably the precentor. Because the new texts centered on a biographical narrative of the saint, his deeds, and miracles, they were called *historiae*.

The Norman Conquest had a major impact on the style of English composition, as it did on the suppression of Anglo-Saxon saints and introduction of new ones. One of the earliest offices known in England, in honor of St. Cuthbert, was written early in the 10th century for the court chapel of Æthelstan or his father, Edward the Elder, probably by a clerk from the Low Countries. Surviving the Conquest, it was adapted for monastic use between 1083 and 1150. Although the *vita* St. Birinus, the missionary to the West Saxons, was reworked in the 13th century, no evidence confirms the continued liturgical use of his office. St. Alphege was venerated later, although only fragments of an office survive. An elaborate vigil and feast day office for Edmund, king and martyr, written about 987, was expanded by a Norman cleric, and remained in use. The office for St. Alban, written about 1000, survived: John Dunstable wrote a 15th-century isorhythmic motet based on one of its chants, and its texts are found in later breviaries. Most of its chants are lost. Of other Anglo-Saxon offices little is known, and there is not even a comprehensive catalogue.

Although the texts appear to be prose, like most of the standard repertoire, and the chants are on the surface indistinguishable from the general style of plainsong, it is clear that both words and music were often structured in some way. In certain items regular poetry occurs: the antiphons for Cuthbert have monosyllabic rhymes in eight-syllable lines, but the responsories are essentially rhymed prose. For Birinus the surviving responsories and some of the antiphons are in rhymed prose, and other antiphons are in leonine (rhyming) hexameters.

As well as techniques that seem to foreshadow the use of full rhyme and regularly accented lines there occur other literary devices not usually found in the standard repertoire. Among these are rhymed prose, regularly accented lines without rhyme, prose with deliberate and extensive use of the literary cursus, and classical meters. Some of these literary structures seem to be reinforced by musical means. Even when presented in a notation that is not

directly transcribable, it is sometimes possible to ascertain the musical modes of the chants. Within each service the antiphons may be arranged in modal order from 1 to 8 followed by a return to 1, and the responsories in a separate similar order. Hymns, if they are proper at all, do not form a part of this modal sequence.

A full study of these early offices needs to be undertaken. No doubt the techniques used in them continued even after the fully rhymed office was usual. But because many manuscripts have been lost, it is rarely possible to know whether an office in, say, a 13th-century manuscript faithfully reflects an Anglo-Saxon version. A noted breviary of about 1300, for example, has offices for Æthelwold and for Kyneburga and Kyneswitha (local to East Anglia): most of the texts are loosely structured. No earlier chants are known, so we cannot know what changes may have taken place. The same is true of the office for St. Ethelbert in the Hereford noted breviary of the 1250s.

An extensive monastic office for St. Oswin, unfortunately incomplete, exists in a 12th-century source. It uses irregularly structured texts and chants. The last known composition of offices in the earlier non- or semistructured style is in the late 12th century. Ralph Niger, born about 1140, wrote a treatise on the four major Marian feasts, including the corresponding offices, about which he says "I sought out [composed?] new chant for the antiphons and responsories." Although neither rhyme nor classical meter occurs, signs of other kinds of structure are present.

From the 12th century and later new offices were mostly strictly rhymed and regularly poetic, conforming to a general change in European liturgical poetry. Of these later "rhymed" compositions few are known or have been investigated, and only recently has a catalogue been published. Many of their texts were printed, without chant, about a century ago in Drevés and Blume's *Analecta hymnica*. In this later repertoire every sung item of the office (as opposed to intoned items) is normally rhymed and completely regular in accent and number of syllables. Typical of the poetic forms are the goliardic meter (lines of seven and six syllables) and the Victorine sequence form (lines of eight and seven syllables). The verses of responsories are occasionally in prose or classical meters. The chants of this repertoire seem to use the modal system and modal order of chants rather rigidly as a prescriptive device for composition, so that the modal character of each item is usually clear: cadences or subcadences at each line or rhyme strengthen the modal clarity. Occasionally the range is extended so that both authentic and plagal versions of the mode are combined. Responsory verses, usually sung to an elaborate tone in the standard repertoire, are now provided with an elaborate melody. The melodic style of the chants is less restrained than that of the standard repertoire. Occasionally overt word painting is present: for example, in the

late-11th-century office of St. Mildred of Thanet, the phrase *stella radi-ans*, “shining star,” is set in the highest register an octave above the final; in the mid-15th-century office of the last English saint canonized in the Middle Ages, St. Osmund, the word *scandere*, “to climb,” occurs with a melisma on *scan-* that rises stepwise through nine scale degrees and falls similarly to its starting point. The latter office is noteworthy also because of its prominent use of classical meters.

Perhaps the earliest completely regular rhymed office in England is that of St. Thomas of Canterbury (Thomas Becket). It is surely the most important. Written before 1193 by Abbot Benedict of Peterborough, it was quickly made into a form suitable for secular use in the newly emerged Sarum liturgy that became the standard for much of the British Isles. Of high literary and musical quality, it spread across the whole of Europe and even nowadays exists in several hundred known manuscript sources. Both in Europe and England dozens, perhaps scores, of later offices were modeled on it, using its poetic forms and adapting its chants. Here, other than the important office for David of Wales, those for the translation of Thomas himself, Chadd, and Edmund Rich (Edmund of Abingdon), a later archbishop of Canterbury, are relevant. Several other offices for Thomas also exist, some in English sources.

Franciscan and Dominican offices were not greatly important, if the surviving sources are any guide. John Pecham, another archbishop of Canterbury (1279–92), imitated the office of St. Francis in his composition for Trinity Sunday; perhaps about 1389 John Horneby is said to have written an office for the Visitation of the Blessed Virgin, with strong Franciscan connections; about 1381 Thomas Stubbs modeled his office for St. Anne on that of Dominic. The sole Augustinian office, although not modeled on a known exemplar, is for John of Bridlington, canonized in 1401: the first responsory of Matins served as the tenor for a cyclic mass later in the century. Unique offices survive to St. Helen the empress (finder of the Cross) and to Gilbert of Sempringham. Most of the metropolitan centers of England produced offices: honoring William (archbishop of York), Wulstan, Richard, and Thomas (bishops of Worcester, Chichester, and Hereford, respectively); Edmund Lacy, bishop of Hereford, wrote one in honor of the archangel Raphael. The office for Osmund (bishop of Salisbury) was the last. Many of these survive with their chants.

Of numerous other national saints, some of considerable importance, there remain only isolated prayers or sung texts, sometimes poetic. Frequently these appear in the books of hours of the 15th century and later. These texts may have been written as commemorations of the saints, to be incorporated into offices of higher liturgical priority, and thus all that ever existed; or they may be survivors of complete offices now lost. The list is long: Aldhelm, Alphege,

Augustine of Canterbury, Dunstan, Edward the Confessor, Ethelburga, Etheldred, Frideswide, Guthlac, Hugh of Lincoln, John of Beverley, Oswald, Swithun, Wilfrid, Willibrord, Winefride, Withburga.

Intriguing are poetic offices (or parts of offices) for saints who were never canonized and in some cases were never likely to be: examples are Simon de Montfort (earl of Leicester, d. 1265) and the mystic Richard Rolle of Hampole (d. 1349). Such offices, which cannot have been authorized for use, may have been written to promote a canonization that never occurred.

Closely related to these English offices and often dependent on the same liturgical use are those of saints from Scot land, Wales, and Ireland, such as Kentigern, Kenneth, David, Patrick, Brigid, and Finian.

Also worth mentioning are three elaborate prose (or semistructured) offices, all monastic. The Cluniac monastery of St. John the Evangelist at Pontefract, Yorkshire, celebrated a special office for the Relics, and for St. John at the Latin Gate, the latter known also in continental sources. Also otherwise associated with sources in Switzerland is the office of St. James in a manuscript thought to be from Reading Abbey, which had a relic of the saint. In a possibly 15th-century manuscript for Ely Priory are found a number of unusual offices. Several are in honor of the Virgin, with partly rhymed items in a single nocturn, a special invitatory, and rhymed Te Deum. Similar is another office and mass said to be entitled *de sancta sophia* (or *de eterna sapientia*., “holy/eternal wisdom”) in “the old books.”

No doubt chants and texts were often borrowed and adapted within this repertoire of offices, but the web of relations has yet to be charted. The antiphon *Ave rex gentis* in various forms, with its chant, runs like a thread from Edmund, king and martyr, and Alban (10th century), to Ethelbert and Oswin (12th century), Edmund Rich of Abingdon (13th century), and a polyphonic motet of the 14th century.

Old Hall Manuscript

An early-15th-century manuscript of music for mass, one of only three relatively complete collections of English polyphony to survive from before ca. 1500, the other two being the organa of the Winchester Troper from ca. 980 and the eleventh fascicle of *Wl* from ca. 1240. Its contents represent the first body of English music to which names can be attached, and well over half the pieces are by named English composers. The Old Hall Manuscript (named for its home from 1893 to 1973 at St. Edmund's College at Old Hall Green near Ware, Hertfordshire) was purchased by the British Library in 1973 and is now BL Add. 57950. According to a scenario established recently by Bowers it was principally compiled ca. 1419–20 for the household chapel of Thomas duke of Clarence. Upon Clarence's death in 1421 the preparation of the manuscript was interrupted and it passed into the hands of the Royal Household Chapel of his elder brother, King Henry V, whose musicians made additions to it. Its whereabouts between the later 15th and early 19th centuries are difficult to trace with certainty.

The Old Hall Manuscript is a large book in vertical format (16.4 by 10.9 inches). It was originally planned for a minimum of 121 folios (of which 98 survive) and later had at least sixteen additional leaves inserted (of which fourteen survive). Thus the present 112 folios, containing 147 musical items,

represent the torso of a volume that has lost more than a quarter of its original leaves, a loss whose dimensions would be amplified if, as is likely, the manuscript once began with a gathering of Kyries, of which there is now no trace. The manuscript has been further mutilated by the removal, in the 19th century, of the more ornate initial capital letters, along with some surrounding music.

The contents of this book fall into two distinct layers. The first layer, mainly copied by a single scribe, represents music compiled for Thomas duke of Clarence, probably under the supervision of Leonel Power, who was his chapel's leading musician. What was intended was evidently a large anthology of pieces from the half-century or more spanning ca. 1370 to 1421, though most of its repertoire, on stylistic and biographical grounds, appears to date from ca. 1390 to 1410. This layer was subject to rigorous organizational principles. On the broadest level pieces were grouped according to liturgical category for use at mass: (Kyrie), Gloria, antiphons and cantilenas (to be used as Sequence and Offertory substitutes), Credo, Sanctus, Agnus, and motets (by their placement and texts, evidently *Deo gratias* substitutes). The Gloria, Credo, Sanctus, and Agnus gatherings were further subdivided so that the simpler settings notated in score precede the more complex settings notated in separate parts. As a further mark of planning there are two pieces, one beginning the section of Sanctus settings in score, the other heading up the section of Gloria settings in parts, that are ascribed to Roy Henry, who is most probably to be identified with Henry V.

In making the second-layer additions later scribes followed the organization of the first layer, adding works on blank staves or tipping in new leaves as necessary. The one exception to this behavior is a group of three second-layer motets inserted between the Sanctus and Agnus sections. These motets seem to be intended as Sanctus sequels rather than as *Deo gratias* substitutes and may originally have been written for the triumphal entry of Henry V into London after the victory at Agincourt in 1415. As a rule the repertoire of the second layer dates from the 1410s and early 1420s; its copyists may have included those among the composers represented who were members of Henry's Royal Household Chapel, thus preserving rare medieval authorial holographs. A younger companion volume ("H6") from the same environment, modeled on Old Hall and overlapping in contents but mainly preserving the repertoire of the Royal Household Chapel at a slightly later date (during the infancy of Henry VI, in the mid- to late 1420s), survives today only in scattered fragments.

The physical division of the music of Old Hall into score or part notation reflects a division of musical style and function as well. The sonorous, chordal, three-voice pieces in score, some freely composed and some enveloping a

plainchant in two outer parts, represent a conventional, functional, and not overly elaborate music for daily (ferial) mass. The compositions in parts are more diverse in approach, employing strict or free isorhythm, strict canon or pseudo-canon (i.e., written out), or some form of treble-dominated texture under less overdy constructivist control. Less conventional, they are more “artificial,” representing a higher and more ostentatious register of musical discourse appropriate to feast days and public ceremonies.

Opus Anglicanum

English medieval embroidery in silk and gold (silver-gilt) thread, designated as *Opus Anglicanum* ("English work") in contemporary documents, carried English art and design to every country in western Europe.

Superb embroideries, a few of which survive, were already being produced in the Anglo-Saxon period. Some 9th-century fragments preserved at Maeseyck in Belgium have designs of arches and circles containing animals and interlace. An early-10th-century stole and maniple at Durham Cathedral in England have a design of superb quality in silk on a gold background, derived from late-classical textiles with standing figures, one above the other. Different from these in style and scale is the massive 11th-century narrative hanging of the Norman invasion of England embroidered in wool on linen, known as the Bayeux Tapestry.

In contrast to the lively style of these earlier embroideries those of the Romanesque and early Gothic periods are more severe, with figures and ornaments stiffly drawn. The embroidery is worked mainly in gold in underside couching (in which the thread is laid on the surface of the material and fixed at intervals by means of a linen thread on the back of the material) on silk backgrounds, with foliate ornament, animals, or human figures within rectangles, circles, or rounded arches. A maniple and two amice apparels of about 1140–70 associated with the great English saint Thomas of Canterbury have foliate crosses within a lattice of interlaced circles (Sens Cathedral and Erdington Abbey, Birmingham). Some early-13th-century fragments of bishops buskins have foliate scrolls containing figures of kings (London, British Museum and Victoria and Albert Museum). A more graceful development of this style is found in the Clare Chasuble (Victoria and Albert Museum), made for a member of the royal family in about the 1270s, in which coiling stems enclose lions and griffins and a band of quatrefoils contains angularly drawn sacred subjects. The development toward Gothic grace and naturalism was a feature of 13th-century embroidery, with details worked in natural colors in silk threads and the gold parts worked with chevron patterns instead of the bricklike patterns of the preceding century.

The international reputation of English embroidery grew at this time, and the flow of embroidery increased as popes and other potentates began to collect. The famous Vatican Inventory of 1295 includes over 100 embroideries designated as *Opus Anglicanum*.

A richer, more flexible style developed in the later-13th to early-14th century, now exemplified in three copies: one with a design based on the Tree of Jesse (Victoria and Albert Museum), and two others in the Vatican and Switzerland (Bern, Abegg-Stiftung). These have elegant draped figures within scrolling or geometric compartments on gold or red backgrounds.

During the first half of the 14th century, coinciding with the Decorated style

in English Gothic architecture and so-called East Anglian manuscripts, English embroidery reached its finest quality. This is exemplified by a panel from a cope (Victoria and Albert Museum) that shows Christ in Majesty and is similar in date, style, and large scale to the Melk Chasuble with a Crucifixion scene (from a monastery at Melk, now in Vienna, Österreichisches Museum für Kunst). The elegantly posed figures in embroideries of this period, with wavy hair and costumes with convoluted folds, are identical with those depicted by court painters, who must also have supplied the embroidery designs. The finest embroideries, regarded as the equal of paintings or goldsmiths' work, were immensely costly.

The lively storytelling seen in some pieces, such as the scenes from the life of the Virgin on an incomplete set of alb apparels of 1320–40 (Victoria and Albert Museum), was another element contributed by painters.

The design scheme of copes changed in the 14th century from that with sacred scenes in quatrefoils, represented by the Syon Cope (1300–20) and Steeple Aston Cope (1310–40), both in the Victoria and Albert Museum, to an arrangement following the curved contours of the cope with scenes in rows of concentric arcades. This more pleasing style is represented by a cope in Bologna (1315–35) and another in Pienza Cathedral (1315–35), the latter one of the finest surviving examples of *Opus Anglicanum*.

Velvet became a popular background material at this time, providing an excellent foil for the silk and gold embroidery. Examples include the Butler-Bowdon Cope (1330–50) in the Victoria and Albert Museum, the closely related Chichester-Constable Chasuble (New York, Metropolitan Museum) and a cope (1340–70) now in Vich in Spain.

A trend toward a more severe style related to that of Perpendicular architecture is represented by the design of the Lateran Cope of 1340–60 (Rome) and a cope orphrey of 1340–60 (Stockholm, State Historical Museum), where gold backgrounds with rectilinear patterns replace the rich curvilinear patterns of the early-14th century.

From the mid-14th century onward English embroidery workshops were still prolific, but the embroideries produced were not of the luxurious quality of the preceding period. Economic and social factors depressed all the arts in England, including embroidery, and the workshops had to meet increasing competition from imports of Italian patterned silks. In response techniques and designs were simplified. Underside couching was replaced by surface couching and narrative scenes were replaced with single or paired saints beneath architectural canopies. Large pieces, such as copes and altar frontals, were decorated with applied motifs powdered over the surface.

Most surviving medieval English embroidery is ecclesiastical work, preserved in the relatively safe environment of the church, although

contemporary documents indicate that numerous secular embroideries were produced as well. A few secular pieces, mostly heraldic, survive, including fragments of a royal horse trapper (1330–40), embroidered with the leopards of England (Paris, Cluny Museum), and the 14th-century Black Princes heraldic surcoat (made before 1376) at Canterbury Cathedral.

All known surviving embroideries were made by professional workshops, with the exception of one band from an altar frontlet (1290–1340) that has the name of the nun who embroidered it on the back (Victoria and Albert Museum). Workshops were situated in the City of London, where the capital necessary for the costly materials required was most readily available. Although the craft required little apparatus, the silks and velvets used for the ground materials and the silk and metal threads for the embroidery all had to be imported, mainly from Italy and Asia.

Embroiderers, both men and women, underwent a rigorous seven-year period of apprenticeship, the gold embroiderers being the most highly skilled and sought-after. Popes Alexander IV (1254–61) and Urban IV (1261–64) had a gold embroiderer, Gregory of London, attached to the papal household. The authorities dealt directly with the workshops or via merchants. Adam of Basing, a wealthy merchant, sold silk cloths and embroideries to King Henry III between 1238 and 1260, but the king also commissioned several embroideries directly from Mabel of Bury St. Edmunds between 1239 and 1244.

The long tradition of religious embroidery in England was abruptly halted by the Reformation, after which embroideries with sacred subjects were no longer required. Much embroidery was destroyed at that time, but sufficient numbers survive, although often altered or worn, to give a glimpse of the riches of an art that was much prized.

Orality and Aurality

Old English

“Orality” refers to the type of discourse produced by a culture depending significantly on immediate subject-to-subject vocality for the transmission of information, ritual, traditions, entertainments, and instruction. Though writing was produced with increasing frequency as the Anglo-Saxon period progressed, writing in the OE vernacular, rather than being conceived of as an autonomous medium for the origination of textual discourse, as in modern societies, was used to a large extent as an auxiliary to the voice and as a cue for memory, recording oral events (poems, medicinal recipes and spells, legal transactions and decisions).

Anglo-Saxon society, at least after the period of the Conversion (600–700), cannot, however, be thought of as a “primary” oral culture, since writing increasingly shaped discourse (and everything we know of Anglo-Saxon “oral discourse” derives from written sources). Yet orality also continued to influence texts. Even when a text was a new composition—rather than the record of an oral or memorial event—oral habits of vocabulary, organization, and thinking often shaped the form and message. The OE poetic style, with its dependence on a relatively small inventory of syntactic and metrical frames, repetition and variation of stock vocabulary, additive style, and arrangement into simple oppositions of scenes and characters, clearly derives from a traditional oral style and continues even in the work of poets, such as Cynewulf, who, fairly certainly, composed by writing.

Oral features, mixed with imitation of Latin style, are the rule in OE prose as well. OE texts tend to be, like oral utterances, context-dependent—that is, they are not designed to be self-explanatory to a reader after the occasion that gave rise to the utterance is absent, which is why so much of OE literature is not only anonymous but without date and provenance, and often obscure as to its intellectual connections and intentions. “Oral style” continued to manifest itself in written work not just because of nostalgia or conservative stylistic habits but because “oral thinking” was deeply ingrained (autonomous textuality being a concomitant of a deeply literate and long-established written tradition) and because almost all OE texts, even when literate in their origins

(e.g., the sermons of Wulfstan and Ælfric), were nevertheless intended for oral delivery to audiences not necessarily literate themselves.

The issue of orality in Anglo-Saxon literature has for many years been centered on “oral-formulaic theory,” an offshoot of Homeric studies. In the 1930s Milman Parry, aiming to establish beyond doubt the orality of Homeric poetry (see the discussion in Lord), found an analogue in the demonstrably oral epics of contemporary Yugoslavia. He posited that this poetry was composed by use of traditional *formulas* and *themes*. He defined the formula as “a group of words which is regularly employed under the same metrical conditions to express a given essential idea” and a theme as “the groups of ideas regularly used in telling a tale in the formulaic style.” The Homeric poems were inferred to be oral and extemporaneous (i.e., not memorized from a fixed text) because of stylistic features (formulas and themes) analogous to those in the Yugoslav songs. A key concept was “formulaic density”; a song showing a high proportion of formulas was thereby concluded to be oral.

In 1953 Magoun somewhat mechanically carried this method over into OE studies, finding that the presence of formulas in *Beowulf* was dense enough that it could be deemed an orally composed poem. Magoun's article set off a storm of debate that has never quite subsided. Benson demonstrated that many OE poems translated from or heavily influenced by Latin were just as formulaic as *Beowulf*. He argued for a mixture of oral and written poems in the poetic canon. Meanwhile Fry modified the concept of “formula” to fit the particular literary and linguistic conditions of OE, as opposed to those of Homeric Greek or present-day Serbo-Croatian. The latter use syllabic meters formed around syntactically related word units, while OE meter depends on alliteration and stress distributed over a line of indeterminate syllable length. Fry redefined the OE formula as a “group of half-lines, usually loosely related metrically and semantically, which are related in form by the identical relative placement of two elements, one a variable word or element of a compound usually supplying the alliteration, and the other a constant word or element of a compound, with approximately the same distribution of nonstressed elements” (Fry, 1967: 203).

More recently Foley has shown the flexibility and productiveness of the formula as a “multi-form” depending on a deep “rhythmic sub-strate” that cannot be explained by its individual surface appearances. He has pointed out that one tradition cannot explain the features of another simply by analogy. During the heyday of New Criticism oral-formulaic theory caused much anxiety because it seemed to some that poetry composed by the recollection of preexisting expressions, apparently without individualized forethought and according to entirely traditional ideas and methods, could not possibly be creative or aesthetically significant. The response among such critics was often

simply to reject the theory. Others (notably Creed and Renouir) attempted to use features of the oral-formulaic theory to show how poems so composed could be original and distinguished while still remaining within the parameters of oral style. Lately work has begun to stress the increasingly symbiotic relation of orality and writing throughout the period, with related methods of memorial retention, recollection, and production and influencing one another as to subject matter, form, and style (see O’Keeffe, Doane, Carruthers).

Middle English

The terms “orality” and “aurality” designate the spoken performance of texts, the former usually indicating a degree of extemporaneous composition at the time of performance and the latter designating spoken performances aided by written texts. Orality and aurality were inescapable phenomena in the Middle Ages, assuming a variety of forms in all social and occupational ranks. To a degree almost unimaginable in the 20th-century West the arts of the spoken word pervaded medieval education and entertainment.

To begin to assess the ways in which orality affected medieval culture it is necessary to consider some important differences between written and oral expression. Unlike writing oral communication is fluid. Although verbatim memorization occurred in some medieval traditions, oral artists generally recreated their stories at each telling, tailoring each performance to fit the mood and composition of a live audience. Written speech, however, is fixed and portable. It can be shared with strangers who have never met its creator. Written style is standardized and objectified to aid communications in the absence of its author.

In oral performance the audience stands face to face with the performer, exerting an immediate and powerful influence, editing the teller as they listen. If listeners reject a speaker’s communication, it is unlikely to survive. Thus the spoken word becomes both a matter of personalized art and community consensus, while written speech, though standardized, allows unpopular individual opinions to outlast the context in which they were formed. The growth of literacy marked the replacement of a number of smaller, oral communities by larger, impersonal societies.

The relationship between spoken and written expression—never simple—grew increasingly complex in late-medieval England. One may assume with some security that most OE poetry was never written down and that much of what does survive was conceived by literate authors to be performed before

largely illiterate audiences. In the ME period, however, literacy was nearly universal among those authors whose work survives and greatly expanded among their audiences. Yet live oral performance continued in force—now increasingly as an option rather than a necessity.

Orality was essential to education. Rhetoric students learned not only how to compose verse but also how to deliver it. Even the most delicate arts of philosophy and logic were understood as outgrowths of spoken communication. Though Anselm of Canterbury and other philosophers of the 11th and later centuries associated orality with illiteracy (Stock, 1988:335), oral dialogues and disputations—in which teacher and student arrive at important insights through question and answer as well as spoken argument—continued to flourish in educational settings throughout the Middle Ages.

As important as oral arts were to literate society, they were all the more crucial to the illiterate, who required oral instruction. Although documentation is scant, we assume that customary oral education took place in situations of shared labor, in households at night, and in special meeting places, such as the mill in the country and the marketplace in the city.

Literate and oral worlds met everywhere. One of the most important crossroads was the pulpit; many preaching manuals include advice to learned preachers on techniques of addressing popular audiences. British oral tradition is rife with folktales that grew out of the great repertoire of sermon exempla shaped in a continuous dialogue between priest and peasant (Owst, ch. 4).

Nor were books completely inaccessible to the illiterate, since the writing and reading of books often involved orality and aurality. For example, *The Book of Margery Kempe* was composed and dictated by an illiterate. This first English autobiography demonstrates that even verbally skillful persons of relatively high social standing (Kempe's father was a mayor of Lynn) could lack reading and writing skills but nonetheless have access to the content of books read aloud to them and to the recording of their ideas by scribes. Kempe's style is influenced by pulpit diction—for example, she continually refers to herself in the third person as "this creature," a standard epithet in homilies.

In the realm of entertainment the preference for live, spoken arts lasted well beyond the age of the oral poet (who composed his work while performing it). Minstrels worked with written and memorized texts before live audiences in a variety of settings, from royal halls to crowded streets. We know of minstrels' activities largely through the disparaging words of clerics like the 14th-century writer John Bromyard, who characterizes them as unholy beggars and chastises those who reward them with money.

In addition to paid specialists amateurs regularly performed oral arts. Squires and pages in noble households were expected to master the arts of

singing and versification. Merchant-class artists engaged in oral pastimes imitating courtly entertainments. Thirteenth-century London was the site of a *puy*, a social club of merchants convened to hold song competitions. The composer of the best entry had his creation crowned a “royal song.” The *puys* songs were in French, but by the 15th century English had become the language of literary supper clubs that met in merchant households to exchange poems.

The oral folktale was popular among all groups but became increasingly associated with the tastes of the lower classes. According to Robert Manning (fl. 1303–38) commoners craved to hear tales at games, on holidays, over ale. Though we do not know the form these stories took, they were clearly plentiful. It is from this great pool of oral narrative that many of the tales in collections like Manning’s *Handlyng Synne*, Chaucer’s *Canterbury Tales*, and the *Gesta Romanorum* ultimately derive, even when they have been mediated at least in part by other written texts.

Ordainers

In March 1310, following a petition from his leading subjects, Edward II consented to the election of a commission of twenty earls, barons, and bishops—the "Ordainers"—to draw up proposals or ordinances for the reform of government. Many of their grievances, such as the purchase of food supplies for royal uses (prises), and the preference given in repaying royal debts owed to Italian merchants, had first arisen in the closing years of Edward I under pressure of war and royal financial constraints.

But a new feature was the hostility of the Ordainers to the favorites who

had gained influence over the king, in particular to Piers Gaveston, to whom Edward II had granted the royal earldom of Cornwall. The Ordainers' work was completed in October 1311, when a document containing 41 ordinances was issued with royal approval. These ranged from prohibitions on the king's departure from England, on the raising of new forms of taxation, on the making of grants of land, and on the appointment of the leading members of the administration and household without baronial approval, to demands that certain individuals, most notably Gaveston, held to have been "evil counselors" of the king, should be removed from court.

The enforcement of the Ordinances was hampered by Edward's wish to retain Gaveston's company. After Gaveston's execution in June 1312 and the return of some of the former Ordainers to the king's side, Edward was more determined than ever to annul the Ordinances. This finally took place in May 1322, after Edward had defeated and executed his chief opponent, Thomas of Lancaster, at the Battle of Boroughbridge.

Order of the Garter

The society of lay knights founded by Edward III in 1348–49; it was the second monarchical order in Latin Christendom (after the Castilian Order of the Band) and the model for most of the later foundations.

Edward first proposed to restore the legendary Company of the Round

Table, as he proclaimed at a tournament of 1344. The new Round Table was to have had 300 knights. When he returned from the victorious Crécy campaign in 1347, he founded a more exclusive society dedicated to St. George, the patron of knighthood. Its device was a blue garter, in the form of a belt buckled in a circle (probably representing the belt of knighthood), bearing the motto *Hony soytke mal y pense* ("Shamed be he who thinks ill of it").

Actually established in stages in 1348/49, the order was a confraternity with three distinct colleges. The first and principal one had 26 knights, inducted as "companions," including the king as hereditary "sovereign" or president; the second college was of a similar number of secular priests, thirteen as "canons" and thirteen as "vicars" for the canons. The third college was to be composed of "poor veteran knights," appointed to serve as vicars for the companions when the latter were absent from the order's chapel at Windsor. The priests and veteran knights were united in the College of St. George at Windsor, and they were to offer daily prayers and masses for their companions' souls. By 1365 the order had a magnificent new hall in Windsor Castle, and between 1475 and 1485 a new and much larger chapel was also built, west of the previous one. Both have been in continuous use ever since.

The companions undertook obligations of loyalty to their sovereign, and also certain fraternal obligations: to refrain from bearing arms against each other (except in the war of their sovereign lord or their own just quarrel) and to have a large number of masses sung for those who had recently died. They met regularly as a body once a year, either on St. George's Day (23 April) or on the second Sunday after Easter. They had, on those occasions, common prayers and a formal banquet. New companions were formally installed during the course of the mass of the feast day.

Edward seems to have founded the order to increase his own prestige and that of his house and kingdom by promoting the image of himself as an heroic king in the tradition of Arthur, surrounded by a company of knights selected for noble birth and chivalrous deeds. Knights from outside England were elected, eventually including foreign princes and kings. The order was also, perhaps, a perpetual memorial to the king's great victory at Crécy and to the knights who fought with him there. It still exists, with newly elected knights installed in the royal chapel at Windsor.

Organ

As an appurtenance of Christian worship, the organ was introduced into England soon after 957, part of the general importation of Cluniac ceremonial principles that vitalized the restoration of Benedictine monastic observance under Archbishop Dunstan and King Edgar. As a striking novelty the presence of such a machine had been noted before A.D. 1000 at the abbeys of Malmesbury, Ramsey, Abingdon, and Winchester Old Minster. The original organ at Winchester, dating from before 984, was enlarged ca. 990, and it seems that the instrument was built on principles similar to those expressed by a slightly later continental writer, the monk Theophilus. The typical organ of the period was modest, both in overall size and technical complexity; the Winchester organ was somewhat larger, having two operators, each managing his own octave (diatonic, plus B-flat). They worked not a keyboard but crude sets of perforated sliders that permitted air from the windchest (supplied by pairs of leather bellows pumped by assistants) to sound the bronze or copper pipes, arranged in one or two inseparable ranks. Such other Benedictine monasteries as Ely Cathedral (ca. 1165), Christ Church, Canterbury (1174), Bury St. Edmunds (1182), and Rochester Cathedral (1192) are known to have possessed organs before the end of the 12th century. Thereafter references to the occurrence of organs in Benedictine and Augustinian monastery churches become commonplace and begin to occur also at the greater secular churches, such as York (1236), Exeter (1280), Wells (1310), and Lincoln (1310).

The quality of the 10th-century organ most striking to contemporaries was its ability to make noise that was penetrating and loud, and as late as 1235 the organ of St. Albans Abbey could still be nicknamed "The Mules." Indeed the organ of the early and high Middle Ages was not created to be in any way a musical instrument. It was installed as a generator of loud and joyful but fairly random noise, to be sounded on festivals and other occasions of importance

just to lend grandeur to the ceremonies, in much the same manner as peals and clashes of tower bells. Such recorded occasions included patronal feasts, the reception of distinguished guests, and the presentation of abbots-elect. For purposes like these the normal location for the machine was an elevated position in the body of the church, not necessarily close to the liturgical choir. For instance, in 1174 the organ of Christ Church, Canterbury, stood some 28 feet above floor level, on a tribune gallery in the southwest transept, and as late as 1332 it was located on a timber gallery outside the choir—as was also the case at Wells in 1310 and Ely in 1329.

During the second half of the 13th century the finger-pressure sprung keyboard was developed, making possible the exercise of some delicacy of control over the sounds emitted by the organ. Thus was rendered possible its evolution from a mere noise machine of limited refinement into a genuine instrument of music making. In England this transition was probably in course by around the second quarter of the 14th century. By 1337 the Exeter Cathedral Ordinal admitted the sound of the organ even to the liturgical service on occasions substituting for the final versicle and response at Matins and Vespers, and following the Sanctus at high mass.

Pictorial evidence from ca. 1100 onward is helpful in portraying the construction and nature of the instrument and the manner and chronology of its development. Essentially all church organs down to the early 15th century were positives (medium-sized, portable organs) of various degrees of elaboration, played by one individual and pumped simultaneously by another. The instrument was still of modest size and of not more than two ranks and apparently did not exceed two octaves in compass (see, e.g., the simplified depiction in the Peterborough Psalter of ca. 1320). Unfortunately little is known about the actual use of the organ at this time. No doubt its long-established functions continued alongside newer ones more musical in nature. There is no evidence whatever to suggest that up to ca. 1500 the church organ in England ever made music *simultaneously* with voices. Rather it seems that it was used principally to enhance the ceremonial impact of certain major items of the plainsong liturgy, through interspersing interludes improvised upon the proper melody between the verses or sections of items sung in the choral monody of plainsong as, for instance, during the singing of *Te Deum* in 1396 at the reception of the abbot-elect of St. Albans.

Reflecting its closer association with the music of the liturgy, the principal church organ from ca. 1350 onward was commonly located in immediate proximity to the liturgical choir of the church. It comes to be referred to as *magna organa*, the “great organ,” to distinguish it from a second, smaller, instrument that is found widely from ca. 1390 onward and was set up in the Lady Chapel for participation in the performance of the daily votive mass of

the Virgin Mary. In England the commonest location for the great organ was the pulpitum, the open loft on top of the choir screen. By the end of the 14th century the use of the organ—equipped by now with a fully chromatic keyboard—was sufficiently routine for its playing to be deputed to particular individuals among the musical staff; to some extent, that is, a distinct and particular skill of church organ playing was coming to be recognized.

During the 15th century the instrument steadily expanded in both physical size and technical sophistication; the number of organs also increased, since from ca. 1430 onward organs began to be installed in many of the wealthier parish churches of the cities, country towns, and even some villages. However, at least by comparison with contemporary Dutch and German instruments, the English organ appears to have remained relatively small, of a single manual, unequipped with pedals, and until the late 15th century enjoying no written repertoire. Nevertheless, the diversity of the sums of money expended on new instruments suggests that organs could be built in a variety of sizes, and while the smaller sums were doubtless for positives of the long-established design, the largest works and expenses involved—as at St. Albans ca. 1425–28, at Lincoln in 1473, and at Lichfield in 1482—were probably for case organs after the continental fashion. This design was of a substantial instrument in which the pipework was enclosed in an imposing timber case; the front of this was primarily an open frame in which the visible pipes were arranged not in scalar but in decorative order—most frequently, *en mitre*, or in an A-shaped arrangement. The common English placement was upon the choir screen. Two early-16th-century organ contracts specify keyboard compasses of 27 “white” notes, and contemporary documents speak of instruments of up to five to seven ranks, separable by stops, played from a single manual without pedals. However, in the absence of surviving pipework it is impossible even to guess at the character of sound that was cultivated.

As the physical size and complexity of the organ increased, the esteem for its player also rose, and the 1453 statutes of Kings College, Cambridge, and Eton College are the earliest to make provision among the chapel staff for a specific player of the organ; thereafter instances of the creation of this office rapidly become commonplace. The most usual direction was that the organ in choir be played on Sundays and major feasts and the smaller Lady Chapel organ daily in association with Lady Mass. Some 15th-century inventories of books for service use include volumes described as “for the organs”; these are always plainsong service books, most commonly antiphoners, with a few graduais. Inventories of late-15th-century written music now lost also mention composed music, written for insertion into, or alternation within, such items as hymns and canticles, and the Alleluia, Sequence, Kyrie, Sanctus, and Agnus from the mass. Apparently the role of the organ at this period was still mainly

to lend distinction to the service on principal days by alternating with the choir, or substituting for it, by means of passages of improvised or written elaboration upon the plainsong proper at that particular point.

Orm (fl. ca. 1170)

Augustinian canon and author of a series of exegetical homilies in verse, which he named *Ormulum* and which expound the life of Christ on the basis of a harmonization, or synthesis, of the Gospel accounts. It was probably written ca. 1160–80, somewhere in the Peterborough-Stamford area, and was conceived of as an aid to preachers. It is a key document for understanding linguistic and cultural developments in 12th-century England.

The work, now a fragment, is preserved in one manuscript, Bodl. Junius 1, the authors holograph. The homilies are preceded by a paraphrase of the pericope (the scriptural reading being explicated) and occasionally end with a short prayer. The exegesis is traditional and nonscholastic; although the precise identity of his sources is unknown, Orm probably worked from a glossed gospel of a type exemplified by the *Glossa ordinaria* and related commentaries

of the 11th and early 12th centuries.

His language has a strong Old Norse element and displays innovative uniformity in spelling and vocabulary, in an attempt to remedy contemporary linguistic confusion and establish a literary standard. Although the verse form, the *septenarius* (a line of seven poetic feet), is of Latin origin, his homiletic rhetoric clearly derives partly from native models, inviting comparison with late OE homilies.

Ormesby Psalter

The Ormesby Psalter (Bodl. Douce 366; [fig. 102](#)), one of the most enigmatic and sumptuously decorated of all 14th-century manuscripts, takes its name from Robert Ormesby, whose gift of the book to the Benedictine Priory of Norwich, where he was a monk, is recorded in an inscription on fol. lv. Cockerell gives a

detailed account of the book's structure and iconographic contents. There were three or four separate campaigns spanning some 50 years (ca. 1280–1330), depending on the dating limits accepted, and the work of at least eight illuminators can be identified. The entire text of the psalter, with the exception of the added calendar and litany of Norwich Cathedral Priory, was prepared in the 13th century (probably ca. 1280), when most likely only one (fols. 10–21) of the seventeen original gatherings was fully illuminated in a style bearing many similarities to the William of Devon group of manuscripts (e.g., the Cuerden Psalter [New York, Pierpont Morgan Library M.756]) or those related to the Huth Psalter (BL Add. 38116). This style is characterized by linear faces, simple figure forms, and dragon motifs that extend from the initials and terminate in rectilinear and cusped foliage elements, some of which provide platforms for hybrids. There is also some unfinished work of this date in the form of outline drawing and gilding.

It is not known for whom the psalter was initiated or, indeed, for whom it was continued at some time between ca. 1310 and ca. 1320, when all the borders and historiated initials at the ten major divisions, except those for Psalm 1 and possibly Psalm 26, were executed by an artist of the highest order. Progressive tendencies in the rendering of the human figure, in which there is attention to anatomical structure, coupled with innovative iconographic motifs, such as the classical trumpeter (fol. 147) and the nude male riding on the back of a lion (fol. 147v), suggest an early instance of Italian influence. These forms may have derived from illuminated Bolognese civil and canon law books circulating in England at the time. The margins on these folios are filled with borders of considerable richness and exuberance, comprising a wealth of naturalistic foliate and flower forms, a variety of hybrids, and narrative genre elements. This unique artist illuminated, single-handed, three other extant works (the Bromholm Psalter, Bodl. Ashmole 1523; a *Moralia in Job*, Cambridge, Emmanuel College 112; and an Apocalypse, Dublin, Trinity College 64 [K.4.31]), but none contains internal evidence for dating.

The artist who illuminated the historiated initial and border at Psalm 26 of the psalter was also responsible for painting the Beatus leaf from another psalter (with the exception of the kneeling monk and bishop who cover the original text) now inserted at the beginning of the Ormesby Psalter's text of the Psalms; it thus forms a splendid frontispiece to the volume. The initial B encloses a kneeling female and male in heraldic dress of the Bardolf and Foliot families. The rest of the frontispiece consists of an elaborate Jesse Tree, one of the most splendid of surviving examples. Whether this portion (including Psalm 26) dates to before or after the

Fig. 102. Ormesby Psalter (Bodl Douce 366), fol. 147v. Psalm 109: Dixit Dominus with Father and Son. Reproduced by permission of the Bodleian Library, University of Oxford.

ca. 1310–20 campaign will be difficult to establish, but the fact that no evidence has been found of a marriage between these families at the date in question may explain why the psalter was again laid aside.

This artist, although thought by Cockerell to postdate the main illuminator, has a more linear style mostly untouched by italianisms. However, the artist who painted the half-page miniature of the harping David at Psalm 1 (fol. 10) and the inset of the monk and bishop on the Jesse frontispiece (fol. 9v) develops the italianate approaches of the main illuminator, but with a vastly different outcome, resulting from the influence of Italian panel painting rather than illumination. This style, often described as Ducciesque, constitutes an important advance toward naturalism. It displays novel technical experimentation, greater corporeality of the human figure, and three-dimensionality in spatial modeling, features well illustrated by the Beatus miniature. Particularly characteristic of this artist is his idiosyncratic use of large amounts of thick white pigment.

This illuminator, who works in the same style as the now damaged Douai Psalter (Douai, Bibliothèque Municipale 171) and the added Crucifixion of the Gorleston Psalter (BL Add. 49622), may also have illuminated the 14th-century portion of the St. Omer Psalter (BL Yates Thompson 14 [Add. 39810]). The dating of this, the final campaign in the Ormesby Psalter, is traditionally based on the supposed dating of between 1322 and 1325 of the related Douai Psalter. Further research, however, may confirm a date in the 1330s for this style, a dating that would make greater sense in the light of developments of the 1340s. If this were the case, then the bishop to whom Robert Ormesby is presenting his psalter would be William de Ayermin, bishop between 1325 and 1336, and not Bishop Salmon. At the time Robert made his gift, the calendar of Norwich Cathedral Priory (fols. 2–7) and a further litany, with collects (fols. 209v–213), also of the priory, were prepared, and the book was finally bound.

This fine example of “East Anglian” illumination is still in its original binding with a chemise of heavy sheepskin. There is little doubt that the 14th-century illumination of the psalter was produced in a workshop somewhere in East Anglia, possibly in Norwich itself. A number of manuscripts to which the various Ormesby artists relate have strong Norwich associations. A precise dating for the various campaigns, however, must await further research.

Orosius, Paulus (fl. early 5th century)

Christian priest, apologist, and historian, who became the pupil of Augustine of Hippo in 414. In 415 he went to Palestine, bearing a letter from Augustine to Jerome, whom he joined in his struggle against the Pelagian heresy. After a synod in Jerusalem, where he confronted Pelagius and was himself accused of holding not entirely orthodox opinions, he composed the *Liber apologeticus contra Pelagianos* to clear himself. An earlier work demonstrating his concern for orthodoxy was his *Commonitorium de errore Priscillianistarum et Origenistarum*—a text that prompted Augustine’s treatise *Ad Orosium contra Priscillianistas et Origenistas*.

Orosius is best known for the *Historiarum adversumpaganos libri septem* (*Seven Books of History against the Pagans*), undertaken at the request of Augustine and intended to provide a context for the latter’s *City of God* by providing a history of the whole world up to 414. After a brief survey of the geography of the world Orosius presents the fortunes of the four great empires: Babylon, Macedon, Carthage, and Rome. Seeing the *pax Romana* as foreordained by God for Christ’s coming, he argued that the whole of history had been leading to the universal empire of Rome, God being the one ruler of all ages, kingdoms, and places. In reply to allegations that the troubles of his time were the result of the abandonment of the pagan gods, he also used history to demonstrate that calamities had always occurred in cycles. Among his many sources were the Bible and a range of both pagan and patristic authors, from Livy, Caesar, Suetonius, Justinus, and Eutropius to Tertullian and Jerome’s revision of Eusebius’s *Chronicon*.

The *History against the Pagans* achieved great popularity in the Middle Ages, surviving in over 250 manuscript copies and attracting both commentators and translators. Translations include an OE translation possibly undertaken under the sponsorship of King Alfred the Great in the late 9th century, containing additional material based on contemporary reports. The

first printed edition of the Latin text was published in Augsburg in 1471.

Oswald of Worcester (d. 992)

Bishop of Worcester (961–92), archbishop of York (971–92), and one of the three leading figures in the Benedictine Reform of the late 10th century, along with Dunstan of Canterbury and Æthelwold of Winchester. The youngest of the three and by many scholarly accounts the most moderate, Oswald established Worcester with its related monastic foundations as a powerful cultural force that continued in influence beyond the Norman Conquest. Oswald's Ramsey, for example, became a model house and Byrhtferth its most famous writer. Byrhtferth's life of Oswald, while depicting Oswald as an icon of Benedictine monasticism, also notes Oswald's wealth, his large retinue, and his gout.

Outlawry

Known in early Anglo-Saxon customary law, although how it evolved is unclear. For nearly 200 years after the Conquest only men accused of felonies—the more serious crimes—could be outlawed, but in the 13th century outlawry was extended to those accused of trespass committed with force and later to defendants in an increasing number of civil actions, such as debt.

When appeals (formal private accusations) of felony were made in the county court, the process of “exigent,” which preceded outlawry, began at the second sitting of the court. If the accused did not appear when felonies were prosecuted publicly before the king’s justices, the exigent was initiated on their orders. In all other cases it needed a writ to the sheriff of the county. The procedure was unvarying; the accused had to be “exacted,” or called to surrender to the king’s peace, at four successive sittings of the (normally monthly) county court, or at five if sureties were found at the fourth for his appearance at the fifth. If, as was usual, he still did not appear, he was then outlawed. Exactions and outlawries were invalid if proclaimed in the absence of the county coroners, who had to record them.

Strictly outlaws “bore the wolf’s head” and could be captured or, if they resisted, slain with impunity. In practice summary execution, even of criminals, was rare and became virtually unknown after 1300. It never applied to those outlawed in civil actions, in which outlawry was merely the culmination of long and complex series of attempts to get defendants to stand trial. Such outlaws, who became numerous, were far removed from the violent but romantic outlaws of legend. Nevertheless, they were outside the protection of the law, had no legal rights, and should have forfeited their possessions. Therefore most—sooner or later—purchased a pardon or had their outlawry revoked on a technicality. Children under twelve and women could not be outlawed; women, however, could be exacted and “waived,” which had the same effect as outlawry.

Outlaws and Robin Hood

“Outlaw” in medieval England had a technical meaning: a person put outside the protection of the laws of the realm. It was in one way the ultimate penalty for crime. The outlaw was a “nonperson”; his property was subject to invasion, his person open to murder without punishment. Yet the sentence of outlawry also reveals the limited reach and effectiveness of medieval law enforcement. It was the sentence passed on criminals who escaped arrest and could not be brought to trial. Either they had disappeared into areas beyond royal control, such as the forests, or they commanded an armed band and local sympathy, making forcible arrest impractical, or both.

The sympathy some criminals enjoyed points out the other weakness of medieval justice. It was open to corruption, to domination by king’s favorites or powerful nobles, and was therefore often less than just. The histories of outlaws are tales of bought justices and stacked juries. At the least this was a common perception of the problem and contributed to the literary popularity of the outlaw figure in romance, epic, and ballad.

Certainly the most enduringly popular of outlaw heroes is Robin Hood. While earlier heroes of story and song, such as Hereward the Wake and Fulk Fitz Warin, had recognizable historical careers, the original Robin Hood is much harder to pin down. And whereas Hereward and Fulk were celebrated in French and Latin romances, the earliest Robin is known through English ballads, though elements of the romances clearly influenced the Robin Hood

tales.

Whether there was an original Robin Hood or not, the type was real enough. The most plausible hypotheses about Robin's career place his activities sometime in the 13th century, probably in the vicinity of Barnesdale in south Yorkshire. The legend grew and spread from there, gaining elaboration in the 14th century. His stomping grounds soon included Sherwood Forest, south of Barnesdale. The Sheriff of Nottingham became the traditional enemy, and Little John, Will Scarlett, and Much the Millers Son joined the merry men early on. Friar Tuck and Maid Marian seem not to enter the tales until well into the 15th century. Robin was from the first a great archer. He lived by poaching the king's deer and by ambushing travelers, especially monks and the sheriffs men.

Initially popular among the yeoman retainers of great feudal households (the early Robin is "a good yeoman"), the minstrels' ballads adapted to the changing social and geographical range of their audience. With the writing down and then printing of the tales in the 15th century the outlaw entered into several centuries of literary metamorphosis. He emerged as the romantic woodsman of 19th-century imagination who stole from the rich and gave to the poor. It is doubtful whether the original outlaw would recognize his socially progressive descendant.

Owl and the Nightingale, The

One of several ME debate poems of literary distinction. It is also one of the masterworks of early ME literature and probably the greatest comic poem in English before Chaucer. Composed in the south of England around 1200, perhaps by a provincial cleric named Nicholas of Guildford, *The Owl and the Nightingale* is the earliest of the ME debate poems, created shortly after the

first vernacular debates began to appear in Provençal and Old French during the 12th century. *The Owl and the Nightingale* reflects many of the conventions that had developed within Latin debate poetry, but it is superior to most of the earlier Latin debates; and although *The Owl and the Nightingale* was composed in English rather than French, it appears to be closely tied to the Anglo-Norman culture of late-12th-century England. Its metrical form is the octosyllabic couplet, a meter used in many contemporary French narrative poems, and it contains allusions to such 12th-century Anglo-Norman works as the *Lais* and *Fables* of Marie de France.

The Owl and the Nightingale is told by a first-person narrator who offers an ear-witness account of a confrontation between two highly contentious birds. The narrator sets the scene, introduces the avian rivals, and provides transitions between their lengthy speeches. He also comments on the inner feelings and thoughts of the birds, but his neutral presence never obtrudes upon the birds' colorful, colloquial exchanges, which occupy the greater part of the poem's nearly 1,800 verses. The birds' exchanges appear to be freewheeling and spontaneous, but they are actually carefully structured. Their debate consists of a preliminary skirmish (lines 29–176) and a “debate proper” that begins about line 215 and continues to about line 1634, where it breaks down. The preliminary skirmish, which consists mostly of insults and threats, is initiated by the Nightingale's disparaging remarks about the Owl's physical appearance and singing ability. The “debate proper” follows the birds' agreement to adopt more formal debating procedures and to submit their views to the judgment of Nicholas of Guildford, a human figure who is praised by both birds. Throughout the remainder of their debate they take turns being on the offensive and the defensive, perhaps somewhat in imitation of legal or ecclesiastical proceedings.

No single issue dominates the birds' attention, and they move through a variety of concerns, sometimes returning to an earlier issue after other matters have intervened. Of particular importance to them are their assessments of the quality and the value of their songs, and related to this are their claims of service to humankind. Their arguments are characterized by quick-wittedness and ingenuity but also by inconsistency and faulty logic. Their most arresting comments concern the sexual behavior of women. When the Nightingale speaks in defense of single women who have committed fornication, the Owl in turn justifies the adultery of married women. These comments, which reflect the birds' mutual sympathies for women (both of the birds, it should be noted, are female), may also reflect the medieval poet's concern for the well-being of women. In any event, when the birds' debate finally collapses into disorder and violence is again threatened, the Wren intervenes, cautions them about breaking the king's peace, and reminds them of their agreement to accept the

judgment of Nicholas of Guildford. The poem ends without being resolved; the birds fly off in search of Nicholas, and the narrator states, “Ne can ich eu na more telle” (“I can’t tell you anything more”).

The author of *The Owl and the Nightingale* exhibits many talents, including a flair for writing colloquial dialogue, the ability to create vivid and psychologically plausible characters, skill at handling a complex structure, and a sophisticated sense of comedy. The identity of this talented poet, however, remains uncertain. Perhaps the author was the “Master Nicholas of Guildford” whose virtuous character is twice described in the poem (lines 191–214 and 1746–80), but attempts to identify a minor churchman of this name have been inconclusive. Because the poem expresses chagrin at Nicholas’s neglect by his ecclesiastical superiors, it is also possible that the author was one of Nicholas’s sympathizers or a close friend. However, if the poem was meant to serve as a plea for Nicholas’s preferment, as some critics believe, one wonders whether the poem’s harsh criticisms of Nicholas’s superiors would be likely to further that purpose. The poet’s attitude toward Nicholas may have an ironic edge, and the birds’ praise of Nicholas may be intentionally hyperbolic. Yet the evaluation of Nicholas offered by the wise little Wren, near the end of the poem seems sincere and reinforces our perception of Nicholas as a man of humanity and discretion.

The Owl and the Nightingale has generated a substantial body of scholarship. In addition to considerations of its date and authorship much has been written about the possible symbolic and allegorical meanings of the two birds, about the poem’s possible relationships to particular historical contexts, and about the poet’s use of sophisticated rhetorical strategies. There is not a great deal of consensus on these matters, but most critics do agree that the two birds represent contrasting attitudes toward living. Whereas previously there was interest in determining which bird was the likely victor, most recent critics favor the view that neither bird emerges as a clear winner and that the poet’s satiric commentary on human nature and human behavior involves both birds fairly equally.

The text of *The Owl and the Nightingale* is preserved in only two manuscripts, BL Cotton Caligula A.ix and Oxford, Jesus College 29, both of which were probably compiled during the second half of the 13th century. These two versions of the poem may have derived independently from a common source. Because the version in the Jesus manuscript contains many scribal emendations, most editors of *The Owl and the Nightingale* have based their editions upon the version preserved in the Cotton manuscript.

P

Paganism and Superstition In Old English Literature

Both “paganism” (from Lat. *paganus*, “rural”) and “superstition” (from Lat. *superstitio*, a word whose semantic derivation has been disputed since Cicero) are value-laden terms. The former, semantically similar to OE *hapennisse* and *hapendom* (cognate with German *Heidentum*), implies that these beliefs are connected with the unsophisticated countryside and rustic culture, while the latter has a connotation similar to that of the German *Aberglaube*, indicating a set of religious beliefs and practices at variance with, but often tolerated by, orthodox religion (Harmening, 1979). The use of “non-Christian” and “pre-Christian” changes the semantics again, as those terms imply customs that are either outside of, or earlier than, established Christian orthodoxy and hence suggest a pejorative connotation. Indeed all such terms, when used of Anglo-Saxon beliefs and practices, are biased in favor of Christianity; moreover the Anglo-Saxon church itself took the view that Christianity was the superior religion. Since it is the Anglo-Saxon church that has enabled the survival of most source material for the investigation of “pagan” and “superstitious” beliefs and practices in pre-Conquest England, it comes as no surprise to find the negative bias associated with these terms reflected in the sources as well.

The sources for our knowledge of Anglo-Saxon pagan beliefs and superstitious practices are sparse. For the period prior to the coming of Christianity with Augustine we are limited to archaeological evidence (often subject to widely divergent interpretations; cf. Hills, 1979) and the reports of outside observers (e.g., Tacitus in his *Germania*, a notoriously jaundiced source; or Venantius Fortunatus writing about Gaul in the 6th century, his views strongly colored by his opinion that the Germanic peoples were barbarians); or even Snorri Sturlusons descriptions of the ancient gods, sometimes used as evidence for the religious practices of an earlier age. In any event what Tacitus, Fortunatus, and Snorri have to say about practices among the Germanic tribes of the 1st or the 6th century or later does not shed much light on beliefs and practices in England.

For the period after 600 we have some additional sources; Bede and Aldhelm are remarkably taciturn about non-Christian beliefs, though they must have had some notion of both the extent and nature of these beliefs. The earliest Anglo-Saxon laws contain condemnations of pagan beliefs, but in general the laws are laconic, and it requires considerable effort on the part of historians and comparative folklorists to tease any kind of “reality” out of them (see especially Liebermann’s voluminous commentaries). The same is true of the penitential handbooks, noteworthy in part for their association, rightly or wrongly, with some famous churchmen (Archbishop Theodore of Tarsus, Egbert of York, even Bede, though the ascription of a penitential to him is probably in error).

The proliferation of penances for various kinds of beliefs contrary to orthodox teachings may indicate that some of these beliefs persisted long after the complete conversion of the English to Christianity. Many of these practices can be explained through reference to Celtic practices, some of which have been more extensively described than English ones. They may not be specifically Anglo-Saxon at all but may have been carried over from continental sources or been common to the entire Germanic world, as seems clear from the fact that the same proscriptions also appear in continental handbooks of penance (e.g., that of Burckhard of Worms). We also have a description in the Legatine Report to Pope Hadrian (742), but the best-known sources are no doubt Wulfstan’s *Sermo Lupiad Anglos* and Ælfric’s homilies *De diis gentium* (*On the Gods of the Nations*) and *De auguria* (*On Divination*). Taken together these form but a small corpus of evidence for pagan beliefs and superstitious practices in pre-Conquest England.

The evidence can be supplemented from several sources. Bede’s famous story of the sparrow (*Ecclesiastical History* 2.13) may throw some light on a non-Christian worldview in the Northumbria of his day, though it must be used cautiously, since we have only Bede’s word for the historicity of this story. The reproving words of the *Beowulf* poet about the Danes reverting to their ancient beliefs are perhaps the best-known statement on this topic, though his attitude is strictly in line with the orthodox teachings expressed by writers from Theodore to Ælfric. Yet little can be said with certainty about the beliefs and practices of the English during this time, other than to point to some of them: divination with birds, horses, sneezing, dogs (Ælfric lists these in the *De auguria*); stars, thunder, meteors, comets, dreams, and the moon; pin-sticking magic (recorded in a charter of 895); holy wells (their pre-Christian origins obscured by the syncretism of the Anglo-Saxon church); and medical charms. And the laws contain a variety of punishments for witches and sorcerers, though just how they practiced their *scincraft* is not specified.

The heroic ethos, expressed as an ideal in *Beowulf* and *Maldon*, and adapted

to Christianity in *The Dream of the Rood* (early on, it would seem, from the lines carved on the Ruth-well Cross), clearly predates Christianity, though like religious beliefs it may have been as often attended to in the breach as in the observance. The same is true of the traditional methods of composing poetry, both in its preferred themes and imagery (e.g., the notion of *wyrd*) and in its versification, whose formal metrical properties were at the same time complex and full of scope for the talented poet. The skills required for a poet (ascribed to divine inspiration by Bede in the story of Cædmon) and the knowledge of stories about pagan heroes (demonstrated in the many “digressions” in *Beowulf* or Aldhelm’s complaint about the monks of Sherborne singing secular songs about pagan heroes) are a clear legacy of “pagan” and pre-Christian England. This legacy not only survived in the secular poetry but was also adapted by Christian poets for the composition of religious poetry.

Painting and Wall Painting, Gothic

English Gothic painting, long neglected because so little survives, is a field rich in isolated works of high quality, often innovative in both subject and technique. Substantial documentation of lost works supplements this lean material. The fact that the two finest panel paintings, the Westminster Retable (a panel designed to be placed behind an altar) and the Wilton Diptych ([fig. 149](#): see WILTON DIPTYCH), equal and perhaps surpass anything produced on the Continent at the time underscores the importance of this field. But the paucity of examples necessarily limits the available avenues of study.

The study of panel painting begins with the Westminster Retable, a unique survival from the 13th century in either England or France. East Anglian altarpieces of the 14th century share its general shape and material (oak) and its textured brilliance: the Thornham Parva Retable, the Cluny Panel, the Norwich Retable, and isolated panels from several Passion retables now in the Fitzwilliam and Ipswich Museums, and the panels from St. Michael-at-Plea in Norwich Cathedral. Numerous stylistic parallels are to be found in other media, especially manuscript illumination and Opus Anglicanum.

The Thornham Parva Retable (Suffolk) and the panel with scenes from the life of the Virgin (Paris, Cluny Museum), long recognized as coming from the same workshop because of the stamps used in their raised backgrounds, have recently been shown to have adorned the same altar as retable and frontal, probably the altar of the Dominican Thetford Priory in Norfolk, founded in 1335. At the center of the retable Christ on the Cross is flanked by the Virgin Mary and St. John the Evangelist, while to either side are saints identifiable by their attributes: Dominic, Katherine of Alexandria, John the Baptist, Edmund, Margaret, and Peter Martyr. The Cluny Panels design is more unusual, featuring Marian narratives in cusped medallions reminiscent of contemporary manuscript illumination. The Nativity, the Death of the Virgin, the Adoration of the Magi, and the Education of the Virgin were probably supplemented by an Annunciation at the far left, thus making the center the Death of the Virgin, a subject thematically aligned with the Crucifixion on the retable above.

As a less expensive alternative to panel painting wall paintings sometimes served as altarpieces. Examples include the paintings along the piers on the north side of the nave at St. Albans, in the chapel of St. Faith in Westminster Abbey, and at Brent Eleigh (Suffolk).

The Newport Chest (Essex) functioned as a portable altar with the open lid serving as the altarpiece showing the Crucifixion flanked by the Virgin Mary, St. John the Evangelist, St. Peter, and St. Paul (repeating the central grouping of the Thornham Parva Retable). Other painted chests include that given by Sir William de Lillebonne (d. 1334) to Winchester Cathedral and the chest of Richard of Bury, bishop of Durham 1334–45 (Glasgow, Burrell Collection).

Paintings often embellished furniture. The Coronation Chair in Westminster Abbey should be the most significant example, but its paintings, including the image of a seated king on the back, barely survive. Better preserved are the paintings on the sedilia, the seats for clergy, in Westminster Abbey (early 14th century). On the altar side, images of standing kings fill the first and third bays, but only the lower vestments of the figure in between escaped defacement, while nothing survives of the fourth figure—the board itself is a replacement. On the back, figures were paired: the Virgin with the angel of the Annunciation and St. Edward the Confessor presumably with the Pilgrim, a subject also depicted on an isolated 14th-century panel at Forthampton Court.

Choirstalls were sometimes painted on the back. The important cycle of types and antitypes at Peterborough has been lost, but at Gloucester Cathedral some of the stalls retain small, charming paintings of Reynard the Fox. Later painted stalls include those at St. George's Chapel, Windsor, and at Carlisle.

Tombs often had paintings, sometimes on the stone base, as, for example, the tomb of Eleanor of Castile (Westminster Abbey, ca. 1291), or, especially later, on a wooden tester over the effigy, such as the tester of the tomb of the Black Prince (Canterbury Cathedral, ca. 1376) and that over the tomb of Richard II and Anne of Bohemia (Westminster Abbey, ca. 1394). More surprising was the discovery of a life-sized effigy of Archbishop Walter de Gray hidden on the inside of his coffin lid and painted in the finest materials, including lapis lazuli and gold leaf (York Minster, ca. 1255).

Two panel portraits of Richard II, the large portrait of the enthroned king in Westminster Abbey and the small, private Wilton Diptych (London, National Gallery), supplement his effigy likeness. These are much higher quality works than the genealogy series that became fashionable in the 15th and 16th centuries.

Gothic walls were usually painted, whether the building was ecclesiastical or domestic. Simple masonry and drapery patterns were popular, as were geometric, floral, or heraldic motifs, but complex, figured compositions were also created. Nearly complete cycles survive in the Chapel of the Holy

Sepulcher at Winchester Cathedral (compare Sigüenza Chapter House in Aragón), Longthorpe Tower near Peterborough, several parish churches, such as the Church of St. Mary at Chalgrove, the Last Judgment and Apocalypse in the Chapter House at Westminster Abbey, and the extraordinary Miracles of the Virgin covering the side walls of Eton College Chapel.

The most famous royal cycle, the Painted Chamber at Westminster Palace, was destroyed by fire in 1834 but is reasonably well documented. Copies record the scene of the coronation of St. Edward located over the king's bed, the Old Testament scenes on the walls, and the virtues and vices along the windows. Fragments from a major cycle in St. Stephen's Chapel at Westminster (British Museum) supplement the copies and documents for that royal project. However, for the beautiful, damaged wall paintings in Byward Tower, the main gatehouse of the Tower of London, no documents confirm their proposed dating to the reign of Richard II.

Ceilings were another important field for paintings, as is clear from the nave at Peterborough (repainted in the 18th and 19th centuries). For the heavenly vault in the Chapel of the Guardian Angels at Winchester gilded wooden stars and rosettes enriched the painted medallions of angels. The chapter house at York Minster had large figures painted on the oak webbing of the vault similar to those that survive on the stone vaults of the Norwich Antereliquary chapel.

However, full cycles, whether walls or ceilings, rarely survive; more often mere fragments must remind us of the visual richness now lost. We lack the context for the three heads at Windsor, the Chichester Roundel, the Wheel of Fortune in Rochester Cathedral, and the images of St. Christopher and the Incredulity of Thomas in the south transept of Westminster Abbey. Some fragments in lesser-known locations are of impressive quality, such as those at Horsham St. Faith (Norfolk, ca. 1250).

Painted wooden screens survive in some quantity from the 15th century, especially in the parish churches of East Anglia and the West Country. The screens at Barton Turf (Norfolk), Ranworth (Norfolk), and Southwold (Suffolk) are especially fine.

Finally the Hereford Mappa Mundi defies categorization. Painted by Richard de Bello of Halingham and Lafford ca. 1277–89, this large map on vellum attached to an oak panel shows Jerusalem at the center of a round earth.

From this survey the incredible richness of Gothic design is clear, yet the paintings should not be considered in isolation but rather in the context of the architecture, sculpture, stained glass, embroidered vestments, manuscripts, metalwork, hangings, tapestries, and tiled floors that they were created to complement and compliment.

Palatinates

The term “palatinate” designates select regions ruled by feudal magnates who owed allegiance to the king. Palatinates had Frankish origins; in Merovingian and Carolingian France the *comes palatinus* or *comes palatii* was an important court official who carried out legal and judicial duties on behalf of the ruler. After the collapse of Carolingian central authority the *comes palatii* emerged as a semiautonomous local ruler; by the 11th century his power diminished as the central government resumed its power. In 12th-century Germany, however, counts palatine had extended local power, best exemplified by the count palatine of the Rhine.

William I introduced the concept of palatinates to England; Orderic Vitalis refers to Odo of Bayeux as “consul palatinus.” From that point until the 13th century its development remains obscure. Palatinates, whether called “liberties” or “franchises,” were at first without a clear legal definition. Nevertheless, they were understood for what they were; areas of considerable distance from the seat of government, in which royal powers were enjoyed by powerful—but not independent—local lords. By 1300 the three greatest palatinates were Chester, Durham, and Lancaster. With the exception of Lancaster power in these regions included the power to raise armies, levy taxes, and exercise justice.

The counties palatine of Chester and Durham had separate histories. Cheshire was created an earldom by William I in 1071 as a northern buffer state against Mercian rebellions. In 1237 Henry III attached it to the crown.

After that date (specifically in 1293, when a *quo warranto* proceeding—an investigation into legal rights to specific powers—uses “palatine” in referring to Chester), it had the advantage of palatine privileges: earls of Chester presided over county courts; royal writs “did not run”; taxes levied by parliament did not apply; feudal military levies exempted Cheshire men. Cheshire was taken under direct crown control in 1377, and Richard II, who recruited his infamous Cheshire bodyguard there, accorded it special status by raising it to the rank of a principality (in 1397). Richards deposition in 1399 returned Chester to its palatine status, but its privileges remained through the 15th century.

Even before the 1293 *quo warranto* proceedings acknowledged its select status, Durham enjoyed palatine privileges. Based ultimately on the ancient immunity of St. Cuthbert, successive bishops of Durham were granted charters of liberty from post-Conquest kings. Like Cheshire the liberty of Durham had most of the benefits of palatine status, including a county charter of liberties issued in 1303. Indeed Durham enjoyed even wider franchisai rights than Cheshire, as it could claim ecclesiastical immunities atop lay liberties. These extensive rights, however, were not exhaustive. Henry II made it clear that royal justice would obtain in “the land of the blessed Cuthbert,” and from time to time the bishopric’s autonomy was curtailed by royal seizures of some of its lands.

Paleography and Codicology

Anglo-Saxon

Although the earliest Anglo-Saxons were familiar with writing in runes and some of them may have been aware of the use of other forms of writing from contact with romanized peoples, it was not until their conversion to Christianity that they themselves became literate in the Latin alphabet. Christian missionaries, from Ireland to the north and west of England and from Rome to the east and south, brought both a new religion and an emphasis on the written word. Although most of these writings were in Latin and ecclesiastical in nature, certain texts, such as the Anglo-Saxon laws, were written down in the vernacular from the earliest days of the Conversion, requiring some adaptation of the sound values of some letters in the Latin alphabet to suit OE.

Latin texts written in 7th- and 8th-century England were usually written in local interpretations of the formal book-scripts used in late Roman ecclesiastical manuscripts. The earliest Anglo-Saxon Gospel books, Bibles, and diplomas were written in majuscule or semimajuscule scripts (Uncials or Half-uncials). The latter are found in books produced in churches associated with the Irish mission and the former in those with closer links to Rome. From the 8th century books and documents were increasingly written in minuscule scripts, those characterized by the use of ascenders and descenders. The earliest varieties are described as forms of “Insular Minuscule”—that is, of a type produced within the British Isles but not specific to any one of the constituent regions. In “Phase I” of this period, before ca. 700, the minuscule script is cursive and has many ligatures (links between neighboring letters); in “Phase II,” from ca. 700 to the first half of the 9th century, the script exists in a hierarchy of grades of formality (hybrid, set, cursive, and current) that could be adapted to a variety of texts.

By the late 9th century it is possible to distinguish an English style (Pointed Anglo-Saxon Minuscule) distinct from Irish or Welsh types of script; this script still allows a number of ligatures (particularly that of high *e* with a following letter) and the “underslung” form of *l*, and has a pointed top to *a*. This was succeeded during the 10th century by Square Anglo-Saxon Minuscule, a reformed script originating in southern England, in which ligatures and the “underslung” *l* were generally avoided, and in which the module of *a*., *n*, *o*, and *u* is square. Although this script continued in use at some writing centers for both Latin and English texts for most of the century, in those monasteries that were reconstituted by the mid-10th-century Benedictine Reform it was usually retained only for English; in Latin texts its place was taken by Caroline Minuscule. In bilingual texts both scripts were used, one for each language,

and in these one can most plainly see the contrasting forms of the letters *a*., *d*, *f*, *g*, *h*, *r*, and *s*.

Caroline Minusculer was a script that had been developed ca. 800 at the court of Charlemagne and had soon spread widely on the Continent but had not hitherto been generally used in England. Its greater legibility as compared with earlier scripts was helped by the scarcity of ligatures and the reduced number of letters having descenders, there being none on *fi* *r*, or high *s*. In England two varieties may be discerned—Style I in manuscripts written at monasteries associated with Bishop Æthelwold, such as the Old and New Minsters, Winchester, and Abingdon Abbey; Style II in those, such as Canterbury and Glastonbury, associated with Archbishop Dunstan. By the mid-11th century the size of letters in English Caroline Minusculer is generally larger than in the contemporary Norman variety. There is also a difference in the treatment of feet on minims, the short vertical strokes used in such letters as *i*, *n*, *m*, and *u*; scribes trained in England tended to make the feet horizontal, while those trained in Normandy formed them at an angle of 45 degrees.

The script used for vernacular texts developed from Square to Round Anglo-Saxon Minusculer in the early 11th century. In this, as in the preceding Insular, Pointed Anglo-Saxon, and Square Anglo-Saxon Minusculer scripts, when OE texts are written there occur the letters ash (*a*), thorn (*p*), eth (*ef*), and wynn (*p*), the 7-shaped abbreviation for *and*, the abbreviation for *pat*, but few other abbreviations.

A study of script can sometimes provide evidence for the origin of a particular manuscript or at least lead to the identification of a group of manuscripts or documents written by the same scribe. Where one of these can be precisely dated from its content, such dating can then give an approximate date to the others. Codicology, the study of the physical features of a manuscript book, may also give significant information relative to its precise origin but usually reveals facts only about its later history. Differences in the character of the parchment (usually calf- or sheepskin) on which the text was written may indicate that it was imported from the Continent rather than produced in Britain—early insular types being thicker and more suedelike and having less contrast between hair and flesh sides. Similarly the method of pricking the parchment sheets to guide the page rulings in each quire of a book (the gatherings of leaves folded and sewn together within a book) may reflect the book's early insular origin. In Britain before ca. 900 such quires were pricked after folding rather than before and therefore show pricks in both margins of each page rather than in only the outer one.

Different styles of decoration, the range of colored inks used in a book, the number and arrangement of sheets used to make its quires, and the manner in which quires are marked for the binder, as well as the nature of any original

binding itself, may each relate to a particular place or region of production and should be carefully recorded. Additional features, such as glosses, marginalia, flyleaves, later bindings, marks of ownership or sale, and library marks, can also tell of the later use and location of a manuscript before it reached its present home. All such external features of manuscripts are relevant to our knowledge of the original patronage, the intended audience, and the continued use of early-medieval texts into the modern period.

Post-Conquest

After the Norman Conquest scribes did not suddenly cease copying OE texts. The Anglo-Saxon Chronicle was still being kept at Peterborough in the mid-12th century, while copies of Ælfric's *Catholic Homilies*, saints' lives, the West Saxon Gospels, and Bede's Death Song were being made elsewhere in the late 12th or early 13th centuries. However, by 1220, it is clear from errors of transcription that scribes had difficulty comprehending the language they were copying, and this inspired a monk at Worcester to provide glosses (usually in Latin but occasionally in early ME) to 23 Anglo-Saxon manuscripts (Ker, 1985: 67–69).

Copies of OE texts were only a small fraction of the total output of book production in 12th-century England. As the century progressed, the demand for books grew rapidly. Cathedral and monastic libraries were anxious to build up their holdings and sought in particular to acquire the works of the Fathers of the Church (Ambrose, Augustine, Gregory, Jerome). Students at the emerging universities required copies of their set texts and commentaries on them. In the 13th century the new orders of friars needed books. Laypeople who read for profit and pleasure also began to desire books (Parkes, 1991).

The increasing demand for books could not be met by monastic scriptoria. Even for a monastery's own needs it soon became necessary to employ outside scribes to help in the task of copying: according to the late-12th-century chronicler of Abingdon Abbot Faricius (1100–17) employed six *scriptores* to copy patristic manuscripts, while the copying of service books was reserved for the monks (the *claustrales*). At Cirencester, ca. 1150, Ralph Pulleham, *scriptor*, was hired to assist canon Alexander produce a copy of Bede. Professional scribes who were paid for copying supplied the new markets created by the secularization of learning and advances in lay literacy. By the mid-13th century a book trade thrived in the university towns, where both new and secondhand copies of texts could be bought by scholars (Parkes, 1991), while in London the trade was firmly established near St. Paul's Cathedral by the end

of the 14th century (Christianson, 1989).

Although one speaks of the “book trade,” this does not necessarily mean that scribes were paid to work in an organized bookshop on a regular footing. John Lutton of Oxford, who copied two manuscripts of Higden’s *Polychronicon*, one for Hyde Abbey, Winchester, and the other for Bath Priory, is recorded in 1410 both as a scribe and a brewer (Doyle, 1990: 18). In London the poet Thomas Hoccleve, clerk of the privy-seal office, was one of five early-15th-century scribes who worked independently to produce a manuscript of Gowers *Confessio Amantis* (Cambridge, Trinity College R.3.2); he must have been “moonlighting” to eke out his income. The mid-14th-century scribe of the Harley Lyrics (BL Harley 2253), the Anglo-Norman romance *Fouke Fitzwarin* (BL Royal 12.C.xii), and of at least 40 documents conveying property for burgesses, craftsmen, clerics, and widows in the Ludlow area may have been the parish clerk.

Scribes like those of the Trinity Gower were probably employed by an entrepreneur who undertook financial responsibility for arranging the copying of a work and who accepted commissions from the book-buying public (Doyle and Parkes, 1978). Hoccleve’s co-workers included one scribe who, since he also copied six other copies of the *Confessio Amantis*, two copies of the *Canterbury Tales*, a copy of *Piers Plowman*, and part of Trevisa’s *Depropnetatibus rerum*, seems to have been a full-time specialist in vernacular book production. A second scribe copied both the Hengwrt and Ellesmere manuscripts of the *Canterbury Tales* (National Library of Wales Peniarth 392; San Marino, Huntington Library 29 C9). On the other hand scribes could also be hired directly by a patron, as was William Ebesham by Sir John Paston to copy a “Grete Boke” of chivalry (BL Lansdowne 285).

Ebesham’s bill for the “Grete Boke” gives some idea of the costs incurred in producing a relatively plain manuscript in the late 15th century. For copying and rubricating (adding headings and other features in red ink) he charged Sir John 63s. 8 d. Earlier accounts itemizing the costs of parchment, copying, decoration, and binding are noted on the flyleaves of books given by William Dyngley, bursar, to Peterhouse, Cambridge (MSS 88, 110, 114, 142, 154, 193). Little was spent on rubricating (only 6d. to 12d. a volume) as opposed to copying these books for the library (from 16d. to 20d. a quire). By contrast a two-volume missal commissioned in 1382–84 by Nicholas Lytlington, abbot of Westminster, containing over 50 historiated initials and miniatures, had cost £4 for copying but £22 3d. for illumination. Because of such costs relatively few ME books had pictures: only six copies of the *Canterbury Tales* were illustrated (Parkes and Beadle, 1980: 3:58 n.72), including the Ellesmere Manuscript, which has portraits of each pilgrim who tells a story. The copy of *Troilus and Criseyde* found in Cambridge, Corpus Christi College 61, was

intended to be illustrated with about 90 pictures, but only the frontispiece was executed (Parkes and Salter, 1978).

Some people copied their own books, thereby saving money: Robert Thornton, a frugal Yorkshire gentleman, copied two large compilations of religious texts, medical tracts, and romances (Lincoln Cathedral 91; BL Add. 31042), and sixteen-year-old Thomas Spirleng shared with his father, Geoffrey (a burgess of Norwich), the copying of the *Canterbury Tales* (Glasgow University Library Hunterian U.1.1).

Books were written in one of three basic kinds of script depending on the type of book: 1) *Textura*, also called Gothic Bookhand or Textualis (Brown, 1990: 80–89), an elaborate, angular “display” script used especially for psalters, liturgical books, and books of hours. A smaller version with drastically modified letter forms was used for academic books. 2) *Anglicana*, a cursive script introduced into books toward the end of the 13th century, which was more familiar to readers who were accustomed to read documents (Parkes, 1979: xiv-xvi and pis. 1–3). Cheap books of vernacular prose and verse were produced in this script throughout the 14th and 15th centuries. A more calligraphic variety of the script, *Anglicana Formata*, was used in more expensive manuscripts containing works like the *Canterbury Tales* and *Confessio Amantis* (the Ellesmere and Hengwrt manuscripts and the Trinity Gower). A third variety was *Bastard Anglicana* (Parkes, 1979: pis. 7–8), used in deluxe books. This was a mixture of the cursive hand of documents and the Textura script of the most expensive books or between a “base” and a “noble” hand, hence described as “Bastard.” 3) *Secretary*, a cursive script imported from France at the end of the 14th century (Parkes, 1979: pis. 11–13); it rapidly became popular, completely superseding Anglicana by the 16th century. The upmarket variety of this script, *Bastard Secretary*, developed from a mixture of Secretary and Textura (Parkes, 1979: pis. 14–15). Throughout the 15th century, however, books were often produced by scribes unconcerned with calligraphy who wrote mixed hands with letter forms appropriate to Anglicana and Secretary appearing together in their individual repertoires.

In most surviving manuscripts text was copied across quire boundaries, the quire being a gathering of conjoint leaves (often eight) secured one within the other by sewing through the middle of the center bifolium. Many manuscripts, however, consist of separate groups of quires where one group or “booklet” originated as an independent unit from another group and included self-contained text. Collecting a number of such booklets together was the cheapest and easiest way to build up a private library.

Because many medieval books contain “libraries” of texts rather than a single item it is often possible to discern from the tastes reflected in the choice of contents the class of reader for whom a particular manuscript was intended.

The mid-14th-century Auchinleck Manuscript (Edinburgh, National Library of Scotland Advocates' 19.2.1) is a compilation of ME religious and secular texts, perhaps produced for a wealthy London merchant who wished to emulate the lettered chivalry in his choice of reading. Like the French books of romances that the latter would have been reading the Auchinleck Manuscript contains illustrated copies of "household romances" (*Guy of Warwick*, *Bevis of Hampton*) and histories (*Richard Coeur de Lyon*). The massive Vernon Manuscript (Bodl. Eng. poet, a.1) contains almost every item of religious and devotional prose and verse available at the time it was produced (ca. 1400), perhaps for a community of women (Doyle, 1987). The title "sowlehele" at the head of its table of contents emphasizes its function as a spiritual encyclopedia. A plain unillustrated volume containing texts from the Primer, saints' lives, and popular and pious romances (CUL Ff.2.38) seems intended for the edification of a devout bourgeois family of the late 15th century. The ownership of a volume (when it can be established) can provide even more specific information about the reception of a work. Thus, from the number of anthologies of courtly verse owned by 15th-century knightly families, it clearly was fashionable among them to read Chaucers and Lydgate's minor verse (Bodley 638 facsimile, p. xxxv).

Parish Church Architecture

The division of England into parishes was a long and complex process, beginning in the later Anglo-Saxon period and continuing into the 12th century. In the Anglo-Saxon period churches with multiple clergy, known as minsters, were the mother churches of areas much larger than the later medieval parishes. The foundation of other churches in the minster's *peruchia*, whether by local thegns, larger monasteries, or even by the clergy of the minster itself, led to the breakdown of the minsters' authority and their eventual relegation to parish-church status themselves, although they sometimes retained special privileges in an area, a higher status often reflected in their post-Conquest architecture, particularly in their possession of cruciform plans.

There appears to have been a "great rebuilding" or building of small local churches, whatever their precise status, in stone during the century ca. 1050–1150. The vast majority of these buildings appear to have been simple structures of two parts, the larger a general assembly area for the congregation—the nave—and the other, at the east, a sanctuary for the altar. The latter space might be apsidal but was more commonly square, though usually narrower than the western compartment. The arch separating the two areas might be decorated with carved capitals or rudimentary arch moldings, and the same might be true of the doorway(s) into the nave, which was generally placed on

the north or south side rather than in the west wall. Botolphs in Sussex or Kempley in Gloucestershire might serve as examples of these simple churches.

Fig. 103. Pattrington Church, Yorkshire, from the south. Courtesy of L. Hoey.

Simple parish churches of this sort continued to be built throughout the 12th century, but after 1100 and especially after ca. 1120 more elaborate buildings began to appear, generally at sites owned by prominent patrons, lay or ecclesiastical. These buildings might retain the simple two-cell plan but add elaborate ornamentation (Steetley in Derbyshire or Barfeston in Kent), or they might expand the plan by adding new cells or a tower (Peterchurch in Herefordshire or Castle Rising in Norfolk). Rib-vaulted chancels became popular in certain regions, particularly in the west (Elkstone in Gloucestershire or the two parish churches of Devizes in Wiltshire), and the grandest parish churches, particularly those in prosperous towns, might sport nave aisles, although these are usually mid-12th-century or later (St. Margaret-at-Cliffs or New Romsey in Kent, Steyning in Sussex, Lambourn and Faringdon in Berkshire, or Melbourne in Derbyshire).

While rare in the Romanesque period, aisles were among the most common additions in the early Gothic, particularly to naves but also to chancels, often in the form of chapels. The reasons for these additions may have to do with increasing population or simply with increasing prosperity that brought a desire for larger buildings on the part of patrons or parishioners. Nave aisles were often added piecemeal, north and south separately, or in even smaller increments, so that pier and arch forms may differ widely in opposing aisles, or even in the same arcade (St. Nicholas-at-Wade in Kent or St. Mary in Barton-on-Humber). These aisles were covered with steeply sloping wood roofs and low outer walls that were almost always replaced by flatter roofs and higher-windowed walls in the later Middle Ages. Clerestories were sometimes but by no means always built with Early English arcades (Eastry in Kent or Bottesford in Lincolnshire).

Chancels were also often enlarged in the 13th century, those in the southern part of the country during the first half and those in the Midlands more frequently in the second. The increasing emphasis on the separation of the clergy from the laity in the 13th century may help account for this rash of chancel construction, but it is not clear who financed these works, and it may as likely have been the congregation as the patron or clergy. The strict division of responsibility for nave and chancel upkeep between parishioners and patron, respectively, becomes clear only in the 14th century. These enlargements of the east arm were almost always rectangular in plan, with a flat facade lit by lancets or later by a large traceried window. Before the advent of traceried windows in mid-century, masons embellished their chancels with dado arcades (Cheriton in Kent or Burgh-next-Aylsham in Norfolk), windows set in shafted arcades (Cherry Hinton in Cambridgeshire or Bamburgh in Northumberland), and occasionally (but rarely in relation to the total of rebuilt chancels) vaults (Stoke d'Abernon in Surrey, Crondall in Hampshire, or Bishop

Cannings in Wiltshire).

Tracery transformed the appearance of parish churches, especially in those areas of the Midlands or West Country prosperous from the wool trade in the 14th century and later. Windows of geometrical or curvilinear Decorated tracery are particularly spectacular in Lincolnshire, in such town churches as Grantham or Sleaford or even in such village churches as Navenby or Ewerby. Chartham in Kent and Patrington in Yorkshire (fig. 103) provide further examples of churches with exceptional Decorated window tracery.

Patrington is a cruciform building and this plan was frequent in more ambitious parish churches (Ashbourne or Wirksworth in Derbyshire are other examples), although, like the addition of aisles in the 13th century, transept arms were often of different dates. In the 14th and 15th centuries the endowment of chantries and chapels led to an increasing complexity in the plans of prosperous churches. Buildings like Cirencester parish church might end up with a bewildering number of aisles, chapels, porches, or annexes by the time the Reformation put a stop to most parish church building. The piecemeal character already apparent in many buildings by the 13th century was much more marked by the 16th.

After about 1330 Perpendicular tracery replaced Decorated, and indeed Perpendicular windows often literally replaced earlier lancets or Norman openings. Churches entirely or largely rebuilt in this period show a great spaciousness, with thin high piers, elegant wood ceilings, and huge, gridded windows. Examples might include Northleach or Chipping Camden in the Cotswolds, Lavenham in Suffolk, or Newark in Nottinghamshire. Large clerestories of almost continuous windows are also a feature of Perpendicular naves, as again at Lavenham, or at Gedney in Lincolnshire.

Towers were also a focus of attention for the parish-church builders of all periods, but especially from the 13th century on, with sharp stone spires the rule in the limestone belt, as at Ketton in Rutland or Grantham in Lincolnshire, while flat-roofed towers were common elsewhere, as at Tenterden in Kent or in many Perpendicular towers in Somerset. Parish-church towers could attain vertiginous height, as in the famous Boston stump or the more elegant spire of near 300 feet at Louth. By the end of the Middle Ages one might argue that more architectural energy was being invested in parish churches than any other type of building.

Parish Clergy

From the time of Augustine of Canterbury in the early 7th century priests, deacons, and clergy in minor orders had a privileged place in society, first established by the laws of Æthelberht (d. 616/18). He who stole the property of a bishop should pay elevenfold, of a priest ninefold, of a deacon sixfold, of a lesser cleric threefold. Priests acting as witnesses to charters in the Saxon period testify to their place in political society, and the surviving number of Norman baptismal fonts as well as complete Norman churches are clear signs that the parochial system was established through most of England and Wales, though Domesday Book mentions few clergy.

Sparsely settled countryside in the north might produce a parish like Halifax, seventeen miles by eleven; in contrast Winchester in the 12th century had at least 36 parishes, Lincoln and Norwich 46 each, and London just over 100.

The Saxon kings planted clergy on royal lands to convert their people, and Saxon landowners built churches on their estates for themselves and their tenants and appointed and supported priests to care for their souls. The Gregorian reforms of the 11th century sought to remove churches from lay control and, by enforcing celibacy, put an end to hereditary priests. The lord retained the right to choose his priest, but the right of the bishop to approve and to regulate the priests' behavior was clearly established. Lords still retained control of the endowment of each church; an unforeseen consequence of the reform was that by the mid-12th century a quarter of all parish churches had passed to monastic ownership, endowments being diverted from the original support of the priest.

Thus, to reflect the complex realities of the “ownership” of parish churches,

the parish priest became either a rector, a vicar, or a parochial chaplain, depending on legal status and the agreed share of income he enjoyed.

The rector held a parish that either remained (probably because of its poor income) independent of outside interference or that paid all but a small proportion of its income as a pension to a monastic house, cathedral, or other religious body. A vicar, a legal substitute, was a parish priest permanently endowed with part of the ancient income—usually the small tithes of hay and lesser crops but not wheat—while the greater share was paid to the monastery or other owner, legally the rector or parson and also the patron with the right to appoint the vicar. A third possibility was to appoint a priest, a vicar or parochial chaplain, with no such endowment, on occasion not even subject to approval by the bishop.

By the 13th century bishops had established reasonable control over parochial clergy of every status but needed to reinforce it by statutes against concubines and excessive drink. The huge losses of clergy at the Black Death suggest that many took their pastoral duties seriously, though laymen and bishops alike still took advantage of church funds by appointing beneficed clergy to work as administrators while they drew incomes from the parish, as the crown employed bishops in offices of state at little cost to itself.

In addition the income from a parochial living might be used to support an aspiring cleric at university. Pluralism (holding more than one benefice at a time) and absenteeism were common, and perhaps a majority of parishes were actually staffed by unbeneficed chaplains living on a pittance and often also serving chantries and teaching for additional income.

By the early 16th century bishops had succeeded in raising clerical standards; many were university graduates, and candidates for ordination were rejected for illiteracy. Visitation records suggest that most were carrying out their pastoral and liturgical duties, though celibacy was increasingly irksome and inflation a serious problem. The post-Reformation clergy were fewer in number but better educated.

Parker, Matthew (1504–1575)

Cleric, reformer, administrator, and bibliophile; born in Norwich and educated at Corpus Christi College, Cambridge, where he became a fellow in 1527. A supporter of Henry VIII's reformation of the English church, he developed close contacts with the court, becoming Queen Anne Boleyn's chaplain. He was elected master of his college in 1544 and later became dean of Lincoln. Parker served twice as the university's vice-chancellor, an office that linked him more closely to central government.

In 1553 Mary's accession to the throne threatened exponents of the reformed church. Parker went into retirement, living in some distress during Mary's reign. When Elizabeth succeeded in 1558, he made clear he wished to resume his mastership, but Elizabeth required him to accept the archbishopric of Canterbury, which he occupied until his death. He had responsibility for overseeing the foundation of the Church of England in its modern sense, defining its doctrine and discipline, and setting it on its middle way between Roman Catholicism and the more extreme continental Reformation. The Church of England was, he believed, no new creation; it was the natural successor to the church introduced by Augustine at the end of the 6th century, though purges of later Romish corruptions had become necessary.

Parker set about collecting historical documents that cast light on the history, writing, and practice of the Anglo-Saxon and medieval churches and so laid the basis of a superb collection of medieval codices, which, supported by a library of printed books, he left in the care of his old college. They include such splendid manuscripts as the Augustine Gospels, a 6th-century Italian Gospel book supposedly brought by Augustine himself, the Dover and Bury Bibles, magnificently illustrated Romanesque display works, and two illustrated volumes of Matthew Paris's *Chronica majora*.

Archbishop Parker is the most important figure in the 16th-century revival

of interest in early English studies. He collected around him a group of scholars, secretaries, and craftsmen who discovered, investigated, and preserved the early records of England and its church.

Parliament

The history of the English parliament is rooted in conditions common to the states of medieval Europe: the need for money to finance the costs and objectives of government, especially war, and the concomitant need for political consultation with those social groups directly involved in or affected by government action. Parliamentary institutions and representative assemblies were hardly unique to England; most parts of Europe saw their development and maturation simultaneously with, or even before, England's. However, the English parliament developed a structure, composition, and range of functions that enabled it to outlast, in terms of real power, its continental counterparts.

This continuity formed the ultimate basis of the modern British tradition of parliamentary sovereignty. It is nonetheless essential to emphasize that medieval English parliaments were creations of, and creatures of, royal power, devised and designed by kings as special instruments to extend and formalize their authority and to make the implementation of their political agenda and public policies more efficient and effective.

The composition and functions of parliament took definite shape during the reigns of Edward I (1272–1307) and Edward II (1307–27). In effect Edward I invented parliamentary assemblies as royalist and consensual vehicles to support and help pay for his wars and to facilitate the tasks of government. Each assembly was separate and ad hoc; strictly speaking, one must always refer to “parliaments,” for it is inaccurate to use the term “Parliament” as if it were a single, continuous, or autonomous institution. Magnates (earls and other great tenants-in-chief) and prelates (archbishops, bishops, and most abbots) were summoned individually; they represented themselves. Lesser aristocracy and borough elites elected two of their number from each shire and each town to speak for, and to bind, those communities—hence the so-called “knights of the shire” and the borough representatives. The sizes of these groups fluctuated. In the mid- to late 14th century, there were usually 50 to 60 lay peers, 21 English and Welsh bishops (including the two archbishops), over 25 abbots and priors (down from about 50 to 56 in the early 14th century), 72 knights of the shire, and two men each from about 70 to 100 towns and boroughs. These are the numbers summoned; many never attended. Lesser clergy were rarely represented (through diocesan proctors); the “Model Parliament” of 1295, which included them, was exceptional, and clerical representation in parliaments ceased altogether after that.

Continental assemblies generally developed a tripartite structure: upper (and some lower) clergy; upper and lower aristocracy; merchants and urban officials. English parliaments, by contrast, were bipartite and wholly lay in character, because prelates were summoned essentially as landlords: upper aristocracy and upper clergy (magnates, prelates) on the one hand, lower aristocracy and borough elites on the other. Under Edward II this structure became formally bicameral: magnates (with an increasingly fixed list of “peers” who automatically qualified for individual summons, regardless of title) and prelates together as the House of Lords, knights of the shire and borough representatives together as the House of Commons.

Not every assembly, however, had or was required to have all these groups present. There were meetings of magnates only, of borough representatives only, and (more commonly) of varying combinations. Every assembly did contain the king, his chief advisory officials, and justices; it is they who determined the agenda, and thus the composition of each particular parliamentary meeting. Parliaments were flexible in composition and multicompetent in function. They might handle petitions, unusual or difficult cases or sensitive political trials, notarize statutes, and, above all, serve as sounding boards for political propaganda and assent to taxation for wars. Edward I and Edward II had recourse to parliaments on a nearly annual basis. Their utility and prominence made them *functionally* essential but not yet

constitutionally essential as an agency of central government and the welfare of the kingdom.

From the mid-14th century parliaments moved from definite (albeit flexible) to definitive shape. Beginning with Edward III (1327–77), parliamentary taxation was fixed on personal (movable) property at the rates of one-fifteenth (6 2/3 percent) on rural and one-tenth (10 percent) on urban property. Only in the 17th century was this system of source and rates replaced by a modernized real-property, or real-estate, system and in the 20th century by the income tax.

In 1340, hard pressed for ready cash for his invasion of France, Edward agreed to allow customs duties to come under parliamentary control. The customs and personal-property taxes now formed the overwhelming bulk of a vastly increased royal revenue; but these sources were subject to parliamentary vote, negotiated largely on an ad hoc, noncontinuous basis, often obtained only with strings attached—a process encapsulated in the phrase “redress of grievance preceding supply.”

Of equal importance, the presence of all consultative and participatory constituencies—magnates, prelates, knights of the shire, and borough representatives, grouped into the two houses of Lords and Commons—was now deemed essential to the legal composition and functioning of parliaments. In addition they took on a specifically legislative cast. By Edward III's time statutes were passed by, no longer merely announced at, parliamentary sessions. Following the convenient fiction that the entire community was represented by the Commons, statutory legislation began in the form of a “commune petition” to the king as the source of law and enforcer of justice. Naturally royal officials drafted most statutes, but there were occasions where one or both houses initiated bills or, more frequently, made substantial changes in those presented to them. The legislative scope of parliamentary statutes extended into important areas of social and economic concern, common law, and the church.

When this legislative function is seen in conjunction with the taxation powers and the corporate consciousness of the two houses (singly and jointly) is taken into account, parliament had indeed come of age as a self-conscious and often proactive institution.

Finally, in the late Middle Ages, parliaments became the arena for spectacular and dangerous forays into factional power politics. The power to impeach and the recourse to acts of attainder for treason were frequent features of national politics. Most dramatic of all was parliament as the setting for solemnizing changes in the kingship itself: the “voluntary abdication” of Edward II in 1327, of Richard II in 1399 and the 1460 treaty whereby the Lancastrian Henry VI “voluntarily” recognized Richard duke of York as his rightful heir. The great lords clearly felt it expedient or even necessary to

legitimate their actions in a parliamentary context. Parliament was the single, central agency for the bulk of governmental revenues and for statutory legislation. By the 14th century it was the favored vehicle to initiate or to ratify the recourse to violence in high politics.

All this, however, did not make England a “parliamentary monarchy.” Legally speaking, parliaments existed only at the king’s pleasure; he was entitled to govern without them, if he could manage financially. By the simple expedient of abandoning the Hundred Years War Edward IV and Henry VII needed far less parliamentary taxation—and so summoned far fewer parliaments. Even when relying heavily on them, moreover, kings worth their salt could manipulate or dominate them, for example by using the speaker of the Commons to control debate on bills.

In the enunciation of political theory, as later articulated by the Tudor monarchs, parliaments existed to bring information to the royal notice and to vote a simple “yea” or “nay,” with a minimum of discussion, on requests for taxation or other business brought before them. The model envisioned was of a conflict-free passive instrument of royal governance, designed to facilitate the realization of the shared interests of the king and of the upper classes that parliaments represented. Medieval kings would certainly have recognized and applauded that model.

Parliament of the Three Ages, The

An unrhymed alliterative poem of 665 lines preserved in the Thornton Manuscript, BL Add. 31042 (ca. 1425–50), where it is followed by *Winner and Waster*, and (lacking the first 225 lines) in BL Add. 33994 (late 15th century). Both the authorship and date are unknown, though stylistic features and details of dress suggest a date around 1400.

Like *Winner and Waster* the poem is a debate set within a dream. In the prologue, the most attractive part of the poem, the narrator vividly describes how he went poaching early one May morning. He shot a fine hart, dismembered it, and hid it from the forester. Waiting for the cover of night, he fell asleep and dreamed of three men, Youth, Middle Elde, and Elde (Old Age), each defending the merits of his perspective on life. Youth, elegantly dressed, describes the service he does for his mistress, his sport of hawking, and his devotion to the courtly activities of chess, reading romances, and dancing. Middle Elde describes his money-making enterprises and scorns the extravagance of Youths life. Elde calls both his companions fools, telling them that all such worldly occupations are valueless. He recounts at considerable length the lives of the Nine Worthies: the pagans Hector, Alexander, and Caesar; the Jews Joshua, David, and Judas Maccabeus; and the Christians Arthur, Godfrey de Bouillon, and Charlemagne. All these great lives have come to nothing. Elde then mentions the famous wise men and the lovers, all now dead, and advises his companions to learn from this that all is vanity. The dreamer is woken by the sound of a horn and returns home from the beautiful wood.

Elde's arguments are not disputed, but neither are they final, for the reader is left with vivid impressions of the beauty of the May morning, the excitement of hawking, and indeed the grand achievements of the Worthies. The sun is setting as the narrator goes home, the horn (is it Deaths horn?) has sounded, but the experiences of the day have been absorbing and cannot be dismissed.

The principal source for the account of the Worthies is a passage in a French poem of ca. 1312, Jacques de Longuyon's *Voeux du paon*, lines 7484–579, supplemented by the English poets surprisingly inaccurate memory. The accounts of Hector, Alexander, Arthur, and Charlemagne are much fuller than in the *Voeux*. The lively and detailed descriptions of the dismembering of the deer and the practices of hawking may be indebted to contemporary manuals on hunting and hawking. The structure of the dream-vision debate and some of Middle Elde's arguments are reminiscent of *Winner and Waster*, and there are further structural and thematic parallels with *Death and Life*, but no certain influence can be demonstrated. There are also some verbal parallels with the descriptions of the Worthies in the alliterative *Morte Arthure*. In diction and style the poem is to be associated with other unrhymed alliterative poems of the northwest Midlands, but there is no secure evidence of original dialect.

Parliamentary Elections

From the late 13th century elections were regularly held in response to writs of summons issued by royal command from chancery to the sheriffs. The sheriff in turn sent precepts to certain cities and boroughs within his bailiwick, directing the authorities to submit the names of their chosen representatives. Each sheriff duly returned the writ to chancery, endorsed with a statement noting that elections had been held and listing the successful candidates.

As many as 36 shires and 99 cities and boroughs were represented in the Commons before 1485 (each sending two members, save for London, with four), although not all of them made returns to every parliament; the House rarely had its full complement of 272. In the shires elections were held at a full session of the county court, but since sheriffs sometimes returned themselves, without bothering to observe the formalities, an ordinance of 1372 barred anyone who occupied a shrievalty from the Commons. In the “Good Parliament” of 1376 the House asked that shire knights might henceforth be chosen by “the better gentlemen” of the counties; electoral legislation passed in the following century was directed toward this end, intending to secure free elections and prevent malpractice.

A statute of 1406 provided that advance notice of parliaments should be given, that elections should be held openly, and that the returns should bear the names and seals of the more important persons present. In practice only a few individuals were actually listed, although “many others” were often recorded as in attendance. When these new-style returns (known as indentures) *do* contain an unusually large number of names, the elections were probably contested. Legislation of 1413 ordered that shire knights should live in the counties they represented and that electors should be resident there, too.

Disputed elections to the parliaments of 1427 and 1429, when a number of fraudulent returns were made by sheriffs, led to a statute of 1430, determining the county franchise until 1832. In future the electorate was to consist only of those who swore on oath that they enjoyed an annual landed income of 40 shillings; sheriffs were threatened with a year’s imprisonment, as well as a stringent fine of £100, should they tamper with the results. An act of 1445 brought the elections of borough representatives within the scope of this legislation and greatly increased the penalties. But despite their growing severity the statutes did not prove effective.

One of the grounds for Richard II’s deposition in 1399 had been his blatant interference in parliamentary elections; the Yorkists used a similar pretext for declaring the parliament of 1459 illegal. As seats in the Commons became more sought after, magnates tried to manipulate the electoral procedure to

favor their own men, even resorting to violence. In East Anglia they had to employ more sophisticated methods, although the gentry still maintained a staunch sense of independence. The Derbyshire elections of 1433 became a confrontation between two gangs of armed men when Sir Richard Vernon challenged Lord Grey of Codnor's candidates. To rebut Lord Tiptoft's authority in Cambridgeshire, in 1439, Sir James Ormond displayed his retainers about the county for three weeks, "charging [the commons] to gyf the voyces atte the elección ... to suche men as they wold have, managyng them yef they did the contrary to be bete and sleyn." When some 2,000 people, "fulle of malesse," turned up at Cambridge Castle on election day, the sheriff refused to proceed for fear of "man slaughter." Nevertheless, Ormond's rabble went ahead, even though most, being outsiders or local laborers, were ineligible to vote.

In cities and boroughs practice at elections depended more on local custom. A few towns and cities (eleven by 1463) ranked as incorporated shires, but only Bristol stuck rigidly to the statute of 1430 by restricting the franchise to 40-shilling freeholders. The four London members of parliament were chosen by an unusually large electorate of 150 or so in the court of common council. Elsewhere elections took place in borough courts, meeting in local guildhalls, and the results were sent to the sheriff for transmission to chancery. Generally the franchise was restricted to freemen of the borough, though in some places a narrower property qualification obtained.

The electorate often reflected the oligarchical nature of medieval urban life, a select body of burgesses acting as the self-imposed delegates of the rest. Only the *potentiores* (powerful men) of Bishop's Lynn were allowed to nominate the twelve jurors who made the choice for the entire community, although Shrewsbury was evidently more democratic. Over 100 burgesses witnessed the indenture of 1478, and when this was disputed a second document bearing an additional 69 names was produced. Here, as elsewhere, the election was made in the first instance by acclamation, the freemen selecting their candidates "with a hoole voyce."

Patronage, Literary

In a period before widespread literacy, printing and copyright laws had combined to offer authors a chance to earn their living by their pen alone, private patronage—that is, a system under which a person of wealth and position supports an artist in return for the honor bestowed by a laudatory dedication—would seem to have provided the only real opportunity for authors to enjoy any degree of security. Yet, perhaps because such a system depends upon the author’s being held in high esteem, the Middle Ages seem to have known little of the kind of patronage practiced in imperial Rome by Augustus and Maecenas. Scholars were certainly drawn to the courts of the great (as Alcuin of York was drawn to Charlemagne’s in the late 8th century), but they seem seldom to have been afforded the opportunity for a life of undisturbed study. The 12th-century court of Henry II of England was comparatively enlightened, yet Walter Map describes how he had to write his *Denugis curialium* “raptim” (by snatches) and even goes on to complain that “the Muses are fugitives from all courts” (*Denugis* 4.2). Broadly speaking, we may distinguish three phases in the changing relationship of author and patron in the Middle Ages: the age of the bard (the Anglo-Saxon *scop*), the period of the minstrel, and the rise of the vernacular author.

Of the first of these Girvan has written that “the patron had no important part in encouraging vernacular writing” (1951: 90). There seem to be two reasons for this. To be a *scop* in anything like a professional sense would have forced a storyteller working within an oral tradition to keep on the move if he were not to exhaust his repertoire. If he did not, like Waldere, peddle his wares from court to court, he risked being, like Deor, supplanted by a rival. Second, the *scop*’s art was not one that set him apart from his social betters. In the

Skaldskaparmal section of the *Prose Edda* the Icelandic Snorri Sturluson (d. 1241) implies that mastery of skaldic verse was an accomplishment worthy of a thegn (*Prose Edda* 2.65); the man who tells the tale of Sigmund in *Beowulf* is not a professional poet but one of Hrothgar's retainers, a "guma gilphlæden" ("proud warrior"); and Taillefer, who Wace tells us recited the *Song of Roland* before the Battle of Hastings (1066), was also a warrior and leader of the Norman vanguard. Only the author who can lay claim to an exclusive skill is likely to be able to reap the full benefit of a system of patronage.

In this respect the lot of the *scop*'s successor, the minstrel of the high Middle Ages, was happier. Though still primarily oral entertainers who were forced by economic circumstances to lead a peripatetic existence, minstrels at least enjoyed the status of professionals with a particular and marketable talent. At the highest level (as with Chretien de Troyes at the court of Marie de Champagne) they may even have enjoyed the fruits of patronage in something like its classical sense, but lower down the scale they could at least aspire to knowledge of an art not shared by their superiors. The emergence of corporations and *confréries* of minstrels in northern France (often attended by visitors from other countries, including England) attests to this sense of professionalism. Nevertheless, the position of minstrels, whether reciting their own work or that of others, was far from that of the true recipient of patronage—much closer to that of the journeyman, paid for performing a service. That service might indeed be commissioned: laudatory biographies like the 13th-century *Histoire de Guillaume le Maréchal* or the 14th-century *Vie du Prince Noir* by the Chandos Herald were minstrel work (at this period there was no great distinction between the roles of heralds and minstrels); minstrels also composed versified history and political propaganda (e.g., Laurence Minot's poems on Edward III's French and Scottish wars). Even here, however, their masters remained primarily consumers buying a product, not (as the true patron must be) investors involved in literary speculation. By the end of the 14th century the status of the minstrel, never high, had declined even further, and in the households of great magnates the term had come to designate a professional musician rather than a literary practitioner; late-medieval romances attributed to the work of minstrels are often uncourtly in tone, and even when we can identify a minstrel-author he is likely to remain (like the Thomas Chestre who composed *Sir Launfal*) little more than a name.

The authors of the late Middle Ages differed from the minstrels who preceded them in a number of important ways. They have names and social status and their biographies can often be reconstructed in some detail. They wrote not only for oral performance but also for private readers. Many of them enjoyed the security of regular employment in the households of kings and princes (e.g., the king's esquire Chaucer and the royal tutors Scogan and

Skelton); some of them were asked to employ their skills for political ends (see Lydgate's *Title and Pedigree of Henry VI* or Skelton's *Douty Duke of Albany*). Unlike their minstrel predecessors, however, the new court poets could no longer boast of possessing an exclusive skill. Literature had become a fashionable pursuit of the aristocracy, and princes, though no doubt happy to discover poetic talent among their servants, seem rarely to have been willing to support them for this talent alone; literature in the late Middle Ages became, as Samuel Moore puts it, not a vocation but an avocation (1913: 369). The origins of the new fashion can be detected as early as the Sicilian court of Frederick II (d. 1250), but by the end of the 14th century it had spread, by way of the court of Robert of Anjou (d. 1343) in Naples, to most of the courts of northern Europe. Though authors abound in the households of late-medieval English kings and noblemen from Richard II's reign onward, few, it appears, were employed primarily for their literary abilities; typically the new men of letters were members of a secular civil service, employed, like Chaucer, in bureaucratic posts that can hardly be regarded as sinecures. Even at the sophisticated 15th-century court of the dukes of Burgundy the offices held by authors seem to have had nothing in common with their literary calling; as the administrative historian T.F. Tout remarks, "Mediaeval conditions made literature an impossible profession" (1929: 381). The French author Christine de Pizan (ca. 1364-ca. 1431) appears to have been unique among courtly authors, outside Italy at least, in being able to make her living largely by her pen. Only with the Renaissance, and a growing recognition of the importance of literature in fostering princely reputations, do we find anything approaching a system of patronage as it is classically understood.

It remains surprisingly difficult to document even the limited encouragement that late-medieval English courts offered practicing poets. Account books, at least the kind that might record casual payments for literary performance, have not survived, and the more formalized records are generally uninformative: Chaucer was a busy civil servant whose name appears frequently in exchequer and wardrobe accounts, yet not a single record gives any indication that he was a poet or suggests that he was officially rewarded for practicing his craft. Far more promising is the evidence of book ownership. We should be wary of automatically assuming that because a nobleman or woman owned a copy of a vernacular work they would have been happy to reward its author (presentation copies were not always encouraged or read, and inherited libraries might be maintained simply because of the value attached to books as expensive artifacts); nevertheless, the purchasing and commissioning of books offer the best evidence we have of active encouragement of literature on the part of royal or aristocratic patrons. Continuing research into the early ownership of surviving manuscripts and on

the library catalogues and book lists of individual collectors seems the most promising avenue for future discoveries about the literary tastes and private patronage of the late Middle Ages. In the current state of our knowledge comparative claims for the literary sophistication of one patron against another (Richard II, say, against Edward IV) seem premature.

It has been claimed that the end of the Middle Ages witnessed the rise of a “new reading public” among the merchant class, but the influence of such a public on the production of literary works has probably been exaggerated. The prestige of great courts was by no means on the wane, and it seems unlikely that a middle-class public would have developed tastes essentially different from those of its social superiors. The author’s best hope of reward still lay with those who had the greatest power and wealth, and though families like the Pas-tons might purchase the products of commercial scriptoria, it would be a long time before their literary interests would provide any tangible benefits for the authors themselves. Even the introduction of the printing press had little immediate effect on the unsatisfactory system of private patronage that had developed in the late Middle Ages, and William Caxton was drawn to wealthy patrons and protectors as surely as his predecessors had been.

Paul the Deacon (ca. 720–799)

Paul the Deacon, from Friuli (Lombardy), was educated in Pavia and entered the monastery of Monte Cassino in 774. Following the Friuli insurrection in 776 against Charlemagne's annexation of Lombardy Paul went to Francia to obtain the release of his brother, who had been taken prisoner; he expected the visit to be brief but remained for several years, caught up in the early stages of the Carolingian renaissance. He returned to Monte Cassino by 787.

Paul was a historian of stature: he wrote an abbreviated world history, a history of the Romans, a history of the bishops of Metz, and a six-book history of the Lombards. He also wrote a major commentary on the Benedictine Rule and, at Charlemagne's direction, compiled a Latin homiliary (based on Italian models) that was intended to be the authoritative, standard collection for use at the night office (the prayers and readings used by monks in the night hours of the divine office).

This homiliary was introduced into England at the time of the 10th-century Benedictine Reform, along with others from the Carolingian period, but surviving manuscripts indicate that it was Paul's homiliary that was preeminent. It was liturgically organized and was mainly an anthology of whole patristic homilies that provided exegesis of the Gospel pericope, or reading for the day. From the outset many of the feast days had several expositions, but subsequent users added to these, so that it has been necessary for modern scholars to reconstruct the original. The manuscripts from Anglo-Saxon England are augmented versions, and it was an augmented text that was used by the vernacular homilist Ælfric. In the preface to the *Catholic Homilies* Ælfric names Augustine, Jerome, Bede, and Gregory as his major authorities, but it has been shown that his immediate source for much of this material was Paul's homiliary, where Ælfric would have found that the patristic authorities were specified.

Pearl-Poet

The designation given to an anonymous late-14th-century poet who is generally assumed to have written the poems *Pearl*, *Cleanness*, *Patience*, and *Sir Gawain and the Green Knight*, all found in BL Cotton Nero A.x. Untitled in the manuscript, the first three of the poems are known by their first words, and the fourth by its general subject. Because *Gawain* is the best known of the four poems, the poet is also referred to as the *Gawain*-poet.

The poems are regarded as the highest achievement of the 14th-century Alliterative Revival. *Cleanness* (1,812 lines) and *Patience* (531 lines) both employ only the classic long alliterative line: four heavy stresses, a caesura between the second and third stresses, and alliteration of the first three stressed words. Marks in the manuscript are thought to divide these two poems into four-line stanzas. In *Gawain* (2,530 lines) the poet employs stanzas of varying lengths: the main body of each stanza is written in long alliterative lines and concludes with a “bob” and “wheel” (terms coined in the 19th century)—a one-stress line (bob), usually otiose, leading into a rhyming quatrain of three-stress lines (wheel), the whole five-line group having the rhyme scheme ababa. *Pearls* demanding verse form uses alliteration, rhyme, and concatenation (linking stanzas by beginning with the previous stanzas last word). Most lines have four stresses, though the poet usually alliterates no more than two stresses per line. The 101 twelve-line stanzas, each rhyming ababababbcbc, are in twenty groups of five—each with its own concatenating word—except for group XV, which has six stanzas, yielding a total of 1,212 lines. *Pearl*, *Patience*, and *Gawain* end by echoing their opening lines.

There is no external evidence of the author’s identity; nevertheless, it does

seem more likely that one person wrote all four poems than that two or more such remarkable talents arose at the same time and place. Arguments for common authorship of the four poems compare vocabulary, phraseology, stylistic features, versification, imagery, and themes shared by two or more of the poems. Attempts to identify the author on the basis of the names “J. Macy,” written on fol. 62v, and “Hugo de,” written on fol. 91, have been inconclusive. The Macy (or Mascy or Massey) theory, which has been supported by arguments for a numerological code, an acrostic signature, and puns on *mascellez* in stanza group XIII of *Pearl*, is currently frustrated by the number of possible candidates, for there were many Macys/Mascys/Masseys in the geographical area of the manuscript and at least five who might have signed themselves “J. Macy.”

The Cotton Nero manuscript offers little help in resolving the authorship question. It was copied in one hand, in places written over, which has been dated variously between the late 14th century and the early 15th, a dating supported by the clothing styles depicted in the manuscripts twelve crude illustrations, which were executed by someone who is as unknown as the author and scribe. These illustrations—four for *Pearl*, two for *Cleanness*, two for *Patience*, and four for *Gawain*—do not always represent the text accurately. On the basis of its language the manuscript originated in the northwest Midlands, probably in southeast Cheshire or northeast Staffordshire.

Assuming one author, critics have often taken *Patience* and *Cleanness* to be works of the author’s youth, whereas *Pearl* and *Gawain*, whose poetic artistry and handling of the material more readily impress modern sensibility, are regarded as works of his maturity. The fact that *Cleanness* borrows from *Mandevilles Travels*, written in French ca. 1357, establishes a *terminus post quern* (earliest possible date) of the 1360s or 70s for that poem, depending on how soon the poet encountered the *Travels*. The date of the manuscript itself establishes a *terminus ante quern* (latest possible date) of the late 14th to early 15th century. The authors knowledge of the Bible and biblical commentary, the arts of preaching, and popular theology suggests that he was a cleric. His familiarity with chivalry and court life, such secular texts as the *Romance of the Rose*, and the legends of Troy and of Arthur does not argue against this supposition; but if he was indeed a cleric, he had strong worldly interests and sensibilities, and if he was a layman, he was unusually learned. The poems themselves cannot resolve this question, since none of the narrators’ self-references need be taken as autobiographical. *Pearl*, for example, might have been written for rather than by a bereaved father.

A fifth poem, *St. Erkenwald*, also of the late 14th century, has often been attributed to the *Pearl*-poet. Its 352 lines relate the otherwise unrecorded story of how the saint, a 7th-century bishop of London, recalls to life and baptizes a

pagan judge whose miraculously uncorrupted body is uncovered during church excavations. *Erkenwaldis* in a different manuscript—BL Harley 2250, scribally dated 1477—and it is in a different hand and dialect from Cotton Nero A.x. Though this may indicate only that a different scribe copied the poem, other evidence argues against common authorship. *Erkenwald's* subject matter connects it with London rather than the northwest Midlands, and its vocabulary, phraseology, and style have little in common with the *Pearl* poems.

Pearl, for which Boccaccio's *Olympia* is at least an analogue, combines elegy, allegory, homily, debate, and dream vision. Set within the frame of a medieval dream vision, it takes place on an August day when the narrator, searching in a garden at the spot where he has lost a most precious pearl, falls asleep and dreams that he is in a jeweled landscape by a stream, beyond which stands his daughter in white apparel studded with pearls. Elegy quickly yields to debate when the narrator and the maiden argue his right to mourn and her right to be a queen of heaven, child preaching to father via the parable of the workers in the vineyard (Matt. 20). The maiden obtains for the narrator the privilege of seeing the heavenly Jerusalem (cf. Rev. 21–22), in the streets of which is a procession led by the Lamb. Seeing the maiden among the 144,000 virgins (cf. Rev. 14:1–5), the narrator attempts to cross the stream and join her, but he awakens, once again in the garden. Though he wishes to return to his vision, he reflects that only submission to God's will could lead him to more of God's mysteries, and his concluding stanza, which returns to the present, speaks of his contentment with this consolation.

The pearl image unifies the poem's experience: the pearl is first a jewel, then a daughter, then the perfected heavenly state itself. But like Dante, whose *Purgatorio* 28–33 may have inspired him, the poet of *Pearl* presents this experience from the twin perspectives of a narrator undergoing a spiritual struggle and a redeemed maiden secure in divine certainty. And, like Dante, he preserves the drama and passion of the narrator's struggle even though it is already over. In this psychologically and symbolically rich work the poet shows a sure and unaffected grasp of medieval theology, lapidary lore, courtesy literature, and even styles of clothing. *Pearl* thus ranks with Milton's *Lycidas* as one of the language's most learned, as well as enduring, poems about loss.

Cleanness affirms the power of spiritual purity to help human beings gain the beatific vision; it accomplishes its goal mainly by recounting incidents from biblical history in which God punished spiritual impurity. The poem's theme is the sixth Beatitude from the Sermon on the Mount ("Blessed are the clean of heart," Matt. 5:8). After illustrating the punishment awaiting the unclean through a retelling of Christ's parable of the Wedding Feast (Matt.

22:1–14; Luke 14:16–24) the poet develops three main examples of God’s angry punishment of sinners: the Flood (Gen. 6:1–9:7), the destruction of Sodom (Gen. 19:1–19:28), and Belshazzars feast (Dan. 5). These are set off by other biblical stories that are instances of lesser punishments, of cleanness, and of repentance. The falls of Adam and Lucifer introduce the Flood; the story of Abraham receiving God in Mambre (Gen. 18) introduces the destruction of Sodom; Nebuchadnezzar’s capture of Jerusalem (4 Kings 24:18–25:17; AV 2 Kings 24:18–25:17) introduces the story of Belshazzar, which is interrupted part-way through by the story of Nebuchadnezzar’s madness and repentance (Dan. 4:32–37, 5:21).

Despite its obvious debt to the Bible and commentary *Cleanness* remains an original work throughout. The poet’s combination and handling of biblical episodes around the theme of the sixth Beatitude has no known source. The poem also contains startling juxtapositions and adopts unexpected points of view. Some of the author’s most striking touches are in the linking passage between the first two and the third of these groups of major and minor examples, a Nativity scene that leads into an excursus on how penance washes the soul clean like a pearl washed in wine (lines 1065–1148). Where we expect moral dryness, *Cleanness* does not deliver it: the poet praises marital sexuality, and a scene describing the torment of the doomed sinners as the Flood waters overtake them contains genuine pathos.

Since *Patience* stays close to one biblical source, it is sometimes considered the earliest of the four poems in the manuscript. The story follows the Old Testament book of Jonah so closely that every verse is rendered, but the poet expands with originality and imagination. In some places the Vulgate is translated directly into ME; in others it is modified with material from other sources, such as Tertullian’s *Liber de patientia*. Throughout the poem the author improvises on his original; for example, Jonah floats into the whale’s mouth “like a mote going through a church door” (268). The poet retells the story with an eye toward the psychological motives of God as well as of Jonah. This humanized God, like that in *Cleanness*, resembles the figure of God in medieval drama, but such an idea of God is virtually unknown in 14th-century theological literature.

The narrative’s frame poses as autobiography. Hearing the eight Beatitudes in the Sermon on the Mount one day in mass, the poet ponders the relationship between the first, poverty, and the last, patience, applying them to his own life. To illustrate the dangers he would incur without patience he retells the story of Jonah, who is here an example of impatience because he could not endure (cf. Lat. *patior*, “suffer, endure”) the hardship imposed on him by his call to preach to the Ninevites. In medieval handbooks on sin and penance patience was the virtue opposed to sloth, which Jonah demonstrates at

various points. But even as the story shows Jonah's impatience, querulousness, and selfishness, it emphasizes God's constant mercy in response to human behavior. God explains to Jonah in the poem's conclusion that his mercy is the love he feels for creatures whom he has nurtured and thus does not wish to harm. Despite the narrator's faith in the ultimate benignness of tests like Jonah's—and, presumably, his own—his refrain is the hardship that must be borne, not the rewards of patience, for these must be deferred until the time in heaven promised by the Beatitudes.

Sir Gawain and the Green Knight has captivated readers since its recovery in the 19th century and has even been adapted (freely) into a feature film. In it Arthur's court is challenged by a green knight, the agent of Morgan le Fay (Fr. Morgain la fée), who arrives at the New Year's feast with an axe and a twig of holly. Accepting the challenge, Gawain cuts off the knight's head, only to see him pick it up and depart uttering a reminder that now Gawain must endure a return stroke in a year. Later, searching for the Green Knight, Gawain is put up at the castle of Bertilak de Hautdesert, who involves "the fine father of manners" in an exchange of daily winnings that turns out to be a test of Gawain's ability to withstand his host's wife's daily sexual advances. Gawain secretly accepts and keeps the wife's purportedly magic girdle in the hope that it will protect him from death when he meets the Green Knight, whose "green chapel" turns out to be in the neighborhood of Bertilak's castle. Meeting the Green Knight, Gawain flinches at the first axe blow but then endures a second, feigned blow and a third, barely deflected stroke, which wounds him slightly. After the three blows the Green Knight reveals that he is Bertilak. Gawain, feeling shame over his behavior, determines to wear the green girdle as an emblem of his fault, and returns to Arthur's court, where his report is received with indulgence and everyone puts on a green baldric, apparently in solidarity.

The simplicity, wonder, and charm of *Gawain* conceal imaginative depths still actively explored by readers of the poem. It is a romance in which the conventions, such as the Yuletide feast at Arthur's court, the challenge, the arming of the knight, the quest, and the return of the hero, are all recreated in terms that impress readers as both symbolic and realistic. Its symmetrical plot presents a series of vignettes of varied purpose but whose underlying interest is in the inner experience of life as Gawain, often seen as an everyman, lives it. Gawain's world, represented by the Yuletide feast interrupted by the Green Knight (himself a complex symbol of nature and natural processes), remains courtly and ritualistic, but Gawain's understanding of his relationship to it changes. Gawain is tested twice unexpectedly: first by the beheading game and then by the bedroom temptations, which turn out to be the test behind the beheading. In the course of the testing Gawain is made aware of his own aloneness and vulnerability; he seizes on the green girdle as protection against

an afterlife that he obviously fears, but in the end he is isolated by the discovery of his sinfulness and mortality. Neither a saint nor the ladykiller of other romances (a reputation of which he is reminded at Bertilak's court), he is an original creation without precedent in Arthurian literature.

Since the late 1800s *Gawain* has been the object of studies of its language, meter, authorship, provenance, and sources and analogues in legend. Throughout the 20th century critics have recognized the poem's moral thrust, examining Gawain against the heroic, social, and religious ethos of the poem, often through the symbols of the pentangle and the green girdle. Recently critics have discussed—among other matters—the role of games in the story and the playfulness of the narration; the many dualities and appearances that, like the double identity of the Green Knight/Bertilak, produce the poem's ambiguities; the intricate networks of imagery; inter-textual relations with French Arthurian romances; and even the poet's application of specialized fields of study, such as law.

Peasant Rebellion of 1381

The rebellion began as a reaction to the collection of the poll tax, toward the end of May 1381, mainly in Essex, Kent, and East Anglia. Its high point was reached when the rebels, under their leader, Wat Tyler, presented their program of demands to Richard II at Smithfield in London on 15 June. Tyler was killed by William Walworth, mayor of London, as he stood before the king, and his dismayed followers were dispersed. Sporadic rebellions, as far away from the original focus of the movement as Worcester and Chester, continued into July, but the crown and nobility had suppressed the main centers of rebellion by the end of June.

It was not an unpredictable outburst. It could be regarded as the culmination of a series of localized peasant rebellions going back to the late 12th century. Nor was it unexpected at the time. Fears had been expressed in parliament in 1377 of a repeat of the French Jacquerie of 1358, for the 14th century was an epoch of widespread discontent and rebellion throughout Europe of which the English land-owning ruling class could not but be aware. Many of the demands expressed in previous village protests were repeated in 1381, especially the demand for freedom for all.

The rebellion was by no means a protest of the poverty-stricken against the rich and powerful. It was more a reaction against attempts to deny social aspirations that were encouraged by the economic conditions of postplague England. The population decline resulted in a surplus of available land and a shortage of wage labor. The long-term trends were toward a fall in rents and services from tenants to landlords and a rise in daily wages. But there occurred what has been called a “feudal reaction” by the government and by the landowners, whose interests were represented by parliament—the so-called Commons as well as the Lords.

The Statute of Labourers, confirming in 1351 the Ordinance of 1349, gave justices of the peace (nominated from the nobility and gentry) power to punish

anyone demanding wages above the level of 1346. This was a response to the great mobility of the work force in the period after the Black Death. Punishment was harshly and systematically imposed. At the same time landowners reacted to the shortage of tenants and the consequent fall in their rent income. In the long term they had to offer favorable terms to would-be tenants, but in the 1350s, 1360s, and 1370s they attempted to increase rents and to raise the monetary cost of such servile dues as marriage fines and death duties, as well as exacting high entry fines from tenants.

Pressures on peasants, artisans, and wage workers were exacerbated by the imposition of heavy taxation from 1371 onward, after a period of freedom from state taxation since 1358. In 1371 a new parish tax was levied that bore heavily on small parishes with many poor inhabitants, especially in the southeast. This was followed by a series of lay subsidies. These were taxes originally based on a proportion (such as a fifteenth or a tenth) of the value of the movable goods of better-off villagers. After 1334 it was levied as a lump sum, due from each village, and liable, therefore, to inequitable distribution. Six and a half of these subsidies were levied between 1373 and 1380, in addition to the poll taxes of 1377, 1379, and 1380–81. These were essentially regressive. That of 1380–81, involving a charge of one shilling a head from all persons of fifteen years and over, was particularly heavy. Advice that the rich should help the poor had little impact, especially in the heavily populated southeastern counties.

Although referred to as a peasants' rebellion, the rising of 1381 had a social composition that included village and urban artisans as well as the lesser people of London. The majority were indeed peasants, reflecting their proportion of the whole population. Many of the leaders were well-to-do peasants, often manorial officials. It was a rising of the bulk of the population, below the gentry, nobility, and wealthy church institutions.

Very interesting is the identification with the rebels of many members of the lesser clergy, of whom John Ball is the best known. This could be due in part to the sympathies of the parish clergy for the grievances of their parishioners. But we must also take into account the medieval tradition of Christian egalitarianism, often but not always associated with heretical movements. There is no indication that John Ball or the other rebel priests held heretical views, unless the old saying used by Ball in sermons ("When Adam delved and Eve span, who was then the gentleman?") can be considered heretical.

The program put forward by the rebels is deduced mainly from the reports of hostile chroniclers. Nevertheless, there is a consistency, both in the contemporary evidence and with that of earlier movements. There was a combination of immediate and far-reaching demands, the latter suggesting the influence of Christian egalitarian ideology. Immediate demands included a

proposal that wage workers be free to engage in employment on the basis of a written contract with employers; another that private fisheries and game preserves be open to all, another that land rent be reduced to *Ad.* per acre.

The far-reaching demands, if utopian, are interesting in that they imply a rejection of the much-preached social theory of the three orders. According to this theory those who pray, those who fight, and those who work (clergy, nobility, and peasants) should all remain in their place. The rebels proposed not only the abolition of serfdom but also the end of lordship, except for that of the king; the abolition of the church hierarchy, except for one bishop; the confiscation of church property and its redistribution among the people; a guarantee of reasonable subsistence to the parish clergy; and the abolition of monasteries, except for two houses of religion. The proposals concerning law are obscure, but it is clear that the abolition of the existing legal system and of all lawyers was proposed, to be replaced by a law enforced by the local communities (the “Law of Winchester”).

The defeat of the rebels, the utopian character of their demands, and the fact that the events of 1381 hardly seemed to alter the post-Black Death trend in rents and wages have encouraged a view of the revolt as an irrelevant episode in English history. This is mistaken. Just as the “feudal reaction” was partly responsible for the rebellion, the rebellion put an end to any further “feudal reaction.” Wages continued to rise. There is good explicit evidence from manorial records that lords were afraid to put up rents or demand unpopular customary services. Landlord self-assertion on these issues effectively began again only in the changed economic and social conditions of the late 15th century.

Pecock, Reginald (early 1390s-ca. 1460)

Theologian, religious educator, and bishop tried for and convicted of heresy. Pecock was a fellow of Oriel College, Oxford (ca. 1414–24); rector of St. Michaels, Gloucester (1424–31); rector of St. Michael Royal (also called St. Michael in Riola) and master of Whittington College (1431–44); bishop of St. Asaph (1444–50); and bishop of Chichester (1450–58). He was unusual in that he tried to bring the Lollards out of error by means of logical persuasion in vernacular treatises, especially in his *Repressor of Over Much Blaming of the Clergy*. Ironically the legal ground for his trial may have been an ecclesiastical statute originally designed to suppress Lollardy, not only because he wrote in English but also because he stressed the authority of reason, and particularly of syllogistic logic, over that of the church doctors, of the scriptures, and sometimes of the church itself.

Pecock's position on these issues was not as extreme as his accusers asserted, but enough evidence was found in his works (many of which, he pointed out, had circulated without his approval) to convict him of heresy in 1457. Upon conviction he was offered the choice of recanting or being burned at the stake. He publicly abjured and handed over fourteen of his books, which were consigned to flames. Although he was reinstated in his bishopric for one more year, his enemies were soon able to remove him from office and have him placed under restrictive house arrest at Thorney Abbey in 1459. Not long after, perhaps within a year or so, he died there.

Pecock wrote or planned to write some 30 to 50 books in Latin and English, but only a few have survived. We know of at least some of those that perished by their mention in the surviving works, which in probable chronological order are these: *The Rule of Christian Religion* (ca. 1443); *The Donet* (ca. 1443–49); *The Poor Mens Mirror* (an extract of part 1 of *The Donet*); the “Abbreviatio Reginaldi Pecok” (ca. 1447); *The Folewer to the Donet* (ca. 1453–54); *The*

Repressor of Over Much Blaming of the Clergy (written ca. 1449, published ca. 1455); and *The Book of Faith* (ca. 1456).

Pecock's extant English treatises are notable for their prose style, which is strongly shaped by the attempt to render theological and philosophical concepts in a relatively nonlatinate English, leading to frequent neologisms (e.g., *un-awayfallable*; *folewer* for "sequel"; *eendal* and *meenaltot* "pertaining to ends" and "pertaining to means"). His language is often abstract and syntactically complex, especially in his expositions of logical arguments. He thoroughly reorganized the standard religious instructional topics (vices and virtues, sacraments, articles of faith, etc.) into a nontraditional arrangement of 31 virtues. Not surprisingly, given the destruction of many of his books and the dense, complex style of those few that survived, Pecock's works had little influence on later writers. Nonetheless, they remain worthy of study for what they reveal about the capacities of late ME prose as a medium for philosophical discourse and the degree to which 15th-century English religious instruction could—and could not—diverge from institutionally approved form and content.

Peerage

A common description of the native aristocracy, a social group that went through a profound period of evolution and redefinition in the later Middle Ages. Whereas in 1300 only earls were separated from the rest of the nobility, by the end of the 15th century the peerage consisted of a hierarchy of five ranks: in descending order, dukes, marquesses, earls, viscounts, and barons. Within each rank was an order of precedence, claimed and quarreled over.

In part this trend represented an enlargement of royal patronage; the crown rewarded service by promotion within the peerage. But in a broader sense it reflected a growth in ideas of social standing and awareness. Such a sense of definition was revealed by a 14th-century statute decreeing that only temporal lords—in contrast to mere knights—could give livery (badges and uniforms) to their servants. The technical distinction between the ranks of the peerage and the gentry was a personal summons to parliament or royal patent of creation. A broader popular recognition of this division can be found in a letter of the 1450s from Thomas, Lord Scales, distinguishing between the “good lordship” (i.e., patronage from a lord) of one such as himself and the “good mastership” of his correspondent, Sir John Fastolf, rich and influential though Fastolf was.

The preeminence of the aristocracy rested first and foremost on landed wealth. Within the peerage incomes were delineated as appropriate for certain ranks: 2,000 marks a year for a duke, 1,000 marks for an earl. A peer whose estates were deemed insufficient could be demoted from his rank (as happened to George duke of Bedford in 1478). Noblemen regarded their inheritance as a sacred trust. William, Lord Berkeley, fell under the opprobrium of future generations of his family for willfully surrendering his estates at the end of the 15th century.

Interference by the crown with the laws of inheritance (as happened in 1397–99) almost guaranteed a political crisis. Noble rebels frequently sought the sympathy of the broader community by claiming they had been wrongfully deprived of their inheritance. The search to protect the integrity of estates encompassed such legal devices as entails (arrangements that limited the course of inheritance) and enfeoffments to use (enfeoffments to one person for the benefit and “use” of another) in reaction to the threat of extinction in

the male line or the problem of dowagers.

Yet, by the late Middle Ages, the position of the peerage rested on a combination of wealth and political service. Income alone did not confirm social status. In the 14th and 15th centuries rich and influential knights, such as Sir Robert Knollys and Sir John Fastolf, were better off than many of the poorer barons. Title was seen as commensurate with leadership, as John Russell, bishop of Lincoln, commented in 1483: "The politic rule of every region well ordained standeth in the nobles." Henry VI wrote Lord Egremont in 1453, reminding him that he had been promoted "to the worship and estate of a baron" for the "keeping of the rest and peace of our land." Similar responsibility was expected in times of war. Outstanding military service in Wales, Scotland, and France earned the Montagues their promotion to the earldom of Salisbury in the 14th century. In the reign of Henry V William Montague was the outstanding English war captain.

The development of the concept of the peerage as natural leaders of society found concrete expression in the evolution of the House of Lords. Since the frequent parliaments of the 1320s and 1330s the right of summons included bishops, abbots, and secular lords; a corporate identity as the high court of parliament quickly developed. The result was a forum for regular involvement in the everyday business of government. A journal of the House of Lords in 1461 shows peers listening to the reading of bills, referring to committees, and consulting with king and Commons. The rate of attendance varied; in the 15th century some two-thirds of the secular lords might participate. The enhanced prestige of the body can be seen in precedence disputes over seating and the pride with which a peer like John, Lord Scrope, left his parliament robe to his son in 1451.

Through the late-medieval period the peerage had become a broader and more defined group. Creation of peers by royal patent and charter and promotions within the peerage became deliberate aspects of crown policy. Sometimes these were controversial, as with Richard Us notorious "duketti" ("little dukes," in derision) in 1397. More often they reflected the demands of an increasingly aware and socially hierarchical society.

Penda of Mercia (r. 633–55)

Penda first appears in the Anglo-Saxon Chronicle for the entry of 628, when he came to terms with the West Saxons at Cirencester after battle. The agreement doubtless involved Mercian annexation of land along the lower Severn that later became the subkingdom of the Hwicce. At this stage Penda's exact status is unclear, but he was certainly king of Mercia by 633, when, in alliance with the Christian Cadwallon of Gwynedd, he ravaged Deira and slew Edwin, king of Northumbria, at Hatfield Chase.

In 642 Penda killed Oswald of Bernicia at Maserfeld (identified with Oswestry). In 645 he drove the West Saxon king Cenwealh into exile following the latter's repudiation of Penda's sister. Penda was killed by Oswiu of Northumbria near Leeds, 15 November 655. Although sources recounting the episode differ significantly, it seems that Oswiu had earlier been forced to offer Penda treasure for peace following his invasion of Bernicia.

Although pagan, Penda permitted his son Paeda to introduce Christianity into the subkingdom of the Middle Angles (653). Penda greatly extended Mercian power, establishing a series of principalities across the Midlands. After his death Mercia became Christian, and Oswiu was overlord of Mercia for three years until Penda's son Wulfhere reestablished control in southern England.

Penitentials

Catalogues listing sins and the penances assigned to them by the priest in confession. Penitentials are often called "handbooks of penance," but most penitentials survive in manuscript form as parts of larger codices rather than as small, self-contained booklets. A few handbook-sized manuscripts do, however, exist, and presumably they were common in the Middle Ages. Penitentials always include lists of sins and penances (these lists are sometimes called "tariffs") and often contain prefatory material telling the priest how to interrogate penitents, determine their spiritual disposition and sincerity in repenting, and weigh the seriousness of their sins. In the later Middle Ages penance required only confession, with its attendant embarrassment, and prayer; during the Anglo-Saxon period private confession was followed by the performance of various penitential acts assigned by the priest according to the catalogue of penances in the penitential.

Penitentials appear to have originated in Ireland, where they were written in both Latin and Old Irish, and to have reached England through the work of Irish missionaries. By the late 7th century the handbook had become an important pastoral text in England. Theodore of Canterbury was the first non-Irish authority to issue a penitential (ca. 690); early handbooks attributed to 8th-century English ecclesiastics (including Egbert of York and the Venerable Bede) show that the form was quickly assimilated into the disciplinary literature of the English church. During the 9th century penitentials of Irish origin were the subject of prolonged controversy on the Continent, but disputes about the orthodoxy of private penance and the literature that regulated it do not appear in English records.

Anglo-Saxon Period

England was second only to Ireland in developing a vernacular literature of penance built around the private penitential system. This literature included—

in addition to the penitentials—confessional prayers, liturgies, and other forms, such as homilies, laws, and clerical letters, that quote the penitentials or share textual sources with them. The Anglo-Saxons organized comprehensive collections that included penitentials, ceremonies for public penance, and confessional prayers, and they made excerpts from these sources for devotional reading and instruction (e.g., Ælfric's collections at the end of CUL Gg.3.28).

Penitentials in Anglo-Saxon England were written in both Latin and the vernacular (the Latin texts being more numerous) and took various forms; those with elaborate prefatory apparatus circulated alongside those that merely listed tariffs for sins. Only three vernacular texts, all anonymous but closely related to older Latin handbooks, are known (see editions by Fowler, Frantzen, Raith, and Spindler below), and they are confined to a small number of important 11th-century manuscripts. The vernacular penitentials list penances identical to those found in 8th-century texts, a fact that cannot be overlooked when the social significance of these texts is discussed. It is expected that penitential tariffs would have been revised as the handbooks passed from region to region and century to century. But the tariffs found in the surviving documents show little change, thus complicating assumptions about how closely penitential practice reflects local customs and daily life in the Middle Ages.

The major holy seasons of the church year—Advent, Lent, and Pentecost—were those in which penance was performed. Three forms were practiced: private penance, public penance, and voluntary acts of pious devotion. Public penance, which in the early church could be undertaken only once, was required for the gravest sins; for example, fratricide or the murder of a cleric carried the penance of exile. Private penance, which could be repeated, entailed a wide range of penances. The most frequent was fasting, for periods ranging from a few days to several years. For theft and crimes involving personal injury restitution was necessary before absolution could be given, a requirement that suggests the importance of ecclesiastical penance in maintaining social order. The interaction of penance and secular law is apparent as early as the laws of King Alfred (d. 899) and continues in the laws Archbishop Wulfstan (d. 1023) wrote for King Cnut (d. 1035).

Penitentials should be studied in the context of both devotional and disciplinary traditions, for the practice of penance regulated by the penitentials was only part of the large place of confession in medieval spiritual life. In Anglo-Saxon England confession was made in three ways: private acknowledgment of sins to the priest; public acknowledgment of sins before the bishop; and devotional exercise in which the sinner confessed in prayer to a ritualized list of sins that probably had little correspondence to his or her spiritual conduct. Of these three forms private confession to the priest

eventually became the norm, but the body of evidence attesting to the tradition is too vague and incomplete to permit our characterizing any one of these modes as dominant in Anglo-Saxon confessional practice. The traditional 19th-century model of regular confession to the priest cannot be traced to the Anglo-Saxon period; nor can a postmedieval stereotype of penance as a form of social control be automatically applied to Anglo-Saxon sources. The educational function of confession and penance is rarely recognized, and the relationship of these practices to historical problems of literacy—the use of written texts in a society whose literature and legal system were primarily oral—remains unexplored.

Post-Conquest Period

Penitentials after the Conquest form an amorphous lot, varying in audience, language, and structure. They are often found nestled among the folios of larger compendia of religious instruction. Some include long sections concerning excommunication, canon law, or marriage; others deal with the Creed, the Lord's Prayer, the articles of faith, methods of celebrating mass, or contrition. All contain material on the seven deadly sins and their branches, and they often alert confessors as to the specific responses they might hear from sinners and the penances they are to assign. Priests were expected to use this information to guide their penitents and to coax the more recalcitrant ones into responding in more detail. Although most penitential manuals were written in Latin for priests, they also gave rise to vernacular writings aimed at less-educated audiences, including some clergy, but mainly the laity and nuns.

Relatively few penitential handbooks, Latin or vernacular, have been edited. For the ME period these include the *Liber poenitentialis* of Bartholomew, bishop of Exeter (ca. 1150–70); the *Liber poenitentialis* of Robert of Flamborough (ca. 1208–15); and the *Summa confessorum* of Thomas of Chobham (completed by ca. 1216). Stimulated by the reforms of the Fourth Lateran Council (1215), which mandated annual confession to one's parish priest for all Christians, many 13th-century English bishops included instructions for hearing confessions in diocesan statutes, along with other spiritual information to be imparted to the laity in their own language (English or French). This educational program led to vernacular works like the *Manuel des péchés* (ca. 1250–75), translated into ME by Robert Manning as *Handlyng Synne* (1303–17); the anonymous *Cleansing of Mans Soul* (late 14th century), addressed to nuns and lay readers; Chaucers *Parsons Tale*, and John Mirks *Instructions for Parish Priests* and the anonymous *Speculum ChHstiani*,

pastoral manuals addressed to priests (late 14th to early 15th century).

Because laity as well as clergy were required to confess, everyone could be expected to know the general content and structure of penitential manuals. It is not surprising, therefore, that authors like Langland, the *Pearl*-poet, Gower, and Chaucer employed penitential motifs in their works, clearly anticipating audiences capable of discerning them. Thanks to the Fourth Lateran Council, the sinner had come to be a common literary figure, knowledgeable about his or her actions, motives, and degree of guilt. Common, too, in later medieval literature is the use of a questioning lay figure functioning as priest; of contrition, confession, and satisfaction in building storylines; and of “confessional words”—*absolve*, *confess*, *grope* (“to examine someone’s conscience”), *guilt*, *intent*, *repent*, *shame*—in secular contexts, forcing the reader to recall the psychological and spiritual experience of penance. The influence of penitential manuals can be seen in genres as diverse as devotional treatises and the literature of courtly love where one lover laments his or her transgressions against the other.

Percy Family

The Percys were originally a Yorkshire baronial family. Their position was transformed in the 14th century when they became a major aristocratic house, dominating the north. While remaining a force in the later medieval period, their power underwent a decline in the 15th century and their broader political influence was sporadic.

The Percys' rise began in the reign of Edward I, when service on the great expedition of 1296 was rewarded with grants of confiscated Scottish estates. In 1310 they purchased Alnwick in Northumberland. Deliberately establishing a role in border politics, they acquired another residence at Warkworth in the 1330s. But a more dramatic territorial expansion occurred in the last 30 years of the 14th century. Purchase of the marriage of the Strathbogie heiresses brought in the baronies of Mitford and Tynedale. In 1376 Gilbert Umfraville was persuaded to make over half his inheritance (including the barony of Prudhoe on the Tyne). On his death in 1382 Henry Percy married Gilbert's widow, Maud, heiress to the barony of Cockermouth in Cumberland.

Percy, elevated to earl of Northumberland in 1377, now had a superb power base in the north; in Northumberland itself his family owned no less than four castles, five baronies, and 70 manors. Growth in territorial power coincided with an increasing involvement in the defense of the border; by the 1390s the office of warden of the march toward Scotland was monopolized by the Percys.

The rewards for the help given to Henry IV in 1399 marked the zenith of the family's importance. But inevitably neither the family's subsequent influence on the new king nor their tangible rewards came up to their expectations, and a rift soon developed between the Percys and the king. Their unsuccessful revolts of 1403 and 1406 led to attainder and forfeiture. The crown increasingly lent its support to the rising Neville family of Raby. By the 1440s the income of the Nevilles' northern lands outstripped that of the Percys. A violent rivalry between the two families led to an armed clash at Stamford (1454) and caused the Percys to enter the Wars of the Roses on the Lancastrian side. Military defeat further curtailed their role. Although the Percy heir was restored as earl in 1469 and managed to retain some influence in Northumberland, the mantle of leadership of northern society passed first to Richard Neville, earl of Warwick, and then to Richard duke of Gloucester.

In the Tudor period ballads romanticized a Percy hegemony in the late

Middle Ages. Northern society was clannish by nature, and such families as the Yorkshire Plumpton had a record of service to the Percys over four generations. The restoration of Henry Percy in 1469 was certainly a popular measure. Yet the much-quoted adage, “The north knoweth no Prince but a Percy,” disguises the waning influence of the family in the 15th century.

Peter of Langtoft, or Pierre de Langtoft (fl. 1271–1307)

Augustinian canon of Bridlington, Yorkshire, and author of a lengthy Anglo-Norman verse chronicle of England, completed in the early 14th century. The fullest manuscripts of his *Chronicle* extend from Brutus, the legendary founder of Britain, to the death of Edward I in 1307. One manuscript states that the work was written at the request of a certain “Scaffeld,” perhaps John of Sheffield, sheriff of Northumberland and a partisan of Anthony Bek, bishop of Durham (1283–1311).

The first section, from Brutus to Cadwalader, paraphrases Geoffrey of Monmouth; thereafter Langtoft draws on well-known Latin prose chronicles, romances, saints’ lives, official documents, and personal knowledge for his material. The narrative of Edward I’s reign is valuable for its account of Anglo-Scottish relations, though it is virulently anti-Scottish. Langtoft’s *Chronicle* was a major source for the second part of Robert Manning’s English *Chronicle*.

Phoenix, The

The OE *Phoenix* survives in the Exeter Book miscellany of Anglo-Saxon poetry. Like many OE Christian poems it was once attributed to Cynewulf, but since it lacks a runic signature this idea is now generally discounted, although the possibility of influence is accepted. The text appears to be complete and has been edited and translated often. A shorter version of the phoenix myth survives in two OE homilies.

The first 380 lines of *The Phoenix* are a paraphrase of the Latin *De ave phoenice* of Lactantius, from which the pagan elements have been removed. The remainder is a homiletic elaboration of the myth based partly on Ambrose's *Hexaemeron* 5.79–82 and partly on Job 29:18, perhaps following the explication of this passage in a commentary attributed to Philip the Presbyter.

The poem concludes with eleven macaronic lines combining OE and Latin.

Though some critics prefer a less rigid reading, most criticism of the poem has centered on its allegorical dimension, with Cross finding a complete allegory on four levels: in addition to the literal narrative of the marvelous bird, allegorically the phoenix is a type of Christ; morally it represents the good Christian, especially the soldier of God; and anagogically it prefigures the soul in heaven. Bugge notes a monastic sentiment in the emphasis on the bird's virginity and ascetic life. In contrast to the christological reading Heffernan's anthropological approach to the phoenix myth finds feminine and specifically Marian imagery at work as well.

Physiologus

The *Physiologus*, or bestiary, genre can be traced back to classical times, but as transmitted to the Middle Ages the collection came to be associated more with Christian allegory than with scientific natural history. All or part of the Latin *Physiologus* was translated into numerous vernaculars; the OE verse rendering, found in the Exeter Book, describes three creatures usually identified as Panther, Whale, and Partridge. The identity of the third creature is particularly uncertain, since the poem breaks off after a single line describing the bird, resuming after the presumed loss of a single leaf to conclude with fifteen lines of allegorical interpretation. The word *Finit* at the end of “The Partridge” signals the close of a descriptive and allegorical cycle that has considered creatures of earth, sea, and sky (representing earth, hell, and heaven).

The Panther (or perhaps Leopard) is described as a gentle beast of many colors, who arises from a three-day sleep with such fragrant breath that all are drawn to him and who is hostile to none except the dragon; a lengthy allegorical interpretation identifies the Panther with Christ. By contrast the Whale (originally a turtle in the Latin tradition), interpreted as Satan, draws little fish to their death by his sweet breath and deceives weary sailors, who mistake his body for an island and are drowned.

The OE *Physiologus* continues an allegorical tradition in Anglo-Saxon poetry that goes back to Aldhelm’s Latin *Aenigmata* and finds its finest and most complex expression in the OE *Phoenix*, also contained in the Exeter Book. The *Phoenix*, though immediately drawn from a Latin poem by Lactantius, itself ultimately derives from the same *Physiologus* tradition. The OE *Physiologus*, moreover, was but the first of a long series of translations of the work, which proved of enduring importance and influence throughout the medieval period.

Pierce the Plowman's Creed

An important work in the English vernacular tradition of antimendicant satire, surviving in three manuscripts and two early printed editions. Written ca. 1394 in the southwest Midlands dialect by an anonymous author, this poem is the first and some would say the best imitation of William Lang-land's *Piers Plowman*. Indeed, from the time of its composition until well into the 16th century, *Pierce the Plowmans Creed* and many other imitations of *Piers* were popular, particularly as documents of discontent with and attack upon the clergy and church authority.

Pierce the Plowmans Creed consists of 855 alliterative long lines and contains savage antimendicant satire and biting social and political commentary. The poem begins with the narrator's statement that he knows his Our Father and Hail Mary but is ignorant of the Creed. In a scene echoing Will's encounter with the Minorite (Franciscan) friars before the third Dream in *Piers Plowman* the narrator sets out in search of the person who will best be able to teach him his creed. He meets in turn a Franciscan, a Dominican, an Augustinian, and a Carmelite friar, each of whom discourses at length upon the degenerate practices of one of the other orders. About halfway through the poem the narrator encounters the suffering family of a poor plowman, Pierce, who sharply criticizes the worldliness of all friars and teaches the narrator his creed. Much of the poem's effectiveness and artistic merit springs from its richly detailed descriptions of buildings, people, activities, and emotions.

Piers Plowman

An allegorical dream vision (ca. 1368–85) in alliterative verse, concerned with contemporary social and religious problems. The content of *Piers Plowman* is best summarized as a dilation on the proverb quoted near the beginning, “When all treasures are tried, truth is the best.” In a series of dreams Will the narrator describes society’s pilgrimage to Truth, and then his own personal quest (through the stages of Do-well, Do-better, and Do-best). Of the many 14th-century poems on the same or similar subjects *Piers Plowman* is the longest and most complex. Since the late 19th century scholars have recognized three distinct versions: the A text, consisting of a prologue and twelve sections called passus (about 2,560 lines); the B text, a revision and continuation consisting of a prologue and twenty passus (about 7,300 lines); and the C text, a further and apparently unfinished revision consisting of a prologue and 22 passus (about 7,340 lines). The name of the author is uncertain. It is conventional to call him William Langland, on the basis of a note in an early manuscript of the C text, but other external evidence is lacking. Internal support includes a possible anagram in B. 15.152, where the dreamer says, “I haue lyued in londe... my name is longe wille.”

Textual Tradition

There are 52 manuscripts, a black-letter edition of 1550 (by Robert Crowley) that represents a 53rd, and three fragments of other manuscripts. Since no two are alike, the original number of manuscripts must have been considerably

higher. From internal evidence the A text has been dated 1368–74, the B text 1377–81, and the C text 1381–85. Recently A.G. Rigg and Charlotte Brewer proposed that MS Bodley 851 represents a fourth version, which they call the Z text, earlier than any of the other three; opinion on the matter remains divided.

The complexity of the manuscript tradition and particularly the existence of three distinct versions led early-20th-century critics to propose multiple authorship. J.M. Manly argued for as many as five authors in a reference work that ensured wide circulation of his theory, the *Cambridge History of English Literature* (1908). Most critics now assume single authorship. The controversy is examined in George Kane's *Piers Plowman: The Evidence for Authorship* (1965).

Skeat's editions of the three versions, standard for a century, have been superseded by the Athlone editions under the general editorship of George Kane. Skeat's method was to present the best manuscript of each version with a minimum of editorial intervention; Kane's procedure was to identify obvious errors, based on the knowledge of "scribal tendencies," and then to emend accordingly. Not all scholars have accepted the Athlone editions as definitive; as Kane himself concedes in his introduction to the A version, "The authority of a text of this kind must vary from line to line" (165). Nevertheless, the Athlone editions are generally regarded as the standard tools of *Piers* scholarship, not because their readings are infallible but because their full display of variant readings allows other scholars to weigh the manuscript evidence for themselves. The classroom editions by Schmidt and Pearsall also deserve mention, especially for their helpful notes. There is a good verse translation of the B text by E. Talbot Donaldson.

Language and Versification

Although the surviving manuscripts were produced in many different parts of the country, certain dialectal features common to them all suggest that the author's holographs were written in the dialect of southwest Worcestershire. This conclusion agrees with the narrator's statement that he had his visions "on maluerne hilles" (A.Prol.5). The poem also contains a fair number of recent French loanwords (a higher proportion, in fact, than Chaucer's works), as well as several hundred Latin quotations, many of which are joined macaronically with the English (e.g., "*Qui loquitur turpiloquium* is luciferes hyne"—"He who speaks filth is Lucifer's servant").

The poem is in alliterative verse. The basic pattern is aa/ax. That is, there are four stressed syllables per line; and the alliteration of both stresses in the a-

verse is picked up in the first stress of the b-verse (e.g., “I sei3 a tòur on a tòft / trieliche ymáked”). Lines with fewer than three alliterating syllables (ax/ax, aa/xx, etc.) are not uncommon but may be defective; lines with more than three sometimes occur in moments of importance or high formality, as in the opening line, “In a sómer sésón whan sófte was f) e sónne.” Like many other alliterative poems *Piers* is full of formulaic half-lines, for example, “so me god helpe”; these appear almost always as b-verses.

Summary

The following summary is based on the B version, the one most often studied and quoted. The poem begins like many other dream visions of the period. The narrator relates that on a May morning, as he lay by a stream on the Malvern Hills, he fell asleep and had a “merueillous” dream (actually the first of eight dreams). In it he sees “a fair feeld ful of folk” between two castles, a “tour,” or keep, on a hill and a “dongeon,” or donjon, in the valley below. Many of the folk are conscientiously going about their work; others are idle or seeking an easy way to get ahead.

What does the scene mean? A lady clothed in linen (a conventional guide figure, later identified as Holy Church) descends from the hill castle and explains it all to the dreamer. The “tour on toft,” she says, is the home of Truth, the father of faith and loyalty (God); the “dongeon in dale” is the home of Wrong, the father of falsehood and treachery (the Devil); the folk on the field are divided into those who serve Truth and those who serve Wrong. Holy Church explains that “truth is the best,” for it is the way to salvation itself. Those who “werche wel... shal wende to heuene,” but those who “werchen with wrong” shall follow him to hell.

This opposition provides the basic framework of the poem in all three versions. The scheme is starkly simple. The poet adds complexity, however, by showing in one episode after another that the will is not always inclined to follow truth and, even when it is, that the intellect is not always able to show the way.

In the first episode the opposition of truth and wrong is restated and dramatized in terms of a rivalry between Lady Holy Church and Lady Meed. Holy Church complains that Meed (wealth, reward) undermines loyalty (*leaute*) and the rule of law. Looking to his left, the dreamer sees a richly arrayed woman, surrounded by a crowd of greedy sycophants, about to be married to False. Theology is alarmed by the prospect of such a match: “God graunted to gyue Mede to trupe” (2.120). The case is brought before the king.

The trial that follows is an exercise in the casuistry of conscience. Meed's defense rests on a recital of her positive actions—the giving of wages, gifts, alms, benefices, and so forth. Conscience, backed up by Reason, counters that there are two kinds of meed, one “measureless” (bribery, usury, excessive fees) and the other “measurable” (honest wages, payment for merchandise). Lady Meed represents the former. The king, convinced that Meed “muche trujpe lettej) [hinders],” rules against her and invites Reason and Conscience to continue as his counselors. Here the first vision ends.

In the next vision, stirred by Reason's sermon to seek “Seynt TruJ) e,” the folk confess their sins and set out on a pilgrimage to the shrine of Truth. Their guide is Piers the Plowman. He is the very incarnation of the virtue they seek. “I do,” he says, “what truþe hoteþ [commands].” He promises to lead them to truth if they will help him plow his halfacre. However, it gradually becomes apparent that in “working well” under the direction of Piers, the folk are in fact already on their way to truth. For truth is not a geographical destination but a form of conduct. Truth himself acknowledges as much by sending to Piers's helpers a pardon. It reads, “Et qui bona egerunt ibunt in vitam eternam; Qui vero mala in ignem eternum”—“And those who do well will go into eternal life; those who do evil, into eternal fire.” This, of course, is precisely what Holy Church said earlier; and yet one of her own priests, having offered to construe the Latin, is unable to understand it as a pardon. His ignorance or blindness is another measure of how far the church has departed from its ideals. In righteous anger Piers tears the document in half and vows to be less solicitous about material things and more given to a life of prayers and penitence.

Piers's resolve marks an important shift in the poem's argument. From the emphasis on truth in the first two visions as a social obligation, manifested primarily in obedience and good works, Langland descends in the third to an examination of its source in the heart. No longer is the dreamer a spectator only; “Will” is now the center of the action. Concerned about his own salvation, he begins his personal quest for truth. What does it mean to “do well”? He consults Thought, who, true to his own analytical nature, divides the concept into three parts: Do-well, Do-better, and Do-best. Will's desire to know more about these takes him from Thought to other personifications of the intellectual life: Wit (native intelligence), Study (application), Clergy (learning), Scripture (books), Imaginatif (prudential judgment). The further Will proceeds, however, the more confused he becomes. The promise of *qui bona egerunt*, “do well and be saved,” is not so simple as it looked at first. Frustrated, Will becomes increasingly impatient with his teachers, until, in a dream within the dream (11.5–406), he rebukes Reason itself. This absurdity shames him into the realization that his own disposition is the main problem. The fault lies not with Reason but with Will. He has been committed to the

search intellectually but not affectively. He has looked everywhere except the one place where Piers Plowman directed the pilgrims to look—"in *Ipyn* herte" (5.606).

To express the unity of Do-well, Do-better, and Do-best—and its basis in the will—Langland often has recourse to the corresponding triad of "words, works, and will" and, more profoundly, to the Trinity itself. Like the three persons of the Trinity the three stages of truth are distinct but inseparable. Each component contains something of the others. Apart from Do-best it is impossible truly to Do-well or Do-better.

This insight is dramatized in the fourth vision (passus 13–14) by two of the poet's most memorable creations. First the dreamer encounters a gluttonous friar, who is full of words about "do well" but has no works to match them. Then he meets Haukyn the Active Man, whose words and works are in apparent harmony. Here, it seems, is the embodiment of "do well"—until Conscience observes that his coat is stained with sins of every kind. Haukyn confesses that hardly a day passes that he does not foul it "þoru3 werk or þoru3 word or wille of myn herte" (14.14–15). The vision ends with Haukyn sobbing, "So hard it is ... to lyue and to do synne."

The recognition that words and works alone are inadequate to truth leads to a concentration on will in the fifth vision. The dreamer's guide, appropriately, is the soul itself, Anima, who exhorts him to charity. The dreamer asks for further instruction: "I haue lyued in londe... my name is longe wylie,/And fond I neuere ful charite" (15.152–53). Charity cannot be known, says Anima, "Neiger þoru3 wordes ne werkes, but þoru3 wil oone" (15.210). There follows a long treatise on the nature of charity, culminating in a description of the tree of charity. The *arbor caritatis*, a conventional image, summarizes in visual form the teachings of Anima. Its root is mercy, its trunk pity, its leaves "lele wordes," its fruit charity. This image gives way to Christ's parable of the good Samaritan, the chief biblical exemplar of charity. The parable is allegorized. The man who fell among thieves and was left for dead is mankind; the priest who passes him by is Faith (Abraham), and the Levi te who does the same is Hope (Moses); the good Samaritan who saves the man is Charity (Christ).

The supreme act of Charity, Christ's sacrifice on the Cross, is dramatized in the sixth vision. The dream begins on Palm Sunday. Jesus enters Jerusalem like a knight on his way to a tournament; he is wearing the armor of Piers the Plowman, that is, *humana natura*. The battle is joined on the Cross itself. Christ triumphs (in his death defeating Death), descends into hell, and, after a debate with the Devil over who has legal rights to mankind, leads forth his own. Through the Redemption the prophecy of Psalm 84:11 is fulfilled: "Mercy and truth have met each other; justice and peace have kissed" (18.421a). The sound of Easter bells awakens the dreamer, who, with his wife, Kit, and

daughter, Calote, goes to church to celebrate the Resurrection.

At this climactic moment the poet might have ended his work, and many readers have wished that he had. But the Resurrection is not the end of mankind's struggle to do well; rather it is the triumph that makes possible his own. In the last two visions, therefore, Langland returns to the field of folk to show the unfinished work of the church. Christ gives to Piers (St. Peter, the pope) the power to forgive sins. The Holy Spirit at Pentecost distributes to the folk the gifts of grace with which to withstand sin; and to Piers, the four seeds of the cardinal virtues and the four oxen of the Gospels with which "to till truth." To store the harvest of truth Piers builds a barn, Unity, "holy chirche on englissh" (19.238).

The action at the end of the poem is clearly a reprise of the pilgrimage to truth on Piers's half-acre. But this time the threat is more insidious. In contrast to the easily identified wasters on the half-acre the forces of Antichrist occupy the highest offices of church and state, and having the appearance of truth they undermine the system from within. The friars are the worst. One "*Sire Penetrans domos*" (2 Tim. 3:6), acting as spiritual physician to those in Unity, lets sinners get by with token penance, "a litel siluer." The sacrament of confession, upon which salvation depends, is compromised. Equally alarming is the helplessness of Conscience; misled by the guile of the friars and others, the moral faculty has lost its bearings. The poem ends as Conscience sets out to "seken Piers we Plowman." The cycle established earlier—the pilgrimage to truth, the search for Do-well—must be repeated yet again, this time by the very guide who had once so confidently led Will. The final lesson of the poem is that in such treacherous times and circumstances the will's hard-earned desire to "do well" is, tragically, not enough.

Versions

So far as narrative sequence is concerned, the above summary of the B version is more or less faithful to the corresponding portions of A and C as well. In other respects, however, the three versions differ greatly. B and C are nearly three times the length of A; they are also more introspective, apocalyptic, and theologically speculative. Between B and C there are also significant differences. C is generally regarded as poetically inferior to B, even by its greatest champion, E. Talbot Donaldson. Its chief aim seems to be clarity. It omits the puzzling tearing of the pardon and numerous other passages that threaten to distract or confuse. On the other hand it also adds much that is new and interesting, such as the grammatical metaphor at 3.333–406a and the

important autobiographical passage at 5.1–108. In general the C revision is looser, more prosaic, and shows (in Donaldson's words) "a mounting ascendancy of idea over form" (1949: 42).

Criticism

The history of *Piers Plowman* criticism has been one of growing respect for the poet's craft, learning, and architectural sense. Early interest focused on the *visio* (as the first two dreams are called in several manuscripts), largely because of its satire, "realism," and topical allusions. It is hardly surprising that from this limited perspective the poem was valued chiefly as an historical document. The occupations of the folk on the field, the corruption of Lady Meed, the breakdown of feudal authority on the half-acre—such things were taken to be an accurate reflection of the times. There was less admiration for the much longer and more abstract *vita* (as the rest of the poem is often called).

The features that distanced many readers (especially from the *vita*)—the allegory, the theology, the heavy use of Latin quotations—were the very features that attracted a new critical approach in the mid-20th century. Robertson and Huppé, reasserting a view expressed earlier by Dunning, argued that the poem could be interpreted only in the context of patristic exegesis, that is, the scriptural tradition developed by the writings of the Church Fathers (e.g., Ambrose, Augustine, Jerome, Gregory). Subsequent critics refined the approach. Controversial though it was, exegetical criticism forced a sweeping reevaluation of the poem. The result was a more serious, more positive regard for the poet's art and learning (and, just as important, an increase in the tools available for literary research in the period).

Stimulated in part by the discoveries of exegetical criticism, other critics have sought to define more precisely the poet's intellectual milieu. Bloomfield sees the poem as the expression of a peculiarly monastic outlook and philosophy. Coleman argues that the poet's system of thought reflects mainly "the influence of Oxford and Cambridge thinkers whom we shall designate as the fourteenth century *moderni*" (1981: 17). Scase examines the principal issues of the poem in the light of contemporary (as distinguished from "traditional") anticlerical writings. Other scholars have made important connections between the poem and grammar, law, antifriar polemic, and both modern and medieval economic and political theory.

Though widely divergent, and often in opposition to one another, such recent approaches have made possible new and complex readings of the poem. The assumption that the author was a careful and sophisticated thinker has

proved far more productive than the earlier assumption that he was not.

Pilgrimages and Pilgrims

Pilgrimage is a journey to a place of particular holiness: the burial place of a saint, location of a relic, or site associated with miraculous events. Pilgrims sought that the holy one associated with the place would intercede with God on their behalf. Pilgrims were privileged travelers; recognizable by staff, badge, and scrip (a small bag or satchel), they were exempt from tolls, were to be treated respectfully, and—especially at journeys end—could expect a hostel to provide free lodging.

Englishmen made pilgrimages to Jerusalem, Rome, or Compostela in Spain, but within England there were a number of notable shrines. That of St. Thomas the Martyr (Thomas Becket, killed in 1170, canonized 1171) in Canterbury Cathedral was the most celebrated, its fame ensured long before Chaucers *Canterbury Tales*. It attracted pilgrims of every class including royalty, both English and foreign. Pilgrims from Winchester or London took well-defined routes, whose courses are still known; that from London by way of Rochester was well organized, with changes of horses available to hire. At popular shrines pilgrims could buy metal badges proving that they had made the journey; at Canterbury these took the shape of St. Thomas or were small flasks filled with holy water.

The shrine of Our Lady of Walsingham was next in importance, within England. About 1130 a widow, Richelde, was instructed by the Virgin to build a replica of the Holy Family's house at Nazareth; the house was used as a chapel. Later it was adorned with a jeweled statue of Mary and furnished with a reliquary believed to contain some of her miraculous milk. From the mid-13th century the fame of Walsingham grew steadily and by the late 15th century probably surpassed that of Canterbury. Other centers of enduring fame and

national significance included the shrine of St. Cuthbert at Durham, the Holy Well of St. Winefride in north Wales, the Holy Rood at Bromholm (Norfolk), the shrine of the martyr Alban at St. Albans Abbey (Hertfordshire), and Glastonbury (Somerset), with the holy thorn tree and a church believed to have been founded by Joseph of Arimathea.

There were numerous places of pilgrimage whose importance was almost entirely local. Swings of fashion brought them into prominence for a time. Thus the tombs of St. William of Norwich (d. 1144) and Little St. Hugh of Lincoln (d. 1255) were visited for a time because the boys, who died violently, were popularly believed to have been ritually murdered by local Jews. Later the tombs of such political “martyrs” as Simon de Montfort, Thomas of Lancaster, and Edward II attracted pilgrims, though no official claim for their sanctity was ever made.

Though fashions for particular shrines fluctuated, enthusiasm for pilgrimages in general remained undiminished, despite criticisms by John Wyclif and the Lollards. Pilgrims made offerings at the shrines they visited, and these resulted in great wealth for the monasteries and churches in which they were located. Canterbury Cathedral was rebuilt with the offerings at St. Thomas’s tomb, while the monks of Gloucester undertook extensive reconstruction of the abbey church with the offerings made at Edward II’s tomb. Shrines of saints were lavishly decorated with gold, silver, and gems; Thomas Becket’s was outstanding for its opulence. All these were destroyed at the Reformation.

Planctus

A lament, most usually upon the death of an important person or the destruction of a city; other types include the planctus on a biblical or classical figure (e.g., David's lament over Saul and Jonathan) and the dramatic or semidramatic Lament of the Virgin at the Cross. As a type of funeral verse the planctus (plur. planctus) was superseded by the elegy in the early 15th century. There are planctus in Latin and all the major medieval European vernaculars. To a large degree the planctus were intended for music in their original performance contexts, and melodies survive for a surprising number. The term denotes no particular metrical or musical shape, though the planctus is often constructed as a chain of repeating versicles, like the lai or sequence. The Latin planctus, sequence, and lai also frequently share a common melodic idiom.

Almost two dozen Latin planctus refer to English figures, with a roughly similar total in the various vernaculars—English, French, or Provençal. For instance, *Anglia planctus itera* memorializes Henry II (d. 1189); Gaucelm Faidit's *Fortz cauzaes* laments Richard the Lionheart (d. 1199); *Seignurs, oiezpurdieu le granthonors* Edward I (d. 1307); and *A dere God whatmay this* responds to the loss of Edward III (d. 1377). Among a number of laments of the Virgin in English, *Stondwel moder ounder rode* is the most widely distributed. One internationally popular Marian lament in Latin, Geoffrey of St. Victor's *Planctus ante nescia*., provided the melody for the Middle English "Prisoner's Prayer," *Ar ne kuthe*, which survives along with an alternative French text, *Eyns ne soy*, in London, Guildhall, Records Office, Liber de Antiquis Legi bus, fols. 160v-161v. There are a number of insular examples of the related genre of Latin lai, of which *Samson dux fortissime* and *Omnis caro peccaverat* (the *Song of the Flood*) are the most ambitious.

Poll Tax

By the late 14th century the traditional subsidies levied on personal wealth had become fixed in yield and thus unable to supply the increasing needs of the exchequer. The last parliament of Edward III attempted to augment revenue in 1377 through the introduction of a poll tax, levied on individuals rather than property. The 1377 tax was set at a rate of one groat (*Ad.*) from all persons over fourteen (except beggars); the palatinates of Chester and Durham were excluded. The tax raised about £20,000, and the returns have provided historians with data for estimates of regional and national population.

A second poll tax was granted in 1379 for persons over sixteen. A graduated scale of assessment, ranging from a groat for the poor to ten marks (£6 13s. *Ad.*) for the dukes of Lancaster and Brittany and the two archbishops, was employed to make the tax more equitable and increase the yield. The results were disappointing—only £27,000 was collected—due to increased evasion of the tax.

In November 1380 parliament was summoned to cramped quarters at Northampton to deal in expeditious fashion with a mounting financial crisis. The result was the third and most famous poll tax. It was decided that the needed funds would require a trebling of the basic rate—a shilling a head on all persons over fifteen. The rich were encouraged to help the poor, but there was no graduated scale. Further, even this pious hope was vitiated by the provision that no man and wife were to pay more than twenty shillings. The tax met widescale evasion; fully one-third the number on the rolls in 1377 had disappeared from the 1381 rolls. Commissions of revision were sent to sixteen counties to counter such evasion. These attempts at collection were a key ingredient in the explosive mixture that produced the Peasant Rebellion of 1381, which began in Essex and Kent.

Popular (or Folk) Culture

A term used to designate the lifestyles, beliefs, value systems, and artistic creations of those groups set apart from the elite by poverty, illiteracy, and lack of power. Most medievalists include among these nonelite groups the rural peasantry, poorer urban artisans, and traveling tradespeople. Because these classes had little access to writing and scant representation in the ruling institutions of church, court, and government, there is great ignorance and great debate concerning the nature of medieval popular culture. Attempting to rediscover this elusive society, scholars have long relied on literary descriptions, though recent scholarship often turns to other sources in hopes of finding less (or at least differently) slanted evidence.

The least contestable evidence of medieval popular culture consists of archaeological excavations and such official records as manorial rolls and coroners' reports. These sources lead social historians like M.M. Postan and Barbara Hanawalt to conclude that peasants' material life and daily practices changed little from century to century. This relative stasis, labeled the *longue durée* ("long term") by French historians of the *Annales* school, has been used to justify resorting to the relatively rich writings of the 15th, 16th, and 17th centuries to help explain the culture of earlier, more sparsely documented times. However, the seeming continuities in technology and material culture do not of themselves guarantee that popular stories, beliefs, and values remained the same for centuries. Researchers must still turn to the more ambiguous evidence of medieval literature. To assess this literature it is necessary to distinguish at least two viewpoints, the outsiders' and the insiders'.

Outsiders' views, sparse in the early Middle Ages, grow more numerous with passing centuries. During the Anglo-Saxon period a few works (e.g., Ælfric's *Colloquy*) described the practices of farmers, fishers, and other ordinary workers. Although descriptions of popular culture grew much more common in the later Middle Ages, they generally reflect a negative bias. One important genre, the estates satire, catalogues various occupations and contrasts their ideal behavior with their actual practices. Typical is John Gower's 14th-century Latin work *Vox Clamantis*, a diatribe accusing peasants

of undermining society by abandoning their duties. Only a few works, like *Piers Plowman*, show peasants “working very hard planting and sowing,” only to “win what wastrels destroy with gluttony” (B.Prol.21–22).

Because elite authors so often condemn the lower classes, it is not surprising that some medievalists view popular culture as a counterculture, defining itself principally in terms of its opposition to the ruling class. In the *Canterbury Tales* Chaucer divides his pilgrims into *gentils* and *cherles*. The “perfect, *gentil* Knight tells a refined romance of courtly love and noble battles, but the *cherlish* Miller responds with an earthy comic tale mocking courtly conventions. The *Canterbury Tales*, like a number of other ME works, stresses class conflict.

Some medievalists distinguish popular culture not by its opposition to, but by its dependence on elite culture: in their opinion popular culture is not creative in its own right but simply borrows, producing poor imitations of refined art. The idea that culture moves only from the top down is labeled by the German term *gesunkenes Kulturgut*. Among adherents of this view was the Celticist R.S. Loomis, who maintained that the Arthurian romances could never have been created in “the fancies of plowmen, goose girls, blacksmiths, midwives, or yokels of any kind.” According to the perspective of *gesunkenes Kulturgut* a work like *The Tournament of Tottenham* represents peasants’ pitiful attempts to imitate noble culture. In this mock romance the peasant contestants use flails instead of swords as they fight for the favor of a bailiff’s daughter, rather than the noble heroines of elite poems.

Most medievalists now reject the more extreme forms of the two arguments just described. Because no known culture exists merely to oppose or merely to imitate another, evidence of a distinct popular culture, with its own *insiders* view, will emerge from certain texts. Among the richest sources of popular culture are religious narratives and romances. An excellent gauge of popular taste is the literature aimed at the lower classes from the pulpits. Striving to keep their parishioners’ attention, preachers (often of nonelite origins themselves) drew upon well-known, well-liked stories, including fables and folktales, converting these to exempla—tales told to underline moral precepts. Robert Manning’s *Handlyng Synne* presents many exempla, including one in which a witch’s spells make a bag move about by itself, sucking milk from cows. She displays her arts for a bishop, who attempts to imitate her but fails. The witch explains that the bishop’s magic won’t work because he does not believe the spell; he then commands her not to believe it either. This story illustrates a folk belief that can still be found in the 20th century. The author is himself a practitioner of popular culture, for his story grants witches magical powers that the official church denied. In Manning’s story, as in popular culture, pre-Christian magical belief and official church doctrine intermingle

freely.

Another important popular genre is romance. Although some claim a courtly origin for romance, others see it as evolving from oral folktales. More important than their origins—impossible to trace—is the fact that many romances are told from or directed toward the point of view of popular culture. Some stories combine elite and popular perspectives; *Havelok*, for example, creates heroes of both a king and his fisherman friend. Other romance plots exist in both elite and popular treatments, and comparing the two may reveal much about the popular view. Gower's *Tale of Florent*, written for a courtly audience, shares a plot with a less refined tale, *The Wedding of Sir Gawain and Dame Ragnall*. Gower's hero is an emperor's nephew incapable of wrong action, who disenchants a princess by granting her the upper hand in love. In contrast the hero of the anonymous *Gawain and Ragnall* is a good servant (Gawain) who acts heroically to help his king (Arthur) save face. Arthur has seized lands from a knight and broken vows of silence, but Gawain intercedes to save Arthur's life. Gawain is ultimately rewarded more generously by a hag (who is transformed into a beautiful woman) than by the king he has faithfully served. These slight changes in plot and great differences in perspective owe much to the different class allegiances of the two authors and their audiences.

As the Middle Ages drew to a close, the romance became progressively the property of popular culture. From Caxton's printing of Malory's *Morte Darthur* (1485) onward book and chapbook publication reached ever broader audiences, as such tales as *Guy of Warwick* and *Bevis of Hampton* were retold in prose form into the 19th century. Oral folktales based on romance themes also thrived, and their descendants have been collected in Scotland late in the 20th century.

Popular Religion

During the Middle Ages the character of popular religion underwent many changes, but it can be most easily and completely seen during the years after 1300. Popular religion centered on parishes, of which there were some 8,600 in England and Wales. The ministrations of the parochial clergy were highly prized, and in large parishes, with a number of hamlets remote from the parish church, dependent chapelries were sometimes brought into existence when funds permitted.

The parochial clergy provided a succession of liturgical services. During the day the priest said the divine office and mass at least once a week, though not more than once a day. From 1215 the laity were bound to make confession and take communion once a year, though in the later Middle Ages there was increasing demand to receive communion more frequently. Perhaps the respectable norm was to attend church on Sundays, feast days, and special occasions and to go oftener when opportunity offered.

The feasts of the liturgical year provided memory milestones and coincided with the agricultural calendar. It is sometimes said that the Middle Ages were fundamentally pagan, Christianity a mere veneer, and that Christianity harnessed and utilized ancient festivals that marked the passing seasons and

the annual round of farming tasks. Thus Christmas satisfied a need for cheerfulness in midwinter, while Easter marked the return of spring. The calendar year began with the Annunciation of the Blessed Virgin Mary, “Lady Day,” on 25 March, but the liturgical year began with Advent (approximately 1–24 December). To commemorations of the life of Christ—Christmas (25 December), Epiphany (6 January), Lent and Easter (late winter and early spring), Whitsun (early summer)—were added a number of saints’ feasts that were similarly easy to remember and that also marked the passing of the months and seasons: St. Hilary (13 January), the Nativity of St. John the Baptist (24 June), St. Michael or Michaelmas (29 September), All Saints (1 November).

Within this general framework liturgy and religious observance were subject to local variations. In England there were five liturgical uses (rites): those of Hereford, York, Lincoln, Bangor, and Sarum (Salisbury), but in the course of the 14th and 15th centuries the Sarum Use gained in popularity over the others. Ironically England became liturgically united on the eve of the Reformation. Some saints’ cults were also localized, yet the number of saints’ days celebrated was probably similar all over the country, with some 50 a year being observed. In the absence of vacations these holy days were the only respites from work generally allowed. Feast days were often literally the occasion for festivities and sometimes for community celebrations: “church ales” to raise parish funds.

At every critical point in an individual’s life the parish church provided rituals that marked the occasion and enabled families and communities to express emotion. Babies were baptized into the church and given godparents, whose relationship to the child was regarded by the church as equal to the blood tie. The sacrament of confirmation, in theory universal, is rarely mentioned in contemporary sources, but weddings were conducted in church porches. Parish clergy heard the confession of, and gave absolution to, the dying. Above all they performed funerals that were important religious, emotional, social, even economic occasions, used by families to express wealth and status and to give charity to the poor, as well as to benefit the deceased’s soul. Wills show a preoccupation with the form the funeral was to take, the numbers to be present, and the hospitality to be given. Subsequent services a month later (the “month-mind”) and a year later (the “obit,” or “year’s-mind”) were intended to commemorate the dead and to generate prayers for the good of his or her soul.

Life expectancy was low, sudden death common, and the pains of hell and purgatory a constant preoccupation. From the 13th century on concern for the soul after death and efforts to speed its passage through purgatory formed the most notable features of popular religion. Almost every member of the propertied classes made some provision for masses to be said for the good of

the soul after death, the number depending on the individual's wealth. Those rich enough—nobility, gentry, and successful merchants—could found a perpetual chantry, an endowment that supported one or more chaplains to say masses for the founder's soul forever. The largest chantries were colleges with substantial buildings, and some had a secondary object of providing education. Many founders of perpetual chantries built chapels, which survive, on to their parish church. Chantries offered a way for the living and the dead to collaborate and should not be viewed as morbid.

Many individuals were able to contribute to the maintenance of a chaplain and to participate in church rituals of enhanced splendor through membership in a guild. Many, perhaps the majority of, parishes had a guild, and some had a number of them. Guilds raised money to support clergy and musicians who arranged feast-day services and ensured that members' funerals were impressive, organized social events; they contributed to a sense of community. Some guilds mounted biblical and morality plays, and perhaps through guilds parishioners organized the repair and rebuilding of church naves, which were their responsibility.

Devotion to the saints was strong and found its expression in the veneration and adornment of their statues and in pilgrimages to their shrines. Religious and secular good works were not separated, so that giving money to dower poor girls, repairing roads, and maintaining bridges were as much religious acts as making donations to parish churches or religious houses.

At the same time as money and effort were put into making parish services more impressive, interest in private devotion was growing. Gentry families sought the privilege of choosing their own confessor and hearing mass in private chapels, while the pious sought the advice of recluses rather than of parish priests. As lay literacy became commoner, it became fashionable to follow the liturgy in a book of hours, and when printed books became widespread around 1500, the book of hours (the Little Office of the Virgin Mary) became a bestseller.

Population and Demography

During the generation after World War II historians, influenced by the newer social sciences, turned increasing attention to demography as a critical factor influencing the economies of preindustrial societies. In the case of medieval England M.M. Postan, professor of economic history at Cambridge 1938–65, was the most influential exponent of a demographically based interpretation of economic and social history. In a series of articles he depicted an agrarian economy whose long-term rhythms reflected aggregate growth and decline in the English population.

Briefly stated, Postan’s argument was that English population expanded by a factor of two or three from the time of Domesday Book (1086) to some point around the turn of the 13th and 14th centuries. The results of demographic growth included a great expansion of the area of land under cultivation, eventual impoverishment and land hunger for the poorest peasants (manifested particularly in the famine years 1315–17), and ultimately a contraction of population due to famine and disease that the Black Death (1348–49) only hastened. The century and a half after that was essentially a prolonged economic contraction, the consequence of an English population probably no more than half its size at its high-medieval peak.

It is noteworthy that little of this early theorizing about medieval English demographic history rested upon a base of directly demographic data. Its major underlying premise was a particular relationship between population and such economic indices as prices, rents, and wages. Having postulated this relationship, one then (following this logic) inspects the abundant available series of economic indices as if they were surrogates for population trends.

Perhaps unfortunately theories like Postans (and that of Emmanuel Le Roy Ladurie for France) have attracted the label “Malthusian”—even if such a label

is erroneous in relation to what Malthus really argued—chiefly because they envisage preindustrial population growth as tending to outrun food supplies and to bring the inevitable repercussion of a population crash after every boom. Theories like Postans tend to regard demographic change as an “exogenous” variable, that is, something “outside” the economy and society and capable of controlling them rather than being controlled by them. And so critics of such theories (especially Marxist critics) charge that demographically based models of economic and social change are deterministic and mechanical and ignore relationships of political and social power, a charge Postan himself vehemently denied.

Fig. 104. English population, 1086–1600, in millions. Based on data in J. Hatcher (1977), and E. A. Wrigley and R.S. Schofield (1989). Prepared by L.R. Poos.

It may be useful to sum up the present state of knowledge about medieval English population under two broad headings: generally accepted empirical observations about important demographic variables, and ongoing debates about the mutual relationships between population processes and the economic environment in which they took place. The broad outlines of aggregate change in the English national population are generally agreed upon, even if debate remains concerning its precise chronology and geography; they are much as Postan asserted. There was sustained growth over the first three centuries of the millennium, a deceleration or even reversal of trend between 1300 and 1348 (including mortality of as much as 10 percent during the harvest failure of the second decade of that century), the abrupt collapse of the Black Death and lesser subsequent plague epidemics, and the prolonged demographic

depression lasting at least until the latter decades of the 15th century (fig. 104).

When we come to estimates of the absolute population, we have some definite guidelines, despite the temptation to join in what one historian called “the popular sport of guessing at the population of England over the broad sweep of almost half a millennium.” Domesday Book, arguably the most remarkable statistical record in European history, recorded about 275,000 persons in 1086. But this document, concerned mostly with property, enumerated people mainly as an adjunct to land, so that historians have variously argued for English population totals at the time as ranging from 1.75 to 2.25 million.

Three centuries later the returns of the first poll tax (1377) included 1,355,201 taxpayers, supposedly equal to all male and female laypersons aged fourteen years and older except for the most needy. Here too, historians have engaged in lengthy arguments over degrees of tax evasion and the percentage to be allocated to the under-fourteens and the clergy, and corresponding estimates of national population have ranged between 2.5 and 3 million. Projecting backward from this figure, on the assumption that the Black Death and other 14th-century epidemics had reduced English population by 40 to 50 percent in the preceding three-quarters of a century, would suggest a population of 4.5 to 6 million for the country at large around 1300. Other evidence buttressing this general picture of overall change includes changes over time in field systems and settlement patterns and in distributions of peasant land-holding sizes.

More recently historical demographers have used the excellent English parish registers of baptisms, marriages, and burials that began in 1538 to reconstruct by computer the national population from thenceforth. The results of this research indicate that during the 1540s and 1550s England possessed between 2.8 and 3.1 million people and that at that point demographic growth regularly approached or exceeded 1 percent per annum. In short, by the midpoint of the Tudor century, England was already well into another phase of expanding population after the late-medieval depression.

In broad terms these relatively fixed points of estimation fit comfortably within the overall scheme of change laid out earlier. And whatever their shortcomings for absolute totals, all these sources concur in showing that the population of England was unevenly distributed spatially throughout the period: the lowland, arable south and east of the country were considerably more densely populated than the upland, pastoral north and west.

It has proven much more difficult to derive empirically based estimates of the more detailed demographic factors that contributed to aggregate growth or decline, such as mortality rates or life expectancies, fertility patterns and ages at marriage, migration, or the size and composition of household units. Regular censuslike data or serial records of birth, marriage, and death from medieval

England are virtually nonexistent or at best survive from such specialized, particular, or local contexts that they are difficult to project onto the bulk of ordinary English men's and women's experiences. It is necessary to emphasize that most of these matters continue to be the subject of debate.

Historians interested in mortality have attempted to use records of such things as the deaths of tenants-in-chief of the crown, or of peasants in manorial records, or of admissions of monks to abbeys and their subsequent deaths, to calculate life expectancy at birth (e_0) in a way comparable with other times and places. The results produced to date have implied an e_0 as low as the range from about 25 to 30 years for the period after the Black Death, when plague had established its presence in England, or in other words as much as ten years lower than in the England of Elizabeth. But since these records deal with the experiences of adults (whereas infant and child mortality may exert a disproportionately strong effect upon e_0) it is difficult to know how much weight to place upon them.

Traditional fascination with the Black Death and bubonic plague, and the presumption of theorists like Postan that mortality necessarily played the major role in adjusting demographic growth, have been giving way in recent years to a new appreciation that fertility, and the nuptiality that was its chief determinant, were at least as important in the demographic equation of premodern England. Parish-register data have shown that after the mid-16th century English men and women married late in life (in their mid-twenties, typically) and that a substantial minority never married at all. Fertility was therefore much lower than its theoretical maximum, and changes in marriage age and incidence raised or lowered fertility enough to set national population rising or falling.

There has been considerable discussion concerning how far this was true of medieval England. Studies of 14th-century poll taxes, wills, and manorial records have yielded a mixed picture, some data implying a late-marrying regime, other data being less clearcut. At the present state of knowledge one should perhaps conclude simply that mortality is unlikely to have accounted for all of the aggregate population movements sketched out here and that the historical demography of medieval England, properly construed, overlaps considerably into areas of family history, popular culture, and economic history.

Power, Leonel (ca. 1375/85–1445)

Composer and music theorist, one of the most prolific and influential in the first half of the 15th century. The first reference to Leonel occurs in 1418 in the records of the household chapel of Thomas duke of Clarence, where he was probably employed as a specialist musician rather than as a cleric. Since his name is given second in the accounts, he may have been one of its most senior members, recruited perhaps as early as 1411–13. After Clarence's death in 1421 Leonel's movements become uncertain, though he may have worked in one of the other English ducal chapels. In 1423 he became a member of the confraternity of the priory at Christ Church, Canterbury, but there is no evidence that this involved any professional duties. That he spent his last years in Canterbury is confirmed by a legal document of 1438 and by records suggesting that from 1439 until his death he acted as master of the Lady Chapel choir of the cathedral.

Most of Leonel's substantial surviving output (over 40 pieces, not counting those with conflicting attributions) is either for the Ordinary of the mass or for Marian services; secular music and isorhythmic motets are lacking. This narrow range of genres is, however, counterbalanced by an unusually wide variety of styles, much wider than that shown by his younger contemporary Dunstable, and his music accurately reflects the important technical changes that occurred during his long career.

Leonel's earliest surviving music comes mainly from the Old Hall

Manuscript and bears the hallmark of a skilled and inventive composer fully conversant with the techniques available at the beginning of the 15th century; clearly he was proficient at all levels of elaboration, from austere discant through florid melodic writing to ingenious use of isorhythm. He seems, however, to have taken a particular delight in rhythmic intricacies expressed through notational tricks that are esoteric even by the standards of Old Hall. Some of Leonel's music seems to be contrived around numerical relationships; in this respect he is typical of composers of his time, though his usage is notably less involved than that of Dunstable.

About this time he and others began to group mass movements in pairs, an idea that eventually led to the establishment of the cyclic mass. Only one such cycle survives with an undisputed attribution to Leonel (built on the plainsong *Alma redemptoris mater*), but two more carry conflicting ascriptions. In this and later music he inclined toward the melodically, rhythmically, and harmonically smoother style cultivated from the 1430s onward; and what appear to be his last Marian antiphons are as forward-looking as anything of the period. Most of these more modern-sounding works are preserved only in continental sources, and doubtless there is further music by Leonel among the many anonymous pieces in the earlier Trent Codices and other mid-century continental manuscripts.

Leonel's short treatise in the vernacular "for hem that wilbe syngers or makers or techers" provides a lucid explanation of improvised counterpoint, especially as it involves boys' voices.

Prayers

A notable product of Anglo-Saxon literary culture and spiritual life is an extensive body of private prayers, found in manuscripts from both early and late in the period. The prayers are written in Latin prose, but in the 11th century some of them were translated into or glossed in OE. The prayers are termed "private" in order to distinguish them from prayers used in the liturgy, the public ceremonies and worship of the church. The private prayers, it is assumed, were used in personal devotions and as the basis of private meditation, predominantly if not exclusively in a monastic setting.

In monasteries, besides being read in solitude, these prayers may have been recited aloud communally at times set aside for public reading, or they may have been memorized and recited by monks (perhaps orally in a low voice) at times provided for individual prayer. The late Anglo-Saxon monastic consuetudinary (a manual of customary religious practices) known as the *Regularis concordia* prescribes the recitation of prayers by individual monks as part of the daily routine in preparation for corporate worship in the divine office. It is important to recognize that the dividing line between public worship and private devotion was almost certainly not so distinct as it became later. Private prayers were often based on the collects and prayers that formed the liturgy, and during the divine office described in the *Regularis concordia* intervals were allowed for individual prayer.

The private prayers of Anglo-Saxon England are found in separate anthologies or in collections of prayers in other kinds of manuscripts, chiefly psalters. There are four prayer anthologies from early Anglo-Saxon England, dating from about 750 to 825. These anthologies might include, in addition to the private prayers, litanies, creeds, hymns, psalms, and extracts from the Gospels. The prayers come from a variety of sources, including the liturgy, hagiography, and the writings of Augustine, Sedulius, Isidore of Seville, and possibly Bede. Many of the prayers are attributed to Augustine, Gregory, or

Jerome, often without foundation in fact. The prayers are usually addressed to the Trinity, Christ, and God the Father; less frequently, to the Virgin, angels, and saints. One type of prayer found in the early collections is the *lorica*, or prayer for protection from spiritual and bodily enemies, which is Irish in origin.

Later Anglo-Saxon collections of prayers, most of which date from the 11th century, are usually found in psalters, where they typically follow the Canticles. This is appropriate, since the Psalms had been used as a basis for private prayer from the beginnings of Christianity. The later collections incorporate many prayers from earlier collections as well as adding new prayers that had been written on the Continent in the time of Charlemagne and his successors.

The prayers of both early and late collections are diverse in character, varying considerably in length and tone. Some are closely adapted from brief liturgical prayers and retain the austerity and formality of the Roman liturgy. Others are more lengthy, effusive, and personal, obviously not suited for the requirements of public worship. But even the most extensive of these prayers should probably not be regarded as expressions of personal feelings and the interior life of their authors. In certain of the prayers one may find what seems to be an emotional effusiveness, but on the whole they are much more restrained than the private prayers of the high and later Middle Ages. There is nothing here, for example, to match the intense emotion, agonized self-examination, or lively remorse that characterizes the devotional prayers of Anselm of Canterbury and the devotional writing of his followers in the late 11th and 12th centuries.

The cultural setting of the prayers is important. The early English anthologies do not appear to rest on continental models but are commonly thought to reveal the strong influence of Irish and Celtic spirituality. The cultivation of private prayer can be seen as an aspect of a particularly Irish attention to the individual soul, also manifested in the early Irish development of private confession and penance. At the same time the prayer books show the influence of Roman service books and the continental ecclesiastical culture that was brought to England beginning with the arrival of the Roman mission in 597. It is assumed that the audience for the English anthologies was primarily monastic and male. Yet one of the anthologies, the fragmentary Harley Prayer Book (BL Harley 7653), may have been a book of private devotions for a woman, and an early prayer from an Oxford manuscript is also likely to have been written by or for a woman (Bodl. Selden supra 30). One of the early anthologies (the Book of Nunnaminster) may have been owned by Ealhswith, wife of Alfred the Great. These examples are interesting in relation to the complex matter of the status of female monasticism in Anglo-Saxon

England and the vexed issue of women's literacy in the earlier Middle Ages.

The English anthologies should also be viewed in conjunction with continental developments associated with the renewal of the church in the age of Charlemagne. Alcuin of York was a leader of the reform movement who wrote devotional manuals incorporating private prayers. Perhaps under his inspiration the private prayer book became an established feature of reformed Carolingian spirituality, both lay and monastic. The influence of this renewed Carolingian spirituality is especially visible in the later English collections of prayers, which are best regarded as a product of the revival of monasticism in 10th- and 11th-century England known as the Benedictine Reform, itself strongly inspired by the Carolingian example.

Private prayers may have influenced OE literary composition, at least in a general way. An OE poem known as *A Prayer* is best understood within the broader context of Latin devotional prayer, and a poem of the Exeter Book, *Resignation*, also seems to owe something to this tradition. Certain passages in the biblical narrative poems *Judith*, *Christ II*, *Daniel*, *Azarias*, and the hagiographical *Guthlac A* may have been influenced by the private prayers, specifically the Celtic *lorica* tradition. Ælfric quite certainly was familiar with prayers of this type and may have incorporated some of their phraseology and structure into his *Lives of Saints* and *Catholic Homilies*.

Prices and Wages

Without statistics for either gross national or domestic product, or per capita incomes or production, it is difficult to measure the performance of the medieval economy or to chart possible rising and falling standards of living for the mass of the population.

The use of price and wage tables can provide a partial answer to the problem. Provided the value of money remained reasonably constant and there were no significant improvements in farming techniques, then a sustained upward movement in prices (especially for cereals; bread was literally the staff of life) might indicate a rising population, beginning to push the limits of subsistence. This would also be reflected in rising rents, entry fines, and income from land, as lords sought to exploit estates to produce for the market. A surplus of labor would be reflected in falling wage rates, and the purchasing power of wages would fall as price inflation began to be felt. Standards of living would fall, and if the population continued to expand there might well be widespread rural impoverishment and the beginnings of Malthusian checks.

On the other hand a cataclysmic decline in population, subsequent to the advent of endemic plague in 1348, would result in falling prices and rents, as land went out of use, and in rising wages, as labor became scarcer. The precise point at which prices moved downward and wages upward would indicate when the plague finally began to cause major economic changes and long-term population decline set in. That might be catastrophic for the land-holding or

rentier class, but the standard of living of the mass of the population, who now had sufficient land to feed their families and wages with substantially improved purchasing power, might well rise.

This can be described as the “demographic” interpretation of the economy, with prices and wages being, in the absence of other reliable information, a main indicator of rising and falling population and standards of living. Medieval people were keenly aware of the significance of price levels and wage rates. Towns regularly attempted to control both, while the first comprehensive wage-price regulation came with the Ordinance and Statute of Labourers in 1349–51.

But the use of tables in which the movement of prices and wages is expressed in terms of a base year or decade, according to value in grams of silver or given annually or decennially in sterling, really begins in the 19th century, with the gathering of data by J. Thorold Rogers, a member of parliament, whose extensive studies *Six Centuries of Work and Wages* and *A History of Agriculture and Prices in England* remain invaluable. Rogers was followed by Sir William Beveridge, with articles on Winchester and Westminster wages, by Phelps Brown on the purchasing power of building workers’ wages, and by D.L. Farmer and J.Z. Titow on the agricultural economy.

Care must be taken in the use of such tables. Year-on-year prices often show rapid fluctuations due to good or bad harvests, and, where the base cost of a basket of consumables—wheat, cheese, meat, or cloth—has been constructed to show subsequent changes in the purchasing power of wages, allowance must be made for alterations in the composition of the basket. Less wheat and more meat might be bought when standards of living were rising, the reverse when they fell. Evidence drawn from great estates, mainly in the south, might not be applicable to the whole country, especially pastoral areas where livestock prices need consideration. Large towns like London exercised a “pull” on the surrounding region, and large-scale imports of grain from, say, the Baltic region could have alleviated high prices in time of dearth. But despite these drawbacks price and wage movements provide one of the important keys to monitoring the performance of the agrarian economy.

What do they show? Little before 1180, since the evidence is sparse. Between 1180 and 1220 there was rapid inflation, especially in grain prices, which then stagnated in the mid-13th century (although at the higher levels of previous decades) but rose again in the last decades of that century and the first decades of the 14th, reaching a peak in the famine years 1315–25. Livestock prices show roughly the same trends, while at the same time wages were low or static and fell in real terms. In the two decades before the Black Death prices and wages moved slowly downward, but then came a few years of wild fluctuation,

followed by a decade when prices and wages again moved together. Only in the mid-1370s did they part company. Prices fell and stayed low; wages rose and in both monetary and real terms remained high for the rest of the Middle Ages.

This story argues for an expanding population, reaching the limits of subsistence by the end of the 13th century, a point of crisis in the early 14th century, and the lowering of the population by perhaps as much as a half after the mid-1370s. It also corresponds to the period of vigorous demesne exploitation and production for the market by the great landlords, with a heavy burden upon the peasantry in the 13th century and the return to a rentier economy, and a general rise in the standards of living in the later Middle Ages.

This is a cogent explanation of change in the economy, but the argument depends on the value of money remaining constant. In the last 30 years this assumption has been challenged. It was not a matter of frequent debasements causing price fluctuations, for English currency was renowned throughout Europe for its quality. There was frequent recoinage, needed to maintain, not to alter, the fineness of the coins. If, however, too few or too many coins were issued, it could, theoretically, have deflationary or inflationary consequences. Similarly changes in the value of the bullion content of the coins could alter their purchasing power.

Silver and gold moved freely around Europe. A shortage in silver, due to a fall in mining output or to the metal being drawn to an area where it was in demand, would push up its value and that of fine coins. When gold coins were struck widely in western Europe (from the mid-13th century onward, but in England chiefly from the reign of Edward III), bimetallic flows emerged. Gold was highly valued in the west, silver in the Muslim world. The exchange of metals created a shortage of silver, the metal most widely in circulation, increasing the value and the intrinsic worth of coins struck from it, and so depressing prices. Silver might also have flowed into England as a result of favorable trade balances from the export of wool and cloth, creating a glut; it could also be shipped abroad to pay for military campaigns or alliances, causing monetary deflation.

Numismatists and monetary historians argue that these factors must be taken into account when discussing prices and wage levels and the performance of the economy in general: the “boom” of the 13th century, the depression of the 15th. The inflation of 1180–1220, with high prices from agriculture to stimulate the change to demesne farming by great landlords, was caused by an influx of silver from wool exports. Edward I’s recoinage of 1279 led to lower prices, due to the limited number of fine coins issued; that of 1304–09, at a time when there was a glut of silver (again from wool exports), to

higher prices, as too many coins came into circulation. In the late 1330s and early 1340s payments abroad in the opening stages of the Hundred Years War had deflationary consequences, while the European silver famine of the 15th century meant lower prices and economic depression. At critical points, then, price and wage levels are explicable in monetary rather than demographic terms, an argument with considerable implications for economic historians.

But such interpretations have not found universal acceptance. The correlation of grain-price fluctuations with monetary changes in the 13th and early 14th centuries “strains credulity,” according to A.R. Bridbury, and can be achieved only by ignoring similar fluctuations with different causes at other times. It is also unlikely that all the profits of the wool trade between 1180 and 1220 would have been brought back as silver. Some must have been spent on imports, and large amounts of coin were shipped abroad to pay for the Angevin wars.

Foreign wars may also have caused the deflation of the 1330s and 1340s, though no convincing monetary explanation has been given for the way in which prices and wages moved divergently in the 15th century. Had this been the result of a silver famine, they should have moved together. They did not; the best explanation is a fall in the population. Prices and wages obviously did respond to changes in the money supply but more to increases or decreases in the numbers of people, and they remain one of the best ways of charting those fluctuations and more general changes in the medieval economy.

Prick of Conscience, The

A long verse compilation (over 9,600 lines in rhyming couplets), primarily eschatological, treating the wretchedness of man’s condition, the world, death, purgatory, Judgment Day, the pains of hell, and the joys of heaven. The author has not been identified, but the poem was probably composed in the north of England toward the mid-14th century.

The poem is divided into a prologue, seven books, and a brief conclusion or epilogue. The prologue is concerned primarily with the importance of knowing oneself and one’s condition as the prerequisite for knowing God, living a good life, and coming to a good end. Book 1 is about the wretchedness of man at his birth, during the course of his life, and at his death; the concerns of this book are standard ones from the *contemptus mundi* (“contempt of the world”) tradition. Book 2 treats the world and the conditions thereof; it begins by distinguishing among the kinds of worlds and then describes at length the transitory and untrustworthy nature of the earthly and human varieties of the lower visible world. Book 3 is about death and the four reasons why it is to be feared. Book 4 treats purgatory, its location and varieties, the seven pains encountered there, who goes there and for what kinds of sins, and how those in purgatory may have their pains alleviated and shortened.

Book 5 begins by describing in detail the fifteen signs that precede the Last Judgment, ending with the fire that will consume the world, and then goes on to the events of Judgment Day itself, when Christ will separate the good from the evil. Book 6 describes the pains of hell, first the fourteen specific ones and then the principal one, the endless yearning for the sight of God; it ends with a discussion of the behavior of those condemned to hell. Book 7 is on the location, nature, and joys of heaven, with special attention to the seven kinds of joys that belong to the body and the seven kinds that belong to the soul, the greatest of which is the sight of God and the Trinity. In his conclusion the author explains that he chose to call his work *The Prick of Conscience* because if a man will read and understand the matters in it, his conscience will be made sensitive, his heart will be stirred to fear and meekness and a yearning

for the bliss of heaven, and he will thus mend his evil ways.

The *Prick of Conscience* is based on many sources, as the author himself says in his conclusion; a partial list of those quoted (arranged in order of appearance) attests to his wide learning: Pseudo-Bernard's *Meditations*, Pope Innocent III's *Demiseria humanae conditionis*, the *De proprietatibus rerum* of Bartholomaeus Anglicus, the *Compendium theologiae ventatis* of Hugh Ripelin of Strasbourg, Augustine's *City of God*, the *Distichs* of Cato, the second *Meditation* of Anselm of Canterbury, Isidore of Seville's *Sententiae*, the French version of Robert Grosseteste's *De poenis purgatorii*, Jerome's *Regulamonachorum*, the *Sententiae* of Peter of Poitiers, and the *Elucidarium* of Honorius of Autun—not to mention the Bible, which is quoted more than any other single work.

The poem itself exists in three versions: an original or main version; a southern recension; and an abbreviated version entitled *Speculum huius vitae*. The main version (in 98 manuscripts) originated in the north of England, probably Yorkshire, and has a preponderance of manuscripts from that area and the north Midlands, but it extended also into the west Midlands and East Anglia and even occasionally into the southeast and the southwest. The southern recension (in nineteen manuscripts) is shorter than the main version and represents a thorough revision; it originated somewhere in the south, perhaps the Thames Valley, and its distribution is more restricted than that of the main version. The *Speculum Huius Vitae* (in two manuscripts) is a heavily revised and abbreviated version of the main version; its manner is admonitional, whereas the original is primarily didactic.

To judge from the number of extant manuscripts of the three versions *The Prick of Conscience* was the most popular English poem of the Middle Ages and was surpassed in English only by the two versions of the Wycliffite prose translation of the Bible and the prose *Brut*. This indication of popularity is supported by other signs: 80 percent of the counties of England can claim at least one copy of the poem, and some have two or more; extracts circulated separately (twelve in eight manuscripts); the poem was quoted in a number of other ME poems (*Stimulus consciendae minor*, *Desert of Religion*, *Of the Flood of the World*, *Wheel of Fortune*) as well as in a stained-glass window at All Saints Church, York; it was translated into Latin prose in the 14th century (six manuscripts exist); and it appears in wills and book lists.

For a long time the poem was thought to have been written by Richard Rolle, to whom it is attributed in five manuscripts, but his authorship was persuasively rejected by Hope Emily Allen. Three manuscripts attribute the poem to Robert Grosseteste, but he lived too early to have been the author; a 20th-century suggestion is William of Nassington, the author of the *Speculum vitae*, but there is as yet no proof for this. In genre *The Prick of Conscience* is

unlike any other extant ME work in verse or prose, though it has some similarities to and has been compared with the *Speculum vitae*; its primary function was probably as a compendium of knowledge from which a parish priest could instruct his flock or draw material for his sermons. Its wide circulation in the 14th and 15th centuries indicates that it achieved its purpose.

Printing

Printing from movable type was a major technological advance of the late Middle Ages, although its full cultural impact and implications belong to the 16th and succeeding centuries.

The western invention of printing is attributed to Johannes Gutenberg, a goldsmith, who solved the problems of designing a printing press, preparing a suitable ink, and, most importantly, casting multiple identical metal types. The first major work to appear by the new process was Gutenberg's 42-line Bible, printed in the German town of Mainz between 1450 and 1455. The first dated printed book was the Mainz Psalter of 1457. In the next two decades printing spread rapidly throughout Germany, Italy, France, the Low Countries, Poland, and Spain, almost exclusively through German printers, attracted by potential patronage and university markets. By the end of the 15th century presses were established in most of the countries of Europe (though Scotland continued to rely on French printers until 1508).

In 1476 printing was introduced into England by William Caxton. Caxton, a merchant who had lived in the Low Countries in 1471–72, had learned the printing business in Cologne, where he may have participated with Johannes Veldener in the publication of an edition of Bartholomaeus Anglicus's *De proprietatibus rerum*. Returning to Bruges, and perhaps having recruited Wynkyn de Worde as his assistant, Caxton established a press and printed two English books, *The Recuyell of the History es of Troye* (late 1473/early 1474) and *The Game of Chess* (1474), and four French editions. In 1476 he moved his press to England, to the precincts of (i.e., premises belonging to) Westminster Abbey.

Until his death in late 1491 or early 1492 Caxton remained the dominant publisher in England, producing around 100 editions, including a number of reprints. Most of these works were in English and they included many translations by Caxton himself and some by aristocratic writers. He catered primarily to an upper-class and wealthy merchant clientele, as his choice of texts reflects. He published courtly poets (Chaucer, Lydgate, Gower), chivalric romances (Malory's *Morte Darthur*), popular historical works (*Chronicles of England*, *Polychronicon*), a popular encyclopedia (*Mirror of the World*), moral and social handbooks, and popular religious works (*Golden Legend*, Mirk's *Festial*).

A press was established at Oxford around 1478 by Theoderic Rood of Cologne, issuing as its first book the *Expositiosymboli* (*Exposition of the Creed*) of Rufinus, bearing the erroneous date 1468 in the colophon. The Oxford press remained active for about eight years, producing works that suggest incipient interest in humanism at the university. Similarly the first books produced at the St. Albans press, begun in 1479 or 1480, were school or university textbooks in Latin. These were followed by two English books, a version of the *Chronicles of England* and *The Boke of St. Albans* (1486), published by the

“Schoolmaster-Printer.”

In 1480 printing was brought to London by John Lettou, who soon formed a short-lived partnership with William de Machlinia, specializing in law books for a legal and mercantile market. Machlinia continued to print until at least 1486, expanding his list to include theological works, a plague treatise, schoolbooks, and an edition of the *Chronicles of England* (1486).

Richard Pynson began printing in London ca. 1490 and produced about 550 items before his death in 1530. The printing of legal material remained the financial base of his business, but he also printed many popular literary works, including a fine edition of the *Canterbury Tales*, works by Lydgate, *Dives and Pauper*, *Guy of Warwick*, and *Mandeville's Travels*. He also issued the plays of Terence, schoolbooks, grammars, and other scholarly and theological works. The missal that he printed in 1500 at the expense of Cardinal Morton is arguably the finest English book of the 15th century. In 1508 or 1509 he succeeded William Faques as royal printer, issuing government documents and in 1521 publishing Henry VIII's *Assertio septem sacramentorum* (*Defense of the Seven Sacraments*), an anti-Lutheran treatise that circulated widely in Europe during the years before Henry's own break with Rome (1534).

Contemporary with Pynson was Wynkyn de Worde, who inherited Caxton's business in Westminster in 1491 or 1492. He moved to London in 1500, motivated probably by a conscious commercial decision to appeal to a wider, non-courtly market. Many of de Worde's publications were popular in literary nature, but he also catered to clerical patrons and an ecclesiastical market. When Julyan Notary also moved his business to London, soon after de Worde, the capital became the undisputed center of printing and publishing in England.

Wynkyn de Worde's output was enormous—some 810 items by his death in 1535. The financial basis of his business was the schoolbook trade of grammars by traditional and modern writers, such as Donatus, Colet, Erasmus, and Whittinton. De Worde's publishing debt to Caxton was large: he printed Caxton's translation of the *Vitae patrum* about 1495 and reprinted many Caxton translations and editions (as well as works originally printed by Pynson and the Schoolmaster-Printer). He published previously unprinted works by Chaucer and Lydgate and a number of English prose works, including Hilton's *Scale of Perfection*, excerpts from *The Book of Margery Kempe*, and Trevisa's translation of *De proprietatibus rerum*.

With the notable exception of Caxton, printing in England was primarily in the hands of foreign-born printers, and books were also printed abroad for sale in England by stationers, many of whom were foreigners. Most of these books were Latin liturgical works, but in 1492 and 1493 Gerard de Leew published four English books at Antwerp, three of which were reprints of Caxton

editions. An Act of Parliament of 1484, repealed only in 1534, allowed free access to the English market and unimpeded residence to alien printers and stationers. The result was to cripple printing in England temporarily; with the exception of Caxton's almost all first-generation English presses closed ca. 1486.

The impact of printing in England was not immediately apparent. Manuscripts and printed books supplemented one another, and dealers in one were often traders in the other also. Printing ultimately allowed a widespread dissemination of literature and knowledge, especially humanist knowledge, through multiple, essentially identical copies; it had a major effect in increasing literacy and education and in altering the relationship between author and audience. In Europe it encouraged the growth of the Reformation through translations of the scriptures and the production of propagandist tracts. The effects of printing on the English language were to support the rise of a written standard based on Chancery English, the standardized language of central government.

Priories, Alien

A term used to describe small religious houses dependent on overseas abbeys. Founded mainly in England (with some examples in Ireland and Scotland) by Anglo-Norman families as thank offerings for the Norman Conquest and subsequent colonization, most were dependent on Norman abbeys, though abbeys elsewhere in northern France also benefited. The English dependencies of French Cluniac houses are also commonly included in this group. The foreign abbeys with the greatest number of English daughter houses were Bec-Hellouin, Fecamp, Marmoutier, St. Étienne at Caen, St. Nicholas at Angers (all Benedictine), and Fontevrault (Cluniac). These and other abbeys held not only priories but manors and rights of ecclesiastical patronage.

All the alien priories were small, with at best a handful of monks; it is not clear that they were ever particularly profitable to the French abbeys, the extensive lands of Bee perhaps excepted. Anglo-French warfare in the later Middle Ages resulted first in the coining of the term “alien priory” (in 1295) and then in the seizure of these houses into the king’s hand, from Edward I’s reign onward. The excuse for this was that these outposts of France were a security risk, and alien priories attracted unfavorable attention in parliament during periods of unsuccessful warfare, as in 1378.

Through the 14th century, however, the crown was often content to allow the French priors to administer their houses on payment of an annual “farm” (a rent) to the exchequer, though it always reserved their ecclesiastical patronage to itself. The annual sums to be paid by the priories’ administrators (“farmers”) to the exchequer were unrealistically high, and recruitment of new monks from France was prohibited. So from the later 14th century the larger houses applied for denization to become English houses, while many of the smaller ones were sold by their mother abbeys to Englishmen, who used them as endowments for new foundations of their own. Among the new foundations that benefited most were Winchester College; New College, Oxford; Eton College; King’s College, Cambridge; and St. George’s College, Windsor.

Prisons

Also called "gaols" (pronounced "jails"), prisons did not play as large a role in criminal justice in medieval times as now; other devices were more often used. To ensure appearance at trial sureties and bonds were employed, and to punish, judicial authorities resorted to execution, mutilation, and amercements (fines).

Nonetheless, examples of imprisonment for both purposes occur in Anglo-Saxon times; their continuous history can be traced from the 12th century on, and from the late 13th century, statutes multiply the occasions for penal imprisonment. Sentences were usually either for brief periods, typically a year, or for life. Incarceration was also used coercively, to compel performance of some act, especially payment of debt. From 1275 on, moreover, deliberately uncomfortable imprisonment—typically on bread and water (bread one day, water the next), and often including "pressing," that is, crushing under heavy objects—was used to coerce accused felons to agree to be tried by juries. This practice was known as *prisonforte et dure*, later as *peine forte et dure*.

Physically a prison might be a separate, usually wooden building in a castle yard. More often it was a room in a larger building, often a castle. Gaol breaks were neither difficult nor uncommon. From 1166 on the sheriff of each county was required to maintain a prison for crown prisoners, but many other authorities had prisons: bishops, monasteries, private lordships, boroughs, and lesser governmental units. Conditions of prisoners varied with the reasons for imprisonment and their wealth. At least for poorer prisoners gaols were

crowded, dirty, frigid in winter, hot in summer. Disease, especially the lethal “gaol fever” (probably typhus), was endemic. Food, clothing, and other necessities usually had to be provided by the prisoners themselves, though charitable contributions sometimes aided the very poor; sheriffs and other gaolers were notoriously corrupt in exploiting their control of living conditions for purposes of extortion.

Privy Seal

By the reign of John, if not earlier, the king had a small or privy seal available for the authentication of documents in addition to the royal (or great) seal in the custody of the chancellor. The privy seal was normally in the custody of officers of the king’s chamber, a branch of the royal household, and so would be ever available to the king for administrative purposes. Thus there evolved a secretariat in the chamber, in addition to the more general household secretariat of the chancery, led by the chancellor. The privy seal, a single-faced seal bearing a shield of the royal arms, could be used for independent chamber administration or to communicate with the chancery to set in motion actions under the great seal.

During the minority of Henry III there was not, by lack of necessity, any privy seal; from 1230 a privy seal reappeared and its use continued to develop. In the 1230s the privy seal was established as the seal of the wardrobe, for a

time the most important administrative department of the household, functioning as its financial and accounting department. The privy seal did not come to have major administrative significance, however, because the great seal was still sufficiently attached to the household to be available for the king's needs. At the same time the existence of the privy seal facilitated the slow separation of the great seal and chancery from the household to permanent headquarters at Westminster.

The Household Ordinance of 12 November 1279 notes that the chief officer of the wardrobe was the keeper, and next after him the controller, whose duties included keeping the privy seal, which caused him to function as private secretary to the king. The controller of the wardrobe was the only administrator keeping a royal seal and not under the chancellor's authority.

The place of the privy seal in royal administration was considerably enhanced in the reign of Edward I. He used the privy seal with increasing frequency to move the chancery and exchequer to action, as well as for correspondence of personal, diplomatic, or other sorts. The active employment of the privy seal to give expression to the royal will continued into the reign of Edward II. Its heavy use may explain why, in the Household Ordinance of York of 1318, custody of the privy seal is no longer the responsibility of the controller of the wardrobe but of a distinct individual, the clerk or keeper of the privy seal. A staff to handle the business of the privy seal had thus become a separate department in the wardrobe.

As the functions of the privy seal achieved a greater degree of formalism and tradition, an office of privy seal was gradually defined and set on the path toward evolving out of the household to permanent headquarters, as had been the case with the exchequer and chancery. Coincidental with this was the development of other authentic instruments to respond immediately to the king's will: the secret seal, the signet seal, and the royal sign-manual (the king's signature or initials). By 1360 the privy seal had separated from the household, and in the reign of Richard II it was solidly established at Westminster as a department of state, along with—though without the prestige of—the chancery and the exchequer. In separating from the household the seal did not lose administrative significance. The instruments it authenticated continued to be central to the initiation of administrative processes, and the keeper of the seal, both as head of his department and member of the king's council, was one of the most eminent officers of state in the late-medieval period. The privy seal was also used to give administrative action to decisions of the king's council, which did not obtain its own seal until 1556.

It was never the practice of the office of privy seal to enroll copies of outgoing letters, and thus the privy seal did not develop a substantial archive, as did the chancery. In the 15th century, however, the privy-seal clerk Thomas

Hoccleve compiled a formulary of the types of documents commonly issued under the privy seal (BL Add. 24062).

Processions and Processional Music

Here "procession" implies a group with a particular membership and disposition, moving in a prescribed manner from one place to another, either within a larger ceremony or as an independent one. The concepts of hierarchy, minute regulation, and calculated display so characteristic of medieval thinking are implicit in this phenomenon. Medieval processions commonly served to enhance the solemnity of secular and sacred occasions; processional elements also touched medieval life in other ways, for instance in courtly conduct and culture. Resonances of processions are particularly evident in liturgical and vernacular drama. This article describes processions within the liturgy.

Although liturgical processions reached their greatest complexity only in the later Middle Ages, processions more or less formal in character had figured in Christian worship since time immemorial. The adoption of Christianity as the official religion of the Roman Empire encouraged the development of public ceremonial, and processions were increasingly utilized to show the prestige

and dignity of the church. The liturgical processions of medieval England, like the liturgies to which they belonged, superimposed layers of local variation and innovation on a Romano-Frankish base; essentially similar to their continental counterparts, they nevertheless had many individual features.

Processions occurred on particular days in several liturgical contexts: before high mass, after Vespers, on certain special days, such as Palm Sunday, and for particular causes, such as the reception of a dignitary. The participants were usually disposed roughly as follows: virger, aquifer, crucifer(s), taperers, thurifer(s), subdeacon, deacon, officiating priest, choir members in pairs in ascending order of dignity, and finally the head of the establishment. Typically they wore silken copes over their other vestments. Minor processions also took place within services, for example during mass immediately before the Gospel.

Processions followed set routes, usually starting from the choir, moving through the church (and possibly other parts of the complex as well), making a halt or station before the Rood and ending in choir or wherever the next liturgical event was to occur. On Palm Sunday and other special days the procession was often longer and more elaborate, perhaps going outside the church, subdividing, making several stations, or visiting a neighboring church. During processions ritual actions, such as the sprinkling of altars, might be performed.

Ecclesiastical buildings were customarily designed with reference to the processions that would have to take place within them. This would, for instance, affect the width of aisles and doorways. Subsequent structural alterations could have interesting consequences, as when a church was extended over the ground where outdoor processions had been accustomed to pass. In such cases, if the proximity of the site boundary prevented the processional path being moved, a passage for the procession might be constructed below the new building. Examples of a north-south passage beneath the nave of a church survive at St. Peter, Mancroft, and St. Gregory, Norwich; and the church at Dedham, Essex, has a similar passage through the base of the tower at the west end. Conversely standard processional routes might have to be altered if the layout of a site was exceptional. At Canterbury Cathedral, for example, the unusual location of the cloister to the north of the church means that the usual sequence of left and right turns in processions would have had to be reversed.

The basic processional material consisted of responsories and antiphons existing elsewhere in the liturgy. If antiphons were sung during the outward progress, responsories were sung during the return, and vice versa. The return to the choir was often carried out to the singing of one of the popular Marian antiphons, such as *Ave regina caelorum* and *Almaredemptoris mater*. Prayers were said or sermons given at stations, and most processions ended with a

versicle, response, and prayer. On some major festivals a prosa was sung, and on penitential occasions litanies were chanted. The survival of faburdens—melodies that formed the basis of simple improvised harmony—for many processional texts presumably reflects the practicalities of singing in procession. While the solemnity of a procession might encourage the singing of something more special than plainchant, the difficulties of walking while reading would discourage reliance upon notation. Improvised polyphony was an obvious and attractive solution. A large number of the faburden melodies that have come down to us are in fact associated with processional texts, for example the prosa *Salve festa dies*.

Until about 1300 the rubrics and chant for processions were normally included in the service books for office and mass. Thereafter this increasingly bulky and complicated material was usually given its own book, the processional. Contemporary inventories often listed much larger numbers of processionals than of other service books, emphasizing that a processional was essentially for individual use. Many processionals survive from English secular and monastic foundations; some seem to have been copied by amateurs, perhaps implying that choir members might be expected to provide copies for themselves. The Salisbury processional was printed several times, suggesting a constant and appreciable demand.

Prophecy Literature

Medieval prophecy literature in Britain was written in Latin, French, Welsh, and English; its concerns were sometimes primarily political, sometimes religious, and sometimes a mixture of both. Prophecies generally contained a certain amount of historical fact (usually presented as having been prophesied before the event) followed by predictions of the future; such predictions were often aimed, especially in secular prophecies, at shaping public opinion and interpretations of past and present events as well as influencing future events. The content of prophecy literature tends to be deliberately obscured or coded by the use of initials, anagrams, wordplay, symbols (animals, plants, astronomical objects), and other metaphoric devices requiring special knowledge to decipher. These codes frequently received various readings depending on when and by whom they were interpreted, and prophetic works were regularly modified to fit new political situations and actual events. Prophecies were taken sufficiently seriously by their audiences that they were occasionally prohibited by law or used as evidence of subversive activities; on the other hand some of them were respected enough to receive substantial explanatory commentaries.

In the political realm the most influential examples of the genre were the so-called “Galfridian” or Merlin prophecies, which originated in Geoffrey of Monmouth’s *Prophetiae Mer-lini* (*Prophecies of Merlin*; found as book 7 of the *History of the Kings of Britain* and as a separate work), and characteristically used animal symbols for political figures. Related to the Galfridian type are versions of the “Six Kings” prophecy, which purports to predict the careers of the English kings after King John. In Wales secular prophetic literature usually emphasized the eventual regaining of control over Britain by the Welsh and was invoked in support of the political aspirations of such leaders as Owen Glendower and Henry Tudor.

A small but influential tradition is represented by a set of Latin and English prophecies attributed to Thomas Becket, and in some cases associated with a vial of sacred oil supposedly given to him by the Virgin Mary for the crowning of the “true” kings of England. Also significant are the prophecies on Scottish and northern English political history attributed to Thomas of Erceldoune, or Thomas the Rhymer, a 13th-century Scotsman later said to have gained prophetic insight by spending several years in fairyland, and prophecies on 14th-century English, French, and Scottish events, usually attributed to the Augustinian prior John of Bridlington (d. 1379).

Important religious prophecies in the Middle Ages included eschatological predictions concerning the end of the world and the coming of Antichrist, deriving from the Bible and from such early Christian works as the Sibylline prophecies of the late 4th century, the late-7th-century *Revelations* of Pseudo-Methodius, and the 10th-century *Libellus de Antichristo* of Adso of Montier-

en-Der. Another major strand of religious prophecy, concerned with salvation history and the future of the church, originated in the work of the 12th-century abbot Joachim of Fiore. Joachim's followers developed his ideas into extreme forms that led to major politico-religious controversy over the next three centuries, especially on the Continent and often in connection with conflicts surrounding the mendicant orders. Though not solely eschatological in its origins, Joachimite prophecy lent itself well to conflation with older eschatological traditions, as well as to the secular political ends of some of Joachim's followers.

The vernacular literature of medieval England reflected these prophetic traditions both directly and indirectly. Prophecies of Merlin, Erceldoune, Bridlington, Becket, and others can be found in ME and sometimes in Anglo-Norman, as well as in Latin. Authors like William Langland, John Gower, or the writer of *Richard the Redeless* and *Mumand the Sothsegger* use Galfridian symbolism in their commentaries on political events of their own times, mainly in an interpretive rather than a prophetic mode; Adam Davy's *Five Dreams* combines political and religious prophecies about Edward II. The direct influence of Joachimite prophecy on English vernacular literature is relatively minor, but it contributes obliquely to the eschatological imagery of much antimendicant satire. In contrast predictions about Antichrist and the end of the world appear in a wide range of works, from *The Fifteen Signs before Doomsday* and the *Chester Coming of Antichrist* play to allegories like *Piers Plowman* and such didactic works as *Cursor Mundi* and *The Prick of Conscience*.

Prose, Middle English

When William the Conqueror invaded England in 1066, there was a flourishing prose tradition in OE, principally in historical and didactic writing. In the former category the major work was the Anglo-Saxon Chronicle, initiated by Alfred and carried on at various monastic houses. In the latter category are sermons and saints’ lives, of which Ælfric had been the foremost composer. It is hardly surprising that after the Norman Conquest it was historical and didactic writing that continued to flourish in English.

Historiography

The Anglo-Saxon Chronicle was continued in the version known today as the Peterborough Chronicle. Found in a 12th-century manuscript from Peterborough, this chronicle extends a copy of the Anglo-Saxon Chronicle with entries up to 1154, a continuation that lasted almost 100 years after the Conquest. This continuation consists of several parts, of which the First Continuation, written in blocks from 1122 to 1131, and the Final Continuation (1131–54) were certainly written at Peterborough. Although the Peterborough Chronicle usually keeps the annalistic approach of the Anglo-Saxon Chronicle, some entries for a given year stretch forward or backward in time to present

small narratives not unlike the Cynewulf and Cyneheard narrative of the earlier Chronicle.

The Peterborough Chronicle is a major historical source for its period, even though that period also witnessed the rise of the great Anglo-Latin historical tradition, including such writers as Henry of Huntingdon and Orderic Vitalis. But it has the great advantage over them of being written more or less contemporaneously with the events it describes. Equally important, the Peterborough Chronicle provides the earliest example of the East Midland dialect in ME and illustrates how the language was changing from OE to ME.

After 1154 historical writing in English became principally latinate until the 14th century, when Trevisa translated Higden's *Polychronicon* and an anonymous translator produced his version of the Anglo-Norman *Brut*. These two texts provided the springboard for historical writing in English in the 15th century, writing that often took the form of continuations to the ME prose *Brut*, though new historical texts, such as Capgrave's *Chronicle* and various London chronicles, were also written. However, no English history in the later Middle Ages has the same historical and literary value as the Peterborough Chronicle; this is partly because the later ones all had Latin competitors and partly because, having arisen as translations, they rarely achieved the effective narrative style found in the Peterborough Chronicle.

Homilies and Saints' Lives

There was continuity also in the homiletic tradition from OE to ME. Many of Ælfric's works were copied up to the 12th century; the 12th-century homilies in Bodleian Library, Bodley 343, may be copies of OE homilies no longer extant or they may have been composed in the 12th century in imitation of the Anglo-Saxon tradition. Many of them are written in the West Saxon literary language found in the pre-Conquest period or at least an approximation of it. In the OE period there had also been a strong literary tradition in the Kentish dialect, and some early ME sermons continue that tradition, particularly the collections of sermons known as the Cotton Vespasian Homilies and the Trinity Homilies. These collections also probably date from the 12th century. It is, however, principally in the west Midlands that the Anglo-Saxon homiletic tradition survives most strongly, and this may be due to the long episcopacy (1062–95) of Wulfstan of Worcester and to the distance of places like Worcester from the main areas of French influence. After Wulfstan's death his biography was written in English by Coleman, a monk of Worcester, but this text has not survived. Its composition testifies to the strength and continuity of the native

tradition in the west. A particularly important collection, the Lambeth Homilies of the late 12th century, represents a late flowering of the OE tradition before the influence of French begins to be felt, though many of the sermons have little literary value.

After the 12th century the homiletic tradition continues with the texts associated with *Ancrene Wisse*, although most sermons and saints' lives from this time were written in Latin and French and were only gradually translated into English. Increasingly sermons were gathered into collections, often linked with the festivals of the church. Such collections were not stable, in that writers would add sermons or saints' lives that had local relevance or importance and they could omit others. In their English form they could be in verse or prose. The two major prose collections of the latter ME period were the *Festial* by John Mirk and the ME translations of the *Legenda aurea*. Mirk was an Augustinian canon of Lilleshall (Shropshire) writing in the late 14th and early 15th centuries, whose *Festial* is a collection of sermons for all the feasts of the church's calendar. Intended for the edification of the clergy, they had an educative and populist aim and provided the parish priest with ready-to-use sermons. The collection was immensely popular: it was constantly copied and adapted, and it was the first English sermon collection to be printed.

The *Legenda aurea* (or *Golden Legend*) was a collection of sermons in Latin written ca. 1263–67 by Jacobus de Voragine, a Dominican friar and archbishop of Genoa (1292–98). This work was a legendary, a collection of saints' lives, which also became popular and was translated into most European languages. Two English translations were made in the 15th century, and the second (by Caxton) was printed. Mirk's *Festial* and Caxton's *Golden Legend* may stand as prose examples of the sermons and saints' lives current in the later ME period. Direct, dramatic, and with a good story line, they were both popular and influential.

Devotional and Mystical Writing

Although the influence of Latin and French grew in the 13th century, the needs of educating the illiterate and barely literate encouraged the writing of books in English. The reforms of the Fourth Lateran Council (1215) spurred this development, as did the growth of religious houses for women, who often required devotional material in English. This latter need became linked with the west Midlands homiletic tradition to produce the texts associated with the *Ancrene Wisse*, which in their turn promoted the growth of a more mystical

approach to Christianity. *Ancrene Wisse* is a guide for anchoresses written in the early 13th century, though in later copies the audience undergoes some change. It is characterized by a sensitive and humane approach to the life that the anchoresses will follow. The associated texts include legends of three female saints (Katherine, Margaret, and Juliana), a treatise on virginity (*Hali Meidhad*), and a didactic prose homily (*Sawles Warde*). Most of these texts are based on Latin sources. Linked to them is the so-called Wooing Group, a series of texts that are more like lyrical prayers of an affective nature than like homilies. They illustrate the growth of mysticism in England and the influence of St. Bernard's devotion to the Passion of Christ and to the Virgin Mary.

It is likely that such texts were intended for a restricted audience, as were the mystical works written in the 14th and 15th centuries. These works were often written to direct the spiritual life of a disciple, whether male or female, or to provide a rule for a community. The growth of more strictly enclosed orders like the Carthusians and of specialized orders like the Brigettines facilitated the production and dissemination of works of this type. Richard Rolle (d. 1349) wrote many works of a devotional nature in which the sweetness of Christ and his name are dominant. Written in the northern dialect, his works are rhetorical and emotional in their impact. Although offering advice to his disciples, Rolle describes his own spiritual experiences.

Most subsequent English mystical writers were more discreet in their approach than Rolle. Walter Hilton and the author of *The Cloud of Unknowing* composed treatises to guide their disciples, but their advice is cautious and restrained, and the language in which they write is measured and thoughtful. The *Revelations* of Julian of Norwich are different again, for they describe a series of revelations she experienced in 1373, which she passed on for the benefit of her fellow Christians. The one mystic to go against this trend toward greater discretion is Margery Kempe, the daughter of the mayor of King's Lynn, whose mysticism has often been considered hysterical (though recent criticism suggests alternative characterizations of her spirituality). *The Book of Margery Kempe* describes her mystical and social progression, sometimes in a passionate language. A proper examination of her spirituality remains to be made. Although didactic and sermon literature continued to be written at this time, the glory of later ME prose is undoubtedly the writings of the mystics. They achieve a balance between content and expression, between instruction and affective description, that other texts could not emulate.

Other Prose Works

Although in Anglo-Saxon England some parts of scripture had been glossed and translated, there was no translation of the whole Bible. A project to undertake a translation of the Bible was launched at the end of the 14th century and is linked with the name of the Oxford scholar John Wyclif (d. 1384). Wyclif wrote and inspired many sermons and treatises attacking clerical and papal abuses, works eventually condemned as heretical. The translation of the Bible also fell under archiepiscopal interdict, because it was associated with the Lollards and their campaign against the clergy. However, the translation was completed in two versions that survive today. The English writings attributed to Wyclif were aimed at less educated people (though one should not think of this audience as uneducated), and their style is relatively simple and direct. Wyclif's intent was to teach and to persuade, and the Lollards (also called Wycliffites) continued to produce works with similar goals well into the 15th century. Although the precise attribution of extant prose writings said to be by Wyclif remains problematical, the influence of these writings on English style and the English language should not be underestimated despite the fact that many have been lost and all were proscribed.

Although there had been a few romancelike works in OE, such as *Apollonius of Tyre*, they ceased entirely in early ME. When romances were reintroduced in the 13th century, they were first written in verse; only gradually did prose versions arise. Sometimes these were translated from the ME verse forms, sometimes they were translated directly from French originals, and finally some were written directly in English prose. The most famous example is Malory's *Morte Darthur*, most of which is translated from French although one episode is a prose version of the alliterative *Morte Arthure*. Most other ME prose romances share with the *Morte Darthur* a date in the second half of the 15th century, as well as great length. There can be little doubt that this prose genre was popularized by Caxton, England's first printer and publisher. He translated many romances from French and printed them. They must have circulated widely and helped to drive the poetic versions out of circulation. Although the critical literature on Malory is extensive, little has been written about the other prose romances. Many of them are courtly in nature, though it may well be that we should extend the genre to include more popular works like *Reynard the Fox* from the beast-epic tradition and *Mandeville's Travels*, a fictional travel book that has many romance features. It is certainly possible to see in these works the seeds of the future novel.

It should not be forgotten that particularly in the later ME period works of scientific or technical interest were also written. Latin was confined to a certain class, and as English became more established as a literary language, it began to be used to meet a growing demand for informational works. Chaucer himself wrote a treatise on the astrolabe and may have written *The Equatorie*

of the *Planetis*. Recipes, charms, prognostications, cookery books, medical works, books of etiquette, and other treatises were all produced. Even theology could be written in English, as the writings of Bishop Pecock reveal, although there was always the inherent danger that such works might be declared heretical. More academic works, such as Sir John Fortescue's writings on law and political theory, are more characteristic of the end of our period.

In ME studies prose tends to attract less attention than poetry. Compared with Latin and even French, the output was not great; but it was uninterrupted and it continued to grow in quantity. By the end of the ME period prose works in English were common enough and set fair to increase their share of what was written.

Prostitution

Evidence relating to prostitution in the Middle Ages derives from religious, medical, and legal sources, of which much survives from the 13th century and later. Whereas medieval theologians unanimously rejected prostitution on moral grounds, they nonetheless recognized that prostitutes provided vital sexual services.

The prostitute's sin was the sin of lust (*luxuria*), but inasmuch as she turned herself into a common woman" she protected other, "honest" women. Were it not for prostitutes, the clergy, scholars, young artisans, and widowers might menace, seduce, and even rape other men's wives, sisters, and daughters. The attitude followed the idea expressed by Augustine: "If you expel prostitutes from society, prostitution will spread everywhere... the prostitutes in towns are like sewers in a palace."

Since medical and theological lore saw women as lustful by nature, prostitution, an expression of excessive sensuousness in a woman, was a manifestation of a feminine quality; her feigning of love and desire was only an extreme form of what was presented in misogynistic literature as the wily and deceitful behavior of all women. Thus a deep ambivalence surrounded the discussion, as well as the treatment, of prostitutes. She was at once sinner, wage earner, neighbor, figure of fun at fairs and carnivals, and source of constant revenue for tenement landlords and town treasurers; she was also vulnerable. Following the scriptural example, prostitutes were sometimes offered the road of penance, and a path to reintegration into "respectable" society, with the aid of philanthropic bodies, such as the charitable "Magdalene" houses.

The ambivalence engendered in the religious sphere, stemming from deep anxieties about sexuality, was carried over into the legal discussion of prostitution. Treatment of such issues as a prostitute's property rights raised a variety of legal opinions but produced by the late 12th century consensus regarding her right to enjoy her earnings, the just reward for her work. Some canon lawyers even regarded the alms given to the church from a prostitute's earnings to be acceptable.

Town authorities attempted to regulate the transaction between prostitute and client, and between prostitute and brothel keeper, to ensure that neither side was defrauded or forced to participate against his or her will. The 15th-century statutes of Sandwich stipulated the price brothel keepers could charge prostitutes for ale, and in Southwark fines were ordained for overzealous seizures of prospective clients off the street. Although regulated similarly to other urban trades, prostitution condemned a woman in many ways to a social

“death”; she could neither sue nor attest in a court, nor in some cases inherit property. Legislation attempted to protect the prostitute against violence and rape.

Thus in villages and towns alike, under seigneurial gaze or the control of town fathers, attempts were made to regulate prostitution, to keep it away from respectable quarters, to limit soliciting in the streets, and to protect both clients and prostitutes. Some cities, like London, had a “red light” district; others had regulated brothels, like the baths of Southwark.

Regulation also produced a steady flow of income to urban and seigneurial coffers, from frequent fining of prostitutes and of brothel keepers, a practice tantamount to taxation or licensing for prostitution and procuring. There is evidence from 15th-century York to suggest that in periods of economic stagnation and contraction in the labor market, more single women may have been forced into prostitution. Prostitutes were part of the life of every community, albeit in a marginal position, and changes in their status, earning capacity, and security reflect general patterns in the social and cultural trends that affected the life and work of women in general.

Prudentius (348-ca. 410)

Latin poet from Spain. After a career in the civil service, Prudentius began writing poetry; he is the author of *Cathe-merinon* (a collection of hymns for daily use), *Apotheosis* (an argument for the divinity of Christ directed at the pagans and certain heretics), *Hamartigenia* (a discussion of the origin of evil

and sin in this world), *Psychomachia* (an allegory portraying the fight of the seven vices against the seven virtues), *Contra Symmachum* (an attack against Symmachus's efforts to revive the Roman pagan religion), *Peristephanon* (a series of poems in praise of various martyrs), and *Dittochaeon* (a series of short poems pairing events of the Old Testament with events of the New Testament).

All of his works were available to the Anglo-Saxons, as the extant manuscripts as well as echoes and quotations in Aldhelm, Bede, and Alcuin show. Though the extant manuscripts contain Latin glosses for all but the *Apotheosis* and the *Dittochaeon*, there can be little doubt that the work the Anglo-Saxons studied most intensively was the *Psychomachia*, since it is extant in ten manuscripts, seven of which are heavily glossed in Latin. Four *Psychomachia* texts are illustrated, indicating a more than usual interest in that particular text.

Prudentius's works were influential on the Latin poems produced by the Anglo-Saxons; his influence on the OE works, however, is less certain, since there are no verbal parallels. Nonetheless, passages in *Christ II*, *Juliana*, *The Phoenix*, and the poetic *Solomon and Saturn* leave no doubt that OE poets were familiar with psychomachia allegory, though it has not been decided yet whether Prudentius's *Psychomachia* is the ultimate source for the images used in the OE poems.

Psalters, Anglo-Saxon

The biblical book of Psalms, commonly known as the Psalter, was one of the most frequently illustrated books of the Middle Ages, its poetic text inspiring many pictorial approaches. Psalters from Anglo-Saxon England preserve examples of many of these types, providing the most generous and coherent body of psalter illustration to survive from the early Middle Ages. Within it we can trace indigenous traditions, adaptations of continental and Byzantine traditions, and new syntheses. The manuscripts are also frequently witnesses to the much admired originality of the Anglo-Saxon monastic artists who produced them.

The Irish world furnished a tradition for symbolic and typological picture programs expressing overall perceptions of the Psalter and used to articulate the major functional divisions of the book. This tradition was first adapted in Anglo-Saxon England when full-page miniatures were inserted in the Carolingian Galba Psalter (BL Cotton Galba A.xviii; [fig. 66](#); see Galba Psalter) at the threefold psalter division and important points in the prefatory texts: its continuing influence can be seen in several 11th-century manuscripts. In the Winchcombe Psalter (CUL Ff. 1.23) four miniatures mark the psalms of the threefold division, 1, 51, and 101, plus the most important psalm of the liturgical psalter division, Psalm 109. Similar articulation occurs in the Tiberius Psalter (BL Cotton Tiberius C.vi) and the Werden Psalter (Berlin, Preuss. Kulturbes., theol. lat. fol. 258), a mid-11th-century German manuscript that reflects in part an Anglo-Saxon psalter. Demonstrating the intermingling of illustrative traditions, the latter three psalters also incorporate within their picture programs adaptations of a continental European tradition of psalter frontispieces based on the common psalter preface *Origopsalmorum* and portraying David as the regal psalmist surrounded by the co-psalmists named in the text.

Drawing on indigenous ornamental traditions, the early-10th-century Junius Psalter (Bodl. Junius 27) is decorated at every psalm with twining initials of foliage and snapping beasts. Similar initials are found in the mutilated Salisbury Psalter (Salisbury, Cathedral Library 150). The Junius Psalter also has

a single historiated initial depicting David fighting the lion (fig. 105), one of the few such initials preserved in Anglo-Saxon psalters. BL Arundel 155 contains an initial with David fighting Goliath, and the Crowland Psalter (Bodl. Douce 296) one with St. Michael fighting a dragon: not until the Romanesque St. Albans Psalter (Hildesheim, St. Godehard) do we find a full cycle of historiated initials in an English psalter, though the evidence of the Werden Psalter initials and those of the earlier insular Vespasian Psalter (BL Cotton Vespasian A.i) suggests that this is an accident of survival.

Of continental psalter traditions adapted in Anglo-Saxon England perhaps the most pervasive is that of the Carolingian Utrecht Psalter, which was in England in the Middle Ages. Many of the drawings accompanying each psalm of this 9th-century masterwork were meticulously copied in the 11th-century BL Flarley 603 Psalter (fig. 71: see HARLEY PSALTER), the only concession to Anglo-Saxon taste being the substitution of colored inks for the brown of the exemplar. However, several artists worked on the Harley Psalter over many decades, and some were extraordinarily creative, abandoning the Carolingian iconography or incorporating imagery from other pictorial traditions, besides references to contemporary thought. In addition it seems possible that beyond the Utrecht manuscript itself Anglo-Saxon artists knew a psalter with interlinear illustrations from the Utrecht Psalter tradition (Harris, 1963). Reflections are found in the few interlinear illustrations of Paris, BN lat. 8824 (a psalter manuscript that also once contained miniatures at its major divisions); and in the Bury St. Edmunds Psalter (Vatican, Biblioteca Apostolica Reg. lat. 12). The latter, probably executed at Canterbury about 1050, has an extensive cycle of dynamic marginal drawings of superb quality, in which Anglo-Saxon erudition, inventiveness, and artistic skill are developed to a high degree.

Fig. 105. Junius Psalter (Bodl. Junius 27), fol. 118, Psalm 109: David and the Lion. Reproduced by permission of the Bodleian Library, University of Oxford.

Anglo-Saxon synthesis of Franco-Saxon letter forms and “Winchester School” ornament yielded the great letter B introducing Psalm 1 in the late-10th-century Ramsey Psalter (BL Harley 2904); succeeding psalters influenced by this *Beatus* initial include BL Arundel 155, Stowe 2, and the

Tiberius Psalter, with the tradition enduring through the Romanesque period. The Harley 2904 Psalter also contains a full-page Crucifixion drawing of extraordinary pathos. The earliest surviving example of the tinted line drawing that became a prominent medium in late Anglo-Saxon manuscripts, this picture is innovative iconographically and is in addition just one pictorial manifestation of a pronounced insular emphasis on christological interpretations of the Psalter. The programs of the Winchcombe, Galba, Werden, and Tiberius psalters all reflect this emphasis.

Several approaches to illustration of the Psalter were combined in the late Anglo-Saxon Tiberius Psalter (fig. 139: see Tiberius Psalter), yielding in the process a new kind of psalterillustration: this psalter is known as the first to contain a prefatory picture cycle of Old and New Testament miniatures. Typologically related David and Christ picture sequences, fusing Byzantine and insular traditions, are framed by images of the Creation and Christ the Judge, and the extensive picture cycle expresses themes appropriate for the psalter's use in the private devotions of a monastic owner: coincidentally it inaugurated one of the major later medieval systems of psalter decoration.

Psalters, Gothic

From the early Gothic period (ca. 1210–20) until the midto late 14th century, when it began to be superseded by the book of hours, the Psalter remained the most popular devotional text to receive lavish and extensive illustration. Although it has been suggested that the Psalter's popularity was due in part to a more literate society, with few exceptions only eminent ecclesiastics, religious communities, or members of the aristocracy were able to commission a richly ornamented psalter text during the greater part of the period.

As an office book, either for private devotions or for use in the church, a psalter was divided into sections corresponding to the canonical hours. Psalms 1, 26, 38, 52, 68, 80 (the first psalm said at Matins each day of the week), and 109 (the first psalm of Sunday Vespers) are distinguished by having larger and more elaborate initials, historiated with scenes derived from the psalm itself or more commonly, in English psalters, from Old Testament iconography. Psalms 51 and 101 are often also historiated, a throwback to an earlier tradition in which the Psalter was divided into three principal parts; but these initials are normally smaller in scale than those for the other main psalm divisions.

The Psalter usually contains additional material, such as a calendar, litany, canticles, the office of the dead, and further prayers. The tendency to illustrate the opening words of each major psalm in literal form (e.g., *Dominus illuminatio mea*, the opening words of Psalm 26, having King David supplicating before God and pointing to his eye) is a convention derived from

France and one that became increasingly standard in English psalters from the late 13th century onward. Up until the onset of French influence, around 1270, English psalter illustration mostly had subjects distinct from contemporary French manuscripts, such as the Anointing of David at Psalm 26 (see Amesbury Psalter [Oxford, All Souls College 6]).

The English Gothic psalter does not lend itself to generalizations; there is considerable variability throughout the period, with regard to both iconography and decoration. A number of examples—predominantly those of the early 13th century—have a set of miniatures prefacing the psalter text and interspersed among the psalms, a notable example being the Munich Psalter of ca. 1200–10, which has 46 full-page miniatures before the text and further picture sections after Psalms 51, 100, 108, and 150, illustrating scenes from the Old and New Testaments. This approach can be largely contrasted with the procedure followed from the mid-13th century of reducing the length of the cycle (Queen Mary's Psalter is an obvious exception, having an extensive set of prefatory miniatures), and the initials then become more of a focus for the iconography. The Cuerden Psalter of ca. 1270 retains a prefatory cycle of miniatures, though diminished in number to eight, and the Peterborough Psalter in Brussels of ca. 1300–10 is unusual among 14th-century examples in having full-page miniatures interspersed at various points within the psalter text, as in the Munich Psalter. (Shelf marks for the psalters discussed here and below appear at the end of the entry in the order in which they are discussed.)

From the mid-13th century a further important development occurs, first evident in the group of manuscripts associated with the de Brailes workshop (as in the Oxford, New College Psalter of ca. 1240–60), in which the foliate elements comprising the letter forms of the historiated initials erupt and extend into the margins, a tendency that is developed in the William of Devon group of manuscripts (as in the Cuerden Psalter; [fig. 51](#): see CUERDEN PSALTER), where the rectilinear border elements provide platforms for a variety of birds and hybrids (also referred to as grotesques or drolleries). The Rutland Psalter of ca. 1260 is probably the earliest 13th-century manuscript to contain hybrids. From around 1270 marginal decoration becomes a significant element in the ornamentation of the page, reaching a height of development in the products of the “East Anglian School” of approximately the first third of the 14th century (as in the Gorleston, Howard, Ormesby, and Luttrell psalters; [figs. 57, 102, and 93](#): see “EAST ANGLIAN SCHOOL,” ORMESBY PSALTER, and MARGINALIA).

Although the marginal decoration is almost invariably extraneous to the text—as in the Ormesby Psalter, which is rich in animal and plant motifs as well as grotesques—there is a notable exception in the St. Omer Psalter of ca. 1340, produced toward the end of the Psalter's period of outstanding

popularity. Here subject matter (an Old and New Testament cycle) is contained within the foliage roundels of the borders. These are in turn further ornamented with charming quotations from rural life. Another variation is provided by the way in which the marginal themes are handled in the Luttrell Psalter, also of ca. 1340, comprising *bas-de-page* (lower-margin) scenes of New Testament subjects and scenes from rural life, while the other margins testify to an extraordinary repertoire of grotesques unequaled in their inventiveness. In the Tickhill Psalter (fig. 106), where the initials are enlarged, a sequential narrative extends from the initials into the lower margins; and an elaborate series of *bas-de-page* scenes can be found in Queen Mary's Psalter (fig. 107: see QUEEN Mary's Psalter). During the last great flowering of the Psalter three psalters commissioned by the Bohun family (now in the Nationalbibliothek in Vienna, the British Library, and Exeter College, Oxford) are exceptional in that every initial, not only those singled out for special decoration at the major psalm divisions, becomes a vehicle for the narrative, underscoring the variety of approach characteristic of English psalter illumination. Standardization in format and iconographic content does not establish itself in England until the end of the 14th century and into the 15th, by which date the most popular service book is no longer the psalter but the book of hours.

In the late 14th century the psalter as a richly decorated text is almost always found as one element of a psalter-hours, as in two Bohun books, BL Egerton 3277 (ca. 1385) and Edinburgh, National Library of Scotland Advocates' 18.6.5 (ca. 1390). An example from the 15th century is the Bedford Psalter-Hours of after 1415. The decline in psalter production in the 15th century cannot be attributed solely to the rise in popularity of the book of hours but may also be due to the number already in circulation from the earlier Gothic period.

While for the 13th century it has been observed that certain groups of artists seem to have specialized in psalter illustration (the Munich, Lansdowne, and Glazier groups), it is not possible to draw such clear-cut conclusions for the 14th century, except that, judging from extant examples, psalters were the most popular books produced by the majority of workshops, the Walter de Milemete group forming a major exception. In the 13th century there appear to have been two main methods of working, the more common being that of a single illuminator who was concerned with all aspects of a book's decoration, and the other—evident in the Sarum and William of Devon groups—that of a division of labor between the major and minor aspects of the decoration. There are instances of both methods in the 14th century, as well as the practice adopted in the case of the central Queen Mary and principal Bohun workshops, in which two artists operate in partnership, dividing the labor on a more democratic basis.

Fig. 106. Tickhill Psalter (New York, Public Library Spencer 26), fol. 26v. Psalm 26: Scenes from the life of David. Courtesy of the New York Public Library.

The 13th century was dominated by two principal stylistic phases—the one, early Gothic, evolving away from the classicizing trend of ca. 1200, manifested in the Munich Psalter group, in which there is emphasis on linear drapery patterns and troughed folds. This first phase culminated in the elegant, monumental figure types of the Sarum Master, as epitomized in the Amesbury

Psalter (fig. 2: see AMESBURY PSALTER). Also evolving from the style of the Munich/Huntingfield Psalter group, though following a different path of development, is that of the William de Brailes workshop, where the emphasis is on more abbreviated figure forms in order to accommodate strong narrative elements. The other main trend in 13th-century illumination was dominated by French influence, resulting in a strong linear style, where chalky white faces are etched with calligraphic flourishes for the features and the draperies are rendered in flat areas of color with sparse black lines for the folds, as in the Cuerden Psalter. For the period of the 14th century when the Psalter was still the most popular devotional text, two main stylistic trends again dominate—the “East Anglian style” and the Parisian-influenced Queen Mary’s Psalter and Tickhill Psalter styles. After ca. 1330 Parisian influence gives way to influences from Flanders and Italy that become fully integrated with the indigenous English style, as in the Bohun Psalters.

It has been concluded that in the 13th century most workshops producing psalters seem to have operated for relatively local consumption. Of the few artistic centers that can be established with any certainty Oxford was important for most of the 13th century, and there is tentative evidence to suggest that it remained so through the 1320s and 1330s. A similar pattern is suggested for London in the same period, with a decline in the 1330s. When London revived again in the later 14th century the Psalter was well on its decline in popularity. There is evidence for York and Norwich as centers that produced psalters in the early 14th century, in the case of Norwich until the 1330s. The years around 1335–40 suggest that there was a migration from these other centers (notably Norwich, Oxford, and London) to Cambridge, but a workshop there appears to have been comparatively shortlived, its artistic activity curtailed by the Black Death of 1348–49. The Bohun family were the first major patrons of psalter production after the Black Death until ca. 1380, by which time London had revived. As a result of the breakdown of secular workshops the Bohuns established a center at Pleshey in Essex, but their illuminators produced books solely for the family.

The dating of manuscripts remains tentative throughout this period, for very few have a firm date. Inevitably much dating depends upon the interpretation of stylistic developments.

Psychology, Medieval, in Middle English Literature

ME writers employ a variety of psychological schemes developed in antiquity and the Middle Ages. The richness of the intellectual inheritance, the eclecticism (and possibly incomplete understanding) with which different systems are used by vernacular writers, and the terminological instability in the varied translations of Latin technical vocabulary permit here only a very general mapping of a complex area.

ME psychological writing is conditioned by a theological understanding of

man's nature and destiny, according to which man is essentially a soul, created in God's image and striving, in the pursuit of virtue, to be united with him. Psychological terms are frequently invoked to explain moral conflict within man. The theme of interior conflict can be traced back to Plato, as can the dualism of matter and spirit in terms of which ME authors generally envisage it (certain biblical remarks are influential here also). The soul is often regarded as having its inclinations toward God thwarted by the body (e.g., Gower's *Confessio Amantis* 7.490–520). But the frequent opposition between reason and sensuality (as in the poem *Reason and Sensuality*, perhaps by Lydgate) sees the soul itself as an arena of conflict between the higher part of human nature that knows the moral truth and aspires heavenward and the part interested solely in the material world, a realm that is available to the senses and stimulates nonrational impulses. The reason/sensuality categorization has similarities to the Aristotelian distinction between three kinds of soul: the vegetative, possessed by plants and giving life pure and simple; the sensitive, through which animals have life and prerational sensory capacities; and the rational, possessed by human beings, who have not only life and sensation but also the ability to reason abstractly and recognize moral imperatives. (On this scheme, and generally, see Trevisa's translation of Bartholomaeus Anglicus *De proprietatibus rerum*.)

ME writers sometimes oppose reason (or "wit," though this is not always an equivalent of reason) to will. Will is often associated with bodily impulses and seen as tending to lead man morally astray, if it is not controlled by reason (cf. *Sawles Wardê*). However, will can also specify the power of free choice, which does not in itself have any tendency toward evil. Virtue may be said to occur when a person wills what reason perceives to be good. The possession of reason and free will distinguishes human beings from the animals. This highest, specifically human, part of the person was influentially analyzed as an image of the Trinity by St. Augustine. The morality play *Wisdom* (among many other works) reflects Augustine's thought in offering a tripartite scheme of the soul as mind (Augustine's *memoria*, the soul in its most fundamental aspect, which corresponds to the Father), understanding (*intelligentia*, corresponding to the Son), and will (*voluntas*, corresponding to the Holy Spirit).

The author of *The Cloud of Unknowing*, following Richard of St. Victor, sees mind, reason, and will as the primary powers of the soul. The secondary powers, unlike the primary, have to do with the material world and are identified as imagination (cognitive) and sensuality (affective), conceived as often ill-disciplined servants of reason and will, respectively (chs. 62–66). Medieval writers generally understand the imagination as retaining sense images and passing them on to reason. Some writers also have it manipulating sense images fictively. In *Piers Plowman* B.1 1–12 the imaginative power

reviews the earthly creation, finds there pointers to God's love, and stimulates the narrator to contemplate his approaching end.

Reason is often regarded as the highest power of the soul, but to the sequence sense-imagination-reason some thinkers add a further term or terms designating the soul's capacity for mental activity more exalted than reasons. Boethius's influential *Consolation of Philosophy* (5.pr.4) speaks of intelligence going beyond the sense-perceptible universe and apprehending the forms of things as they exist in the mind of God.

Work on Aristotle's *On the Soul* made available to later ME writers complex schemes for understanding postsensational, prerational (animal-like) processes. (Aristotelian thinking took the soul to possess distinct faculties, as against Augustinian views, which saw the soul's powers as names given to a single entity as it performed various operations: Langland and Trevisa both use a set of such names derived from Isidore of Seville's *Etymologies*.) In Pecock's *Donet* the postsensational faculties or "inward bodily wittis" (elsewhere "inwits") are 1) common wit, which synthesizes impressions received from the various senses; 2) imagination, which retains those impressions; 3) fantasy, which combines them into imaginary structures; 4) estimation, which is responsible for instinctive awarenesses not dependent on sense impressions; and 5) mind, which retains what the others provide.

Puy

The word traditionally used for poetic and musical guilds in northern France and Flanders in the Middle Ages. Normally these guilds had religious origins and affiliations but fostered secular song, often in contests, and drama also. There were important *puy*s in Arras, Amiens, Lille, Valenciennes, Abbeville, Douai, Cambrai, and Rouen. In England at the close of the 13th century the London *puy*, a guild of French merchants dedicated to God, the Virgin, and All Saints, is of particular interest, not least because of the survival of its informative Statutes, written in Anglo-Norman French. At the main feast of the year competing "roials chaunsouns" were performed. There was great insistence on the need for musical competence on the part of the judges, and no *chant royal* could win if it lacked "the sweetness of a melody to be sung." The winning composer was elected Prince for the following year and awarded a crown. His arms were to be mounted in the banqueting hall and beneath was to be suspended a fair copy "clearly and well written, without mistake" of the winning song. No singer might begin at the annual contest unless he saw the previous year's winning entry duly displayed. A principal purpose of the guild's activities was to "nourish and encourage good companionship, pleasant pastime and enjoyment between people... and to forget one's cares." In a different category are minstrels' guilds, such as those in Paris, London, Chester, Tutbury, and Beverley, which are, rather, professional trade unions.

Queen Mary's Psalter

Queen Mary's Psalter (BL Royal 2.B.vii; [fig. 107](#)), an early-14th-century manuscript of 319 folios that once belonged to Queen Mary I (1553–58), contains an extraordinary wealth of decoration, chiefly in the form of elaborate picture cycles. The Psalter text is preceded by a series of 223 Old Testament scenes (fols. 1v–66v), mostly arranged two to a page. These give an account of the Bible narrative from the fall of Lucifer and the Creation to the death of Solomon. The compositions are set against plain vellum grounds and executed with great delicacy in a pen-and-wash technique. Beneath each miniature is an explanatory rubric in Anglo-Norman. The Tree of Jesse (fol. 67v) and three composite miniatures (fols. 68–69v), illustrating the genealogy of Christ and prophets and apostles, arranged typologically, are the first of a large number of miniatures in fuller color.

These subjects provide an effective link between the preceding Old Testament cycle and the New Testament narrative that follows. Between these (on fols. 71v–83) is the calendar, in which each month is spread over two facing pages: the left page is topped with an oblong miniature representing the labor of the month, while the right page has a miniature of the same type incorporating the corresponding sign of the zodiac within an actual scene (e.g., at April, for Taurus, men herd bulls and at July, for Cancer, fishermen heave a large crab into a boat).

The Psalter itself (fols. 85–280) is illustrated with scenes from the life of Christ. Within the ten-part division of the text the cycle is unusually detailed, having not only a historiated initial but also a miniature at the beginning and end of each section. The majority of miniatures and initials have grounds of colored diaper or of plain, pounced, or hatched burnished gold, the larger scenes being enclosed within Gothic architectural canopies. With the exception of the Crucifixion scene on fol. 256v the format of the illuminations then changes to accommodate a cycle of fourteen composite miniatures, set within simpler frames and each divided into four compartments. These miniatures, which are dispersed throughout the remaining psalms up to the opening of the

first of the canticles (fols. 234–281), illustrate the Northern Passion, a verse narrative covering the events from the conspiracy of the Jews up to the soldiers' report of the Resurrection. The canticles are mostly illustrated with historiated initials. The unusually lavish litany (fols. 302v-318) is decorated with sixteen rectangular miniatures opening with the Last Judgment, but consisting mainly of standing figures of saints.

Fig. 107. Queen Mary's Psalter (BL Royal 2. B. vii), fol. 168v. Psalm 68: Marriage feast at Cana, Jonah and the whale. Reproduced by permission of the British Library, London.

The decorative and iconographic richness of this fine psalter is further enhanced by an extensive cycle of *bas-de-page* (lower-margin) scenes, 464 in

all, which begin on the second page of the psalms (fol. 85v) and continue to the end of the book. They are in the same tinted drawing technique as the prefatory Old Testament cycle and comprise a variety of subjects. The first series, depicting such scenes as a hedgehog gathering apples and the correct method for slaying a unicorn, relates to the bestiary. From fol. 130 this gives way to conflicts between knights and monsters, followed by scenes of secular life, such as hunting, feasting, and playing draughts, after which the tone becomes more serious with 36 miracles of the Virgin (fols. 204–232). The final cycle, that of the lives and passions of the saints, forms a particularly fitting accompaniment to the litany, where these scenes are married both to the miniature cycle above and to the text.

The Psalter is illuminated in a courtly style. Many of the figures are S-shaped, having restrained yet expressive head and arm gestures. The draperies fall in soft, straight folds or elegantly sweeping curves, the faces are pear-shaped, and the facial features are drawn with extreme delicacy. This manuscript, which is of considerable importance for the development of English painting in the early 14th century, can be assigned to a single anonymous hand (the Queen Mary Artist). The so-called Psalter of Richard of Canterbury (New York, Pierpont Morgan Library Glazier 53) was also illuminated entirely by him. This master worked in collaboration with another illuminator (the Ancient 6 Master) throughout a career that spanned some fifteen to twenty years (ca. 1310–25). His hand also appears in Bodl. Douce 79, but since this was probably once joined to Paris, BN fr. 13342 (a tract on the mass), in which the Ancient 6 Master also participated, it must be classed as a collaborative work. These two illuminators, who worked with no other artists, collaborated in two other extant manuscripts, and there are others linked to this workshop, illuminated by the Ancient 6 Master alone. The Queen Mary Artist has been erroneously assigned the first sixteen folios of an Apocalypse (BL Royal 19.B.xv), but this portion is by a clever copyist.

Queen Mary's Psalter is devoid of internal evidence for dating and provenance. However, as a result of a close study of the related manuscripts, a date between 1310 and 1320 has been proposed. For the Queen Mary books that contain evidence for localization London emerges as the most likely center of production, a provenance further reinforced by the stylistically and iconographically derivative *Liber Horn* of 1311 or 1312 and the *Liber customarum* of 1321, both now in the Corporation of London Records Office and indisputably linked to London. The Queen Mary Artist and the Ancient 6 Master constitute a presumably London-based central workshop, while a further close imitator of their style (the Subsidiary Queen Mary Artist), who produced portions of a psalter and bestiary (Cambridge, Corpus Christi College 53), the Alice de Reydon Hours (CUL Dd.4.17), and other works, seems to have

been operating mostly in East Anglia.

Both the iconographic and stylistic sources of Queen Mary's Psalter have yet to be fully explained, but the iconography appears largely to have an origin in literary material, while the often cited Parisian qualities of the style are readily explained by the political connections existing between the French and English courts at that time. Although it may never be possible to be more precise about its origin, or to determine the original owner, Queen Mary's Psalter stands as a unique product of English "court" art of the early 14th century.

Queens and Queenship

Royal wives were not automatically designated "queens" (*regiruie*) in the pre-Conquest period. Asser explains how West Saxon royal wives lost the title following the disgrace of Eadburh after the death of her husband, King

Beorhtic, in 802. Their low status seems reflected by charter evidence; while 9th-century Mercian queens are regular witnesses to royal diplomas, West Saxon royal wives are noticeably absent. Gradually the situation changes. From the mid-10th century royal wives and mothers were designated “queens.” The practice of their consecration, developed earlier on the Continent, seems to have been adopted in Wessex in 973, when Ælfthryth, third wife of King Edgar I, was anointed.

Royal wives were generally chosen from great noble clans, and the subsequent support of her powerful family for her husband, the king, often proved crucial in the survival of a dynasty. Circumstances of conversion and female monasticism opened up opportunities for royal women all over Europe. Noble women had rights of possession and free disposal of land and were often generous supporters and allies of the church.

During the ecclesiastical reform of the 10th century divorce became increasingly problematic, thus strengthening the royal wife’s position. In pre-Conquest England primogeniture had not been established, and queens often wielded greater power as widows and mothers than as wives. Although some queens are mentioned in the earlier period—Seaxburh, believed to have ruled Wessex for a year after her husband Cenwealh’s death in 762, or Æthelburh, Ine’s queen, who demolished Taunton in 722—detailed evidence does not emerge until the 10th century.

Æthelflæd (d. 918) took over as virtually independent ruler of Mercia following her husband Æthelræd’s death in 911. Described in the Mercian Register as *Myrcna hlafdige*, the exact equivalent of *Myrcna hlaford* (the title by which Æthelræd had been known), she built and defended a line of fortresses against the Vikings and Welsh, making possible her brother Edward’s (899–925) reconquest of the Danish Midlands and the subsequent unification of England under the West Saxon royal house.

Edward’s wife, Eadgifu (d. 966/67), a great patron of the monastic revival, used her position at court to influence her sons in favor of the ecclesiastical reformers. Much of her extensive landed possessions were given to reformers and religious communities. Her influence is shown by her frequent appearance in witness lists of royal diplomas, where she signs after the king but before all other witnesses, including the archbishops and athelings (princes), a position she retained after her elder son’s marriage. Dominant during the reigns of Æthelstan and her two sons, Edmund and Eadred, she and Dunstan were pushed aside in Eadwig’s reign (955–59) in his attempt to break the power of the reform group. Backing the claims of Edgar, her younger grandson, she fell from power. Her lands were confiscated, to be restored to her on the succession of Edgar after Eadwig’s death.

The events of 1035–37 exemplify the risks of intervention in succession

disputes. Following Cnut's death in 1035, Emma chose to support the claims of Harthacnut, the king of Denmark and her son by Cnut, rather than either of her sons by Æthelred II, hoping to gain support from the Anglo-Danish aristocracy. However, Harold Harefoot, Cnut's son by his mistress Ælfgifu, had many supporters, and he was appointed to act as regent until Harthacnut's delayed arrival from Denmark. In 1036 Harold was in a sufficiently strong position to seize the royal treasure and regalia from Emma, and in the following year—actively helped by his mother—was proclaimed the *de jure* king of England. Emma's former ally Godwin switched support to Harold; Emma was exiled. After Harold's death (1040) Emma and Harthacnut returned to England. But when Æthelred and Emma's son Edward the Confessor succeeded Harthacnut, Emma was deprived of her treasures for failing to support his claims.

The queen's power was gradually eclipsed in the later Middle Ages by the implementation of primogeniture. Queens were no longer considered the automatic choice as regent to a minor. In order to preserve family property, their rights to inherit and freely to dispose of property were curtailed, further reducing their influence. Few post-Conquest queens exercised real power. An exception is the remarkable Eleanor of Aquitaine (d. 1204), wife of Louis VII of France and then of Henry II. As queen of England she frequently served as regent and promoted her sons' interest at Henry's expense. After her active participation in her eldest son's rebellion (1173), she was kept under watch until Henry's death. While her son Richard was in captivity during the Crusades, his mother virtually ruled England, successfully thwarting John's ambitions.

Until Edward IV married Elizabeth Wydeville in 1464, all the queens after Eleanor of Aquitaine were from abroad, and the story of the king's marriage belongs more to the realm of diplomatic history than to that of social or domestic affairs. However, the queens sometimes played a prominent role. Isabella of France was instrumental in the deposition of her husband, Edward II, in 1327, and Margaret of Anjou led the Lancastrian cause after Henry VI's inability to govern became apparent in the 1450s. The queens had no formal or designated role in government; they were just expected to bear children and offer their counsel in private. Nevertheless, they were figures with their own households and estates. They often engaged in philanthropic activity with the church, educational institutions, and the nameless sick poor as their beneficiaries.

Quo Warranto Proceedings

The administrative and legislative reforms undertaken by Edward I on his return from crusade included investigation not only into maladministration but into fundamental questions of who held what liberties (privileges ranging from hunting rights to holding courts) and by what warrant (*quo warranto*) those liberties were held. Edward issued the Statute of Gloucester in 1278, authorizing the itinerant justices in eyre to enquire by writs of *quo warranto* into all privately held liberties in the realm. His purpose was to establish the principle that all liberties belonged to the king, held privately only by royal authorization. He did not plan to take all private liberties into royal hands. In fact liberties found to be held without proper warrant were almost always granted back on payment of a healthy fine.

Proof of right to a liberty was demonstrated either by a charter from the king or by long use and possession. Defining the latter caused trouble and prolonged litigation. In 1290 the Statute of *Quo Warranto* defined long use as continuous possession back to the accession of Richard I (1189), a date accepted as the limit of legal memory for other purposes.

Edward's success in the quo warranto proceedings was mixed. Though the principle that all liberties were royal ones came to be accepted, the process of enquiry and the overtones of extortion aroused resentment. In practice writs quo warranto were gradually abandoned by the crown as a means of controlling private liberties because a judgment in favor of the defendant secured the liberty permanently from crown control. Other means were developed to further the crown's authority and the trend away from private and personal government toward public and bureaucratic government.

R

Regularis concordia

The key document of the Benedictine Reform in England, resulting from a national council of bishops, abbots, and abbesses held in Winchester in the early 970s. As indicated by its programmatic title—*Regularis concordia anglicaenationis monachorum sanctimonialiumque* (*The Monastic Agreement of the Monks and Nuns of the English Nation*)—it was meant to establish a uniform observance for monks and nuns throughout the country on the basis of the Rule of St. Benedict. The heterogeneous compilation contains relatively few traces of individual authorship; those discernible point to Æthelwold rather than Dunstan, to whom the work was formerly attributed. It has come down to us in two loosely related copies, both probably produced at Christ Church, Canterbury, about the middle of the 11th century: BL Cotton Tiberius A.iii, fols. 3r-27v, a complete version, augmented by an OE interlinear gloss and a thematic frontispiece, and BL Cotton Faustina B.iii, fols. 159r-198r, a reproduction of the Latin text, lacking the epilogue, and with its final leaf cut off and bound with BL Tiberius A.iii (now fol. 177) in the Cottonian library. There are also two fragmentary OE prose translations, an adaptation in Latin by Ælfric—known as the “Letter to the Monks of Eynsham”—and a number of more or less faithful verbal echoes in other liturgical documents.

The main body of the *Regularis concordia* is subdivided into twelve chapters that contain regulations on liturgical practice throughout the year and instructions on monastic life in general. These largely accord with reformed monasticism on the Continent, especially with the customs of Fleury, but there are also a number of genuinely English traits. One of the outstanding features of the *Regulans concordia* is its inclusion in the Easter office of the *Quem quaeritis* trope that marks the beginnings of liturgical drama in medieval England.

In form as well as in content the prologue and the epilogue stand out against the customary proper; written in the “hermeneutic style” as practiced by Æthelwold, these parts reveal the political dimensions of the reform, attesting to a mutually profitable alliance of the royal house, represented by King Edgar

(957–75) and Queen Ælfthryth, and the monastic reform party, at the expense of the nobility losing its rights to exert lay dominion over monasteries.

There is only scant information as regards the long-term impact of the *Regularis concordia* on monastic life in England. The two surviving copies attest to a prolonged interest in the document, though in drawing up his post-Conquest constitutions for the Christ Church monks Archbishop Lanfranc showed a characteristic disregard of what once constituted the unifying bond among all Anglo-Saxon monastic communities.

Regularis concordia and the Arts

The *Regularis concordia*, the document that describes the common rule of life accepted ca. 970 by the English monastic houses, says nothing specifically about the arts. The Benedictine order had always cultivated the arts, however, and art played an important part in Anglo-Saxon monastic life. The monastic church was the place where Christ's incarnation, death, and resurrection were made present through the liturgy, and its design and decoration had to reflect that fact. The paintings in liturgical manuscripts did not simply recall the historical events being commemorated; they showed the significance of those events, leading those who saw them away from the temporal to the eternal. This much is common to all monastic art.

The leaders of the 10th-century monastic revival added three things to their Benedictine inheritance: royal patronage, uniformity of observance, and a sense of unity with the reformed monastic houses on the Continent. The close links between English monasteries and the royal family, seen particularly in the prayers for the royal family enjoined upon the monks, are reflected in the numerous crowned crucifixes and other crowned figures of Christ from late Anglo-Saxon England, as well as in the appearance of royal insignia in paintings of the Adoration of the Magi and the Baptism of Christ in such manuscripts as the Benedictional of Æthelwold. The emphasis on uniformity, together with the controlling influence of the three founders of the English monastic revival (Dunstan, Æthelwold, and Oswald), meant that monastic houses were grouped in families with common tastes and ideas. Monks moved from one monastery to another, books were written in one monastery for presentation to another, and together with the books went a transfer of style and iconography. Contacts with continental monastic houses resulted in a form of manuscript decoration that was closely dependent on Carolingian art. The liturgical provisions of the *Regularis concordia*, and the forms of piety associated with it, affected the layout of churches and their decoration. Space was needed for processions, for the Good Friday veneration of the Cross, and for the dramatization of the *Quem quaeritis* trope on Easter Sunday. Towers and crypts were built for the display of relics, and side chapels were provided for private prayer.

Regularis concordia and the Liturgy

The earliest surviving English monastic customary, containing extensive information on contemporary liturgical, monastic, and social customs. It is also one of the most significant documents of the 10th-century revival of monasticism in England. It was compiled ca. 970 by a council of bishops, abbots, and abbesses in an attempt to establish a nationally uniform pattern of monastic lifestyle. Edgar, king of all England from 959 to 975, presided over the council at Winchester, at this period the seat of the royal household, the site of three Benedictine foundations, and the major center of book production and illumination in England. *Regularis concordia* has never been conclusively attributed to a single author, but the central role of the reformer St. Æthelwold (d. 984) in the compilation of the document is unquestionable. It survives in two sources, both likely to have been copied at Christ Church, Canterbury (a house influenced by Winchester), in the late 10th century and the mid-11th century, respectively, and it also forms the basis of a customary compiled by Ælfric “the Grammarian” (ca. 945-ca. 1015) for the new Benedictine

community at Eynsham in Oxfordshire (founded 1005).

Regulans concordia takes the Rule of St. Benedict (ca. 526) as the authoritative model for the monastic life, while acknowledging that the Rule in itself is not adequate as a means of securing the desired level of conformity of practice. To this end the Winchester council summoned representatives from Fleury and Ghent, two of the major centers of reformed European monasticism, to discuss different interpretations of the Rule. Consequently there are several strands of influence within the document. Thomas Symons's extensive research has identified customs borrowed from the legislation of Benedict of Aniane (d. 821) and the late-8th-century customary *Memoriale qualiter*, in addition to more recent practices drawn from the Cluniac and Lotharingian uses (represented by Fleury and Ghent, respectively).

There is also substantial evidence of uniquely English customs. The close relationship between king and monks (underlined by the physical proximity of monasteries and royal palace at Winchester) is referred to several times in the document, but it is most overtly reflected in the daily custom of offering psalms and collects for the royal family after each of the hours (except Prime) and after high mass. The morrow mass was also offered for the king on certain occasions, and the king had the right to participate in abbatial elections. Other customs that do not feature in contemporary continental customaries include a recommendation for daily reception of the eucharist, the pealing of bells during Christmas week, and the prescription of a room with a fire during winter.

Regularis concordia consists of a prologue outlining the history of the monastic revival and the Council of Winchester, followed by twelve chapters dealing with the daily monastic routine. These cover the observance of feasts, matters of discipline, reception of guests, and rites for the sick and the dead. Numerous appended liturgical ceremonies are described, including the votive offices of the dead and of All Saints, several groups of specially chosen psalms recited before and after offices, and a series of three independent antiphons addressed to the Cross, the Virgin Mary, and the patron saint, respectively, which followed Lauds and Vespers outside Advent. There is also a particularly full description of the ceremonies of Holy Week. The details for the performance of the dramatic liturgical dialogue *Visitatio sepulchri* on Easter Day are especially important, for they clarify the context of the same ceremony which is included in the famous Winchester Tropers and found in many contemporary continental manuscripts. *Regularis concordia* does not supply complete texts for the *Visitatio*, but it describes precisely the manner in which the ceremony was performed and specifies its liturgical place, between the third (and last) respond and the Te Deum at Matins on Easter Day.

Religious Allegories

Extremely varied in form and complexity, ME religious allegories elude simple summary. At one end of the spectrum we find static allegories devised to assist

recall of basic truths. These include allegorical buildings (e.g., *The Abbey of the Holy Ghost* or *The Castle of Love*, based on Robert Grosseteste's *Chateau d'amour*); charters (the several versions of *The Charter of Christ*); clothing and armor, often with reference to Ephesians 6 (*A Treatise of Ghostly Battle*); landscapes, trees, and other plants (*The Desert of Religion*, *The Truelove*, and various trees of virtues and vices). Allegorical ships, ladders, oceans, beds, wells, and so on can also be found.

These static allegorical devices need not be mechanical or simplistic. Among the most moving is the versified *Long Charter of Christ* (mid- to late 14th century). Speaking in words from the Good Friday liturgy, the crucified Christ offers a charter granting joy in return for love; his skin is the parchment, his wounds are words made by the pen of the scourge, and so on. Legacies of the eucharist and the sacrament of penance complete the linking of love and suffering. The emotion of the recalled Passion is intensified by being set in and contrasted with the liturgical and legal formulas. In static allegory spiritual relationships may also be suggested: the granary of Meditation in the prose *Abbey of the Holy Ghost* is above the cellar of Devotion because it is more important; Pity distributes not only wheat from the granary and wine from the cellar but also the product of meditation and devotion, the oil of Comfort. The unrelated prose *Charter of the Abbey of the Holy Ghost* links the Abbey's inhabitants to the implications of the Fall and to Christ's life. It also modulates its style subtly and effectively. For example, the charter itself is full of conditionals expressing God's regret for its coming invalidation: this neatly suggests divine timelessness, pity preceding the action that will deserve it. The Fall is presented in a variety of modes ranging from the charter's formality to the uncontrolled outburst of Adam's confession.

Less static and thus more capable of suggesting process and change are allegories of the life journey, often represented as a pilgrimage. Noteworthy examples are the ME versions of the first two parts of Guillaume de Deguileville's important poetic trilogy: the *Pèlerinage de la vie humaine* and *Pèlerinage de l'âme*. The anonymous prose *Pilgrimage of the Life of the Manhood*, translating the first recension (1330–31) of the *Vie*, allegorizes the interdependence of the sacraments and includes a rare allegorical mass imaginatively interwoven with holy orders and penance. The diffuse second recension was translated into verse by Lydgate. The prose *Pilgrimage of the Soul* modifies the *Ame* for a lay audience, demonstrating man's need of Christ through the soul's experience after death. (Part 3, the *Pèlerinage de Jhesucrist*, has no ME version.)

More than one of the allegorical devices described here may appear in any given allegorical work, as with the *Charter of the Abbey* above, or the allegory of the green tree and the dry tree embedded in the *Pilgrimage of the Soul*.

Another device common to many religious allegories is personification allegory, frequently used to represent virtues and vices and often able to suggest spiritual relationships and interactions more fully than is possible with inanimate allegorical entities alone. Of particular interest are the allegorical narratives of the Four Daughters of God (Truth, Justice, Mercy, and Peace, drawn ultimately from Ps. 84:11 AV), who debate such issues as the Incarnation, Grace, or the release of souls from Limbo and are eventually reconciled. The device is widespread, appearing in *The Castle of Love*, *The Charter of the Abbey*, *Piers Plowman*, *Cursor Mundi*, and elsewhere. Personification allegory, the life journey, and allegorical buildings can also be found in the morality plays, such as *Everyman*, *Mankind*, and *The Castle of Perseverance*.

Religious allegories in ME generally echo accepted values and doctrine. Nonetheless, the greatest of them resist easy classification or analysis, because they are more concerned with exploring spiritual relationships and process than with mere statement. The subtlest in ideas and most varied in allegorical modes is *Piers Plowman*, which, like *Pearl*, concerns spiritual transformation; both poems show how language itself—with its figurative, allegorical capacities—reveals to man his spiritual purpose.

Repton

Fig. 108. The Anglo-Saxon crypt at Repton. After E. Fernie (1983). Drawing by C. Karkov.

The Church of St. Wystan, Repton (Derbyshire), was originally part of a double monastery (a community of both men and women under the rule of an abbess)

founded in the 7th century. There were several phases of construction at the site during the pre-Conquest period. The Anglo-Saxon monastery was succeeded by a Norman priory, and the nave and west end of the church were rebuilt in the later medieval period.

All that remains of the pre-Conquest fabric ([fig. 108](#)) are the square-ended chancel, the crypt beneath it, the two eastern angles of a central crossing that separated chancel and nave, fragments of the north transept, and a monolithic window head. The church as reconstructed had a central tower with north and south porticus. The crossing tower was wider than the chancel and northern and southern arms, a characteristically Anglo-Saxon feature of ecclesiastical architecture. Sections of stringcourses and moldings are preserved on the eastern walls of the central crossing, and a stringcourse and pilaster strips decorate the exterior of the east end.

Excavations at Repton have uncovered fragments of window glass and imported glass vessels that suggest the presence of a 7th- or 8th-century church predating the present crypt. The earliest feature surviving at the site is the crypt, originally an independent mausoleum, partially below ground, that was eventually incorporated into the fabric of the church. The crypt is a single room, approximately 15 feet square divided into nine vaulted bays by transverse arches set on four monolithic columns. The columns are carved with ornamental spirals possibly in imitation of those that covered the shrine of St. Peter in Rome. At the center of all four walls are deep recesses (possibly later insertions) that originally housed tombs, shrines, or important relics. The corners of the niches are articulated by square pilasters.

There is evidence for three or four Anglo-Saxon building campaigns within the present fabric. The lower part of the crypt walls, constructed of long, brownish, well-dressed stones, is all that remains of the first phase of construction. Just above this level is a second phase characterized by more roughly hewn stones and massive quoins at the corner angles. The third phase begins just beneath the level of the later medieval windows and is marked by a change to smaller rectangular stones of a light grey color. Pilaster strips decorate the exterior of the building at this level. The four spiral columns and pilaster responds that support the vaults belong to the third phase. Lastly the diagonal staircases that originally entered the crypt from the north and south porticus were added.

The dates of these phases are controversial. Taylor dates phase 1 to the 7th and 8th centuries, suggesting that the mausoleum was built to house the remains of King Æthelbald of Mercia (d. 757); phase 2, 8th to 9th century; phase 3, associated with King Wiglaf (827–40); and phase 4, with the death of Wystan in 849. Fernie suggests that Wiglaf built the mausoleum and dates phase 1 to 827–40 and phases 2, 3, and 4 to 850–1035, probably 920–1020, on

the basis of parallels both within England and on the Continent.

The Vikings spent the winter of 873/74 at Repton. The church was incorporated into their fortifications, and a cemetery, possibly centered on a royal burial, was sited to the west of the church.

Rhetoric

In contrast to the modern, postromantic traditions emphasis on the expressive aspect of language, rhetoric examines the effect of language on an audience. Rhetoric was the dominant theory of discourse in the premodern West; its structures, terminology, and character shaped the way that those who thought about language expressed their thoughts. Originally rhetoric was concerned with the persuasiveness of an argument presented in a public forum. But almost from the beginning of the ancient Greeks' systematic study and teaching of rhetoric they recognized its importance to understanding the effectiveness of written as well as oral texts.

Classical rhetoric, with its emphasis on adult male political and judicial decision making, is often considered to be the most fundamental type of

rhetoric (Kennedy). But during the Middle Ages the pedagogical aspect of rhetoric—its use as a tool to teach literacy, particularly the ability to read, write, and analyze Latin texts—was more important. One of the most illuminating descriptions of medieval rhetorical pedagogy is John of Salisbury’s description of the methods of a famous teacher, Bernard of Chartres. Bernard gave close readings of the Latin authors, including explanations of grammatical rules and rhetorical techniques, which he dispensed “gradually, in a manner commensurate with [the students’] powers of assimilation”; he assigned daily exercises in memorization, recitation, and imitation that were tailored to the strengths and weaknesses of individual students; he gave evening instruction that included explanations of the “poets and orators who were to serve as models for the boys in their introductory exercises in imitating prose and poetry”; and he demanded daily compositions in poetry and prose that were then presented in informal competitions (*Metalogicon* 1.24).

The analytical terminology used during the Middle Ages to talk about rhetorical discourse derives from Roman treatises that taught one how to compose and present oral arguments. The traditional division of rhetoric into five parts (invention of material, arrangement, style, memory, and delivery) and the definitions of these parts (also called the canons, aspects, or topics of rhetoric) reflect the origin of rhetoric in the composition of speeches. A classical rhetorical treatise that was influential during the later Middle Ages and much of the Renaissance reads, “Invention is the devising of matter, true or plausible, that would make the case convincing. Arrangement is the ordering and distribution of the matter, making clear the place to which each thing is to be assigned. Style is the adaptation of suitable words and sentences to the matter devised. Memory is the firm retention in the mind of the matter, words, and arrangement. Delivery is the graceful regulation of voice, countenance, and gesture” (*Rhetorica ad Herennium* 1.3).

The *Rhetorica ad Herennium*., from which these definitions are quoted, was attributed to Cicero during the Middle Ages and early Renaissance. From the 9th century on it was a supplement to another Roman treatise also popular during the Middle Ages, one by the young Cicero that concentrates on the first part of rhetoric: *De inventione*. For most of the Middle Ages these texts, although originally written to teach the rhetoric of Roman courts of law, were used as textbooks for all kinds of language study.

Aristotle’s *Rhetoric*, a text much admired today but almost unknown in the ancient world, was known but not widely read during the later Middle Ages. Yet the translation of Aristotle’s work on memory into Latin in the 13th century may have helped to codify treatments of the fourth part of rhetoric and reintroduce it into scholastic rhetoric in medieval Europe, especially

medieval England (Carruthers). Taught in the medieval universities, scholastic rhetoric examined systematically the relationship between rhetoric and dialectic (Fredborg), a question already raised in the *De differentiis topicis* of Boethius (ca. 480-ca. 525), a work that remained influential throughout the Middle Ages. In medieval schools, however, as we see in John of Salisbury's description, the teaching of rhetoric overlapped with the teaching of grammar and the analysis of specific Latin texts.

The great rhetorical narrative poems of the 12th century, such as the *Cosmographia* of Bernardus Silvestris and the *Anticlaudianus* and *Complaint of Nature* of Alan of Lille, helped to inspire a new group of rhetorical treatises, the arts of poetry, or *artes poetriae*. The rhetorical principles of these treatises were based on classical rhetorical manuals; unlike the manuals, however, and like Horace's *Ars poetica* (another of their classical sources), the *artes poetriae* emphasized the composition of verse. The most famous of these and the one most widely read during the later Middle Ages was the *Poetria nova* of Geoffrey Vinsauf, written about 1200–15.

While the *Poetria nova* specifically treats poetic composition, and while this work and excerpts from it were so well known in England that a vernacular writer like Chaucer could paraphrase (*Troilus* 1.1065–69) and parody (*NPT* 3337–51) it, the work was used to teach prose composition as well. Arts of poetry by other Englishmen, such as John of Garland and Gervase of Melkley, also included sections devoted to prose composition. Treatises on letter writing according to rhetorical principles (*artes dictaminis*) became popular about the same time as the arts of poetry, but in England the *artes poetriae* seem to have been at least as popular as the *artes dictaminis* in teaching all kinds of composition (Camargo, 1988).

Medieval rhetorical techniques taught in the *Poetria nova* and emphasized in commentaries on it include textual amplification and abbreviation; the use of proverbs and exempla to begin a work and focus the attention of the audience; and the division of figurative language into “difficult ornament,” or metaphoric transference, and “easy ornament,” or the construction of sentences in such a way as to create deliberate patterns in the words themselves or in the arrangement of the content of short passages.

The arts of poetry are meant to be comprehensive treatises, but to modern readers they seem to emphasize the third part of rhetoric, style, especially the figurative aspects of language. In fact separate lists of definitions and examples of the tropes and figures of speech were popular throughout the Middle Ages. Most of the medieval arts of poetry draw on earlier lists and definitions of tropes and figures, like those in book 4 of the *Rhetorica ad Herennium*, although the authors of the medieval treatises tinkered with the lists and usually inserted or made up their own examples.

The examples of rhetorical tropes and figures in the arts of poetry, as well as in earlier, shorter treatises like Bede's *Deschematibus et tropis* (*On Figures of Speech*, ca. 700), were as likely to be drawn from Christian as from classical stories and traditions. The association of rhetoric with paganism that centuries earlier inspired Augustine of Hippo to write a book on using rhetoric for specifically Christian purposes seems not to have been the source of so much concern or fear for most later medieval teachers of rhetoric, although the potential harm of pagan texts continued to be debated in other circles.

However, Augustine's treatise on a christianized rhetoric, *On Christian Doctrine* (*De doctrina christiana*), did give rise to a distinct rhetorical tradition of its own. This tradition has been called "counterrhetorical" (Camargo, 1983) because of Augustine's rejection of precepts (4.3.4) and his emphasis on clarity and directness (4.8.22) rather than sophistication of composition and style. But it paved the way for the development of the medieval arts of preaching (*artes praedicandi*) as well as the later medieval controversy about circumscribed access to and uses made of the text of the Bible, most notable in England in the Wycliffite movement.

The practical interest in preaching caused by the challenge to the church of the powerful heresies and the Crusades of the 12th and 13th centuries led to a change in the function of sermons in medieval religious life and the need for texts and aids to help in their composition. The arts of preaching were influenced by scholastic methods of textual analysis, both in the use of biblical quotations as a focus for thematic development and amplification and in an emphasis on division into parts. Collections of sermons were as influential as preceptive manuals in the teaching of the composition of sermons, and these collections indicate that the intended audience influenced the choice of compositional structure and method of development.

Because many medieval rhetorical manuscripts still remain unedited and even unread by modern scholars, there are many questions about medieval rhetoric, especially rhetoric in England, that are only just now beginning to be answered: What texts were used in which medieval schools and universities? Were those who were excluded from institutionalized education during the Middle Ages also affected by the rhetorical tradition inherited from the classical world? How did knowledge of rhetorical treatises that were not part of the pedagogical system spread? What was the result of rhetorical teaching on writers in the vernacular? Much more work must be done before we can answer those questions fully.

Richard I (1157–1199; r. 1189–99)

Son of Henry II and Eleanor of Aquitaine. Richard the Lion-heart was already duke of Aquitaine in right of his mother and heir-apparent to the English throne upon the death of his elder brother, Henry "the Young King," in 1183. His nickname, "the Lionheart" (Fr. "Coeur de Lion"), can be traced back to Gerald of Wales (d. ca. 1223), who compared the king to a lion, and can already be found circulating in a 13th-century romance of Richard's life.

Just as his late brother would have been a disastrous king, Richard could have been a great one had he spent his reign in England rather than on crusade and in the Angevin lands across the Channel. Although a man of knightly prowess, a writer of courtly poetry, patron of culture, cunning politician, and diplomat, Richard exhibited qualities regarded today as repulsive. Even by contemporary standards he could be less than humane, vengeful and beastly; however, he was the ideal martial king and a masterful leader of men. A recent study (by Gillingham) has refuted the view that Richard was homosexual. His reign is most conveniently examined by looking at his role in Angevin politics on the Continent, at his conduct of the Third Crusade, and at the governance of England during his nine-and-a-half-year absence.

Filial piety was not a characteristic of Richard's personality. Henry II sought to maintain the territorial integrity of his lands in France, fighting a doomed struggle against Louis VII (1137–80) and Philip II (1180–1223), a struggle that, under Richard's youngest brother, John, would result in the loss of all English holdings north of the Loire. Richard, desiring effective control of his inheritance, revolted against his father in 1173–74 and again in 1188–89, both times in alliance with the king of France. The warfare was not only patricidal, but fratricidal as well—as John and his brother Geoffrey of Brittany fought against both Henry II and Richard.

Although the conflict was not resolved before the death of Henry, after his return from crusade the fighting decisively favored the Lionheart. The promising course of the wars ended with Richard's death, while fighting a contumacious vassal in Aquitaine: an engagement waged over political issues, not over treasure trove (as some romantic versions of the story have it). Perhaps the greatest tragedy of Richard's early death was not the coming frustration of English ambitions on the Continent but the opportunity denied him to demonstrate his potential greatness as king of England.

Richard was best known in his own day as a crusader, as he is in literature, owing to the once great popularity of Walter Scott's *The Talisman*. For European affairs the most important development of the Crusade was the Treaty of Messina, sealed in 1191. Philip II (Philip Augustus) of France granted territorial boons to Richard, but by this agreement Richard recognized Philip's suzerainty over the Angevin lands on the Continent. Shortly after the two kings arrived in the Holy Land, Philip, a reluctant crusader, fell conveniently ill and returned home, motivated largely by his hope of taking advantage of Richard's absence so as to meddle in the English lordships in France. Richard conducted himself brilliantly as soldier and general and entered into Scott's legend as a revered and worthy opponent and respected friend of Saladin.

After helping to settle the political problems of the Latin kingdom of Jerusalem Richard left for England in October 1192. However, nature and politics interrupted the journey; a victim of shipwreck, he then fell into the hands of the duke of Austria, who delivered him to Henry, the Holy Roman Emperor. Henry, with the active support of Philip of France, kept the Lionheart in captivity until April 1194, when he was released after paying a king's ransom.

Richard had made careful plans for the governance of England during his absence; his kingdom, of course, had been accustomed to an absent king ever since the Norman conquest, owing to the royal policy of ruling personally over their French lands as over their English ones. Richard had a smoothly functioning machinery of government, guided such by able and experienced administrators as William Longchamp, Hubert Walter, and Geoffrey Fitz Peter. Every source of revenue was efficiently exploited, though at Richard's death the treasury was empty—unremitting warfare being the most expensive activity in which a government engages.

Despite the continuing plots of Prince John the country remained loyal to its king and his ministers. In Richard's absence there was less initiation of new institutions than refinement in administration; the great inquest of 1194 checked up on the enforcement of royal judicial, feudal, and financial rights. The role of what would become known as the gentry expanded in the administration of justice; while the end was not foreseen by Richard's

ministers, the ultimate result of this enlargement of nonnobles' participation in government gave those of less than noble birth a sense that the government was theirs as well as the king's.

Until recent decades historians have tended to deprecate Richard, as they have Henry V. And yet the popular opinion of his own day is worth something. Wars were not viewed from a modern perspective, nor were their aims to be construed in terms of the goals of modern war. Richard was highly regarded by his contemporaries; perhaps they knew better than we what it meant to be a chivalric hero.

Richard II (1367–1399; r. 1377–99)

Born at Bordeaux on 6 January 1367, the second son of Edward the Black Prince, Prince of Wales (d. 1376). After Richard succeeded his grandfather Edward III in 1377, government in his minority was conducted jointly by his three uncles (especially the eldest, John of Gaunt), the earls, and leading

officials of his grandfather and father.

Richard displayed courage and leadership during the Peasant Rebellion of 1381 and in the next few years was encouraged by bosom companions and some officials to assert his will over patronage and policies. His prestige was enhanced by his childless marriage in 1382 to Anne of Bohemia (d. 1394), daughter of the late Emperor Charles IV, and by his first major expedition to Scotland (1385). But parliaments were concerned about royal finances, and there was growing disquiet, expressed by some magnates, over failures to check the French in war and over royal indulgence of court intrigues against Gaunt. In 1386 Richard, freed from Gaunt's shadow by the latter's expedition to Castile, alienated public opinion by the evasion of financial restraints and the failure to prevent the buildup of an invasion threat from a French armada in Flanders.

In the autumn parliament of 1386 the Commons, abetted by the king's uncle Thomas of Woodstock, duke of Gloucester, and Thomas Arundel, bishop of Ely, secured the dismissal from the chancellorship and the impeachment of a royal favorite, Michael de la Pole, earl of Suffolk. A commission was appointed with wide powers to monitor administration for a year. Determined to evade its control, Richard toured the realm in 1387, seeking support. He prompted the judges to define recent political initiatives as treasonable encroachments on royal prerogative; he aroused suspicions of a sellout to the French by seeking a conference with King Charles VI. In November Gloucester and the earls of Arundel and Warwick rose in arms and launched an Appeal of Treason against five of the king's supporters. Richard conceded that the appeal would be heard in parliament.

The "Appellants" were joined by Gaunt's son Henry Bolingbroke and by Thomas Mowbray, earl of Nottingham. Richard's close friend Robert de Vere, duke of Ireland, raised an army at his instigation, only to be defeated by the Appellants at Radcot Bridge (in Oxfordshire). In parliament in 1388 the appellees were found guilty; the two in custody, the Londoner Nicholas Brembre and Chief Justice Robert Tresilian, were executed. The Commons impeached other judges and four household officers; the latter (notably Sir Simon Burley, who had tutored the king) were executed.

The Appellants soon lost common purpose and support. The schemes of Gloucester and Arundel for an invasion of France failed, and in August, at Otterburn in Northumberland, the English suffered the worst defeat by the Scots since Bannockburn (1314). In May 1389 Richard declared himself of age and took control of government; in the early 1390s his moderate exercise of authority was underpinned by the returned Gaunt, principal negotiator in attempts to make a final peace with the French.

Richard boosted his authority by suspending the liberties of London (1391–

92) and leading an expedition to Ireland (1394–95); London citizens and Irish chieftains alike submitted to his mercy. Continuous truces with the French since 1389 culminated in 1396 in a truce for 28 years; Richard married Charles VI's daughter Isabella.

But the moves in the 1390s toward an Anglo-French rapprochement provoked widespread disquiet; the earl of Arundel was a leading critic, and from 1395 Gloucester emerged as one. In July 1397 Richard arrested Gloucester, Arundel, and Warwick; young nobles made an Appeal of Treason against them for their acts in 1386–88, and they were found guilty in the September parliament. It was announced then that Gloucester had died in custody; Arundel was executed, Warwick sentenced to life imprisonment. The condemnations of 1388 were reversed, and Richard rewarded his noble partisans, such as his half-brother John Holland, earl of Huntingdon, with exalted peerage titles and the forfeited estates of the traitors.

In 1397 Richard had a more solid base of noble support than in 1387 and could call on the many knights and esquires he had retained in recent years, as well as his bodyguard of Cheshire archers. But the general alarm caused by his policies was augmented by the exclusion from the general pardon of January 1398, of those who had ridden against him. Supporters of the Appellants in 1387–88 now had to seek the royal mercy and pay fines. Richard's daring restructuring of magnate power was threatened when, in this session, Bolingbroke accused Thomas Mowbray, his fellow Appellant of 1387–88 and 1397, of treason. In September Richard intervened when the parties were about to settle their quarrel by judicial duel and sentenced Mowbray to exile for life and Bolingbroke for ten years. On the death of Bolingbroke's father, Gaunt, in February 1399 Richard made his banishment perpetual and confiscated the Lancastrian inheritance.

In June, soon after Richard had gone on expedition to Ireland to salvage his 1395 settlement, Bolingbroke sailed with a small company from France and landed in Yorkshire. He was soon joined by Lancastrian retainers and northern lords, including the earls of Northumberland and Westmorland, disgruntled by Richard's interference in their sphere of influence. Bolingbroke advanced through the Midlands to seize Bristol; Richard's uncle and regent, Edmund duke of York, along with other supporters, was unable to rally effective opposition. From Bristol Bolingbroke moved up through the Welsh marches to capture Chester, the main bastion of Ricardian sentiment.

In Ireland Richard failed to appreciate the urgent need to rally support in person in north Wales and Cheshire; he landed too late in south Wales, moving north to Conway after his forces had disintegrated. The mediating earl of Northumberland betrayed Richard into Bolingbroke's hands; he was conveyed as a prisoner from Flint to the Tower of London. There he was apparently

forced to abdicate, and in September a version of this agreement was submitted to the parliament summoned in his name. His requests for a public hearing were refused; the estates accepted the charges made against him in parliament as ground for deposition and acknowledged Bolingbroke's claim to the throne.

The deposed Richard was moved to other prisons, eventually to Pontefract in Yorkshire, where he died (or was killed) after the rising in January 1400 by some of his former favorites—Huntingdon, Huntingdon's nephew Thomas Holland, earl of Kent, John Montague, earl of Salisbury, and Thomas, Lord Despenser. It was easily suppressed. In February Richard's body was brought from his prison for public view in London and buried obscurely in the Dominican friary at Langley, Hertfordshire. In 1416 Henry V moved it to the splendid tomb Richard had prepared for himself in Westminster Abbey.

Richard was 6 feet tall, well built, handsome, and lightheaded. Willful, devious, vindictive, sharp-tempered but not bloodthirsty, he was capable of showing affection and inspiring loyalty. He wanted his majesty to awe his subjects but could exert the common touch. He shared the conventional tastes of the higher nobility: hunting, the tournament (mainly as a spectator), courtly poetry. Not notably pious, in maturity he shared with Charles VI an enthusiasm for peace among Christians, an end to the Great Schism of the papacy, and a crusade against the Turks.

His real passion was to stabilize the personal authority of kingship, raising respect for its holy nature by trying to procure the canonization of Edward II and adopting the supposed heraldic arms of Edward the Confessor. His regal ideals and some of the ways in which he tried to project them can be seen in his portrait in Westminster Abbey, in the Wilton Diptych (National Gallery, London), and in his rebuilding of Westminster Hall. Denunciations of his rule are to be found in the poem *Richard the Redeless* and in John Gower's *Tripartite Chronicle*.

Richard III (1452–1485; r. 1483–85)

No medieval English king has generated more controversy and emotion, not least as a result of Shakespeare’s portrayal of him as the personification of evil. Shakespeare, moreover, clearly reflected images already well formed in early

Tudor times. Polydore Vergil, for instance, considered Richard a man who “thought of nothing but tyranny and cruelty”; Sir Thomas More derided him as an ambitious and ruthless monstrosity “who spared no man’s death whose life withstood his purpose.” Even the king’s contemporaries were frequently critical. Dominic Mancini, writing within a few months of his seizure of the throne in June 1483, remarked forcefully on his “ambition and lust for power,” and the well-informed Crow-land chronicler was scathing on the tyrannical northern-dominated regime that, he believed, Richard established in the south.

Yet the last Yorkist king has always had his admirers as well as critics. Thomas Langton, bishop of St. David’s, declared in August 1483 that “he contents the people wherever he goes better than ever did any prince,” and the York Civic Records reported “great heaviness” in the city when news arrived of his fate (“piteously slain and murdered”) on Bosworth Field in 1485. Modern historians, too, have brought in notably contrasting verdicts, ranging from Charles Ross’s conclusion that no one familiar with “the careers of King Louis XI of France, in Richard’s own time, or Henry VIII of England... would wish to cast any special slur on Richard, still less to select him as the exemplar of a tyrant” to Desmond Seward’s hostile biography of this “peculiarly grim young English precursor of Machiavelli’s Prince.”

The youngest son of Richard of York, Richard duke of Gloucester proved notably loyal to his brother Edward IV during the crisis of 1469–71 and in the 1470s showed himself as reliable and trustworthy as any of the king’s servants (and was rewarded accordingly). His rule of the north during these years was singularly successful; he built a powerful affinity there. Mancini admitted that he “acquired the favour of the people.” No one will ever know for certain whether he set his sights on the throne as soon as he heard of Edward IV’s sudden death on 9 April 1483, or if, at first, he merely intended to obtain control of his nephew Edward V so as to prevent the Wydevilles—the family of young Edward’s mother—from securing power. What is clear is that the series of preemptive strikes by which he outmaneuvered the queen’s family, seized Edward V, eliminated William, Lord Hastings, and rendered the Yorkist establishment impotent, enabled him to become king in his own right before the end of June 1483. The probable murder of his nephews in the Tower of London was the inevitable culmination of this ruthless pursuit of power.

Richard III may have been convinced that he was indeed serving the interest of the nation; such, through the ages, has been the politician’s justification for arbitrary action. The critical turning point in his fortunes probably was the rebellion of the duke of Buckingham (hitherto his closest and most spectacularly rewarded supporter) in October 1483. Edward IV’s men, who for the most part had accepted Richard’s protectorate and even acquiesced in his usurpation, now deserted him in droves in the south and west. Even more

ominously the exiled Henry Tudor, earl of Richmond, emerged at the same time as a potentially serious rival. The king responded vigorously to these threats; the rebellion was put down. In its aftermath, however, given the extent of southern defection and the numbers who now fled the country, he was forced more and more into dependence on his own affinity. This meant, in particular, men from the north. Their advancement in the royal household and appointments to office, not only in southern and western counties but in the Midlands, is amply documented.

Since he reigned for so short a time, it is difficult either to judge Richard's potential and qualities as a ruler or to draw meaningful conclusions about his government. The 15th-century antiquary John Rous, later one of his harshest critics, recorded that he ruled his subjects "full commendably, punishing offenders of his laws, especially extortioners and oppressors of his commons," and won the "love of all his subjects rich and poor." His only parliament—perhaps with his personal encouragement—passed measures clearly benefiting the people; and his establishment of the Council of the North in July 1484 was both popular and enduring.

Though he did make considerable efforts to widen the basis of his support, with the threat of Henry Tudor looming ever larger, his reliance on his own affinity, largely from the north, remained paramount. When he at last faced his rival on the battlefield of Bosworth on 22 August 1485, he was backed largely by the same men who had brought him to power; many, though by no means all, probably fought for him with vigor. However, his own death (in the midst of the action and, according to the Crowland continuator, striving to the end "like a spirited and most courageous prince") made the accession of Henry VII inevitable.

Richard the Redeless and Mum and the Sothsegger

Two related fragments of alliterative verse (1399–1400; 1403–06) concerning King Richard II of England and his successor, Henry IV. The two fragments were once considered to be parts of one longer poem (sometimes referred to together as *Mum and the Sothsegger*), but recent scholarship has shown that they are probably separate works, perhaps by the same poet. Both are written in alliterative long lines, and only one manuscript of each survives (*Richard* CUL LI.4.14; *Mum*, BL Add. 41666). *Richard* is 857 lines long, broken off at the end; *Mum* is 1,751 lines long, with material missing before the point where the manuscript begins. The author or authors of the fragments are unknown, but the original dialect of both fragments was probably Southwest Midland.

Richard the Redeless can be dated between August 1399, when Richard was taken prisoner, and February 1400, when he died. The fragment is divided into a prologue and four sections called passus. In the prologue the poet hears news of Henry's invasion of England, and he uses the occasion to write a poem of advice to King Richard. Passus 1 criticizes Richard's favorites; passus 2 and 3 denounce his retainers, the White Harts, who attacked the duke of Gloucester, the earl of Warwick, and the earl of Arundel and his son, allegorized as the Swan, the Bear, and the Horse and the Colt. Passus 4 criticizes Richard's

extravagances and the corruption of the parliament of 1397.

Mum and the Sothsegger can be dated after the execution of certain friars for treason in 1402; other events in the fragment suggest that it was completed by 1406. At the beginning of the fragment the poet is discussing King Henry's household and asserts that a truthteller ("sothsegger") is needed in the court. Unfortunately no one dares to fill this post, and instead all follow the example of Mum, who profits by remaining silent. Troubled, the poet searches for answers in the university, the friary, the abbey, the monastery, and the cathedral. He finds that Mum is master everywhere. Wearied, the poet falls asleep and in a dream vision he encounters a gardener keeping bees who tells him that all evil has its source in Mum. The gardener advises the poet to follow the truthteller, who resides in the heart of man, and to write his poem and send it to the king. Upon waking the poet does so.

Both fragments reflect the poet's (or poets') awareness of political theories similar to those of William of Ockham and Marsilius of Padua, who emphasized the rights of the governed as a limit on royal power. Verbal similarities between *Mum* and *Piers Plowman* suggest that the poet was familiar with Langland's work. *Mandevilles Travels* and the *De proprietatibus rerum* of Bartholomaeus Anglicus are direct sources for passages in *Mum*.

Riddles, Old English

The composition of riddles, both popular and literary, is a virtually universal cultural phenomenon. Whereas in the Western “literary” tradition of discourse, riddles have today lost any significant status, they appear to have formed a serious genre in the early Middle Ages, particularly in Anglo-Saxon England. The Exeter Book collection of nearly 100 OE riddles (including one Latin riddle) stands witness to this, as do the several extensive collections of Latin riddles, or *aenigmata*, written by Anglo-Saxon authors chiefly in the 7th and 8th centuries. The vernacular riddles show especially close affinities with that ubiquitous metaphoric form of Germanic literature the kenning, a feature that lies at the core of much Anglo-Saxon poetry as well.

Of primary importance for the development of the genre of Latin literary *aenigmata* is the collection of Symphosius, dated to the 4th or 5th century. His 100 *Aenigmata* consist of three hexameter lines each and form the earliest complete collection extant; they also seem to have had some influence on subsequent Anglo-Latin riddles of the Anglo-Saxon period. This influence is most clearly evident in the 100 riddles written by Aldhelm, abbot of Malmesbury and first archbishop of Sherborne (640?-709/10). Aldhelm explicitly acknowledges his debt to Symphosius in his *Letter to Acircius*, in which the *aenigmata* are intended to serve as illustrations of the metrical theory expounded in other parts of this letter, *Demetris (On Meter)* and *De pedum regulis (On the Rules of Poetic Feet)*. But whereas Symphosius’s riddles lack religious orientation, Aldhelm imbues many of his with a Christian character.

Indebted to Aldhelms *aenigmata* in subject matter and theme are the 40 riddles (nearly one-third of which deal with theological subjects) written by his younger contemporary Tatwine, archbishop of Canterbury (d. 734). This “incomplete” collection was supplemented by the Anglo-Latin writer Eusebius, also believed to be Hwætberht, friend of Bede and abbot of Wearmouth-Jarrow (ca. 680—ca. 744/47), who sought to expand the collection to 100 riddles by adding 60 of his own. Also among the known Anglo-Latin riddlers is Boniface, missionary to Germany, who wrote 20 *aenigmata* on the Christian virtues and

vices.

The single most important and certainly finest collection of riddles of the period from a literary point of view is that found in the OE Exeter Book. While the manuscript can be dated to the late 10th century, scholars have reached no consensus on the date of composition of the riddles themselves. Attempts to date them by linguistic means have been largely unsatisfactory, and nothing is known of their authorship. The theory current in the late 19th century that Cynewulf penned them all is no longer accepted. The relationship of the Latin riddling tradition to the Exeter Book riddles has long been a matter of debate. Beyond the close translations of two of Aldhelm's enigmas (nos. 33 and 40) only three of the OE riddles show an undeniable debt in terms of subject matter, content, and form (nos. 47, 85, and 86 correspond to riddles by Symphosius). In other cases any resemblance between the Latin and the OE may be due as much to their common subjects, themes, and motifs as to any direct derivation.

In comparison with the Latin collections the Exeter Book riddles are a heterogeneous compilation, exhibiting greater diversity in their subject matter, length, and form, a fact that many feel supports the notion that the collection was compiled from disparate sources rather than composed by one author. Unlike their Latin counterparts no solutions appear in the manuscript (with the exception of five cryptographic riddles, whose solutions are coded and concealed in runes), and as a consequence much of OE riddle scholarship has devoted itself to debating their solutions.

In addition to the Exeter Book collection the 9th- to 10th-century poetic dialogue *Solomon and Saturn II* contains riddling questions, many of which resemble the Exeter Book riddles in form and style. That such riddling dialogues were popular among the Anglo-Saxons is suggested by the survival of a number of them, in both Anglo-Latin and the vernacular. To the latter belong the prose *Solomon and Saturn* and *Adrian and Ritheus*, to the former Alcuin's *Disputatio Pippinicum Albino*, the Pseudo-Bede riddles of the so-called *Flores* collection, and the *Jocaseria* in CUL Gg.v.35. A lone prose riddle in OE survives in the Vitellius Psalter (BL Cotton Vitellius E.xviii).

But the apparent taste among the Anglo-Saxons for lyric riddling is attested elsewhere in the corpus of vernacular literature as well. Other works notable for their riddlelike qualities include the OE *Rune Poem* and *The Ruin*, and it has often been remarked that such gnomic verses as *Maxims I* and *II* come close to being a frame for riddles. Furthermore, in *Christ I* and *II*, while dealing with two baffling mysteries in his subject matter (the Trinity in *Christ* 1216–24; the absence of angels dressed in white garments at Christ's birth in *Christ II* 440–41), the poets use language that is strongly and appropriately reminiscent of OE riddling diction. The opening of the Cross's speech in *The Dream of the*

Rood also shows affinities with the riddles, and the poem's dominant rhetorical mode—prosopopoeia (speech attributed to an object)—is shared by about half of the OE riddles in the Exeter Book. In fact Aldhelm draws an explicit connection between riddling and prosopopoeia and the appropriateness of both for composing poetry on scriptural themes. This connection has in turn led to the belief that Aldhelms *Letter to Acircius*—which contains both his 100 *aenigmata* and the discussion of prosopopoeia—may have had an influence on the composition of *The Dream of the Rood*.

Roads and the Road System

Ancient tracks formed the basis of a local network of roads in the early Middle Ages; continued use was also made of major Roman roads. However, a proper system of roads developed only with the centralization of government in the two centuries after the Conquest, as traffic became focused on London. A fully established system, with main roads radiating out from London, was established by the mid-14th century and is shown on the Gough Map (Bodl. Gough Gen. Top. 16; ca. 1360); there was no fundamental change in this network before 1600.

From Anglo-Saxon times roads of special importance were under the protection of the king. The definition of the "king's highway" was extended to include all routes between markets and to ports; additionally the crown assumed the right to regulate the maintenance of private as well as public highways—and highways also included bridges and causeways. In the country main roads were wide enough for two wagons. Roads were not surfaced and were maintained largely by the passage of feet; flooding was the main hazard, and maintenance usually meant clearing drainage ditches. The responsibility for this, with that for building and repairing bridges and causeways, was deemed to lie with the owner of the land through which the highway ran.

Maintenance was a complex and contentious issue, especially with regard to building bridges, which were expensive. Grants of pontage were made by the crown to help defray these expenses. Many new bridges and causeways were in fact built, a testimony to the growth in traffic and the increased significance of the road system. In urban areas town councils assumed responsibility for the maintenance of roads, and the main urban streets were often paved. The council was assisted by grants of pontage and pavage; properties were also donated by townspeople so their rents would form a fund for bridge maintenance. Pious donations were responsible for the upkeep of many routes, particularly those leading from the town to important local markets.

Traffic on the roads was heavy. By preference people traveled by land, not by water. The Norman and Angevin kings were constantly on the move, summer and winter; with them went a vast baggage train. Subsequently the centralization of government in London and the extension of royal power

increased the travel of royal servants and justices. War brought the movement of troops and arms, and that of royal purveyors, collecting forced levies of food. War against the Scots entailed moving the government machine to York with wagonloads of legal and administrative records. Ordinary people took to the road on pilgrimage, to seek justice, to buy and sell. Traders carried valuable commodities, such as cloth, by pack horse. Although bulky goods were transported by water where feasible, many went by cart. This was the commonest means of transport to market; one of the duties of a peasant was to cart goods for his lord.

Robertsbridge Codex

This is the name usually given to the oldest piece of notated keyboard music in existence, though it is in fact not a codex but a music fragment used in the binding of an old register of Robertsbridge Abbey in East Sussex (BL Add. 28550, fols. 43 and 44). It contains the fragmentary conclusion of an *estampie* or similar dance form, two complete *estampies*, two arrangements of motets from the *Roman de Fauvel* (1316), and an incomplete arrangement of an English sacred cantilena. The date, formerly believed to be ca. 1325, is more plausibly put at ca. 1360.

The fragment is certainly English in origin (the repeat structure of the *estampies* is clarified by the word “return”), but most of the music in it is not English. The *estampies*, not so called in the manuscript, are related in style to the Italian 14th-century *istampita*; the two motets are French, and only the last

piece, “Flos vernalis,” is of undoubted English origin. The notation throughout is italianate in character, and its manifest archaisms are what prompted the earlier of the dates mentioned above. But no native Italian manuscript of Ars Nova polyphony can be shown to predate 1350, and as the notation is used to clarify the originally ambiguous semibreve groupings of the French works, a date in the second half of the 14th century seems more likely. This is confirmed by the fact that the overall compass required (*c-e*) is fully chromatic from fupward, something again that is otherwise unknown prior to the later part of the century.

The music is conceived idiomatically for a keyboard instrument, being based on an elaborately ornamented top part accompanied by left-hand chords interspersed with melodic progressions. In the *estampies* there are also passages ofhocket between the hands.

Its original purpose is not known for certain, but the manuscript may have been associated with the court of the captive King John II of France, who was a prisoner of Edward III from 1357 to 1360. In 1360 Edward gave John an *echiquier*, a generic name for a stringed keyboard instrument; the Robertsbridge fragment perhaps offers us a glimpse of the repertoire for which it was destined, or of one of the kings court organists.

Rolle, Richard, of Hampole (d. 1349)

Hermit and mystical writer. Little is known of Rolles life, although some facts can be gleaned from the readings of the liturgical office prepared for the possibility of his canonization, and some conjectures can be made based on his writings. According to the office he came from Thornton, near Pickering, in the diocese of York, and was sent to Oxford with the support of Thomas Neville, archdeacon of Durham. He left the university at nineteen, however, and returned home, where he retired to the forest to live as a hermit. Shortly thereafter he was taken in by John de Dalton, a local squire, and given an eremitic lodging within Daltons household. This proved inadequate, and he removed to some other place—apparently against Daltons will. Rolle seems also at this time to have been tempted to take a lover (possibly a real person was involved, or perhaps only a diabolical apparition) but resisted the temptation by invoking the precious blood of Jesus.

Rolles writings contain a number of passages referring to criticism, particularly for irregularity in changing his place of hermitage. However, no record survives indicating either his formal enclosure as a hermit or formal proceedings against him. Records of his education and possible ordination are similarly lacking. We do not know when he took up residence at Hampole, Yorkshire, nor in what relation he stood to the Cistercian convent there, in whose cemetery (later church) he was buried.

Although we have only the vaguest knowledge of his worldly life, Rolle has left us some clear indications of the progress of his spiritual development. In the *Incendium amoris* he describes the reception of the gifts of “heat, sweetness, and song” that are characteristic of his spirituality. The first gift he received was that of actual physical heat warming his breast. At first, he says, he thought that what he felt was some form of temptation; but he came to recognize it as corresponding to a second gift, of sweetness in prayers. Finally, while at prayer in chapel one day, he heard “as it were a ringing of singers of psalms, or rather, of songs.” Time and again Rolle writes of this threefold gift of heat, sweetness, and song (*calor, dulcor, canor*).

Works

Rolle's works can be divided into three classes: scriptural commentaries, original mystical treatises, and lyrical and poetic compositions.

The most important scriptural commentaries are the Latin and English commentaries on the Psalter; Rolle also composed Latin commentaries on the first few verses of the Song of Songs, the first six chapters of the book of Revelation, and the Lamentations of Jeremiah. Five other treatises (including, particularly, the *Judica me Deus*) also derive their name and form from their commentary on particular scriptural verses. Another four commentaries are based on biblical texts used in the liturgy or on ecclesiastical texts. All of these lesser commentaries are in Latin. Although the commentaries are based for the most part on earlier works in the same genre (the Psalter commentaries, for example, derive largely from the "literal" explication in Peter Lombards *Commentarium*), they also develop a number of themes characteristic of Rolles interests and teaching, such as devotion to the name of Jesus, and the experience of heat, sweetness, and song. These works probably derive from the period of Rolle's spiritual maturity.

The most important works in Rolle's canon are his three great Latin treatises and his four Latin and English epistolary tracts. The first treatise, *De amore Dei contra amatores mundi*, compares the eternal joys of the lover of God with the passing pleasures of this world. In each of its seven chapters Rolle describes a different aspect of worldly love and shows how the lovers of this world, though they seem happier, will be betrayed in the end into eternal sorrow. The second major treatise, the *Incendium amoris*, deals more specifically than any of Rolles other writings with his experience of spiritual heat, sweetness, and song and is more autobiographical as well. Although focused on these themes, the *Incendium* also treats discursively a number of theological topics—yet it always returns to Rolle's own spiritual experience and to the idea that God's contemplative gifts to those who love him alone far outweigh the worldly satisfaction of merely intellectual pursuits. The *Incendium* was translated into ME, along with the *Emendatio vitae*, by the Carmelite Richard Misyn. The third of Rolles Latin treatises, the *Melos amoris*, is in some ways the most difficult of his works to describe: highly alliterative in style and allusive in form, it appears to represent and attempt to reproduce in writing the transformation of contemplative prayer into heavenly song that he describes as the culmination of his spiritual experience. The probable aim of the *Melos* is not so much persuasion as mystagogy—the re-creation in the reader's mind of the author's spiritual experience, which by grace the reader may also attain. The style of the *Melos* has led many to regard it as an immature work; but

Arnould, its editor, has pointed out that it more probably manifests the latest stage of his spirituality.

Rolle's most important epistolary tract, and by far his most popular work, is the *Emendatio vitae*. This letter and the parallel English *Form of Living* are, addressed in some manuscripts to two of Rolle's disciples—William (Stopes?) in the former case, Margaret Kirkby in the latter—and are probably the last things he wrote. Of particular importance in both is the treatment of the "three stages of love": insuperable, inseparable, and singular. The treatises also exhort Rolle's audience to an immediate rejection of the world's blandishments and conversion to God in the eremitic life. The *Form of Living* was translated into Latin, and the *Emendatio vitae* into English by Richard Misyn and no fewer than six other, independent translators. The themes of the stages of the love of God and the necessity of total conversion to him also occur in Rolle's two other English epistolary tracts, the *Commandment* and the *Ego dormio*. Rolle included a number of lyrics in the *Egodormio* and the *Form of Living*; a further collection of eight to ten lyrics is attributed to him in two manuscripts. He also wrote the *Canticum amoris*, a Latin hymn of praise to the Virgin Mary.

Rolle's reputation, like that of many influential medieval writers, was so great that many works not written by him came to be associated with his name. Hope Emily Allen's *Writings Ascribed to Richard Rolle* has proven decisive in establishing his canon, although her conclusions regarding chronology and biographical references must still be viewed with some skepticism.

Teaching and Influence

The most distinctive feature of Richard Rolle's spirituality is the experience of the graces of heat, sweetness, and song that follows upon the total conversion from the world to God. He is not always consistent in the hierarchical and chronological ordering of these graces, however; nor despite important similarities, is their description entirely consistent with that of the three degrees of love—insuperable, inseparable, and singular—found in the later epistles. These three degrees apparently derive from Richard of St. Victor's *Quattuor gradus violentaecharitatis*, minus the fourth (insatiable) degree.

For Rolle the rejection of the false pleasures of this world and a complete conversion to God are the *sine qua non* of the contemplative life, which he believes is most fully lived in the eremitic life. He considered the religious vocation to be comparatively worldly and grouped members of religious orders together with other lovers of this world.

The experience of heavenly song, with that of sensible heat and sweetness in prayer, is particularly characteristic of Rolle's spirituality and that of his followers. Certain sections of *The Cloud of Unknowing* and of Walter Hilton's *Scale of Perfection* and *Of Angels Song* caution against using words like "heat," "sweetness," or "song" too literally in describing spiritual experience, a fact that suggests that this form of affective mysticism was popular in the later 14th century. These negative comments, together with more positive presentations of this kind of affective mysticism by Thomas Basset, Richard Methley, and John Norton, can be taken as evidence for an informal "school" of Richard Rolle.

Rolle achieved his greatest degree of popular influence with the spread of the devotion (particularly in lyric poetry) to the Passion of Christ and to the Holy Name of Jesus. According to Knowlton the cult of the Holy Name does not seem to have been prominent in England, despite imitations of the "Dulcis Jesu Memoria" and devotional pieces in the tradition of Anselm of Canterbury's *Meditations*, until after the time of Rolle. A number of late-14th- and 15th-century ME lyrics reflect not merely these devotional themes but also the phrasing of Rolle's devotional poems and descriptions of his own spiritual experiences. Rolle was not merely the first of the 14th-century English mystics; he also had the greatest influence on popular piety before the Reformation.

Rolls of Parliament

From the very beginning some kind of memorandum must have been kept of business transacted at meetings of parliament. However, the earliest surviving records of such business come only from the early years of Edward I. These are brief and clearly not intended to form any kind of permanent record. Matters of major import were enrolled elsewhere among the records of chancery, exchequer, and the common-law courts.

A decision was apparently taken in 1290 to keep a much fuller permanent record of business done at meetings of parliament. Initially this took the form not of a single comprehensive roll of parliament but of a number of separate rolls recording the different types of business transacted. The first known clerk

of the parliament, responsible for drawing up the rolls between 1290 and 1314, was Gilbert of Rothbury, who was not a chancery clerk. His successor was; it soon became established practice to appoint senior chancery clerks to this post, as they combined occasional parliamentary responsibilities with their continuing duties in chancery.

Prior to 1327 it appears to have been the practice to make at least two copies of the main rolls, one of which passed into the custody of the exchequer, the other remaining in the custody of the clerk of parliament or passing to the kings wardrobe. Thereafter only a single copy appears to have been made, and it was retained among the records of chancery. It was also early in Edward III's reign that we first find a single roll of parliament, recording most of the important business done at parliamentary sessions. However, the legislation enacted there continued to be recorded separately on the statute roll until 1483.

The rolls of parliament are not a full record of everything said and done at parliament but only a formal summary of some of the important business done by parliament as a whole. The rolls provide no record of what was said in the two houses when they were meeting separately; they do record the common petitions and the grants of taxation, the outcome of the Commons sessions.

Romances, Middle English

A loose designation for a group of over 110 narrative works composed between 1225 and 1550. Depending on whether different versions or fragments are counted, and excluding tales by Chaucer and Gower, there are about 90 verse romances and about twenty in prose.

Unlike modern romances, which are primarily love stories, ME romances may best be characterized as a type of adventure story, often with no love interest whatsoever. Some romances focus on the activities of a militant Christian champion (such as *Bevis of Hampton*, *Guy of Warwick*, or *Richard Coer de Lyori*), while others are variations of the Constance story with attention focused on a long-suffering female protagonist (such as the heroines in *Emare*, *Octavian*, *Sir Eglamourof Artois*, *Sir Torrent of Portyngale*, and *Sir Triamour*).

If these narratives are unlike modern romances, they are also unlike their medieval counterparts in France and Germany. Most romances in England were written after the great flowering of romance during the 12th century, best exemplified by the French writer Chretien de Troyes and the German Wolfram von Eschenbach. Only eight of the extant ME romances are thought to date from before 1300: *King Horn* (ca. 1225), *Floris and Blancheflour* (ca. 1250), *Arthour and Merlin* (ca. 1250–1300), *Havelok* (ca. 1280–1300), and *Sir Tristrem*, *Amis and Amiloun*, *Guy of Warwick*, and *Bevis of Hampton* (all near the end of the 13th century). Four of these early works deal with native English heroes or typically English concerns, and only two of them with Arthurian legend. The remaining ME romances were written in the 14th and 15th centuries, with the prose romances all composed after 1400 (mostly ca. 1450 or later). Generally speaking, then, the stories of heroes from the courts of Arthur or Charlemagne and those from classical legend did not concern ME writers until the 14th century. Thus the initial impetus for ME romance did not spring primarily from the chivalric or courtly-love traditions associated with continental Arthurian romance. Out of the whole corpus of ME romances only twenty to 25 are based on Arthurian knights or the Matter of Britain.

When compared with French courtly romances the ME works have often been considered debased, incompetent, and unsophisticated. Frequently the adjective “minstrel” or “kitchen” has been applied to ME romances, so as to distinguish them from their French aristocratic counterparts. Even Chaucer, in *Sir Thopas*, parodies some of the worst features of the genre by referring to its “drasty speche” and “rym dogerel.” Most, however, are not as trivial or superficial as Chaucer’s criticism might indicate.

The comparison with French romance is inevitable, not only because the French works are anterior but also because many of the ME romances have Anglo-Norman or French originals. Yet it is wrong to assume that ME writers intended to write French romances in English. Clearly they retained many

motifs and elements found in courtly French romance: aristocratic or courtly settings, knights with idealized codes of chivalry, and the quest pattern as a structuring principle. Nonetheless, the English product is often nothing like the French original. The bookishness, rhetorical ornamentation, elaborate descriptions of courtly life, and internal debates and monologues that characterize French and German romance generally are not features of the English romance. The commonest meter in ME romance is the tail-rhyme stanza, not the octosyllabic couplet of the French romances. The social, economic, political, and literary conditions in England were dramatically different from those that gave rise to the romance in France. These differences cannot be overestimated. For ME romance the most striking characteristics are its frequent bourgeois and baronial orientations and its strongly moral, didactic flavor.

ME romance constitutes an especially problematic genre, even among medieval genres, which are notoriously difficult to define satisfactorily in terms familiar to modern readers. Texts within the generic boundaries of ME romance range from histories with clear moralizing tendencies to adventure stories with connections to folktales and ballads. Often these works seem to have little in common to distinguish them as “romances,” and only twenty verse romances actually use that label in describing themselves. Instead of using the term “ro mance” most refer to themselves as “boke,” “geste,” “story,” “tale,” or “vita.” Even the word “romance,” which originally meant only that the work was written in French rather than Latin, did not appear in titles of collections of these verse works until the early 1800s, with the editions of Joseph Ritson and George Ellis. Since then these narratives have retained this not altogether satisfactory generic label. The works themselves span several centuries, from the early-13th-century *King Horn* to the mid-16th-century *Carle off Carlile*, they treat heroes as disparate as Charlemagne, Joseph of Arimathea, and Havelok the Dane; they vary in length from 370 lines to over 700 pages in modern editions; and the verse romances employ different metrical forms, from the four-stress rhymed couplet and tail-rhyme stanza to the alliterative long line. Nonetheless, as diverse and dissimilar as they are, these narratives cluster along a spectrum that can be distinguished from other recognizable literary forms, such as saints’ lives, sermons, epics, or ballads.

Types of Romance

Since the romances are an unwieldy group as a whole, many scholars have tried to find productive ways of classifying smaller sets of texts within the

genre. One of the earliest attempts was that of George Ellis in 1805. Following the lead of the 12th-century writer Jean Bodel, who divided medieval French romances into the Matter of France (heroes indigenous to France, such as Roland and Charlemagne), the Matter of Britain (Arthurian knights), and the Matter of Rome (heroes taken from classical legend and history), Ellis added the Matter of England to account for stories about native English heroes not found in French romances. Although this classification has the advantage of being based on a medieval perception of the genre, it tends to bring together texts that vary widely in style, form, audience, and purpose and whose only similarity may lie in a broadly defined common subject matter. Furthermore these four “matters” include only some 65 of the 110-plus ME romances.

Despite its problematic nature classification by subject matter has remained popular into the 20th century. Anna Hunt Billings’s *Guide to Middle English Metrical Romance* (1901) deals specifically with 37 verse romances under three general headings much like those of Ellis: English and Germanic Legends, Charlemagne Legends, and Arthurian Legends. The *Manual of Writings in Middle English* (1967) classifies the romances as English Legends, Arthurian Legends, and Charlemagne Legends; Legends of Godfrey of Bouillon, Alexander, Troy, and Thebes; Eustace-Constance Legends; Breton Lays; and Miscellaneous Romances. A different extension of the matter categories appears in Laura Hibbard Loomis’s *Mediaeval Romance in England* (1924), a study of 39 texts not covered by Bodel’s *matières*, grouped under three broad headings: romances of trial and faith, romances of legendary English heroes, and romances of love and adventure. Loomis’s divisions, while useful in identifying common thematic concerns among texts, are more important in their suggestion of the generic range of ME romance, from exemplary tale to popular ballad.

This view of ME romances focuses on the texts’ general purposes, broadly conceived, from edification and education to entertainment. The largest group of romances, between a quarter and a half of the extant texts, are stories that educate their audience or inform them about historical or semi-historical events and figures, such as the sieges of Troy and Thebes, Alexander, Arthur, Charlemagne, and Godfrey of Bouillon (or Boulogne). Most offer history as a moral exemplum (e.g., *Alexander B*, the stanzaic *Morte Arthur*, and Lydgate’s *Siege of Thebes* and *Troy Book*) or celebrate the militant Christian spirit that infused many of the French *chansons de geste*. All the works classified as the Matter of France fall into this grouping: *Sir Ferumbras* as well as all the Otuel and Roland stories. The remaining pseudo-histories also translate or adapt historical or legendary material for an audience that would otherwise not have access to it.

ME writers often modified their sources with the specific purpose of

showing patterns of behavior for the reader's edification. Lydgate's *Siege of Thebes* and *Troy Book* are good examples of this moral intention. Even the stanzaic *Morte Arthur*, which might be expected to represent chivalric romance at its pinnacle, emphasizes instead the moral implications of the tragic outcome of Lancelot's involvement with Guinevere. It ends not with the tragic death of Arthur but with the subsequent religious lives of Guinevere and Lancelot: she as a nun until her death and burial at Glastonbury Abbey and Lancelot as a hermit-priest until a revelation through visions of his salvation and his own death. Such an ending softens the tragic fall of the Round Table by shifting the work from a chivalric to a moral context, in which actions are judged not by a secular code but by a religious one in which repentance and salvation are possible.

Other works, romantic histories, embellish primarily historical accounts with more affective motifs and conventions from chivalric, courtly, and epic traditions, including descriptions of battles, the *enfances* (childhoods) of the heroes, the joys of feasting and music, and heroic laments for a hero's death. The best example of this type of narrative is the Laud *Troy Book*, based on Guido delle Colonne's *Historia destructionis Troiae*; it omits or expands elements from its source in order to romanticize history and create a romance about Hector. Although the ME author called his work a romance—the only account of Troy or Thebes to do so—the work remains a history overlaid with techniques and conventions of romance. The alliterative *Morte Arthure* also reflects this interplay of history, epic, and romance, with its heroic tone and structure and moral complexity. The author, however, successfully reshapes chronicle tradition to reflect 14th-century views on chivalry, kingship, and tragedy in his poem. Even many of the courtly or chivalric romances discussed below set their action against a background considered to be historical, as in *Sir Gawain and the Green Knight* or *The Earl of Toulouse*. Most of the works associated with the traditional “matters” are of this historical or semihistorical type.

The next-largest group of romances comprises didactic, pious tales with similarities to hagiography. Hanspeter Schelp discusses about twenty ME works as “Exemplary Romance,” Dieter Mehl labels nine as “Homiletic Romances,” and Diana Childress identifies thirteen as “Secular Legend.” Regardless of the nomenclature or number of works classified it is clear that certain ME romances revolve around a set of overtly moral and religious messages that determine the structure and presentation of their stories. Although these works may contain some motifs from secular romance, they consistently point to the religious significance of their stories: in conversions (*Amor-yus and Cleopes* and *King of Tars*), in spiritual regeneration and repentance (*Roberd of Cisyle*, *Sir Gowther*, and *Bone Florence of Rome*), or in

heavenly aid to the innocent (*Chevalere Assigne* and *Bone Florence of Rome*). Seven works (variants of the Constance and Griselda stories) emphasize the innocence and self-sacrificing nature of a female character, as well as her humility, piety, and patience. These include *Octavian*, *Sir Eglamour of Artois*, *Sir Torrent of Portyngale*, *Sir Triamour*, *Emare* (sometimes called a Breton lay), *Le Bone Florence of Rome*, and *Chevalere Assigne*. They usually involve a mother's unmerited suffering and exile, her son's childhood, the reunification of the family, and the punishment or repentance of wrongdoers. Other works tied closely to these include *Sir Isumbras*, *Roberd of Cisyle*, and *King of Tars*.

Despite their basic similarity of subject matter these pious tales employ a variety of plot structures, often emphasizing different themes. Some, such as *Sir Isumbras*, *Sir Amadace*, and *Amis and Amiloun*, follow a test-reward pattern; others, like *Athelston*, follow a sin-repentance structure. *Sir Isumbras* demonstrates the Job-like patience of its protagonist, who loses and regains his wealth, wife, and children. *Amis and Amiloun* and *Athelston* focus on the testing of sworn brotherhood and male friendships. The exemplary, didactic nature of these works is also suggested by their manuscript placement. In the Auchinleck Manuscript (National Library of Scotland Advocates' 19.2.1), one of the most important collections of ME romance, *King of Tars* is preceded by a saint's legend and followed by eight religious or homiletic pieces, *Amis and Amiloun*, five religious pieces, and then *Sir Degare*. The Vernon Manuscript (Bodl. Eng. poet. a. 1), often considered a purely religious manuscript, contains *King of Tars*, *Joseph of Arimathie*, and *Roberd of Cisyle*. Two other homiletic or didactic collections—the Thornton Manuscript (Lincoln Cathedral 91) and CUL Ff.2.38—contain thirteen versions of these ME pious romances.

The moral implications of a story are such a dominant force in ME romance that four works attempt to transform chivalric romances into stories with serious religious meaning. *Bevis of Hampton* is the most successful, with its hero fighting heathens, falling in love with and converting the Saracen Josian, reestablishing justice, and finally retiring to Mombrant, where he dies a holy death with his converted wife. *Guy of Warwick* is less successful in presenting a lover-knight and religious exemplar because the change in Guy is handled mechanically and has little effect on his behavior. Both *Guy of Warwick* and the *Romauns of Partenay* deal with the religious choices of chivalric knights whose virtues shift from martial deeds to piety and repentance. A fourth work, *Richard Coerde Lyon*, is markedly different in tone and glorifies a brutally militant Christian spirit.

At least some of the ME romances fulfill the expected criteria of continental romance: a chivalric ethic and courtly knights, quests, an interest in questions of honor and love, and some element of mystery or supernatural or magic. The best example is *Sir Gawain and the Green Knight*, which has also been viewed

as an antiromance because of the ways its author undercuts the elements of the genre. For example, he twists the typical mysterious challenger into a Green Knight, who combines elements of the Wild Man and the Green Man traditions; he also converts the beheading, the typical convention for breaking an enchantment, into a challenge at the story's beginning. Other English romances—*Generides*, *Ipo-madon A*, *Partonope of Blois*, *Sir Degrevant*, *Squire of Low Degree*, and *William of Paleme*—are more conventional, especially in their interest in love. *Ipomadon A* fairly closely follows its source, Hue de Rotelande's 12th-century *Ipomedon*, which may be seen as a psychological study of the woman as tormented lover. In subordinating action to contemplation and introspection the author delights in describing the changes that love creates in the characters' perception of their world.

William of Paleme is the only other ME romance (excluding Chaucer's *Troilus*) at all like *Ipomadon A* in its exploration of the painful and disruptive energy unleashed by love and passion. Instead of marrying a Greek prince Melior runs away with her lover, William. Disguised at first in bearskins, they encounter many hardships in their exile, which never breaks their devotion and idyllic love. This poem successfully combines a picture of its protagonist as courtly lover, valiant knight, and ideal ruler—a portrait more complete than any other in ME romance. *Sir Degrevant* pushes the limits of romance into realism by employing romance conventions (the love of an enemy's daughter, the secret meetings aided by faithful squire and maid, the treacherous steward, the three-day joust) but placing them firmly in a realistic feudal situation of a knight summoned home from the Crusades to defend his land from a neighboring earl.

At the far end of the scale of works considered romance are those resembling minstrel tales, marked by a style that is both popular and simple. They often contain jingling or easy rhymes to aid oral delivery, almost-meaningless tags to fill out metrical lines, and a straightforward, unembellished method of narration. When a French source exists, it is sharply diminished. Some of these—*Gamelyn*, *Havelok*, *King Horn*—carry a political and moral message. The works usually considered Breton lays fall into this group as well: these include *Earl of Toulous*, *Emare*, *Lai le Freine*, *Sir Degare*, *Sir Orfeo*, *Sir Gowther*, and *Sir Launfal*. Several chivalric tales move even farther from a learned style toward a balladlike presentation, using such techniques as parallelism, repetition, brevity, and narrative speed and pacing. *Eger and Grime*, *Carle off Carlile*, and *Grene Knight* all demonstrate their closeness to popular ballad in their diction, verbal patterning, and structural parallels.

Dissemination

The range and diversity of tales that fall within the boundaries of ME romance suggest the wide appeal and popularity of the genre. They were not confined to an aristocratic or courtier class, nor do they belong exclusively to the bourgeoisie or common people. The popular appeal of certain romances is attested by the number of manuscripts in which these works appear. There are five or more manuscripts of *Guy of Warwick*, *Sir Degare*, *Partonope of Blois*, *Libeaus Desconus*, *Siege of Jerusalem*, and *Arthour and Merlin*; ten or more manuscripts, fragments, or prints of *Titus and Vespasian*, *Bevis of Hampton*, *Sir Isumbras*, *Roberdof Cisyle*, *Sir Eglamour of Artois*, *Richard Coerde Lyon*, and *Gamelyn*. The striking popularity of these romances is particularly noteworthy given the fact that about two-thirds of the romances are known from a single manuscript or solely from printed editions. Our knowledge of the historically based romances is based on especially slender evidence, since most of the romances in the great cycles concerning Thebes, Troy, Alexander, Charlemagne, and Roland and Otuel exist in only one surviving version. Many of the best-known or most highly prized ME romances likewise occur in only one extant version: *Sir Gawain and the Green Knight*, the alliterative *Morte Arthure*, the stanzaic *Morte Arthur*, *Havelok*, *Athelston*, *William of Paleme*, *Chevalere Assigne*, and *Sir Percevalof Galles*. Given the accidents of transmission and the survival rate of medieval manuscripts, our view of the genre is necessarily partial and must often remain speculative. There is no way of knowing how much was lost or how well what survives today represents the romance tradition as it existed in medieval England.

Romsey Abbey

The starting date of Romanesque Romsey (fig. 109) is not documented. Comparison of the sculptured capitals with those in Canterbury Cathedral crypt and elsewhere, and of the architectural details with the post-1107 fall-of-the-tower work at Winchester, suggests that construction commenced ca. 1110–20. Building advanced as far as the first bay of the nave by ca. 1150, after which time work slowed dramatically until the nave was completed ca. 1230. During this long building program the proportions of the elevation continue unchanged, while the articulation, pier form, capitals, and moldings reflect current fashions.

Romsey preserves the earliest extant example of a square ambulatory, a feature later used extensively in English architecture as at Byland Abbey and Salisbury and Exeter Cathedrals. The three-story elevation with main arcade, gallery, and clerestory with wall passage, and the crossing tower with wall passage and lantern windows, belong to the family of St. Etienne at Caen as transmitted through Winchester Cathedral. As at Winchester, the main spans at Romsey are wood-roofed while the aisles are rib-vaulted, as in the post-1107 work at Winchester. Whether ribs were initially intended at Romsey is a moot point; they are not consistently articulated from the ground, but uniformity is seldom deemed essential or even desirable in English architecture.

In the bays connecting the transepts with the nave aisles and galleries the giant order is introduced. The outer shaft of the pier rises through two stories to support the inner enclosing order of the gallery arch, in contrast to the separate main arcade and gallery piers in the presbytery and the east side of the transepts. The giant order is continued throughout the nave but with an interesting variation in the first nave pier. It is cylindrical rather than compound and may well have been a liturgical marker for the nave altar.

Romsey Roods

Two Anglo-Saxon roods (carved depictions of the Crucifixion) reset in the Romanesque fabric of Romsey Abbey. One (29 inches high by 17.5 inches wide) serves as a reredos, or high screen behind an altar, in the eastern apse of the south presbytery aisle; the other (max. height 88.5 inches; max. width 70.5 inches) is found on the exterior west wall of the south transept ([fig. 110](#)). The small rood, which has poorly preserved surface detail, is carved in shallow relief with a living, upright Christ on a cross with T-shaped terminals. Beneath the arms of the cross Mary stands to his right and, below her, Stephaton bears the sponge. To his left is John and, below, Longinus with the spear. There is a demifigure of an angel above each cross arm, and plant ornament flanks the stem of the cross. The iconography and animated poses of the attendant figures depend on Metz School ivories of the 9th and 10th centuries (A. Goldschmidt, *Die Elfenbeinskulpturen aus der Zeit der karo-lingischen und sächsischen Kaiser VIII–XI. Jahrhundert*, Vol. 1 [Berlin, 1914], nos. 78, 85, 86, 88, 89, 115). The T-shaped terminals to the cross are paralleled in Anglo-Saxon manuscripts, as in the Arenberg Gospels (Temple, cat. no. 56).

The monumental rood, which is carved in deep relief from three pieces of stone, is the best-preserved example of what may have been a common Anglo-Saxon type. Other instances in the Winchester diocese, albeit poorly preserved, are above the south doorway of Breamore (Hampshire), and on the former west wall of the pre-Conquest church at Headborne Worthy (Hampshire). The bearded Romsey Christ holds his head erect in triumph over death. His feet rest on a sloping *suppedaneum* (foot support). The Manus Dei (Hand of God) appears from a stylized cloud above his head, as at Headborne Worthy. This feature and the *suppedaneum* are common in Anglo-Saxon art (Temple, cat. nos. 35, 56, 77, 82, 103). The clinging drapery of the loincloth has been compared with the frieze on the Romanesque facade of Lincoln Cathedral, but the flying angels above the chancel arch at St. Laurence, Bradford-on-Avon (Wiltshire), provide an appropriate pre-Conquest analogue. Originally the Bradford-on-Avon angels may have flanked a large-scale rood, and it is possible that the monumental rood at Romsey occupied a similar position.

Fig. 109. Romsey Abbey, nave, south side. RCHME, © Crown copyright.

The Anglo-Saxon nunnery at Romsey was reformed or refounded in 967, possibly under the reforming influence of Æthelwold, bishop of Winchester (963–84). It was patronized by King Edgar, who had his infant son, Edmund, buried there in 971. This royal association is relevant on two counts. First, it helps explain the similarity to monumental Ottoman roads; the example at

Ringelheim (Hanover) is especially close. Second, in keeping with Æthelwold's ideas of kingship, it suggests that the flat top, and the drill hole to the side, of Christ's head in the large rood indicate that the Christ figure wore a metal crown.

Rondellus

Literally either “a small circular object” or, in poetry, “a rondeau.” Music historians use the term to identify a distinctive technique in the 13th-century English polyphonic repertoire in which all voices begin together, presenting musical material that is then permuted or exchanged between voices in subsequent periods until all voices have sung all parts. One unit of rondellus in three voices could be represented as

a	b	c
c	a	b
b	c	a

Insular techniques of rota and voice exchange, cultivated in the same era, are related but not identical (and it is the rota that most closely approximates a modern “round”).

The term “rondellus” is attested in this sense only in music theorist Walter Odington’s *Summa de speculationemusicae* (ca. 1300), with one example, *Ave mater domini*. Rondellus techniques occur in conducti and motets (“conductus-rondellus” and “rondellus-motet”), troped settings of Alleluias, and independent rondelli, mostly in three voices. For a complete listing see Lefferts (1986: 31); the publishable pieces are edited by Sanders (1979).

Rota

Literally "wheel." Music historians use the term to identify the rare, distinctive technique of round canon at the unison as it occurs in the 13th-century English polyphonic repertoire. Insular techniques of rondellus and voice exchange, cultivated in the same era, are related but not identical. *Munda Maria* is the only known unaccompanied rota, while the well-known Sumer Canon places a rota above a two-voice ostinato accompaniment (both are edited, among other places, in Sanders, 1979). The fragmentary *Salve Symon Montisfortis* may also have been an accompanied rota.

The term "rota" is attested in this sense only in the elaborate set of performance instructions that survives for the Sumer Canon. In the text of a large-scale English voice-exchange motet of the early 14th century, *Rota versatilis*, the word specifically denotes the Katherine wheel while also clearly alluding to the musical means of construction, which is in this case noncanonic.

Ruin, The

One of the so-called elegies of the Exeter Book. Like the other elegies *The Ruin* presents a contrast between past and present, but in this poem the contrast takes the form of an impersonal contemplation rather than, as in other elegies, arising from the speakers own experience. The speaker of the poem observes the remains of what he refers to as "the work of giants," the ruins of a great city of the past.

A Latin analogue to *The Ruin* is a 6th-century poem by Venantius Fortunatus, *De excidio Thoringae*, but closer parallels are to be found in the vernacular tradition. The conventional theme of the ruined hall appears in *The Wanderer* and *Beowulf*. A similar theme is reflected in early Welsh poetry. The version in *The Ruin* is remarkable for the specific detail of its depiction of the ruined city, this detail being evidently the result of observation as well as of conventional description. The poet pays particular attention to the baths of the city, which are described with admiration and fascination. The emphasis on the baths, indeed, has encouraged some scholars to identify the place described as the Roman city of Bath, although the evidence for such an identification is hardly conclusive.

The Ruin presents a contemplation on the relentlessness of time. Some critics suggest that the poet implies a powerful condemnation of the worldliness of the people who once heedlessly enjoyed the splendor of a Babylon-like city. The poem is entirely lacking in homiletic castigation, however, and its evocation of the life of the inhabitants of this city is not unsympathetic. The people are presented in Germanic terms, as proud warriors experiencing the bright joys of the hall and living a life of wealth and success. Their lives and dwelling places are overcome by *wyrd* (fate), as their splendor

is destroyed. The object of the poem's preoccupation is the effect of time rather than the wickedness of the people who lived in glory in the past. The poet adopts an attitude of observation rather than renunciation.

The damage to the closing pages of the Exeter Book, caused, it seems, by a burning fragment of wood, has rendered the text of *The Ruin* deficient in two places, affecting thirteen of the poem's 49 lines. The second of these lacunae represents a particularly unfortunate loss, since it impairs much of the description of the baths with which the text ends.

Runes

By the 5th century A.D. the use of runes, the Germanic adaptation of the Roman (or a related) alphabet, is attested across Europe from Scandinavia to

the Black Sea. A knowledge of the script was certainly shared by some of the earliest Anglo-Saxon settlers: about twenty inscriptions dating from the 5th to the 7th century have been discovered, mostly in the south and east of England. During this period, in response to a series of sound changes that shaped the OE language, the values of some old runes were altered and several new symbols were invented, giving the Anglo-Saxon script an appearance distinct from that of its neighbors (though Frisia shared some of the developments). In Scandinavia the runic alphabet is termed the *futhark*, a modern coinage derived from the values of the opening runes of the traditional sequence; the alterations in England produce instead the *futhorc*.

Like most Anglo-Saxon artifacts of the period almost all the early runic inscriptions come from burial contexts; they are found on cremation urns and on a range of objects—such as sword fittings, brooches, and domestic vessels—buried as grave goods. None of these early texts is longer than three words, and many are obscure. Among the identifiable sequences there are some echoes of “charm words” known from contemporary runic inscriptions in Scandinavia, and there are several personal names. Since inscriptions on perishable material, such as wood, have not survived, it is difficult to comment with authority on the extent of early Anglo-Saxon literacy or the uses to which it may have been put. It might be noted only that, so far, the earliest texts provide no evidence of a commercial or overtly religious function for runic writing. Instead they reveal a taste for the prosaic: the ankle bone of a roe deer, found in a 5th-century cremation urn, is apparently labeled “roe deer’s”; and a 7th-century brooch, damaged and mended (none too expertly) in antiquity, proclaims “Luda repaired the brooch.”

A more obviously practical application appears in the 7th century, when runes are used on some of the earliest Anglo-Saxon gold coinage. From the end of that century until the 9th, coin legends in Kent, East Anglia, and Northumbria are cut sometimes in Roman, sometimes in runic, and sometimes in a mixture of the scripts. Other types of inscription reinforce the impression that during this period, in parts of the east and north of England, the two scripts tended to be used with little distinction of purpose. A series of memorial stones from the religious houses of the northeast coast simply record the names of the deceased in either Roman or runic; another series, bearing versions of a short vernacular prayer in loosely alliterative verse, is evidenced across Northumbria in both scripts.

All of these memorial stones are explicitly Christian in content or context, and this holds true of the great majority of 8th- and 9th-century runic inscriptions. Some pieces, such as a pair of silver tweezers bearing just a personal name, and a gold finger ring recording owner and maker in a mixture of scripts, indicate their owner’s faith only by the symbol of a cross. Others,

like a casket found in Normandy but probably made in northern Mercia or Northumbria and a bone comb recovered from a midden near the monastery at Whitby, carry short prayers. Most strikingly some of the figures incised on the wooden coffin of St. Cuthbert, historically datable to the translation of his body by the Lindisfarne community in 698, are labeled in runic script. Unusual in having no apparent religious content are three rings bearing versions of the same nonsense text, which is related to sequences found in Anglo-Saxon manuscripts that may ultimately derive from meaningful Irish charms.

The longest Anglo-Saxon runic inscriptions are found on a pair of monuments that are both typical of, and far exceed, the rest of the corpus. Like other inscribed pieces the Franks Casket and Ruthwell Cross are Christian and use both scripts; but, in contrast to the usual short and prosaic texts, their extensive inscriptions are also among the most significant early Anglo-Saxon literary and linguistic records. Both are probably in Northumbrian dialects of the first half of the 8th century.

Runes also appear in manuscripts, though it is evident that, whereas they were considered an acceptable alternative to Roman in inscriptions, in books they were not used as a primary script. Often they are listed, either in futhorc order or rearranged into alphabetical order. Such lists are particularly common in manuscripts written on the Continent from the end of the 8th century onward, and it is probable that they reflect the runic knowledge of Anglo-Saxon scholars and missionaries who traveled south during the 8th century. (The Anglo-Saxon pilgrims who carved their names in runes at sites in Italy might be compared.) More ambitious than these simple lists is the *Rune Poem*, which recounts gnomonic lore attaching to the names by which the runes were known (*lagu*, “water,” for *l*, *dag*, “day,” for *d*, etc.). These rune names were exploited in various ways. Some scribes occasionally drew the runic symbols as shorthand ideographs for their names; the poet Cynewulf “signed” four compositions by working the names of the runes that spelled his name into his text.

The Anglo-Saxons’ attitude to runes no doubt changed over time and probably varied also according to region. It has sometimes been suggested that runes carried connotations of paganism into the Christian period, but the evidence of the inscriptions suggests the contrary. Christine Fell has shown also that the word *rūn* itself, for most of the OE period, means “thought” or “truth” rather than “secret” or “mystery,” as it has generally been glossed. Toward the end of the period, however, there may have been a change. Few Anglo-Saxon runic inscriptions are dated later than ca. 900, and over the following centuries runes probably came to be considered unusual or archaic. A scatter of inscriptions across the country attests to the arrival of the Vikings with their own distinctive version of the script. The Vikings were certainly

reviled as heathen invaders, and it is perhaps against that background that Ælfric's explicit association of runes and *dry craft*, "sorcery," around the beginning of the 11th century, should be set.

Ruthwell Cross

The Ruthwell Cross ([figs. 111–14](#)) stands today in the church in the village of Ruthwell (Dumfriesshire), near the Scottish border with England. Struck down

by Presbyterian iconoclasts in 1642, it lay for a while embedded in the church floor before being abandoned to the churchyard. This mistreatment has left it scarred and incomplete. In 1887 it was declared a national monument and reinstalled within the church. And there it remains, rising to 17 feet 4 inches in height, from a well set into the apse behind the altar.

Fig. 111. Ruthwell Cross, Dumfriesshire. Courtesy of A.J. Hawkes.

Together with the comparable cross at Bewcastle it is undoubtedly the most important sculptural survival from Anglo-Saxon Britain and arguably from early-medieval Europe. Constructed of two blocks of local sandstone, it is ornamented on all four sides with carved images and inscriptions in both Latin letters and Anglo-Saxon runes. On the principal faces are figures and scenes drawn mainly from the life of Christ. On what was probably the front (original west face) of the cross are the Crucifixion, the Flight into Egypt, SS. Paul and Anthony meeting in the desert, Christ being adored by beasts, and St. John the Baptist. In the cross head, of which only two of the original arms remain, are small reliefs of the evangelist Matthew with his symbol, and at the top the evangelist John with his eagle. On the reverse (original east face) at the bottom is a panel now completely obliterated. Above is the Annunciation, the miracle of the man born blind, Mary Magdalene wiping Christ's feet with her hair, and two women embracing, possibly the Virgin Mary and Elizabeth at the Visitation or Martha and Mary. In the cross head is a kneeling archer stretching taut his bow and taking aim with an arrow, and at the top an eagle perched on a branch. Around the panels are Latin inscriptions, mostly drawn from passages in the Bible, identifying the scenes.

Fig. 112. Ruthwell Cross, Dumfriesshire. Detail of Christ and Mary Magdalene. Courtesy of A.j.

The sides of the cross are ornamented with plant scroll inhabited by animals and birds. The runic inscription in the frame around the scrollwork is related to the Anglo-Saxon poem *The Dream of the Rood* (preserved in a 10th-century manuscript), though the exact nature of the relationship between the two texts is problematic. In both poems the Cross tells of its experiences on that first Good Friday when it supported the dying body of Christ.

Although the Ruthwell Cross has attracted an extensive body of scholarship, many controversial questions remain. The date is still in dispute, with opinion being divided between the late 7th century and the middle of the 8th. The sudden appearance in Britain of carving of this quality, unique in Europe at the time, has been associated with the import of foreign masons by Benedict Biscop and Wilfrid of York in the 670s to build their churches at Wearmouth and Hexham. Suggestions as to the origins of the foreign influence apparent in the style of the figure sculpture and ornament have ranged from Gaul to Italy to Syria and Coptic Egypt. The elaborate iconographic program has likewise inspired numerous interpretations; even the identity of some of the scenes is not agreed upon. A consensus has been reached, however, that the broad message of the figure sculpture reflects the eremitic ideals of the early Northumbrian church. Although the Ruthwell Cross is only one of a series of Northumbrian crosses, it is the finest and most complete of the group and of pivotal importance to the understanding of Anglo-Saxon art.

St. Albans Abbey

The Benedictine abbey church of St. Albans ([fig. 115](#)) was commenced by Abbot Paul of Caen (1077–88). It was the first post-Conquest church to be conceived on the vast scale of 4th-century imperial Christian basilicas in Rome. The setting for the shrine of St. Alban was thereby associated with St. Peter's, Rome, while the monumentality of the new church stood as a powerful symbol of Norman administration. Solid walls separated the four-bay presbytery from its five-bay aisles. The east end probably terminated in three apses, with those to the aisles enclosed in flat east walls. Of the groin-vaulted presbytery aisles there remain the two western bays on the south and the westernmost on the north. The painted decoration of these groin vaults is 13th-century, but traces of similar work underneath suggest that the ribbons on the groins and the false ashlar webbing reflect Romanesque precedent. The presbytery originally had a high groin vault, while the transepts and nave were wood-roofed. The aisleless transepts, formerly with two apsidal chapels to the east, have a three-story elevation with superposed triforium and clerestory passages. In the nave the second story takes the form of a low gallery. The crossing lantern tower, with superposed wall passages, recalls St. Étienne at Caen, but the upper external passage may derive from imperial Germany.

Built of reused Roman brick from Verulamium and flint rubble, Romanesque St. Albans is often dismissed as a plain, even crude building. However, in the crossing and nave it uses three-order arches, and in the transepts and nave stringcourses balance the vertical thrust of the pilasters. These elements stand at the beginning of the tradition of rich articulation in English Romanesque churches. The nave arcades preserve a great variety of Romanesque painted patterns, while the fifth and sixth piers of the north arcade break from the straightforward compound type to signify the area of the nave altar.

St. Albans Psalter

The St. Albans or Albani Psalter (Hildesheim, St. Godehard) ranks as one of the

most important English Romanesque illuminated manuscripts because of its extensive miniature cycle. The psalter text is preceded by calendar illustrations, 40 full-page framed scenes drawn mainly from the New Testament, and five tinted drawings from the life of St. Alexis and the Emmaus story. There are two full-page miniatures depicting the martyrdom of St. Alban and David with his musicians at the end of the manuscript. In addition 211 historiated initials accompany the psalms.

The manuscript's provenance and date have been established on the basis of entries in the calendar, several of which may suggest that it was made for the anchoress Christina of Markyate, a disciple of Roger, who had been for a time a monk at St. Albans and later lived the life of a hermit in the vicinity. Since Roger died before 1124 and the entry for his death was made after the calendar was completed, an approximate date before 1130 has been assigned to the manuscript.

This dating makes the St. Albans Psalter the first extant English manuscript with a cycle of full-page painted miniatures since the 10th century. The style and iconography of both miniatures and historiated initials differ substantially from Anglo-Saxon works, making them the earliest surviving representatives of a new pictorial tradition in the Romanesque period. The figure style is characterized by elongated figures shown in profile and clothed in clinging draperies overspun by a fine cobweb of white highlights. Pächt viewed the style as a new development in English art introduced by the main artist, whom he called the Alexis Master, and identified the major source of this artist's inspiration as Italo-Byzantine art. Swarzenski and Kauffmann questioned this interpretation by pointing to elements of the style in manuscripts produced in England or under English influence in the first quarter of the 12th century.

A similar debate exists concerning the iconographical sources for the miniatures. Pächt indicated that the Alexis Master drew directly upon a wide range of sources, including Anglo-Saxon, Ottonian, and, to a greater extent, Italo-Byzantine models in creating this cycle. Others have expressed doubt about the originality of the cycle as a whole and have also questioned which sources shaped it. Kauffmann, drawing attention to similarities between the St. Albans cycle and two other 12th-century New Testament cycles, suggested a common archetype for the group, thereby removing the Alexis Master from a major role in the creative process. Swarzenski questioned the originality of particular iconographical details, citing precedents in earlier continental manuscripts, and stressed the importance of Ottonian art as the major influence on the New Testament cycle.

The tinted drawings are grouped together with the earliest extant Anglo-Norman French version of the *Vie de saint Alexis*. Pächt argued that the inclusion of this particular text and the specific scenes chosen for illustration

had a special relevance for Christina, thereby underlining the private, individualized nature of these miniatures.

Some of the 211 historiated initials, such as those of David as Psalmist and Christ Trampling the Beasts, follow well-established models used in liturgical psalters. However, the majority echo commentaries on the psalms, principally that of St. Augustine. While some compositional similarities exist elsewhere, Dodwell viewed the initials as fairly original creations that emphasize monastic values. Stylistic parallels exist in Norman and Flemish manuscripts.

St. Nicholas Crosier

This ivory crosier, or bishop's staff of office (London, Victoria and Albert Museum inv. no. 218–1865; [fig. 116](#)), shows scenes from the life of Christ (the Nativity and the Agnus Dei supported by an angel on the volute and the Annunciation to the Shepherds on the stem), and three scenes from the life of St. Nicholas: his birth, his refusal of milk from his mother's breast on fast days, and his gift of dowries to the daughters of an impoverished nobleman of Myra to prevent their being sent into prostitution.

Originally interpreted as representing the infancy and passion of Christ, the crosier has been attributed variously to Germany, France, and England, and to

dates in both the 11th and 12th centuries. However, Dale identified the iconography by comparison with the stained glass at Chartres, dating the ivory to about 1175.

The importance of St. Nicholas (established by the 6th century) grew considerably following the translation of his body from Myra to Bari in 1087. The inclusion of scenes from his legend suggests that the crosier was commissioned for a church dedicated to the saint or for a bishop of that name.

Although stylistic comparisons have been made with stained glass and sculpture at Canterbury (1174–80), and with the Portail Royal at Chartres, the most convincing parallel for the distinctive figure style is offered by the Winchester Bible (Swarzenski, figs. 310–14) and thus supports a date of about 1150. The crosier is generally accepted as English, although Gaborit-Chopin relates it to reliefs at St. Aubin d'Angers executed for Abbot Robert de la Tour Landry (1127–54), suggesting Angers as a possible place of origin.

The beautiful carving is unusual in its lack of purely decorative motifs and in its details, such as the apparent emergence of St. Nicholas's father from the ivory itself. The use of elephant ivory was also still rare in England at this date.

Saints' Lives, Illuminated

Libelli are small books containing various types of cult material concerning one saint (or occasionally two), usually produced by and for the monastery of which the saint is patron. England was late in producing an independent illustrated *libellus* of a saint's life, presumably because of the disruptions of the Conquest, but succeeded by the end of the Middle Ages in producing perhaps the most interesting and beautiful group of such books.

The first English example is the tiny manuscript of Bedes *Life of Cuthbert* (Oxford, University College 165; [fig. 117](#)), supplemented with translation and miracle accounts, made at Durham and dated variously between 1100 and 1120. It has been connected with Norman monastic appropriation of the Anglo-Saxon cult of Cuthbert previously sponsored by canons at Durham and Lindisfarne. In particular a translation of Cuthbert's holy, incorrupt body to a new shrine took place in 1104. However, the tiny size and intimate quality of the manuscript argue against its use in public ceremony, and Baker has suggested that it was produced for a private patron. The 55 charming multicolor line drawings, each in the space of a few square inches of text column preceding its chapter, advance a lively narrative. Special emphasis is placed on Cuthbert's monastic life and his asceticism but also on his public life.

Fig. 117. Life of Cuthbert (Oxford, University College165), p. 35. Cuthbert prays through the night in the sea; otters dry his feet. Reproduced by permission of the Master and Fellows of University College, Oxford.

A second copy of the *Life of Cuthbert* (BL Yates Thompson 26), produced at

Durham ca. 1200, provides a striking contrast to the Oxford manuscript. Although also quite small, it is a lavish manuscript with 45 remaining miniatures framed and painted in full color and gold. Again the miniatures precede the chapters of Bede's *Life* and added miracles. Although occasionally miniatures on both pages of an opening allow narrative to move across space, in general the lively quality of the earlier Cuthbert illustrations has been transformed into a more monumental, almost iconic vision. Scholars have argued that the copies of Cuthbert's life in manuscripts and other media all spring from the same family tree.

The illustrated *Life* of Edmund, king of East Anglia and martyr, now in the Pierpont Morgan Library (M.736), contains 32 full-page, full-color miniatures preceded by a few preliminary texts and followed by miracles, the *Life* by Abbo of Fleury, and an office decorated with historiated initials. While the text is in a Bury St. Edmunds hand, the miniatures are closely allied to if not actually by the hand of the Alexis Master of the St. Albans Psalter and may be dated ca. 1120–30. The manuscript may represent a special project intended to enhance the prestige of Bury's patron saint, commissioned by Abbot Anselm from a visiting artist. To that end the miniatures focus on themes of pilgrimage, kingship, and the proper exercise of power, as well as on the saint's ability after his death to defend his monastery by miraculous intervention.

The Guthlac Roll (BL Harley Roll Y.6), produced for the monastery of Crowland ca. 1220, is a beautiful if late example of line drawings in the "Style 1200." Although loosely based on the *Life* of the ascetic saint by Felix, the roll is exclusively pictorial, with only a few short *tituli*, or captions. It has been suggested that the series of eighteen contingent roundels on the Roll was intended as a model for stained glass or for some object, such as an enamel shrine. However, the finished quality of the drawing also allows the recent suggestion that the roll was intended for display in the monastic church on the occasion of the saint's feast. The last roundel represents donors making gifts at the altar and has been associated with forged charters and land disputes in which the monastery was involved at the time.

Between ca. 1230 and 1259 Matthew Paris produced at least one illustrated *libellus* himself, that of the patron of his monastery, St. Alban (Dublin, Trinity College 177; [fig. 95](#): see MATTHEW PARIS), and probably wrote the Anglo-Norman text and provided sketches for two others, those of St. Thomas of Canterbury (BL Loan 88) and St. Edward the Confessor (CUL Ee.3.59). These manuscripts show an innovative narrative approach. Matthew works in framed rectangular miniatures running across the top of the page, above two or three columns of text. Often both miniatures in an opening work together to create an active, complex visual narrative that complements and even extends the written text. Matthew uses line drawings enhanced with color in a style more

common earlier in the century, allied to the “Style 1200.” The Dublin manuscript contains notations about the lending of Matthew’s manuscripts of saints’ lives to ladies, clearly defining his intended audience as the aristocracy, an audience reflected in his concern for chivalric and courtly values.

Salisbury (Sarum), Use of

The liturgical customs of Salisbury Cathedral in the southern English county of Wiltshire. The form “Sarum,” current since the Middle Ages, is a misreading of an abbreviation for Salisbury’s Latin name, *Sans buna*. Formed mainly between the late 11th and mid-14th centuries and described in great detail in contemporary documents, this use became increasingly influential in Britain between the early 13th century and the Reformation, and it was even observed

abroad.

In modern times, particularly between about 1850 and 1920, there has been a major revival of interest in the Use of Salisbury. This was largely prompted and sustained by controversy between High and Low factions within the Church of England, by the reemergence of the Roman Catholic church as a potent force in English religious life, and by the deep vein of nostalgia running through Victorian culture. Although the tendency of English scholars to concentrate heavily on the Use of Salisbury at the expense of other English and continental uses has produced an exaggerated impression of its uniqueness and quality, the integrity and sophistication of the use and its immense importance in the context of English liturgy are undeniable.

A use is a body of regulation and custom ordering the corporate activity of an ecclesiastical foundation or group of foundations, such as a cathedral church and its diocesan churches, or a religious order, such as the Cistercians or Franciscans. Such uses were common in late-medieval Europe, particularly at diocesan and metropolitan levels, and many were recorded in writing. Although some medieval uses made provision for various constitutional and administrative matters, most concentrated on the liturgy: the content of the services (the rite), their conduct (the ceremonial), and the liturgical responsibilities of the institution's members. Since in most medieval services any text intended to be audible was sung rather than spoken, there was an intimate connection between the rite and its associated music. Thus the musical repertoire particular to an institution can arguably be regarded as part of its use. This repertoire would normally consist entirely of plainchant, although some uses envisaged the performance of polyphony and even prescribed specific polyphonic items.

In the later Middle Ages, because of the wide dissemination of Roman liturgy and plainchant in revised and augmented Carolingian versions, most of western Christendom shared a common liturgical tradition. This embraced the main elements of the liturgical calendar, the basic structure of mass and the divine office, the nature of the chief liturgical forms and the methods of performing them, and the central repertoire of plainchant. There nevertheless remained scope for local divergence and variation. In view of the impracticability of establishing and maintaining complete and widespread uniformity this was probably inevitable; it was also desirable and perhaps even encouraged, because it allowed churches to respond to local conditions and requirements, thereby enhancing a community's sense of identification with the liturgy. Divergence commonly involved the observance of local saints' days, changes in the detailed structure of services, differences in methods of performance, and the use of variant or nonstandard plainchant melodies. Deviation attained the status of a use when it became sufficiently extensive

and systematic to be recognized in its own right.

The diocese of Salisbury came into being in 1075, when William the Conqueror made his new town of Salisbury (located on the site now called Old Sarum) the administrative center of what had previously been the diocese of Sherborne; the latter had been founded about 705, some 70 years after St. Birinus's successful evangelization of the Saxon kingdom of Wessex. With a few minor anomalies Salisbury diocese encompassed the counties of Dorset, Wiltshire, and Berkshire. When the see fell vacant in 1078, William secured the appointment of Osmund, a fellow Norman who was currently his chancellor. At Salisbury Osmund introduced constitutional and administrative reforms probably based on the example of Norman cathedrals, such as Bayeux, Évreux, and Rouen. Like several Saxon cathedral churches Sherborne/Salisbury had been a Benedictine monastery, but by 1089 Osmund had replaced the monks with resident secular canons, perhaps because the site available was too cramped for conventual buildings. In 1091 he provided a constitution for the new body in the form of documents known as the *Charta Osmundi* and the *Institutio Osmundi*. None of this was revolutionary; reform had been taking place in the post-Conquest English church since the appointment of Lanfranc to Canterbury in 1070, and already in 1090 Thomas of Bayeux and Remigius of Fecamp had created similar legislation for their cathedral churches of York and Lincoln. Osmund's surviving ordinances for Salisbury are only peripherally concerned with liturgy, and there is no proof that he made innovations in liturgy and chant to match his constitutional reforms. It does, however, seem likely that he did, because the change from a monastic community to a secular chapter would itself have had liturgical implications. Lack of evidence on this crucial issue means that the sources from which the Salisbury liturgy and its chant were assembled remain obscure; Rouen seems a likely source of influence.

The bleak site of Old Sarum proved unsuitable for settlement, and in 1218 the town was moved about a mile south to what is now Salisbury, where a new cathedral was built between 1220 and 1266. The dominant personality in the cathedral at this time was Richard Poore, dean from 1197 to 1215 and bishop from 1217 to 1228. Poore seems to have been another efficient administrator, and the earliest surviving detailed account of the cathedral's customs apparently dates from his time. It is contained in two principal documents, an ordinal and a consuetudinary; the former is essentially a service book listing the items to be performed in each service and describing the method of performance, while the latter is basically an administrative handbook defining the liturgical and some other duties of the cathedral's personnel. The ordinal and consuetudinary together formed the basis for most subsequent documents describing the use. Again there was nothing novel

about these developments; Lichfield already had an ordinal and consuetudinary in the time of Hugh de Nonant, bishop from 1188 to 1198. Our ignorance of liturgical usage at Salisbury between Osmund's reconstitution and the move to New Sarum makes it impossible to assess how far Poore was recording established liturgical practice and how far he was describing recent innovations. Nor is it clear whether he inherited any substantial documentary tradition; the phrases from the *Charta Osmundi* and the *Institutio Osmundi* incorporated into the consuetudinary dealt with constitutional rather than liturgical matters.

In addition to the ordinal and consuetudinary Salisbury had the full range of service books common in the later Middle Ages: missal, breviary, gradual, antiphoner, processional, manual, pontifical, tonal, and so on. In the earlier 14th century a new book called the customary was introduced; apparently intended for parish churches, it was derived from the consuetudinary, omitting most of the constitutional material and concentrating more on the divine office than on mass or the processions. It seems to have largely supplanted the consuetudinary, often being copied as a supplement to the ordinal. The rubrics of the missal, breviary, and other service books were drawn mainly from the ordinal, the consuetudinary, or the customary. Like most other liturgies that of Salisbury was in a constant state of development, adopting new feasts, altering the grading of existing feasts, and making various other changes, particularly in ceremonial. The liturgical books were altered from time to time in response to these developments. Initially the alterations were made piecemeal, but eventually the ordinal particularly became so unwieldy and confusing that a thorough revision was necessary. This revision, carried out in the mid-14th century, resulted in what became known as the "New Ordinal." The preeminence of Salisbury Use is attested by the fact that in the late 14th century the Wycliffites singled it out for attack on account of its elaborateness.

During the 15th century Salisbury's reputation for liturgical propriety declined, probably partly because the ever increasing complexity of the liturgy made it difficult for anybody to understand all its workings and partly because the canons of the cathedral genuinely lacked interest or expertise in such matters. In the middle of the century Clement Maydestone, a member of the Brigittine community of Syon, wrote three tracts on aspects of the use. The *Directorium sacerdotum* (ca. 1440) clarified some of the ordinals complicated provisions for reading the Old Testament histories, singing responsories, and observing commemorations. The *Defensorium directorii* (ca. 1448) sought to justify the *Directorium* by exposing discrepancies between the ordinal and current faulty interpretations of its regulations. *Crede michi* (ca. 1452) listed and criticized answers recently given by the canons of Salisbury to certain questions on liturgy and added numerous other comments. It should be noted

that such criticisms were directed not at the use itself but at contemporary errors in observing it. The advent of printed service books in the later 15th century seems to have stimulated efforts to restore the purity of the use; the *Directorium sacerdotum* was printed several times in a revision by the Cambridge scholar William Clerke, and the rubrics of the breviary were recast for the 1509 edition. Salisbury service books were printed remarkably often from about 1475 onward, mainly in Paris but also in Rouen, Venice, London, and elsewhere. Before the abolition of the use there were more than 40 printings of the breviary and even more of the missal. Salisbury chant books were also printed, notably the processional (about 25 times between 1502 and 1554), the gradual (1527, 1528, and 1532), and the monumental edition of the antiphoner (1519–20).

The splendor and elaboration of Salisbury's liturgy and the comprehensiveness and order of its regulations impressed contemporaries and invited imitation. The use's success in southern England also reflects a lack of competition, in particular the unsuitability of Canterbury's monastic liturgy to serve as a model for secular institutions. Salisbury's early influence seems to have been primarily constitutional, gradually but surely being overtaken by its liturgical influence. From the 12th century onward many dioceses, including Lincoln, Lichfield, Moray, Glasgow, Chichester, Dublin, Wells, Exeter, and London, imported elements of Salisbury Use, while the Austin canons, academic colleges, and royal and aristocratic household chapels also observed it. It is easier to list the dioceses that remained aloof; foremost among these were York and to a lesser extent Hereford, which preserved distinctive constitutions and liturgies until the Reformation. The Use of Salisbury was even carried abroad—for instance, wherever English royal and aristocratic household chapels happened to be functioning and to Braga in Portugal when Philippa, daughter of John of Gaunt, married John I in 1385. The adoption of the use throughout the southern (Canterbury) province of the English church in 1542 must have seemed a natural and inevitable recognition of Salisbury's liturgical primacy. A few years later, however, came the Protestant vernacular liturgy embodied in the prayerbooks of 1549 and 1552; the former was closely based on Salisbury Use, but the latter was considerably more independent of it. The Use of Salisbury itself was reintroduced during the Marian revival of 1553–58, but the Elizabethan religious settlement finally abolished it. Vestiges still remain in the Book of Common Prayer, for example some of the Collects and many of the Epistles and Gospels.

Comparison of the three major nonmonastic uses of medieval England, those of Salisbury, York, and Hereford, reveals frequent but mainly minor discrepancies. The text of an item on a certain day may vary; for example, in mass on Saturday in the third week of Advent Salisbury, York, and Hereford

have the Secrets *Super has hostias. Sacrificiis praesentibus*, and *Ecclesiae tuae*, respectively. Among plainchant items the Sequences often differ; in the dawn mass of Christmas Salisbury has *Sonent regi*, York *Laetabundus exultet*, and Hereford *Caeleste organum*. The series of Alleluia verses for the Sundays between Trinity and Advent are also different, as on the sixth Sunday after Trinity, when Salisbury's *Eripe me* contrasts with York's *In te domine* and Hereford's *Omnes gentes*. Similar discrepancies occur within the divine office, so that (for instance) in Salisbury Use the verse to the eighth responsory *Intuemini* at Matins on the fourth Sunday of Advent is *Et dominabitur*, whereas in York and Hereford it is *Precursorpro nobis*. There are also variations in spoken items and ceremonial, such as the procedure for the giving of the Pax (Kiss of Peace) within the Canon of the mass: in Salisbury Use the prayer *Domine sancte pater* precedes the Pax, whereas in the York and Hereford uses it follows it; the ceremony concerning the articles on the altar differs; and the celebrant gives the Pax with different words. As one might expect, some of Salisbury's plainchant melodies contain characteristic variants.

The Use of Salisbury makes little or no mention of polyphony; the customary prescribes the singing of the *Benedicamus* "dupliciter" on a few special days, but the intended meaning could conceivably be "by two people" rather than "in two voices." However, some other English uses (such as that of Exeter) make less ambiguous and more extensive provision for polyphony both within the regular liturgy and in extraliturgical acts of devotion. Many surviving polyphonic compositions show evidence of having been intended for such usage, and there are also numerous references to polyphony being improvised in these contexts by using such techniques as discant and faburden. Often polyphony replaced the normal plainchant performance of a liturgical form, such as a hymn, a Lady-Mass Alleluia, or an item from the Ordinary of the mass; in such cases the original plainchant melody was commonly incorporated into the polyphonic setting as a *cantus firmus*. Polyphonic settings of additional nonliturgical texts could also be inserted into services (e.g., after the Sanctus of the mass) or substituted for certain liturgical items such as the *Benedicamus* at the end of Matins and Lauds. In the 15th century it became common to sing a polyphonic votive antiphon with a versicle, response, and prayer as an independent act of devotion after Vespers or Compline. Sources of polyphony apparently closely connected with the Salisbury liturgy include the Old Hall Manuscript (BL Add. 57950, probably from the household chapel of Henry V's brother Thomas of Clarence) and the Pepys Manuscript (Cambridge, Magdalene College Pepys 1236, possibly from the Almonry Chapel of Canterbury Cathedral). Although during the later Middle Ages polyphony was presumably cultivated at Salisbury just as at other secular cathedrals, the earliest surviving music by a composer associated

with the cathedral appears to be the mass *Libera nos* and some smaller pieces by Thomas Knyght, instructor of the choristers between about 1529 and 1549.

Salisbury Cathedral

Salisbury Cathedral ([figs. 118–19](#)) is the most historically and stylistically homogeneous of English medieval cathedrals, being almost entirely the result of a single extended campaign of construction from 1220 to 1266. This uniformity is partly the result of the wealth of chapter and bishop that allowed such a prodigious and continuous outlay of funds and partly the result of building on a virgin site devoid of any previous church. The Romanesque cathedral of Sarum was located some two miles north, on a site within a castle bailey that had proved too cramped to allow the expansion deemed

commensurate with the prestige of a 13th-century bishop. The new site allowed patron and architect the unwonted luxury of any design they could afford.

The design they chose has sometimes been taken to represent the quintessential Early English cathedral, but the individuality of all English early Gothic cathedrals makes the search for quintessence a misguided one. Salisbury has the horizontal expansiveness characteristic of much English medieval architecture, both in its plan, with two sets of transepts and a long nave and choir, and in its elevation, with vault shafts rising only from the gallery spandrels so as not to interfere with the longitudinal flow of arcade and gallery, a flow aided by the judicious use of Purbeck marble shafting, particularly in the complex clustered piers of the middle story. Arch moldings are complex in profile as in any Early English building, and there are six different pier designs, all except one with detached Purbeck shafts set around coursed cores of various shapes.

While these features give Salisbury a visual opulence when set against the designs of contemporary French cathedrals, Salisbury is usually compared with its English contemporary at Lincoln, where decorative forms are used with much greater abandon than at Salisbury. In particular Salisbury lacks the fanciful rib patterns of Lincoln, being covered entirely with four-part vaults, and the rich foliage sculpture and dado arcades of the northern building. Some have seen the relative austerity of the Salisbury design as a conscious rebuke or at least repudiation of the exuberance of Lincoln, perhaps connected with the liturgical reforms of Bishop Richard Poore (1217–28), who began the project. Whether the work in progress at Lincoln would have weighed so heavily on the minds of southern ecclesiastics may be open to question; more interesting is the continuity with the old church of Sarum that Poore and his chapter seem to have been interested in preserving.

Fig. 118. Salisbury Cathedral, nave interior, north elevation. Courtesy of L. Hoey.

There is some evidence that the new building was related to the old in its dimensions, and it seems clear that the eastern projecting Trinity Chapel at the

former was a modern version of the eastern chapel of Bishop Rogers east arm at Old Sarum. The elegant Trinity Chapel, a miniature hall church with slender Purbeck piers, may have been designed as a shrine for Osmund, the first important post-Conquest bishop of the see, whose canonization the chapter sought. In the event Osmund was not made a saint until 1457, after which his shrine did indeed stand in the Trinity Chapel. If this was its original intent, the inspiration would have been the Trinity Chapel at Canterbury, where Thomas Becket was enshrined.

Fig. 119. Salisbury Cathedral, After G. Webb (1956). Reprinted by permission of the Yale University Press.

The most striking exterior feature of Salisbury is its central tower and 400-foot spire. This addition, begun probably in the last decade of the 13th century (its dating is controversial), has dimensions that may well have been

determined according to the proportional schemes of the original building. As spectacular as its stone skin is the 13th-century wooden interior scaffolding used to construct the tower and left inside afterward as a kind of brace.

Salisbury Chapter House Reliefs

Carved ca. 1280, these Old Testament scenes are set in the spandrels of the wall arcade on the interior of the chapter house ([fig. 120](#)). The narrative begins and ends with the figure of Christ presiding over the entrance on the west wall. It includes 60 separate scenes: Creation, Creation of the Firmament (west wall, right of entrance); Creation of Plants to Adam and Eve Hiding (northwest wall); the Expulsion to Noahs Vineyard (north wall); Drunkenness of Noah to Sacrifice of Isaac (northeast wall); Jacob Blessed by Isaac to Meeting of Jacob and Esau (east wall); Josephs Dream to Joseph Accused by Potiphar's Wife (southeast wall); Joseph Imprisoned to the Cup in Benjamins Sack (south wall); Moses Striking the Rock and Receiving the Tablets of the Law (southwest wall). The final scene and the central figure of Christ over the doorway set the business of the cathedral chapter that was conducted within the room firmly within the context of Old and New Testament law.

Fig. 120. Salisbury Chapter House Relief. The Fall. Courtesy of C. Karkov.

The scenes, carved in relatively deep relief, were originally richly painted. All are set in a stylized landscape consisting of wavy groundlines, decorative patterned trees, and formulaic architecture. Some of the figures are executed in

a classicizing style with graceful bodies and gestures and thin clinging draperies. Others are carved in an expressive style characterized by animated poses and lively gestures. It has been suggested that stylistically the reliefs are closer to contemporary painting (e.g., the scenes of the months on the ceiling of the Salisbury choir) than they are to contemporary sculpture (Stone, 1972: 132).

Perhaps the most remarkable aspect of the reliefs is the clarity with which their narrative content is expressed. There is much drama, but scenes are readily identified and the flow of the narrative is easily followed.

The heads of all the figures were destroyed in the 17th century, when a parliamentary committee sat in the chapter house. They were replaced in the 1860s during John Birnie Phillip's somewhat heavy-handed campaign of restoration.

Salve Service

An evening votive observance in honor of the Virgin Mary, sung after Compline and taking the form of a memorial consisting of an antiphon, versicle, and collect. Its name is derived from one of the most popular and frequently performed Marian votive antiphons, *Salve regina*. This short service, new in England in the mid-13th century, was performed either in choir or at another location in the church, such as in the Lady Chapel or at a statue or side altar. In the later 14th and 15th centuries the Salve was specifically included in the customs of many new secular choral foundations, and it grew to occupy a position of ritual and ceremonial importance in the life of these institutions. The chief musical ornament of the service was the antiphon,

increasingly set in elaborate polyphony. From the mid-14th century to the mid-16th the polyphonic Marian antiphon was one of the most numerous and significant genres of English composition.

Satire

The satire of classical Rome was widely known in the Middle Ages through the inclusion of Horace, Juvenal, Persius, and other satirical authors in the school curriculum. Many medieval writers drew on, commented on, and cited classical satire in their own works. Medieval literary theorists treated satire as part of the rhetoric of praise and blame, praising classical satire for its reproof of human vice. In the classical period satire was thought of as a genre characterized by medley and variety, and therefore appropriately termed *satura*., "fullness" or "mixed stew." These and other speculative etymologies for *satura*—sometimes spelled *satira* or *satyra* in postclassical writings—were known in the Middle Ages. It used to be widely believed among literary historians that in the Middle Ages satire was thought of as a mode rather than a genre until selfconscious imitation of the classical genre began in the Renaissance. However, recent research into the reception of classical satire in the Middle Ages has shown that medieval commentators developed from their reading of classical satirists a full theory of the genre, in which satire was seen as forthright, unadorned verse that aims to reform vice and spares no one from censure, not even the poet.

In some modern bibliographies and critical works satire has been coupled

with complaint, creating a loose category of writings on the condition of the world. Greater awareness of medieval literary theory has recently led to an appreciation that “complaint” is a term better reserved for the medieval *planctus*, a genre distinguished from satire by its aim of evoking pity for the speaker, not reform in society.

Medieval satiric theory was but one of a number of potential influences on ME satire. The favorite targets of the ME satirist were often the same as those of satirists writing in other vernaculars and in Latin. Studies of some of the main medieval satirical themes—the evils of women and marriage, the luxury of the monasteries, the ignorance of the parish clergy, the hypocrisies of the friars, corruption in court and church, the professional dereliction of lawyers and doctors, the general failings of all estates of society—have revealed close links between ME satire and earlier and contemporary satire in other languages, especially Latin and French.

In the second half of the 12th century England saw a flowering of satirical writing in Latin. One of the most important poems from this period is the *Speculum stultorum* (1179–80) by Nigel Longchamps or Wireker. The poem is a general satire (*satira communis*), a review of society as a whole. Following the adventures of Burnellus the ass, the poet exposes the follies of ecclesiastics, religious orders, and university clerics. Chaucer evidently knew the work, for he refers to the poem of “Daun Burnel the Asse” in the *Nuns Priests Tale*. John Gower exploited the general satire in all of his major works and drew on Nigel’s poem in his Latin satire on the evils of the times, the *Vox Clamantis*. Another 12th-century writer who acquired a name as a satirist was Walter Map. Map was the author of one of the best-known antifeminist satires of the Middle Ages, the *Dissuasio Valerii ad Ruffinum philosophumne uxorem ducat* (before ca. 1181). The *Dissuasio* is a Latin prose epistle in which Valerius attempts to dissuade Ruffinus from marriage by cataloguing examples of its snares and disasters. The treatise circulated widely in England and provided some of the antifeminist satire adapted by Chaucer for the *Wife of Bath’s Prologue*. Map incorporated the epistle into a longer prose satire on the court and the religious orders, *Denugis curialium* or *Courtiers’ Trifles* (ca. 1181–92).

It is thought that Map’s *De nugis* hardly circulated at all during the Middle Ages. Map’s medieval reputation as a satirist rested largely on scurrilous goliardic verses that were attributed to him by scribes but that he almost certainly did not write. The term “goliardic” is often used of satirical poetry or prose issuing from a clerical milieu, usually in Latin, mostly on antifeminist or anticlerical subjects and characterized by delight in parody, burlesque, and wordplay. Such works are often associated with a burlesque of the clerical order that imagines a “Bishop Golias” and associated dissolute clerics, the Goliards. Among the best-known examples are the *Apocalypsis Goliae*

episcopi, a parody of the book of Revelation that exposes the corruption of the clergy, and *Goliard de conjuge non ducenda*, an antimarriage satire that was translated into ME. Gower's *Vox Clamantis* shows the influence of goliardic techniques, and although much of the wordplay was untranslatable from Latin to English, traces of goliardic traditions have been detected in *Piers Plowman* and other ME satire.

Some satire was composed in Anglo-Norman on political, anticlerical, and antifeminist subjects, Gower's *Mirour del'Omme* (ca. 1376–79) being one of the latest and most notable examples. However, the *Roman de la Rose*, written on the Continent in the mid-13th century, was perhaps the most influential French satirical work for ME writers. The poem was well known in England, and parts of it were translated into English. Chaucer drew on the figure of Faus Semblant (False-Seeming) for his friars and the Pardoner and on the Vieille (Old Woman) for the Wife of Bath. Another important continental satire was the cycle of narratives dealing with Reynard the fox. Versions of this beast-epic satire of court and church appeared in several vernaculars. There was no ME version of the full epic until 1481, when William Caxton printed the *History of Reynard the Fox*, but images and episodes from the narrative cycle appeared earlier in English art and to a lesser extent in English literature (most notably in Chaucer *Nuns Priest's Tale* and Henryson's *Fables*).

Alongside these literary influences on ME satirists there are thought to have been satirical traditions of a popular, subliterate, and even oral kind. Because of their nature less evidence for these traditions has survived, and their impact on ME satirists is more difficult to estimate. Scurrilous popular songs were composed for and against despised social groups, and named individuals were attacked in invectives. The "flyting" was a verbal contest in which opponents poured torrents of extravagant abuse at one another. The Scots poet William Dunbar included flyting and invective in his rich repertoire of satire.

Popular sermons were another occasion for satire. Some commentators have considered the pulpit a more important source of inspiration for ME poets than satirical works in Latin or French. A favorite subject for preachers' satire was the failings of the clergy. Orthodox and heterodox preachers alike castigated the failings of the clergy in sermons to the laity.

From the first half of the 14th century English was increasingly used for satire on political subjects and topical grievances, such as the government of the realm, war, taxation, miscarriages of justice, and the oppression of the poor by their masters. Notable early-14th-century examples are the *Complaint of the Husbandman* (ca. 1300–40), on the oppression of the rural poor, and *The Simonie*, a topical review of society in three versions, the earliest dating from 1322 to 1326/30. *Winner and Waster*, from mid-century (1352–70?), is a debate on the relative merits of getting and spending wealth that includes much satire,

especially on the friars, merchant classes, and extravagant aristocracy. Few authors of this kind of verse have been identified, and it may be best thought of as generically anonymous. In the 15th century, however, this anonymous clerical tradition changes somewhat, with the appearance of satirical and political verse by identified authors, such as Thomas Hoccleve and John Lydgate.

The later 14th century produced the most important ME satirical poets: Geoffrey Chaucer and William Langland. Chaucer's General Prologue to the *Canterbury Tales* satirizes a wide range of social classes. The Prologue owes much to traditional "estates satire," but Chaucer transcends tradition by questioning the possibility of moral certainty. Chaucer's *Wife of Bath's Prologue* draws on classical and medieval antifeminist traditions in a similarly innovative way.

Langland's *Piers Plowman* satirizes many of the estates and classes of society and includes various political and topical allusions, with an emphasis on anticlerical satire. Many critics have seen Langland's satire as conventional and derivative, but recent study of the poem's anticlerical satire in the light of the contemporary historical context has shown how satirical tradition could be given new meanings in new circumstances.

Chaucer and Langland influenced satire to the close of the Middle Ages and beyond. Chaucer's reputation as an anticlerical satirist led 16th- and 17th-century editors to attribute to him the virulently antimendicant *Jack Upland* and the anticlerical *Plowman's Tale*, works from the early 15th or possibly late 14th century. Langland's achievements were imitated and developed, notably in *Richard the Redeless* (1399–1400), and the probably distinct work *Mum and the Sothsegger* (ca. 1403–06), both satires on the government of the realm, and the antimendicant *Pierce the Plowman's Creed* (ca. 1394). In the 16th century the figure of the plowman was associated with the Protestant reformers' ideals.

Schools

Everyone was educated in medieval England, in the sense of acquiring social education and training for work. This usually began at home with one's parents, but as children grew older they were frequently sent away to live and learn in other people's houses. Aristocratic boys and girls were placed in noble or royal households as pages and attendants, and nonaristocratic children were dispatched to work on farms or in domestic service or, in the case of boys and a few girls from moderately wealthy families, to be apprenticed to craftsmen or merchants. These practices can be traced down to the Renaissance and beyond.

Education in the narrower sense of literary education dates from the conversion to Christianity in the 7th century. The church recruited clergy, First monks and later secular clergy living in the world, and required them to be literate in order to pray and study. The language of the church was Latin, and as Latin was so different from English it needed to be formally learned in schools. Some found the language too difficult and, having studied the alphabet, used it merely to read and write in English. Secular literature and some documents were written in this way. From the Anglo-Saxon period onward we find both elementary teaching of the Latin alphabet, preparatory to the reading of English (or, after the Norman Conquest, French), and more advanced teaching of Latin ("grammar," as it was called), leading to a full knowledge of the language. Grammar was taught in the best schools and had the greatest prestige, but elementary teaching and learning were very common.

The earliest schools were in monasteries and other religious houses. At first monks were admitted in boyhood as well as in adulthood, and in 749 the Synod of Clofeshoh laid down that such children should study in schools. The teachers were adult monks. In the 12th century the admission of children as monks was abolished; monastic schools accordingly became confined to older novices, aged seventeen or more. There continued to be boys in monasteries, however, helping as servers and choristers, in addition to noblemens sons, sent to live with the abbot as in a great lay household. These other boys were taught separately from the monks by a nonmonastic chaplain or schoolmaster, and many Englishmen received their education in this way down to the Reformation. Some became monks, but others left the cloister and followed careers in the world as parish clergy or laymen.

From about the 8th century religious houses were supplemented by parish churches, served by secular clergy whose duties included the teaching of basic prayers, beliefs, and practices to the laity. Around 1005–08 the "Canons of Edgar" directed the clergy to teach boys to assist them in services, and by the

11th and 12th centuries examples occur of them giving instruction in reading and grammar. The chronicler Orderic Vitalis was taught by a cleric at Shrewsbury, and John of Salisbury at Old Sarum. Such teaching was never universal, but a few parish clergy kept schools to supplement their income and many more taught single pupils to assist them. This was a widespread source of education throughout the Middle Ages.

Self-contained schools, taught by professional schoolmasters, first appear in records in the late 11th century. They occur in cathedral cities, county towns, and the larger ports and by the 13th century were spreading to smaller places. The masters were secular priests, clerks in minor orders, or laymen (sometimes married), working for fees and giving instruction in reading, song (i.e., plainsong such as the clergy used), and Latin grammar. In the 12th century some cathedral cities (notably Exeter, Hereford, Lincoln, London, Salisbury, and York) had masters teaching the liberal arts, canon and civil law, or theology; by the 13th century these studies became chiefly concentrated at the new universities. Lectures in theology and canon law, however, continued to be provided by some monasteries and friaries for their own members and by some cathedrals for the local parish clergy.

The early town schools might be discontinuous; masters came and left. This problem was met in many places by the intervention of a patron (bishop, monastery, lay lord, or, later, the town council) who assumed responsibility for appointing the master and often gave him a monopoly of local teaching to ensure a reasonable livelihood. As time went on, benefactors (both clergy and laity) provided buildings, books, and scholarships to help the schools, and in the late 14th century endowments began to be given to provide the master with a salary to teach without fees. Early examples of such schools were Wykeham's wealthy college at Winchester (1382) and Lady Katherine Berkeley's small-town grammar school at Wotton-under-Edge in Gloucestershire (1384). Over 80 other towns and villages acquired free schools by the 1530s.

Girls did not attend most of the schools described here. Nunneries were fewer than monasteries, and they trained their own members. Noble girls learned to read at home from parents or visiting clergy or in nunneries. Schools for girls are first mentioned in London and Boston in the 15th century, taught by men or women and catering to the daughters of wealthier townspeople, sometimes taking in small boys as well. With some notable exceptions girls tended to be schooled in English or French rather than Latin and in reading rather than writing; their education was general and informal rather than specialized and formal. A few women nevertheless learned enough to become authors, especially in the 12th and 15th centuries.

Teachers of Latin, in both monasteries and town schools, were inventive in

helping pupils master the language. The Anglo-Saxons and Celts were the first in Europe to devise grammars for non-Latin speakers, and Ælfric of Eynsham (ca. 945–1020) wrote a Latin grammar in English as well as a Latin *Colloquy* about everyday life to capture his students' interest. The grammar-school curriculum included the study of grammar and vocabulary, using texts in verse or in question-and-answer forms that were easy to remember. Pupils practiced writing sentences and formal letters (*dictamen*), while disputations and speeches developed oral skills. Poetry was studied and written, and logic and philosophy were sometimes learned, especially in monastic schools. Arithmetic, law, and commercial subjects, however, appear to have been taught by specialized private tutors or by employers, rather than in schools.

The later Middle Ages saw renewed activity in the writing of grammars by such men as John Cornwall (fl. 1344–49) and John Leland (fl. 1415–28), both in Oxford, which had the most influential schools of the day. Cornwall compiled the first Latin grammar since Ælfric to include an element of English, and Leland improved on this by writing a series of short, clear Latin grammars entirely in English, used until well into the Renaissance. Other 15th-century authors produced the first Latin-English and English-Latin dictionaries for schools, and collections of sentences (*vulgaria*) were written for pupils to translate, paralleling Ælfric's work by dealing with news, jokes, scraps of rhyme and folklore, and descriptions of the everyday world. Late-medieval grammar was in a flourishing condition when the arrival of humanist studies from abroad brought about further changes in the early Tudor period.

Science

Prior to the 12th century scientific knowledge in western Europe was largely that derived from Greek writings available through the Latin encyclopedists. There were compilations from Greek sources, such as Pliny the Elders *Natural History*; translations, such as those by Boethius (d. ca. 525) of parts of Aristotle’s *Organon*, and of Porphyry’s (d. 304) *Introduction to Aústotlēs Categories*’, commentaries, such as that of Chalcidius (fl. early 4th century A.D.) on Plato’s *Timaeus*; and more or less original writings inspired by Greek learning, such as Martianus Capellas (d. 439) *On the Marriage of Philology and Mercury*.

Bede (d. 735) was one of the greatest Latin encyclopedists. Although his encyclopedic *On the Nature of Things* (*Denatura rerum*) is based largely on Pliny, he presents the classical theories of astronomy, meteorology, and geography within the context of Christian theology. Bede was among the first to use the birth of Christ as the reference for dating, and his two treatises *On the Division of Time* (*De temporibus*) and *On the Reckoning of Time* (*De temporum ratione*) examine problems of calendars and chronology and contain information on astronomy, the annual determination of Easter, and the tides.

Because Boethius never completed his intended translation of all of Aristotle into Latin, the bulk of Aristotelian philosophy remained unknown in the West until its discovery, near the end of the 11th century, in Arabic translations in the great Muslim libraries of Spain and Sicily. Not only were Aristotle and other Greek philosophers translated into Latin for the first time in the 12th and 13th centuries, but so were more than a thousand years’ accumulation of critical commentaries, a corpus of Neoplatonic thought, and more recent Arabic and Jewish scholarship.

One of the first and foremost of the early translators from England was Adelard of Bath (fl. 1116–42), who traveled extensively in search of Arabic learning. His Latin translations of the astronomical tables of the Arab mathematician al-Khwarizmi (fl. 813–33) and Euclid’s *Elements* introduced trigonometry to the West. His summary and interpretation of the learning that he found in Arab texts, the *Quaestiones naturales*, discussed astronomy and astrology, meteorology, and the nature of humans, animals, and plants. Other

writings attributed to him include treatises on the abacus, the astrolabe, and falconry, as well as a revision of an earlier alchemical work.

A countryman of Adelard, Robert of Chester (fl. ca. 1150), helped introduce alchemy and algebra, previously unknown, to the Latin West through translations of *On the Composition of Alchemy* and al-Khwarizmi's *Algebra*. Other translators from England included Roger of Hereford (fl. 1170–1200) and Daniel of Morley (fl. 1180–90), both of whom translated astronomical works, as well as Alfred of Sareshel (fl. 1180–1220), who translated several works of Aristotle, including the *Physics*, and some alchemical works of the Persian philosopher Avicenna (980–1037). The translations, commentaries, and original writings of such English scholars show a distinct inclination toward the description of nature, rather than pure philosophy, and thus helped establish Oxford University as a medieval center for the study of the physical universe.

Translations from Greek and Arabic into Latin continued into the 13th century; an increasing number were made directly from Greek, offering improved versions of some previous translations from Arabic. At the same time this newfound knowledge was being assimilated by scholars and reconciled with Christian theology. This synthesis was due largely to the Englishman Alexander of Hales (d. 1245), the German Albertus Magnus (d. 1280), and the Italian Thomas Aquinas (d. 1274). While Alexander is the least familiar of the three today, he was actually the first to undertake a systematic interpretation of Aristotle—his *Metaphysics*, *Physics*, and other scientific writings—within the framework of Christian thought.

Of the many commentaries and popularizations written in the 12th century the textbooks by John of Sacrobosco (or Holywood) (d. 1244 or 1256?) on astronomy and mathematics were widely read and remained popular well into the Renaissance. His handbook on astronomy, *On the Sphere*, was the first European exposition of Ptolemy's *Almagest* and contributed to the acceptance of the Ptolemaic system over the less accurate system of Aristotle. John's *Common Algorism* was influential in the eventual adoption of Arabic numerals, which reached the West from India through the Arabs.

This 13th-century synthesis, which institutionalized Aristotelian thought within the church, effectively prevented progress in most sciences beyond the works of the officially sanctioned Greek philosophers. Physics and astronomy were notable exceptions; some of the first medieval advances in these fields came from Robert Grosseteste (d. 1253), the greatest English intellectual force of his time. He wrote some of the first and most influential European commentaries on Aristotle's *Posterior Analytics* and *Physics*, as well as treatises on calendars, calendar reform, astronomy, and cosmology. He held that the stars consist of the same elements and are subject to the same laws as the earth.

Grosseteste's own cosmology, derived from both Ptolemy and Aristotle, is noteworthy for the central role it assigns to light, identified with the light of God. As a proponent of the "light metaphysics" he believed that an understanding of the nature of light would help reveal the mystery of God to man, and he is best known for his theoretical and experimental work on optics. He was one of the first to recognize and promote the importance of observation and experiment, coupled with logical and mathematical analysis in the study of nature.

Among the followers of Grosseteste, Roger Bacon (d. ca. 1292) is the best known, though his enduring fame seems to rest more on his elaboration of Grosseteste's ideas than on his own work. He was already an outstanding scholar in theology and philosophy before turning to natural philosophy and mathematics at Oxford. His career, however, was a curious one. While claiming to have spent more than £2,000 of his own money on books, instruments, and experiments during a twenty-year period, he made no substantial contribution to any science. Bacon was a fervent believer in alchemy, magic, and astronomy, beliefs that caused him continuous trouble with the church. After his death his scholarly writings were quickly forgotten, but his legendary fame as an alchemist and necromancer persisted for centuries.

Bacon was successful in spreading ideas about the importance of experiment and mathematical analysis, and by the beginning of the 14th century there were vigorous debates over the proper role for induction in the study of nature. Two of Grosseteste's philosophical heirs, John Duns Scotus (ca. 1266–1308) and William of Ockham (ca. 1285–1347), were prominent participants in these debates. Duns Scotus advocated the need to distinguish between empirical generalizations, as indications of *how* natural events occur, and causal laws, as indications of *why* they occur.

Ockham argued for the necessity of induction from the observation of particular instances, as the only knowledge possible, rather than deduction from supposed universals handed down by authority. His ideas formed the basis for the school of thought known as nominalism, though today he is remembered mainly for the principle of analytical parsimony known as "Ockham's razor," which states that assumptions should be kept to a minimum needed. In addition to his philosophical treatises he wrote commentaries on Aristotle, including the *Physics*; his unfinished *Natural Philosophy* contains a novel treatment of place, time, and motion.

These are the same concepts at the heart of the work carried out in the second quarter of the 14th century by the so-called *calculatores*, the calculators, of Merton College, Oxford. Thomas Bradwardine (ca. 1290–1349), John Dumbleton (fl. 1330–1350), Richard Swineshead (fl. 1340–1355), and

William Heytesbury (d. ca. 1372), the most famous of the *calculatores*, are credited with at least four significant contributions to the science of mechanics, including the mean-speed theorem. That theorem asserts that “a body moving with a uniformly accelerated motion covers the same distance in a given time as if it were to move for the same duration with a uniform speed equal to its mean (or average) speed” (Lindberg, 1992: 300). Of the various proofs of the theorem in the Middle Ages that of the Paris philosopher Nicole Oresme (ca. 1320–1382) was one of the best known and provided the basis for Galileo’s treatment of freely falling bodies.

Galileo’s use of results from the medieval natural philosophers shows that science persisted and in some cases even flourished during the Middle Ages. Just as the great plays of Shakespeare emerged out of a long—and now largely unknown—tradition of medieval drama, the Scientific Revolution arose from an even longer tradition of medieval thought and study on natural phenomena.

Scientific and Medical Writings

Treatises on science and medicine from medieval England survive in considerable numbers in several languages: in Latin and OE until the Norman Conquest; in Latin and Anglo-Norman until the second half of the 14th century; and in Latin and, increasingly, ME from the second half of the 14th century to 1500. Such writings, particularly those in Latin, must be understood as part of the larger European tradition of scientific and medical texts (see Thorndike, *History*, 1923–34; Siraisi, 1990; and, for specific authors, the *Dictionary of Scientific Biography*). The earliest medieval Latin texts were monastic, but monastic learning was joined by cathedral schools in the 12th century and by university study from the late 12th century until the end of the Middle Ages; Latin texts are catalogued by Thorndike and Kibre. In addition a great many texts written in vernacular languages, often outside traditional institutions, survive from both the early- and late-medieval periods. Upward of 8,000 OE and ME scientific and medical texts are extant (Voigts and Kurtz).

Surviving scientific texts from the Anglo-Saxon period have largely to do with the reckoning of time. Bede (672/73–735) wrote two important Latin treatises to address the need for ascertaining the liturgical year, *De temporibus* (703) and *De temporum ratione* (725). These texts determine calendrical usages still applicable, such as the modern dating system based on the Christian era (A.D.). Bede treated other subjects with originality as well; for example, *De temporum ratione* formulates a law of tidal action. He also compiled *De natura rerum* (703), an encyclopedia drawing heavily on Pliny's *Natural History*.

Bede's first treatise on time was the major source of the *Enchiridion* (or *Manual*) compiled in 1011 by the monk Byrhtferth of Ramsey; it was written in a mixture of Latin and OE. Likewise at the beginning of the 11th century the abbot Ælfric drew on all three of Bede's scientific works for his OE *De temporibus anni*. A number of short OE texts dealing with calendrical questions were also composed in Anglo-Saxon England. Another OE scientific text was the early-11th-century *Lapidary*, deriving from earlier Latin works.

The largest body of vernacular writing from the pre-Conquest period was medical. In addition to glossed recipes, charms, and a few short texts scattered through a number of manuscripts five major OE medical works survive. The five include four remedy books—*Leech book* I and II, the *Lacnunga*, and the Greek-titled *Pen Didaxeon*—and a large compendium (surviving in four copies) comprising the *Herbal* of Pseudo-Apuleius, an herbal wrongly attributed to Dioscorides, and two late Roman texts on medicines derived from animals. The manuscripts for all these medical treatises were copied in the last two centuries of the Anglo-Saxon period, but the texts seem to incorporate earlier material. Both Latin and OE medical texts from the Anglo-Saxon period are practical rather than theoretical and derive mostly from Roman medicine, although a recent focus of study has been the Greek sources behind some texts.

After the Norman Conquest vernacular English scientific and medical texts were eclipsed by those written in Latin and Anglo-Norman; except for medical recipes almost nothing written in English survives from post-Conquest England until after 1350. Latin texts on the calendar (*computus*) continued to be produced, and a number of important Latin treatises were written in the 12th century by Englishmen who traveled on the Continent. For example, Alexander Neckham (1157–1217) compiled an encyclopedia titled *De naturis rerum* (ca. 1195); its first two books (of five) deal with natural history.

Other 12th-century English travelers to the Continent played a major role in the introduction of Arabic science—and Greek science via Arabic texts—to the West. These include Adelard of Bath (fl. 1116–42; *Quaestiones naturales*); Daniel of Morley (fl. 1180–90; *Liber de naturis inferiorum et superiorum*), and Alfred of Sareshel or Shareshull (fl. 1180–1220; *De motu cordis*). Daniel, Alfred, and Roger of Hereford (fl. 1170–1200; *Computus; Theorica planetarum*) are associated with the important 12th-century center of scientific study at the cathedral school of Hereford.

The writings of these Hereford masters influenced the study of science at Oxford, particularly the writings of Robert Grosseteste. From the 13th century most Latin scientific writing in England appears to have emanated from the universities, especially Oxford, where texts deriving from the continental reception of Arabic learning were known. A number of important 13th-century Latin texts were written by three Oxford Franciscans, Bishop Robert Grosseteste (ca. 1170–1253), Roger Bacon (ca. 1213/19–ca. 1292), and Archbishop John Pecham (or Peckham, ca. 1230–1292); all are known for their writings on optics and astronomy.

Grosseteste's scientific writings, composed between 1220 and 1235, include his *De iride* and *De sphaera*, which advanced the study of refraction and cosmology, and his *De lineis, angulis, et figuris*, which deals with the application of mathematics to the natural sciences. Roger Bacon's most

important scientific treatise is the *Opus maius*; part 4 deals with the importance of mathematics, and part 5 (titled *De perspectiva*, a work that circulated independently) advances Grosseteste's optics in its treatment of lenses. Bacons arguments for calendrical reform were also ahead of his time. His treatise on aging (*De retardatione accidentium senectutis*) circulated widely in late-medieval England, in both Latin and English translation. In later centuries a number of Latin and ME texts, especially alchemical treatises, were wrongly attributed to Bacon because of his reputation as an alchemist. Although John Pecham's writings are less innovative, his *Perspectiva communis* has been called the most popular medieval text on optics.

A great deal of scientific and medical lore was also compiled by another 13th-century Franciscan, Bartholomaeus Anglicus (fl. 1230–50), in an encyclopedia titled *De proprietatibus rerum*. This compendium was probably the most popular encyclopedia of the Middle Ages; it was translated into ME by John Trevisa in the late 14th century, and Trevisa's translation—in its printed form—was still in use 350 years after the work was originally composed, by Shakespeare and his contemporaries. Another 13th-century scientific writer of considerable influence was John of Holywood, better known as Sacrobosco (d. 1244 or 1256?), probably first educated at Oxford. His major writings, however, on mathematics (*De algorismo*), on calendrical reform (*De computo*, a work that suggested the Gregorian calendar reform of 1582, which was adopted in England in 1752), and on cosmology and astronomy (*De sphaera*), were written in Paris. *De sphaera*, arguably the most popular astronomical treatise of medieval Europe, became the first printed book on astronomy (1472) and continued to be used as a textbook into the 17th century.

In the late 12th and 13th centuries three Englishmen were responsible for important Latin medical treatises written on the Continent. Ricardus Anglicus's *Micrologus* (late 12th century) was a compendium of medical knowledge at Salerno and Montpellier, two major medical centers of Europe; Henry of Winchester (early 13th century; *De naturalibus et medicinalibus*) was a Montpellier master. The most influential of these medical writers was Gilbertus Anglicus (fl. ca. 1230), whose *Compendium medicinae*, a practical compilation incorporating scholastic methods, circulated in Latin and later in English translation.

Vernacular medical texts in 13th-century England were written almost exclusively in Anglo-Norman. Anglo-Norman recipe books from the 13th century were joined by Anglo-Norman translations of surgeries and more theoretical texts in the 14th.

In the 14th century Latin medical texts by Englishmen were written in England rather than on the Continent, as had previously been the case. John of Gaddesden compiled his *Rosa anglica* in the first half of the 14th century, and

Simon de Bredon (d. ca. 1368) composed a lengthy, incomplete medical treatise called the *Trifolium* (in addition to mathematical and astronomical writings). Both Gaddesden and Bredon were associated with Merton College at Oxford. By the end of the 14th century Latin medical and surgical treatises were also being written outside the university. The *Breviarium Bartholomaei* of John of Mirfield was compiled in London. The surgeon John Arderne of Newark was apparently not university-educated, although he was well read in treatises by university teachers of surgery on the Continent. Arderne was the author of a number of texts written after 1370, the best known of which deals with the surgical treatment of anal fistula. His works were soon translated into English.

In the Latin scientific tradition of 14th-century England the Oxford-educated abbot of St. Albans, Richard of Wallingford (ca. 1292–1336), wrote a number of texts on mathematics, time, astronomy, astrology, and astronomical instruments. His *Quadripartitum* has been called the first medieval treatise on trigonometry. His texts on instruments dealt with his own inventions, the most famous of which (*Tractatus Albionis*) was the “albion” (a pun on “all-by-one”), an equatorium—a device for calculating planetary positions—with ancillary instruments. At least two of his texts, his *Exafrenon* and his *Declarationes*, circulated in English.

Another genre of 14th-century scientific writing was the *kalendarium*, incorporating astronomical information in text and tables. The tables of planetary positions derive from the so-called Alfonsine Tables (associated with Alfonso X of Castile) and enable an astronomer to compute positions of celestial objects for any point in time, calculation that is essential to astrology as well as astronomy. Best known among 14th and 15th-century Englishmen responsible for *kalendaria* were William Rede, John Somer, Nicholas of Lynn, John Holbrook, and John Somerset.

From the standpoint of modern science perhaps the most important scientific writings produced in 14th-century England were those of the mid-century writers on what we now call physics, especially mechanics—the so-called *calculatores* associated with Merton College at Oxford. Treatises by Thomas Bradwardine (ca. 1290–1349), Richard Swineshead (fl. 1340–55), and William Heytesbury (d. ca. 1372) articulate mathematical laws on motion, velocity, and resistance. These concerns with what we now call laws of physics were largely the outgrowth of the philosophical analysis of problems in logic, some of them known as “sophisms,” puzzling propositions to be resolved by logical rules and sometimes by mathematical calculation. A typical text is the *Regulae solvendisophismata* (*Rules for Solving Sophisms*) of William Heytesbury.

Bradwardine’s *Geometria speculativa* also addresses the relationships between mathematics and philosophy.

The 15th century is often seen as a period of stagnation in Latin scientific and medical writing produced in England, but a considerable amount of Latin alchemical writing, much of it falsely attributed to Roger Bacon and the 13th- to 14th-century Catalan philosopher Ramón Lull (including texts actually translated in England from Catalan into Latin), was produced in the later Middle Ages.

In contrast to the declining production of Latin treatises in the late 14th and 15th centuries there was in this period a remarkable surge of interest in translating scientific and medical treatises into ME and in composing texts in the vernacular. The best known of such 14th-century efforts are two texts on astronomy and astronomical instruments, the *Treatise on the Astrolabe* by Chaucer and *The Equatorie of the Planetis*, perhaps also by Chaucer. Another 14th-century figure, the Dominican friar Henry Daniel, translated (and apparently compiled) both a lengthy treatise on uroscopy, which contains much other information on such topics as physiology and astronomy, and a text on herbal medicine. The late 14th century also saw the translation of the encyclopedia of Bartholomaeus Anglicus by John Trevisa and of the Latin writings of the surgeon John Arderne, as well as the composition in the 1390s of what appears to be an original English-language surgery treatise by an anonymous London surgeon.

The translation—and to a lesser degree composition—of scientific and medical writings in English continued unabated in the 15th century. However, only a few of these texts are available in modern editions: Trevisa's translation of Bartholomaeus's encyclopedia, some remedy books, two versions of one of the several gynecological texts of the period, the compendium of Gilbertus Anglicus, and surgery texts by a number of authors (Arderne, Lanfranc, two versions of Guy de Chauliac, and a text wrongly attributed to Thomas Morstede). The rest must still be consulted in manuscript.

Other unedited and unstudied ME texts include translations of other continental surgery treatises, a number of plague treatises, and translations of medical writings of Galen, Hunayn ibn Ishaq, Constantinus Africanus, Roger Bacon, Benvenutus Grassus, Petrus Hispanus, Arnald of Villanova, and Bernard of Gordon. ME translations and translations-with-commentary of scientific texts by Haly Abenragel, Abraham ibn Ezra, Roger Bacon, and Regiomontanus also survive, as do the ME verse alchemy of Thomas Norton (fl. 1477), alchemical writings ascribed to George Ripley (1470s), and many anonymous ME alchemical treatises. The study of these writings, singly and collectively, remains a desideratum.

Scientific Manuscripts, Early

Most medieval libraries possessed little scientific material beyond a few treatises on the subjects of the quadrivium: Boethius for arithmetic and music; Euclid for geometry; and Ptolemy's *Almagest* for astronomy. These might be supplemented by an anonymous *Algorismus*, or elementary arithmetic book, a *computus* to reckon astronomical time, and treatises on the astronomical instruments, such as the sphere and astrolabe. Anything beyond this depended on whether there was someone in authority who was involved in the subject, and the illustrated manuscripts here discussed gain much of their interest for just that reason.

In 986 Dunstan invited Abbo of Fleury to teach at Ramsey. Abbo stayed for only two years, but this contact with Fleury brought about the introduction to England of two separate bodies of learning that made Ramsey the dominant center of monastic science in the early period. The first was Cicero's translation of the astronomical poem by the 3rd-century B.C. Stoic Aratus, usually called the *Aratea*. The ultimate source of the English manuscripts of the *Aratea* was the 9th-century Fleury Book (BL Harley 647), which contains a page written in an English hand datable to around the time of Abbo's visit. As a poem the *Aratea* has its merits, but it is short on astronomical information. It therefore attracted a scholarly gloss to make it more informative, and in Harley 647 the poem is written below the drawings of constellations while the

Fig. 121. Byrhtferth's diagram of the harmony of the "physical and physiological fours" (Oxford, St. Johns College 17), fol. 7v. Reproduced by permission of the President and Fellows of St. Johns College, Oxford.

gloss is written inside their bodies. This scheme was not universally adopted in England, but it is found in BL Cotton Tiberius C.i, a Peterborough manuscript datable to ca. 1122.

As well as the *Aratea* Tiberius C.i contains a series of computistical and cosmological diagrams with accompanying text traceable directly to Abbo

himself. Byrhtferth, Abbo's pupil, made copious notes, and although the original of these does not survive, a copy made around 1110–11 (Oxford, St. Johns College 17), richly illustrated with diagrams (fig. 121), reveals that Abbo's teaching was based largely on Bede's *Denatura rerum*, Isidore's *Etymologies*, and Abbo's own writings. The diagrams show in graphic form a network of microcosmic and macrocosmic relationships between humankind and the cosmos. BL Harley 1506, written at Fleury in the late 10th century, contains a similar combination of Abbo's teaching and the *Aratea*, with illustrations by an Anglo-Saxon artist.

The last of the English astronomical manuscripts in this tradition, before the massive penetration of Arabic science into Europe, are Bodleian Library, Bodley 614 (ca. 1120–40), and Digby 83 (perhaps a decade or two later); and indeed the latter shows some effect of this in its use of Arabic names for the planets.

The microcosmic cosmology taught by Abbo provided a theoretical connection between astrology and medicine that was to make the two disciplines inseparable. Durham, Hunter 100, a Durham manuscript of ca. 1100–20, combines cosmological works and the *Aratea* with various medical texts, including remedies and cautery illustrations.

The Marvels of the East is a 4th-century account of the fabulous peoples encountered on an imaginary journey to India: people with dogs' heads (*Cynocephali*), with horses' hooves (*Hippopodes*), with faces in their chests (*Lemniae*). Its earliest appearance in its complete and illustrated form is in Anglo-Saxon manuscripts of ca. 1000: BL Cotton Vitellius A.xv (which also contains *Beowulf*), with an Anglo-Saxon text, and BL Cotton Tiberius B.v, in Latin. In the latter, and in Bodley 614, the *Marvels* is found in combination with the astronomical and cosmological treatises discussed above, but it also found its way into bestiaries like Westminster Abbey 22.

Scogan, Henry (13617–1407)

An esquire in Richard *II*’s household and later tutor to the sons of Henry IV. In his *Moral Balade* Scogan urges the princes to cultivate virtue; to help substantiate his point he quotes the whole of Chaucer’s *Gentillesse* in his own poem. Chaucer’s *Envoy to Scogan* is probably addressed to this man.

Scottish Literature, Early

The greatest poets of late-medieval Scotland—Robert Henryson, William

Dunbar, and Gavin Douglas—did not flourish in a cultural vacuum. There existed from the 14th century onward a lively tradition of vernacular poetry, not wholly separate from that of England yet highly distinctive. (Early Scottish prose is less sophisticated, and its character is largely didactic or theological. Literature in Gaelic does not fall within the scope of this volume.)

Our picture of this literature, however, is inevitably distorted, since much has been lost. Dunbar, in “Timor Mortis Conturbat Me” (by later editors called “The Lament for the Makaris”), names 21 poets “of this cuntre”; some of these are still well known, but of others not a scrap of verse remains. Few love songs or religious lyrics survive from medieval Scotland; the cataclysm of the Reformation swept away much frivolous secular verse as well as overtly “papistical” works. The Reformers were likewise responsible for the destruction of most medieval Scottish drama, leaving Sir David Lindsay’s powerful morality play, *Ane Satyre of the Thrie Estaitis*, strangely isolated. Nonetheless, much excellent and varied poetry has been preserved, particularly in the great 16th-century manuscript anthologies associated with the names of John Asloan, George Bannatyne, and Sir Richard Maitland.

Scotland was a small, impoverished country on the northern fringe of Europe, but it was not culturally isolated nor were its writers parochial. For political reasons Scotland was particularly receptive to the influence of France, its “Auld Ally.” Many works were free translations from Latin and French: some of these were fairly short, such as the formal lament for the young Scottish princess Margaret (d. 1445), briefly married to the dauphin, later Louis XI of France; others were compositions on a larger scale, such as *The Buik of Alexander* (ca. 1438) and the prose writings of Sir Gilbert Hay. Latin, in Scotland as elsewhere, was not only the language of the church but the medium of education—the essential means of acquiring knowledge of law, theology, history, rhetoric, and ancient poetry. By the end of the 15th century there was also a growing interest among Scottish scholars in the new humanistic ideas emanating from Italy; one fruit of this was the *Eneados*, Douglass celebrated translation of Virgil’s *Aeneid* (1513).

But England, despite being nicknamed “the Auld Enemy,” was Scotland’s closest neighbor. It is clear that English books of many kinds—manuscripts at first and printed editions later on—circulated in Scotland. Dunbar referred casually to the story of *Bevis of Hampton*, and Douglas denounced Caxton, in spirited terms, for mangling Virgil in Caxton’s *Eneydos* (1490). The first books to be printed in Scotland (ca. 1508) included the English romance *Eglamour* and Lydgate’s *Complaint of the Black Knight*. Glowing tributes to Chaucer, Gower, and Lydgate were voiced by Scottish poets from the early 15th century onward; the influence upon them of Chaucer and the courtly verse associated with his name, although sometimes denied, is incontrovertible. They, no less

than their English contemporaries, regarded Chaucer as the master of a type of poem then the dominant literary form—the dream allegory—and as the model for a new, subtle, and sophisticated mode of writing.

Chaucer's practice also popularized the seven-line stanza known as rime royal, introduced to Scotland in *The Kings Quair* (1424?). This, the finest medieval Scottish love poem, is clearly indebted to *Troilus and Criseyde* and also to works by Lydgate. Later Scottish poets, though in no way servile imitators, also learned much from Chaucer and delighted to acknowledge this. Henryson's *Testament of Cresseid*, Dunbar's *Thrissill and the Rois*, and Douglass *Palice of Honour* often echo Chaucerian phrases, themes, and motifs yet are highly original poems.

But there was great diversity of theme and subject. Medieval Scots were interested in history, particularly that of their own country. This taste was supplied not only by Latin chronicles but also by such vernacular poems as John Barbour's *Bruce* (ca. 1375), which celebrated Robert Bruce (1274–1329), the hero of the War of Independence; Andrew Wyntoun's *Orygynale Cronykil* (ca. 1420); and Harry's popular and influential *The Wallace* (1470s). Scotland also shared the European taste for stories about Troy, Alexander the Great, Charlemagne, and King Arthur. Most of the important medieval literary kinds and genres were known, though they sometimes reached Scotland belatedly: fabliaux and romances, saints' lives and other religious verse, and dream poems of widely different types. The beast fable, practiced superbly by Henryson, was ingeniously combined with many other topics in Richard Holland's *Buke of the Howlat* (ca. 1448). The didactic tradition of the *speculum principum*, or "mirror for princes," was remarkably popular in the late 15th century; it figures in works as various as Henryson's *Fables*, Dunbar's *Thrissill and the Rois*, and the anonymous *Thre Preistis of Peblis* (1490?). One minor literary form, the testament, enjoyed a vogue among Scottish poets; the poet of *King Hart* (formerly attributed to Douglas), Henryson, Dunbar, and Lindsay all put it to varied use.

A striking feature of Scottish poetry in the 15th and early 16th centuries was a rich tradition of descriptive poetry: this includes the formal "erbere," or walled garden, of *The Kings Quair*, the wintry opening of Henryson's *Testament of Cresseid*, and the glittering dawn scene in Dunbar's *Goldyn Targe* and culminates in the grand panoramic landscapes of the "Nature" Prologues to Douglas's *Eneados*. Scottish poets also excelled at storytelling; this is particularly true of Barbour and Henryson but is also evident in the alliterative *Rauf Coifyear*, the fabliau-type *Fnars of Berwick*, and the many short comic tales in the Bannatyne Manuscript. This manuscript also contains a distinctive group of short pieces—including *Kynd Kittok*, *The Gyre Carling*, *King Berdok*, and *Colkelbie Sow*—that blend comedy with the supernatural.

They have much in common with Dunbar's comic fantasies, and it is clear that he shared the same imaginative heritage as these poets.

Another strength of Scottish poets was their metrical competence; they were not afflicted by the clumsiness that characterized much contemporary English verse. Certain forms, notably the octosyllabic couplet and rime royal, were popular, as in England, but some poets—Dunbar in particular—seemed to enjoy experimenting with stanzas of varied shape and length. There was an impressive tradition of alliterative poetry; it reached Scotland late, flourishing toward the end of the 15th century, at a time when it was becoming moribund in England. Most Scottish poets favored the combination of alliteration with an elaborate thirteen-line stanza; the unrhymed form occurs only in Dunbar's *Tua Mariit Wemen and the Wedo*. Alliterative verse was employed for straight narrative—as in the Arthurian romance *Golagros and Gawane*—but was increasingly restricted to comic and satiric purposes, as is evident in Henryson's "Sum Practysis of Medecyne" or Douglas's Eighth Prologue.

Much Scottish verse, as so often in the medieval period, was anonymous. Even when the names of poets survive, we possess little information about their lives and careers. Many were "clerks," or educated men, with university degrees and often held some kind of office in the church: Barbour was archdeacon of Aberdeen, Holland was a precentor of Moray Cathedral, and Douglas became bishop of Dunkeld. It is evident that some poets, such as Holland and Douglas, had aristocratic patrons. Others served in the royal household. James IV's servitors included not only Dunbar but several of his fellow poets—Stobo, Mersar, Walter Kennedy, and the notary Patrick Johnston, who devised dramatic entertainments for the palace at Linlithgow. Kings dispensed patronage in various ways, by bestowing fees, church benefices, and offices at court. Most of the poets whose names we know were associated with the eastern Lowlands; this was the richest and most fertile part of Scotland, the most exposed to continental influences, and also the area where Scots—as opposed to Gaelic—was predominantly spoken.

Lowland Scots was a northern descendant of Anglo-Saxon. In Barbour's time the language was not strikingly different from northern ME, but during the 15th century it diverged increasingly from English in phonology, spelling, and vocabulary. Until the end of the 15th century most vernacular writers called their tongue "Inglis"; Douglas was one of the first to distinguish his own language from English and to call it "Scottis." In literary Scots there existed considerable variety of usage, a variety largely determined not by regional dialect but by style and subject. The diction of narrative and comic verse thus tended to be densely Scottish; but poets who sought a refined and elegant style, and to emulate Chaucer, employed anglicized and often archaic words, spellings, and grammatical forms, along with more complex syntax and the

“colours” of rhetoric. Late-medieval Scottish writers had available to them a remarkably wide range of linguistic options; the most confident and experimental among them, such as Dunbar and Douglas, gained much from this diversity.

Screen Facades

A screen facade is one in which the lower roofs of the aisles in the basilican section typical of English medieval great churches are invisible behind masonry screens that extend the height of the central nave outward to the line of the aisle walls or beyond. In English architecture such screens are usually

covered with horizontal layers of blind arcading and sometimes with statuary. The best-known examples are the facades of Wells ([fig. 122](#)) and Salisbury cathedrals, both of approximately the second quarter of the 13th century.

Wells and Salisbury differ in the details of their decoration, but a more substantive difference lies in their lateral terminations, which are true towers at Wells, set beyond the lines of the aisle walls, but at Salisbury are only stair turrets that project slightly. These two plans have separate genealogies that extend back into 12th-century English Romanesque architecture. The screen with stair turrets was used for the west facades of Malmesbury and Croyland abbeys, while the plan with towers can be found at St. Botolph's Priory in Colchester, at Earls Colne Priory nearby, in an aborted west facade at St. Albans Abbey, and in the west front of St. Marys Priory in Coventry, which was probably contemporary with Wells and Salisbury, if not later. While there are Romanesque predecessors for early Gothic screen facades, there are no late Gothic successors, for later churches tended toward simple sectional facades or the twin-tower facade most common in French Gothic.

Another screen facade of roughly contemporary date with Wells and Salisbury is that of Lincoln Cathedral. The difference is that the Lincoln facade is a composite of three periods, late 11th century, the 1140s, and the 1230s. The first campaign produced the beetling rectangular facade of a castle keep, the second added sculpture and west towers, and the third heightened and extended laterally the Romanesque facade, framing it with octagonal stair turrets. As in the two western cathedrals, the early Gothic portion was covered with blind arcading.

In contrast to these screen facades proper there were also a number of western transepts in English architecture with facades similar to those of the true screens, stretching horizontally across the church without acknowledgment of the section of nave and aisles behind them. Romanesque examples are found at Bury St. Edmunds, Ely, and Kelso, and early Gothic examples at Peterborough and Kilwinning. Ely and Kelso have central west towers and Peterborough its idiosyncratic portico of gargantuan size, but they share with each other and with the true screens discussed above a sense of free facade composition, similar to that found with different architectural forms in western France or Italy, untrammelled by any need or desire to reflect the shape of the building they preface.

Scrope, Stephen (ca. 13967–1472)

Translator of didactic works. Scrope's life received its shape principally from his widowed mothers marriage to Sir John Fastolf (1409). Although he later blamed Fastolf for disinheriting him as well as allowing him to be disfigured in his youth by an illness, Scrope served Fastolf in France, apparently as his purchasing agent at Honfleur (before 1420). By the time Scrope appears in the Paston letters as a suitor of Elizabeth Paston (ca. 1449), he has fathered a married daughter. His marriage to Joan Bingham (ca. 1454) produced John, his heir. Fastolf's interests overshadowed Scrope's until Fastolf's death (1459); nor did Scrope prosper thereafter.

Notwithstanding the tensions between them Scrope translated at least two works of courtesy and moral instruction for Fastolf: Christine de Pizan's *Epistle of Othea* (ca. 1440) and the *Diets and Sayings of the Philosophers* (ca. 1450). Couched as advice to a prince (Hector), the *Epistle* contains 100 verse texts, the last 95 of which are quatrains, each supported by a gloss and a prose allegorization. The prose *Diets*, a translation of the French *Dits moraulx*, collects the words and actions of Greek philosophers. Some scholars also credit Scrope with translating the *Mirror of the World* from French and writing *The Book of Noblesse*. Scrope's translations are central to understanding the transition of English prose to its early-modern forms.

Sculpture, Anglo-Saxon

Early Sculpture

Stone sculpture was an art form largely lost in England after the disintegration of Romano-British society during the 5th century. Although the production of carved stonework may have continued in the western parts of mainland Britain during the 5th to 7th centuries, and although some Anglo-Saxons may have been aware of its existence, stone carving does not seem to have been an art form practiced among the Anglo-Saxon population of England before the arrival of the Christian missions from the Mediterranean world at the end of the 6th century.

Because the art of stone carving was introduced through this (ecclesiastical) medium, most surviving early sculpture seems to have emerged within a religious context; it was a Christian art form, one deployed by the church, and so dependent on its establishment and well-being in England. Thus, before the late 9th century (and the redistribution of land and wealth, particularly in the areas of Scandinavian settlement), stone carving in Anglo-Saxon England was limited to monuments and functions that served primarily Christian purposes. It was used to decorate stone churches, it was used for funerary monuments (gravestones, tombs, and shrines), and it was used for the freestanding monumental crosses.

It is difficult to overestimate the initial impact of these monuments on the Anglo-Saxon landscape. Not only was the earliest stone carving an unusual phenomenon, it was also probably highly colored. Remains of gesso and paint have survived on a number of fragments, such as a Crucifixion plaque from Penrith (Cumbria) that retains traces of black, green, and red coloring. While this would have clarified greatly the carved detail, it would also have made monuments, such as the freestanding crosses, a remarkable sight, attracting attention to the existence of the church in Anglo-Saxon England and making more memorable the message of that church.

The exact chronology of a great deal of the material is uncertain, and in the absence of clear documentary evidence the dating of most individual monuments is dependent on stylistic, art-historical comparisons. As stone sculpture in its initial phases seems to have been produced in association with the earliest stone churches, comparison of the decorative motifs appearing on these early carvings has been used to develop chronologies for Anglo-Saxon sculpture as a whole. However, much debate surrounds the questions of chronological models based upon supposed stylistic degeneration or on the identification of Carolingian prototypes, especially within the context of the localized areas of influence of the workshops that produced the sculpture. As a result the dating of individual monuments can vary, but usually only within a 50- or 100-year time bracket.

The exact development and inspiration of the sculptured monument forms current in Anglo-Saxon England is also unclear, although it seems that most forms coexisted throughout the period. The earliest sculpture, that which formed part of the decoration of the new ecclesiastical stone buildings in the latter half of the 7th century, includes church furnishings, such as the stone abbot's or bishop's seat from Hexham (ca. 672), as well as architectural sculpture in the form of carved stringcourses, monumental low-relief figures, sundials, carved imposts, and ornamented door and window openings, used to decorate the outer fabric of buildings, as at Wearmouth (ca. 675–89); inside, friezes of animal, vinescroll, and geometric patterns were used to enhance the walls, as at Jarrow (ca. 685). Some of the later, 9th-century friezes and panels decorated with figural ornament, such as images of Christ, the Virgin, angels, and saints (e.g., Fletton, Northamptonshire), may have served additional purposes, perhaps functioning as sculptured icons, objects of veneration intended to inspire the viewer with awe and reverence.

Sculpture was also used from an early date for the production of funerary monuments. Initially, and almost exclusively at sites linked to the Celtic mission established at Lindisfarne in the 7th century, stone was employed for small, carefully cut grave markers (the so-called pillow stones), often decorated with no more than the name of the deceased and a central cross whose form

was apparently inspired by the central crosses decorating the carpet pages of early insular manuscripts (e.g., the pillow stones from Lindisfarne). At Wearmouth and Jarrow, centers more closely associated with the Roman church, stone grave markers with central crosses were also produced, but these were larger monuments with more elaborate and deeply cut crosses, and the inscriptions were lengthier; these monuments are closer to the later Pictish cross slabs of Scotland in their general layout and appearance than the contemporary pillow stones of the Celtic foundations.

In the late 8th and 9th centuries sculpture was also used in funerary contexts for tombs and shrines in Northumbria and Mercia. The late-8th-century Hedda Stone at Peterborough is probably one of the earliest surviving Anglo-Saxon stone shrines, although its small size and apparently blocklike construction suggest that it is unlikely to have contained substantial human remains. However, the early-9th-century composite monuments at Hovingham in Yorkshire and Wirksworth in Derbyshire, of which only the front (at Hovingham) and the coped lid (at Wirksworth) remain, probably both contained the physical remains of a local saint; they functioned both as tombs and shrines, focal points of pilgrimage and worship. Both are carved with narrative figural scenes depicting events from the life of Christ and the Virgin Mary, scenes that refer the viewer to the Resurrection and consideration of the rewards of this life in heaven. Fragments of a similar coped monument exist at Bakewell (Derbyshire), and a number of the panels decorated with figural sculpture at Breedon in Leicestershire ([fig. 136](#); see **STONEWORK As ECCLESIASTICAL ORNAMENT**) are also assumed to have been part of a tomb or shrine.

At some point during the 8th century, and coexistent with the development of these various sculptured monument forms (architectural and funerary), it seems that freestanding decorated stone crosses were first introduced. The exact source of inspiration for these distinctive monuments is unclear, as, unlike architectural sculpture and stone funerary monuments, freestanding crosses were not a common feature of ecclesiastical art elsewhere in Europe. Archaeological evidence suggests freestanding totems were part of the Germanic Anglo-Saxon landscape (e.g., at Yeavering, Northumberland), and it appears that freestanding wooden crosses were part of the material culture of Celtic Christianity in the west of the British Isles. Adamnan's account of the life and death of St. Columba describes wooden crosses erected within the monastic complex of Iona, and in the 630s, when Oswald returned to Northumbria from exile among the monks of Iona, he is credited by Bede with raising just such a cross just before his battle at Heavenfield. It may be that the introduction of the art of stone carving by the Roman church fused with Celtic and local Germanic traditions in Anglo-Saxon England to produce the

freestanding crosses, especially at a time when the cult of the True Cross was gaining popularity with the elevation of a fragment of this relic at Rome at the turn of the 8th century.

Whatever their inspiration, stone crosses were important ecclesiastical monuments in Anglo-Saxon England. Comparatively few have survived in situ, but from those that have, and from documentary, archaeological, and art-historical evidence, it appears that they served a variety of purposes. Some were raised as boundary markers of estates and others as grave markers or commemorative monuments; some performed a complex liturgical role within ecclesiastical centers. The 8th-century cross at Bewcastle ([fig. 74](#): see HIGH CROSSES) stands in situ and has a lengthy runic inscription that, although badly worn, implies it was raised as a commemorative monument; its figural ornament and sundial suggest that it also had a liturgical function on religious occasions. Other crosses, however, have been badly damaged in subsequent centuries, many being destroyed by iconoclasts in the 17th century.

Fig. 123. Sandbach Crosses. Courtesy of A.J. Hawkes.

The original function of these monuments has to be interpreted largely from their surviving decoration. The inscriptions and figural iconography of the Ruthwell Cross, which has been reconstructed within the village church, imply complex references to the eucharist and the rites of Easter week, suggesting a primarily liturgical role for the cross within a religious (monastic) community.

The iconography of the two crosses (fig. 123) that have been reerected in the market square of Sandbach (Cheshire) suggests a more general appeal to a wider lay audience. It is concerned to proclaim the power and authority of the church as founded on Christ and his saints, while at the same time referring the viewer to the importance of the eucharist as the church's main sacrament. Although distinctions between monastic and episcopal churches were not clear in the early Anglo-Saxon period, it seems the Sandbach Crosses were more probably products of an episcopal center than a strictly monastic one, as was the Ruthwell Cross (figs. 111–14: see RUTHWELL CROSS).

The figural iconography of the sculpture can thus play an important role in our understanding of the earliest Anglo-Saxon stone carvings. But figural decoration was not a common feature of Anglo-Saxon sculpture; more usual were the plant scrolls and interlace patterns. The interlace of plait is the most common ornamental motif found on the sculpture, and although the large number of variations in its composition makes it difficult to categorize, identical patterns exist, and there seem to have been formal principles underlying its construction; recognition of this has led to various attempts at formal (and regional) grouping. The plant-scroll motifs, almost as common as interlace patterns in the decoration of Anglo-Saxon sculpture, were introduced into the artistic repertoire of Anglo-Saxon England together with the art of stone carving. Their theological significance was developed from the reference in St. John's Gospel (15:1–17) to Christ as the True Vine, but not being indigenous to the British Isles the insular carved representations of the vinescrolls vary considerably from the botanical plant; it is these variations that allow for regional and chronological analyses of the motifs and the monuments on which they appear.

The significance of early Anglo-Saxon sculpture lies in the fact that it was an art form alien to the Anglo-Saxon population of the British Isles and thus represents in its initial phases an essentially ecclesiastical medium. It appears to have performed functions over and above the decorative. Used to convey the developing institutional power and authority of the church, sculpture was also used for memorial purposes and as the focus for devotion and elucidation of the subtleties of Christian theology and dogma. Its decoration allows insight into the social context of the sculpture and into the possible developments of the medium.

Late Sculpture

Late Anglo-Saxon sculpture is generally understood to be that which was produced between the later 9th and 11th centuries in those areas of England lying beyond the traditional boundaries of the Danelaw, or in areas outside direct Scandinavian influence, such as Durham, where sculpture continued to be produced into the 11th century, using increasingly archaic (Anglian) decorative motifs and an old-fashioned iconography.

Most of the material that survives from this period, in geographical areas south of the Danelaw, indicates that there was a significant increase in sculptural activity in Anglo-Saxon Wessex and its satellite provinces and that much of the new carved stonework was produced to decorate renovated and rebuilt churches, probably as a result of the reforms to the church undertaken during the 10th and 11th centuries. Over five times as much sculpture survives from this later period as from the 7th to early 9th centuries, and approximately half of this later material represents architectural decoration, while less than a tenth represents the remains of monumental cross shafts; from the earlier period less than a third of the sculptural remains are architectural, while nearly half are cross-shaft fragments. This indicates a clear increase in sculptural production as well as changes in the function of carved stonework.

The surviving material also indicates that the number of centers producing the sculpture may also have increased. Whereas the earlier material seems to

have emerged from a limited number of sites in restricted areas, such as modern-day Kent, Hampshire, and Gloucestershire, the later material is more widely dispersed geographically, and most is not obviously associated with those ecclesiastical centers thought to have been so influential in the 10th-century reform movement. The similarities between the carved decoration and that of other artifacts, such as ivories, metalwork, and manuscripts, nevertheless shows that there was contact between the major ecclesiastical centers and those producing the sculpture. These similarities also help date much of the late Anglo-Saxon sculpture that has not survived in situ.

The architectural stonework, which constitutes the largest body of surviving late Anglo-Saxon sculpture, is extremely varied. It consists of a number of baluster shafts (e.g., from St. Augustine's Abbey, Canterbury), cable-decorated window frames (Breamore, Hampshire), pilaster bases carved with foliate motifs (Corhampton, Hampshire), ornamented capitals (Langford, Oxfordshire), friezes and carved stringcourses (Sompting, Sussex), numerous sundials (Corhampton, Hampshire), and a number of large-scale figural carvings. Most of these latter are composite reliefs depicting the Crucifixion (Breamore, Head-bourne Worthy, and Romsey in Hampshire [fig. 110: see ROMSEY ROODS]; Walkern, Hertfordshire; Langford, Oxfordshire [fig. 124]), but other figural scenes carved as single panels have also survived (such as the Harrowing of Hell at Bristol), as have panels carved with individual figures, such as those at Sompting (Sussex) and Daglingworth (Gloucestershire).

The mostly fragmentary remains of late Anglo-Saxon cross shafts indicate that round, as well as square- and rectangular-section, monuments were produced, while both freearmed and ringed cross heads were used. Most of the crosses seem to have been carved with foliate and interlace motifs, but a few, such as the fragments from All Hallows-by-the-Tower, London, did feature figural decoration.

Apart from the crosses and architectural sculpture, stone continued to be used for the production of funerary monuments in the late 9th to 11th centuries. This body of late Anglo-Saxon sculpture consists primarily of grave slabs, but the remains of some stone coffins and sarcophagi also survive (e.g., a coffin lid from Westminster Abbey). Most are decorated with panels of interlace set on either side of a median ridge, although gravestones decorated with figural ornament do survive, such as those from Newent (Gloucestershire) and Winchester Old Minster. It may well be that the limited decorative repertoire of these funerary monuments (and many of the cross shafts) represents the continuation of conservative traditions in these areas of sculptural activity, while the more varied architectural monument forms and their decoration reflect newer tastes.

The foliate ornament that decorates much of the late Anglo-Saxon sculpture

indicates that some of these tastes were introduced from the Continent and reflect the influence of a classicizing movement that transformed the earlier insular features. The tree scroll, for instance (found on early-10th-century pieces from St. Oswald's Priory, Gloucester; Braunton in Devon; Wells, Somerset), based on a central axial stem with fleshy tendrils and extravagant flourishes, shows how earlier, 9th-century, Anglian scrollwork was transformed by the incorporation of the Carolingian acanthus-leaf motif. This process of transformation is found on a larger scale on the 10th-century column at Wolverhampton, where small animals, similar to those featured in 9th-century Anglian work, are set in registers of plant scroll that have their nearest parallels in Carolingian art; the monument probably represents a 10th-century antique revival in late Anglo-Saxon sculpture.

The figural decoration of this sculpture also reflects the influence of Carolingian art, but in the large-scale architectural reliefs there is little that recalls earlier Anglo-Saxon work; many of the figures are stone versions of the "Winchester style," more usually associated with manuscript art of the period, and characterized by lively figures and the acanthus plant scroll. The large-scale relief angels that have survived, probably from Crucifixion scenes, at such churches as Deerhurst (Gloucestershire), Bradford on Avon (Wiltshire), and Winterbourne Steepleton and Stinsford (Dorset) demonstrate the characteristics of the fashion with their contorted bodies and complicated layers of drapery with kicked-out hems.

The iconography of the Crucifixion scenes themselves also shows the influence of Carolingian innovations. The robed figures of Christ featured at Walkern and Langford, for instance, probably depend on a type that was rare in western Europe after the 9th century but that saw a brief revival in France and Germany in the late 10th and 11th centuries. Likewise images of Christ depicted as "dead" on the Cross, with his arms and legs hanging in a contorted manner, were rare before the late 10th century, when manuscript illustrations began to reflect contemporary theological interpretations of the Crucifixion. The appearance of this iconographic type at Breamore and Langford suggests the strong influence of such continental developments.

The sculpture that has survived from the latter part of the Anglo-Saxon period, particularly in southern England, thus demonstrates a change in function and an increase in production and variety of monument form. Stone carving was still used essentially for religious purposes, with the continuing production of funerary monuments and crosses, but the increased use of stone for architectural decoration marks a dramatic change. Apart from these architectural contexts the range of decorative motifs is relatively limited, particularly in the choice of figural subjects, but the strong influence of French and German developments resulted in a new complexity in the iconography of

late Anglo-Saxon sculpture.

Sculpture, Gothic

Our understanding of Gothic sculpture will always be incomplete due to the enormous losses incurred largely during the 16th-century Dissolution of the monasteries. Sculpted roods and shrines, monuments that would have been included in the vast majority of churches, have all but completely disappeared. Wooden figural sculpture (with the exception of effigies) has also suffered enormously, although significant examples of this genre do survive in Scandinavia, where they were particularly popular in the later Middle Ages. Virtually all Gothic sculpture was originally brightly painted to a degree that we would consider gaudy today; the purity of the carved stone surfaces that we now associate with the material was never intended.

There is no sharp break between the end of the Romanesque style and the beginnings of Gothic sculpture. At the end of the 12th century Romanesque abstraction and expressionism gradually give way to the gentler, more naturalistic forms that characterize the Gothic. Perhaps most significantly draperies begin to reveal the form and movement of the figures they clothe, rather than simply defining contours and creating decorative patterns across the body's surfaces. There is also a growing interest in illusionism created through shade and highlighting and the play of refracted light. The transitional style is exemplified by the ca. 1200 polychrome oak Virgin and Child in the Victoria and Albert Museum, London (A.79–1925), from Langham Church, Essex. The seated wooden Madonna and Child is a Romanesque type of monument (the *sedes sapientiae*), and the Virgin retains the stiffness and frontality associated with the Romanesque; however, her facial features show a new softness and delicacy, and her body a new monumentality. Her robe falls in thick, soft folds, revealing the softly rounded forms of her arms and legs.

A true early Gothic style first emerges in England in the West Country in

the early 13th century at such sites as Worcester and Wells. The capitals in the east end of Wells Cathedral are carved with “stiff-leaf” foliage, an English reworking of the purely French foliage style used for the capitals of the choir at Canterbury Cathedral (1174–79) and characterized by crisp outlines and regular rhythmical patterns. The retention of comical figures (a man with toothache, a peasant pulling a thorn from his foot) is also a reflection of English taste; such figures were not popular in contemporary France. Many of these images (e.g., the ca. 1250 corbel heads and labels stops—carved end of a moulding—from Westminster Abbey) achieve a psychological depth not seen in any but the best Gothic portraiture.

While the figural sculpture on the west facade of Wells also responds to the new style, the development of Gothic figural sculpture in England is best studied through the corpus of memorial effigies. Here, too, developments begin in the West Country, where in the late 12th century workshops at Corfe were turning out Purbeck “marble” (a type of dark limestone) slabs with incised or shallow relief images. Early in the 13th century the Purbeck marblers appear to have formed the first workshops for the large-scale production of sculpture. By ca. 1240 the West Country workshops, particularly at Wells, added depth and movement to their effigies, carving figures in a greater variety of recumbent poses; first the arms were brought up to lie on the chest, then the legs were crossed. By the 1250s figures were deeply undercut and lavish details, such as foliage or architectural elements, were added, particularly by the London workshops. The 13th century was dominated by the Purbeck-marble workshops of London and the West Country.

In the 14th century the desire for rich polychrome surfaces led to the use of cheaper stone that could be decorated with gems and painted. Around 1340 alabaster became a popular material, probably due to its translucence. Less costly but equally ornate wooden effigies were also produced. The oak effigy of Robert Curthose, duke of Normandy (Gloucester Cathedral), carved ca. 1250, depicts the duke with crossed legs, his right arm reaching for his sword, as if ready to spring to the defense of the realm. A drawing of 1569 indicates that it was originally richly painted.

The pivotal event in the development of Gothic sculpture was the rebuilding of Westminster Abbey by Henry III in the 1240s. While it is certain that Henry employed West Country sculptors on this project, it also marked the beginning of a recognizable “London School” of sculptors. The heart of the program was the tomb of Edward the Confessor created at a cost of £4,000–5,000. Over the 13th and 14th centuries the tombs of the royal family, the most magnificent collection of English Gothic tombs, were grouped around that of Edward, creating a monumental royal shrine.

In addition to Edward’s shrine the rebuilding also necessitated a full range

of architectural sculpture. The best known of these are probably the censing angels in the triforium spandrels at the north and south ends of the transepts. The softly rounded faces, gentle smiles, and fluttering draperies of the angels show an awareness of French works (e.g., the Reims angels), but the poses of the Westminster angels are much more dynamic than those of their French prototypes.

The mannered swaying poses of the Annunciation group (ca. 1253) from the chapter house doorway also show an awareness of French style, but their tense poses, particularly that of Gabriel, who stands with his legs crossed, hark back to the Romanesque. The drapery style, with its V-folds and long vertical pleats, is characteristic of the Westminster sculptors. Both the Virgin and the angel Gabriel have been attributed to the sculptor William Yxeworth, though they may not be the work of the same hand.

A painted oak St. Michael and the Dragon of ca. 1250–60 from Mosvik (Norway) old church (now UNIT-Vitenskapsmuseet Archaeological dep. Trondheim, T 2451) is carved in a similar style, with elongated body, crossed feet, and drapery that falls in a combination of V-folds and vertical pleats. It may be the product of a group of Westminster sculptors working in Norway, where 13th-century English wooden sculptures were popular.

The “Decorated style” (ca. 1290–1350), the first major English Gothic style, is characterized by a love of applied ornament and decorative detail and an increased use of secular subjects and presence of secular monuments within churches and abbeys. Scenes from romance become popular, as do depictions of aristocratic pastimes, heraldry, and “babewyns” (literally baboons, a term used to describe comical or grotesque subjects of all varieties). The introduction of the style is associated with Edward I and his emulation of monuments created under the patronage of Louis IX (St. Louis) and the kings of France. The twelve Eleanor crosses, the monuments traditionally associated with the introduction of the Decorated style, were erected under the influences of a series of crosses erected in Louis’s memory by Philip III. Edward may also have been responding to Louis’s creation of a royal shrine at St. Denis in his additions to the Westminster Abbey royal effigies. One of the earliest masterpieces of the style is the life-sized gilt-bronze effigy of Eleanor of Castile made for her tomb at Westminster by the goldsmith William Torel, ca. 1291–93. The idealized head of the queen rests on elaborately chased and gilded cushions, the whole embellished with enamel and paste jewels. The tomb on which the effigy rests is attributed to Alexander of Abingdon, who used Torel’s effigy as the model for the statues of Eleanor he created for the Waltham Cross.

One of the characteristics of English Gothic art is its bringing together of different art forms in the creation of single monuments. This is exemplified by

the Eleanor crosses, as well as by the tombs of Edward Crouchback and his wife, Aveline, added to Westminster ca. 1300. The effigies of Edward and his wife, angels at their heads, lie beneath elaborate tracery canopies filled with imitation stained-glass windows composed of colored glass on tinfoil backing. In the arches of the tomb bases stand weepers arranged in pairs, turning inward to each other as if in conversation while simultaneously stepping over the frames of the niches. This detail, along with the turned heads of the effigies, helps to unite sculptural space with the architectural space of the church.

Although not part of the Westminster group, the tomb of Edward II at Gloucester (ca. 1327–31) is one of the glories of the Decorated style, as well as one of the first tombs to use English alabaster. The idealized features and elegantly curled hair of the king may have been influenced by the beautiful lovers of contemporary romances; on the other hand they have also been linked to contemporary portrayals of God the Father and may have been used instead as a deliberate attempt to create a saintly image for the murdered king. The tomb is covered by a complex canopy of delicate tracery.

One of the characteristic monuments of the Decorated style is the Easter Sepulcher, a type of monument that appeared in England in the late 13th century and remained popular to the end of the Middle Ages. This elaborate, tomblike structure was designed to hold the consecrated host from Good Friday to Easter Sunday. One of the earliest to survive is the ca. 1290 sepulcher in Lincoln Cathedral, a flat tomb with relief carvings of the sleeping soldiers, surmounted by a simple canopy. Perhaps the finest example of this type of monument is the Percy Tomb in Beverley Minster (Yorkshire), erected ca. 1340. The tomb is a plain chest covered with ogee cusplings decorated with spreading foliage, lush ripe fruits, and the Percy arms. The deeply cut figural ornament includes images of the Virgin, Christ, St. Michael, and the Percys. The whole culminates in a serene image of God the Father receiving a naked soul.

Great shrines were one of the most common and most significant forms of Gothic sculpture, but few have survived. Documentary sources indicate that these, too, were decorated with gables, arcading, figural sculpture, and foliate motifs. The shrine of St. Albans Cathedral, carved ca. 1305–08, was made of painted and gilded Purbeck marble. During the 14th century it became popular to block the view of the shrine (located in the chancel) by placing a screen between it and the altar. Exactly why this occurred remains unclear, but it clearly did contribute to the mystery and drama of the mass. The 14th-century Neville Screen at Durham is an excellent example of this type of monument. The screen is carved in a miniaturist style (as if it were a monumental piece of goldwork), with faceted niches designed to hold small metalwork figures, a style typical of the London workshops. By the end of the 14th century shrines

had become the focus for aristocratic burial (as at Westminster), burial in close proximity to the saints being one way to ensure salvation.

The late 14th century saw the rise of a new class of minor aristocrats and wealthy merchants and a consequent widening of the market for sculpture. Yet the overall quality of sculpture declined, probably due to a combination of mass production and loss of artists to the plague. The more costly effigies were produced by a small number of workshops in Chellaston, Nottingham, London, and York. On these effigies lineage and social status were often emphasized over personality and individual identity, a phenomenon also seen in funerary brasses. However, some of the finest effigies of this period are set apart by their realism. The 1386 gilt-copper effigy of Edward III at Westminster shows the king with a long, thin face and beard. It was probably produced under the influence of Jean de Liège's 1367 effigy for Edward's queen, Philippa of Hainault, for while the effigy appears quite realistic the accompanying weepers are stiff and impassive. The influence of Jean de Liège foreshadows the enormous influence Flemish-Burgundian art would have on English artists in the second half of the 15th century.

The same workshops that produced alabaster effigies also produced small figural panels for retables and altarpieces. The subjects depicted were often ones of great joy or sorrow, the Joys of the Virgin and the Passion of Christ being the two most popular subjects. A fine example of this type of subject is the late-14th-century altarpiece in the Victoria and Albert Museum (A.48–1946, A.50–1946, A.49–1946, A.51–1946, A. 52–1946), which today consists of five panels depicting the Last Supper, Crucifixion, Deposition, Three Marys at the Tomb, and the Incredulity of Thomas; additional panels have been lost. The group is delicately carved and was originally embellished with paint and gilding, some of which survives in the background to the Crucifixion panel.

Scenes of the lives of popular saints were also depicted on devotional panels. An especially fine panel of ca. 1370 (private collection; see Alexander and Binski, 1987: no. 26) depicts the murder of Thomas Becket. Its style and the type of stone from which it is carved suggest that it may be a product of one of the Nottingham workshops. Much of the paint that currently covers the panel is postmedieval, but some of the details, particularly on the armor of the knights, may be original. The panel is unusual for the prominence given to the arms of the donors, Sir Godfrey Foljambe and his second wife, although the emphasis on heraldry is characteristic of the period.

The Flawford Alabasters (Nottingham Castle Museum 08–146, 147, 148) of ca. 1340–80 may also have been produced in Nottingham (figs. 125–27). The

three figures of the Virgin and Child, St. Peter, and an unidentified bishop were originally part of an altarpiece, designed to stand against a flat surface (to which they were secured by wires), rather than to be freestanding, as they are exhibited today. The figures are carved in a style similar to that of the Percy Tomb. The drapery on all three figures is treated similarly: falling in long vertical folds over the arms and gathering in V-shaped folds across chest, stomach, and thigh. The bishop is shown in a stiff frontal pose, while the Virgin and St. Peter stand in gentle S-curve poses. Peter holds his keys in one hand and a church in the other; the small figure at his feet may be the donor. The Christ Child holds the Virgin's exposed breast, a motif common in contemporary manuscript illumination (e.g., the Cuerden Psalter [New York, Pierpont Morgan Library M.756]) and probably linked to the increased interest in birth, death, and natural processes that characterized the late 14th and 15th centuries throughout Europe.

Fig. 127. Flaivford Alabasters, Unidentified Bishop (Nottingham Castle Museum 08–148). Reproduced by permission of the City of Nottingham Museums; Castle Museum and Art Gallery.

An interest in natural processes, as well as an increase in the emotional

content of art, is also evidenced by the introduction of emaciated cadavers and worm-eaten corpses in the 15th century (e.g., the stone cadaver of Sir John Golafre at Fyfield, Berkshire, ca. 1440–45). In fact the depiction of extremes of emotion, whether of sorrow or of joy, that began in the mid-14th century becomes far more pronounced in the 15th. At times the tension created by the depiction of gruesome subjects in a courtly style can be thought-provoking. A fragmentary chest front of ca. 1410 in the London Museum (75.2) is carved with scenes from (or related to) Chaucer's *Pardoners Tale* (fig. 128). The figures are elegantly dressed and set in a lush landscape, but the narrative is one of greed, murder, and death.

The landscape background of the London chest has been compared with Flemish and Netherlandish textiles. Flemish influence is also apparent in the new delight in capturing realistic details, such as the thickness of woolen cloth or the pattern of veins on the back of the hand that can be observed on such monuments as the 1452–53 tomb of Richard earl of Warwick in St. Marys, Warwick. This realism represents a shift in style that signals the end of the Gothic era and the beginning of the northern Renaissance.

Sculpture, Romanesque

A lack of confirmable dates and widespread damage confuses this difficult field. But the surviving works can be categorized into significant groups, formed by the geography and prestige of their location and defined by style, subject matter, and common motifs. Romanesque sculpture reflects the developing political situation in England.

The earliest group is found around Scandinavian settlements in London, East Anglia, and the Midlands, which had hoped for a Scandinavian king of England rather than the Norman, William I. These works have a perpendicular

relief profile with flat upper surfaces, vertical incisions, and flat recesses. This accompanies derivatives of the Scandinavian Ringerike and Urnes styles, sometimes including elements of the 10th-century "Winchester style." Examples range from the pre-Conquest St. Paul's grave slab, with its Ringerike Great Beast (ca. 1030), to the tympanum from Southwell Minster (ca. 1120), with its Urnes and Ringerike beasts.

A group of related schools are found on rural churches inside a wide arc around Hereford, running from Shropshire to Somerset, an area frequently in revolt against the Norman crown. From the 1130s this area was associated with the empress Matilda until she rejoined her husband in Anjou in 1148. At the same time Arnulf de Montgomery, brother of the earl of Shrewsbury, married a Munster princess, thus fostering Irish contacts. As in the "Scandinavian" group there is a strong sense of folklore, the perpendicular relief profile, and a cumbersome rounded version of that profile also found on 11th-century Irish crosses and churches. Subjects are "savage": fighting beasts, St. Michael, St. George, tangled foliage, and geometric patterns in unframed panels, often set beneath beakhead voussoirs. Biting or overlapping the torus, beakheads are an insular response to the masks on European Romanesque arches. Influences from this group are felt in Ireland, Anglo-Scandinavian areas, Matilda's Anjou, and places offended by King Stephen (1135–54). A "savage" tympanum reproducing motifs from a church in Oxfordshire appears in Ireland at Cormac's Chapel (1127–32); beakheads appear at Old Sarum at about the time that Bishop Roger of Salisbury (1102–39) was at loggerheads with King Stephen, and at Lincoln, ca. 1141 and the years following, under Bishop Alexander, Roger of Salisbury's nephew. At Reading they may be associated with Matilda rather than her father, Henry I, who founded the abbey in 1121. Foreign elements apparently entered the Hereford School after a local official, Oliver de Merlimond, went to Santiago ca. 1140. Evidently he took the westernmost route, as later Hereford School tympana at Brincop (ca. 1150) and Stretton Sugwas (ca. 1150) reproduce battle scenes from churches around that route, while inside Kilpeck (ca. 1150) are three-tiered column figures known from Santiago itself.

But for the large monasteries grander ideas were favored. By 1086 all but two foundations had been transferred to Norman control. Rebuilt or established with the ostensible help of Cluny, their churches were often designed after Cluny (III) itself and bore Cluny's long-distance sculptural stamp. In England, as in Europe, this was the distinctive "Plaque" style and its derivatives, recognized primarily by double-line drapery folds in parallel lines and curves, large hands and feet, and smooth flat faces with protruding eyes. This lasted ca. 1100 to ca. 1140, before mutating into a purely English style at Lincoln, Malmesbury, and Canterbury.

Possibly the earliest example, despite its presently attributed date, is a head from York that is remarkably similar to the Moissac Durandus of ca. 1100. At Wolvesey Palace in Winchester (head with human hairclip), Chichester (screen), and Norwich (head) are figures derived from the more refined and dynamic version of the Plaque style found at Silos and Souillac. Works at Norwich (capitals) and York (Virgin and Child) reflect the increasingly rigid banding on the capitals at Autun (ca. 1120–30), although the Virgin's heavy proportions show her roots in the original Plaque style. Ely's Prior's Door recalls the tympana of Moissac and Autun, and Rochester's tympanum reflects that of Cluny III. Finally at Lincoln (Majesty and St. Paul, ca. 1140–45), Canterbury (choir screen, 1180?), and Malmesbury (porch, ca. 1180?), we find a fluid derivation with no European parallels, possibly developed in England.

But Cluny did not itself use the Plaque style, and the Normans likewise rejected the style for their royal establishments. For these they employed the Canterbury School, which is recognized primarily by a lush winding foliage with raised beaded veins, borders, and other details. A richly decorative and attractive style, it has origins suggested in the Crucifixion leaf of the Anglo-Norman psalter BL Arundel 60, ca. 1070, where Winchester-style foliage has been elongated into winding tendrils with veins highlighted to suggest beading. This Norman adaptation of a royal Anglo-Saxon style may have been considered particularly appropriate for royal and archiepiscopal projects: Canterbury (crypt capitals, ca. 1120); Reading Abbey's cloister (ca. 1125); Hyde Abbey, Winchester (ca. 1125–30); Wolvesey Palace, Winchester (ca. 1140–50); Glastonbury Abbey (ca. 1150). The style is also well known in contemporary ivories and manuscripts attributed to the same Canterbury School, where it later acquired the damp-fold of the ca. 1135 Bury Bible.

Damp-fold appears on the rood screen from Durham, ca. 1155, which was made for Hugh le Puiset by a team of sculptors from Winchester. It is partly executed in a damp-fold style similar to the Bury Bible and partly in a plainer style found on some pages of the Winchester Psalter (ca. 1150). Hugh had been archdeacon of Winchester under Bishop Henry of Blois, who had been educated at Cluny, and it is interesting to find damp-fold tympana in Cluny's ambience at Charlieu (ca. 1140–50) and Jonzy (ca. 1140–50), where both display the cobweb effects found in the Winchester Psalter.

English Romanesque sculpture reflects England's history of invasion and settlement by Vikings and Normans, together with its Irish and Burgundian contacts. The English "Plaque" style parallels European developments, and it was similarly rejected for the most prestigious foundations. Charlieu and Jonzy suggest that artistic influence could travel in both directions, as do the beakheads in Anjou after Matilda's marriage to Count Geoffrey in 1128, and possibly also the similarities Zarnecki sees at Lincoln and St. Denis. Italian

elements are found at Lincoln, whose facade friezes recall those of Modena in concept, and Durham, whose caryatids recall those of Parma.

Scutage

A money payment made to the king by tenants-in-chief in lieu of military service, that is, quotas of knights owed in return for the lands held from the king.

Scutage was certainly levied by Henry I and probably by William I and William II. The king could demand it as a right and probably did so on each occasion he summoned an army, fixing the rate of payment at so many shillings for each knight or shield (*scuta*, hence “scutage”) owed by his tenants-in-chief. It was up to each tenant to decide whether to send the due number of knights or pay scutage, in which case he was allowed to recoup the money from his own tenants. The king often preferred the money to the service, since he could then hire mercenaries. The rate at which scutage was levied varied. It

was taken at 26s. 8d. per knight's fee in 1159 and 1161—precisely sufficient to hire a knight for the 40-day period of feudal service, assuming his wages were 8 d.a day.

Later scutages under Henry II and Richard I, however, were levied at either 13s. *Ad.* or 20s, while a knight's wages rose steadily, reaching 2s. a day in the 1200s. John attempted to do something about this situation. He levied scutage at rates rising to 40s. a shield and with greater frequency than before, sometimes without actually fighting a campaign. There were eleven scutages in his sixteen-year reign as opposed to seven in the 35 years of Henry II and three in the ten years of Richard I. Not surprisingly clauses 12 and 14 of Magna Carta laid down that scutages were to be levied only with the "common counsel of the kingdom." In the charter of 1217, however, as in all subsequent versions, these were replaced by the vague injunction that scutage was to be levied as in the reign of Henry II, which presumably meant less frequently and at lower rates than under John. In part, at least, this clause was obeyed. There were eleven scutages between 1218 and 1245, only two assessed as high as 40s. Thereafter 40s. became the standard rate; the tax was taken less and less frequently, only eight being levied between 1246 and 1306.

Scutage was difficult to collect and brought in only a few thousand pounds. Its yield was dwarfed by new taxes on movable property. Although still levied occasionally in the 14th century, it had become an anachronism.

Seafarer, The

The Seafarer survives with other so-called OE elegies in one manuscript, the

late-10th-century Exeter Book. Sometimes read as a poem about a literal or symbolic pilgrimage, or as an allegory of the soul's journey to God, or as a poem using a seafaring setting to develop its didactic message, *The Seafarer* has enjoyed little critical agreement except for near unanimity that it is one of the great English poems of the early Middle Ages. A disjunctive style making rich use of antithesis and parallelism adds to the usual textual and semantic problems faced by Anglo-Saxon scholars attempting to understand poetry from a distant past.

The Seafarer has two sections, a lyrically powerful description of both the miseries and attractions of seafaring (lines 1-64a), and a homiletic exhortation in the *contemptus mundi* ("contempt for the world") tradition (64b-124). Formerly critics distinguished between different speakers in the poem to explain the conflicting attitudes expressed toward seafaring and other attractions, such as worldly glory and comfort. Recent critics have seen a single speaker whose often antithetical statements are important to the larger didactic theme: the superiority of God's glory to any glory found in this transitory world.

Antithesis and parallelism, major rhetorical devices of Anglo-Saxon poetry, are here skillfully employed. The main contrast of the poem, between the instability of this transitory world and the eternal joy awaiting the Christian in heaven with God, was disparaged by early critics, and lines 64b to the end were often dismissed as a Christian addition. However, critics have long appreciated such contrasts as that in lines 8b-11a ("My feet were constricted with cold, bound by frost, with cold fetters, where those cares sighed hot around my heart") and the antithesis between several descriptions of comfortable living (especially the brief description of spring in lines 48-49) and the extended description of the winter storms and isolation the speaker experienced at sea.

Also appreciated as exemplary of Anglo-Saxon poetic style is the contrast of being locked in, denoted by *hreperlocan* (58: "breast-locker, or body"), with the idea of flying or sailing out and away from the constraints of the body (58-61a: "my mind turns beyond the body, my spirit turns widely over the native land of the whale with the sea tide"). Use of contrasts extends to verbs like *hæbbe gebiden* (4b: "have experienced") and *gecunnade* (5a: "explored, ventured upon"), the first rather passive, the second notably active, but both denoting the speaker's involvement with sorrow. Similarly line 32a ("frost bound the earth") contrasts with 33b-34a ("thoughts now beat against the heart").

Particularly troubling to critics is the poem's repeated use of *forþon*, usually translated "therefore." Unwilling to articulate a causal relationship in lines 33 and 58, many critics resort to the less usual translation "indeed" when, after describing his misery contrasted with the fortune of other men, the speaker

uses *forpon* to introduce clauses emphasizing his eagerness to depart on the sea voyage. In lines 64–66, however, the repetition of *forpon* (“*therefore* the joys of the Lord are hotter for me than this dead and transitory life on earth”), in the clause that closes the poem’s first section, adds unity to the major and minor antitheses, uniting the contrast between seafaring and a more comfortable life in the first section and the contrast between worldly and spiritual joy in the second.

Seals

Marks of singular authority pressed in relief upon a plastic material by the

impact of a matrix-engraved intaglio, medieval seals were not a medieval invention, though their medieval form and function were innovative. The history and modalities of medieval English seal usage display some unique features.

The kingdoms of the early period maintained the Roman use of seal rings to produce impressions that guaranteed the authenticity and closure of letters and functioned as tokens of credence or marks of office. This practice is evidenced in Anglo-Saxon England by the extant 9th-century signet rings of the kings Æthelwulf and Alfred the Great and of Queen Æthelswith; by the surviving matrices of Bishop Æthilwald (ca. 860), St. Edith of Wilton (757–94), Ælfric (ca. 980), Godwin and Godgytha (ca. 1000–ca. 1040), and Wulfric (ca. 1050); and by the seals of a few conventual houses (Durham, Exeter, Sherborne, Athelney, Glastonbury, and Christ Church, Canterbury).

On the Continent the Merovingian chancery attached wax seal impressions on its documents (diplomas) from the 6th century onward, a prerogative maintained by Carolingian kings and emperors and neighboring rulers. However, Anglo-Saxon diplomas remained unsealed. Sealed charters in the name of Offa of Mercia (790), of Æthelwulf of Wessex (857), and of Edgar (960) are forgeries.

Edward the Confessor's introduction of the sealed royal writ (ca. 1057) brought about a revolution in English seal usage and initiated a series of royal seals uninterrupted to the present day. Both the nature and form of the novel Edwardian seal established the characteristic features of English sealing practice, soon to expand within the context of Norman and Angevin rule.

English sigillography evolved from royal administrative requirements; sealed writs were royal written commands to local officials responsible for administrative matters. After the Conquest such writs expanded into a variety of royal sealed charters and letters—both patent, or left open with a seal attached, and close, or rolled up and sealed closed—by means of which the country was administered. The great seal was at first unique, traveling with the king and chancellor, in whose responsibility it was placed from the time of William I onward. As a sedentary bureaucracy developed, and with the extension of Anglo-Norman-Angevin dominions, a duplicate great seal, that of the exchequer, was kept at Westminster from the 12th century onward to ensure authentication in the absence of the mobile great seal. This is the most ancient of European departmental (or deputed) seals, and the first of a long series of deputed English great seals, including the great seals for Ireland, Gascony, France, Scotland, Wales, and the palatinates (Chester and Lancaster), as well as the judicial seals for the Queens Bench and Common Pleas.

In the reign of Henry III the right to seal was delegated to various departments of the central administration, irrespective of the great seals

location, while the privy seal enabled the monarch to authenticate orders addressed to such departments. In the early 14th century the privy seal came to be reserved for a department and thus lost its personal association with the ruler. Signets, in the keeping of the king's secretary, developed for diplomatic correspondence and household purposes. The flexible system implicit in deputation of the great seal, and the use of numerous smaller official seals of central and local government, testify to a sigillographie process remarkably sensitive to, and reflective of, administrative structure.

Initially the act of sealing for documentary validation was a mark of sovereign authority. Its earliest diffusion throughout society was associated with the assertion of authority and, in the words of Henry II's justiciar Richard de Lucy, befitted exclusively kings and important people. Until 1100 only rulers and bishops possessed seals. By 1200 this privilege extended to barons and cities, by 1250 to knights and lesser clergy, and by 1300 to smallholders. Even "bondsmen" were expected to authenticate deeds with their seals, according to the Statute of Exeter (1285).

The seal derived a general authority from its early linkage to ruling power. In an evolution of fundamental importance such authority begot authenticity, as seals came to be necessary for the validation of written records and agents for imparting trust in their texts. This contribution to the growth of literate modes was enhanced by the material characteristics of seals.

A tangible object, like the physical symbols used for oral conveyances of property, the seal bore the name and title of its owner in the legend and thus enabled an illiterate person to sign his or her name. From the matrix—a personal object kept by its owner—identical wax impressions could be reproduced repeatedly and attached to charters. The writing on seals was associated with a pictorial device evocative of the sealer's social status. As visual symbols seals stood at the juncture of orality and textuality, with the pictorial component translating and certifying the textual component; as icons they articulated the organizing principles of medieval English society.

Sedulius (fl. ca. 425–50)

Sedulius, whose first name may have been Caelius or Coelius, wrote Christian works in Latin in the second quarter of the 5th century, probably while living in Greece. The introductory letters to his dual work, or *opus geminatum*, the *Carmen paschale*, written in hexameter verse, and the later *Opus paschale*, in prose, furnish some biographical information. Addressed to a priest named Macedonius, the letters reveal that Sedulius had turned from secular studies, perhaps in Italy, to write Christian poetry that combined the pleasures of profane verse with the knowledge of Christ. The first book of the *Carmen paschale* describes miracles of the Old Testament; the following four, based on the Gospels of Luke and Matthew, discuss New Testament miracles from the life of Christ. Sedulius later transposed this work into the prose *Opus paschale* at the request of Macedonius, thus adapting the classical Latin literary practice of *conversio* to Christian writing.

Many surviving manuscripts demonstrate the popularity of Sedulius's works, particularly the *Carmen paschale*, which frequently appears in “classbooks” for Latin students. One copy of the *Carmen paschale* is bound with the Parker Chronicle in Cambridge, Corpus Christi College 173. Following Sedulius's example, the Anglo-Latin writers Aldhelm, Bede, and

Alcuin produced *opera gemina* of prose and poetry. As Bede notes in the *Ecclesiastical History*, Aldhelm's *Carmen de virginitate* is written in the style used by Sedulius.

Sedulius also composed biblical stories in elegiac couplets, known as the *Veteris et Novi Testamenti collatio*, and Latin hymns. The opening verse from his abecedarian hymn, *A solisortus cardine*, has been adapted for the Feast of Christmas and the verse *Hostis Herodes impie* for the Epiphany. The Marian antiphon *O Virgo virginem* is based on the *Carmen paschale*.

Sedulius Scottus, or Scotus (fl. ca. 850)

Irish-born poet and scholar who traveled to Liège between 840 and 851, participating in the flowering of scholarship and the arts known as the "Carolingian renaissance." Little information exists about Sedulius in Ireland, but speculations about his birthplace suggest Kildare, Leinster province. Much of what is known about his later life comes from his own works, including a corpus of Latin poetry considered to be of a high standard.

Viking raids were taking a heavy toll on the Irish in Sedulius's lifetime, and monasteries were especially hard-hit. With these events in his homeland Sedulius took advantage of the Frankish kings' invitations to scholars from abroad. Upon their arrival in Liège Sedulius and his group received support from Bishop Hartgar, a patron of the arts who had important political connections. After Hartgar's death in 855 Bishop Franco continued to support the Irish circle until 881, when the Vikings overwhelmed Liège. It is not known what happened to Sedulius, when he died, or where he is buried. It has been suggested that Sedulius did not remain in Liège but also resided in Cologne, Metz, and Milan.

Sedulius and his fellow Irish scholars are known for preserving classical authors to a greater degree than most Christian scholars of this era. The Liège group was part of a larger community of Irish scholars on the Continent. Sedulius's own works include his poems, as well as grammatical commentaries on Eutyches and Priscian, commentaries on the epistles of Paul and Matthew, and a *Collectaneum* that demonstrates Sedulius's knowledge of Greek as well as Latin and that contains several works of Cicero preserved nowhere else. He also wrote the *Derectionbus christianis*, a "mirror for princes" thought to be composed for Lothar II, son of Lothar I, although recent claims suggest it may have been intended for Charles the Bald.

Sequence

A major genre of Latin liturgical chant, sung immediately following the Alleluia as an addition to the Proper of the mass. Sequence composition began around 850, and some 150 melodies and 400 texts were composed up to the end of the 10th century; over 5,000 existed by the end of the Middle Ages. A

sequence is normally constructed as a long series of textual couplets or paired strophes, with each line of the couplet or strophe of the pair set to the same melody and a fresh melody composed for each new formal unit, resulting in a chain of double versicles. It may begin or end with a single, unpaired line or strophe. Although the term “sequence” is virtually synonymous with double-versicle structure, it should be stressed that this form was employed for other musical genres as well, including the French and Latin lai, the Latin planctus, rhymed offertories, Sanctus tropes, Matins proses, and the estampie (a type of medieval dance). Pieces not in this form were sometimes used as the sequence at mass—for example, the strophic devotional song *Angelus ad virginem*., specified as a sequence in the ordinal of St. Mary’s, York (Cambridge, St. John’s College D.27). And known liturgical sequences sometimes appear in different functional roles, as, for instance, hymn and offertory substitutes.

The development of the sequence is commonly described in terms of three epochs: the early or first epoch sequence of the later 9th and 10th centuries, the second or intermediate generation sequence of the later 10th to the earlier 12th centuries, and the standard or later rhymed (“Parisian” or “Victorine”) sequence of the 12th through 16th centuries. Early sequences, whose texts are in prose, display a wide variety of textual and musical styles and details of structure. The later sequence shows a gradual regularization of syllable count, accent, rhyme, and strophic pattern, culminating in the regular versification and uniform strophic structures of the third epoch, with corresponding musical developments in melodic idiom and tonality. The later sequence shares not only form but also musical language with contemporary, nonliturgical genres of Latin song, such as the planctus and lai.

The history of the sequence in England, the subject of significant current research, cannot yet be given authoritative treatment. Sequence collections tend to vary considerably with locale and to change over time. Despite pressures toward normalization emanating from diocese, religious order, and the authority of the prestigious Use of Salisbury, each surviving source preserves a chronologically multilayered and idiosyncratic selection of internationally well known works, nationally or regionally circulating pieces, and local products. Despite pioneering work, especially by Hesbert and Hiley, essential questions remain to be asked of most sources: How many sequences are local products? In these how much is locally contributed (text, music, or both)? Is there a local dialect or idiom of music or Latin evident in the local products? Do any of the more widely known pieces show signs of the local idioms in their melodic or textual variants?

A few broad observations about the evolution of the sequence in England can be made. There was a wholesale adoption of continental repertoire in the 10th century during the Benedictine Reform, represented by the mainly

northern French repertoire of the Winchester tropers. This process of adoption was repeated in the 11th century at the time of the Norman Conquest, with its accompanying liturgical upheavals. In the last epoch no such dramatic turnover occurred, and a much lower proportion of earlier sequences was supplanted by the later rhymed sequences in England than on the Continent. From this era arise both Archbishop Stephen Langtons popular Pentecost sequence *Veni sancte spiritus* and an anonymous English Cistercians strophic devotional poem *Dulcis Jesu memoria*, whose earliest musical setting (Bodl. Laud misc. 668, fol. 101–101 v) is in varied double-versicle form. Beginning in the 13th century, polyphonic sequences began to supersede the monophonic sequence as the focus of insular compositional activity, with the demand for new sequences being driven primarily by the local expansion of the Marian liturgy (and to a lesser degree by new feasts). The polyphonic cantilena, whose principal function appears to have been that of sequence and offertory substitute, became a major insular genre in the 14th century.

Serfs and Villeins

Persons who, while freer than slaves, still suffered particular legal restrictions and were bound to their landlords by ties not solely economic. Slavery, involving the public buying and selling of household or estate workers, disappeared in England early in the 12th century, but it is likely that tenants of small holdings—the nearly 200,000 *villani*, *bordarii*, and *cotarii* of Domesday Book (1086)—were by no means free to come and go, to take up or leave their holdings as they wished. It is likely, however, that the restrictions varied, perhaps a great deal, from place to place.

In the late 12th century, perhaps not until the 1190s, the royal courts began to recognize villeinage as a concept in common law. Certain tenants—often defined as those who owed unspecified labor services or who made a payment (merchet) on a daughter's marriage—were classed as villeins (Lat. *villani*, or neifs, Lat. *nativi*) and were held to be unable to bring a case in the royal courts in defense of their holdings; these lay exclusively in the jurisdiction of the lord of the manor.

By the mid-13th century a structure of detailed regulation, which owed something to the Roman law of slavery, emerged. The villein and his children were subject to the manorial lord. He could be evicted from his holding at any time, had no right of inheritance, and could own no personal property. All his money and goods belonged to his lord, who could thus exact whatever rents or other dues he pleased, plus any amount of labor services. Without the lord's permission the villein could not leave, exchange, or sell his holding; neither could he take holy orders nor go on pilgrimage, nor his daughter marry, nor his son go to school. So far did these ideas permeate legal thinking that the sale of villein holdings from one lord to another was expressed, in the charter of conveyance, as the sale of the villeins themselves and their families. The law distinguished in some respects between villeins by birth and villeins by tenure, the latter being free men who became tenants of villein holdings, and elaborated rules on the status of children born to parents of whom only one was a villein.

To those tenants who did not fall within it the royal courts' definition of villeinage probably gave increased freedom; they could appeal against locally imposed constraints. And in practice the villeins position was neither so complex nor so downtrodden as the letter of the law might suggest. His lord's

jurisdiction was exercised in the manorial court, which administered not the common law of royal courts but the custom of the manor. This varied in detail from place to place but everywhere allowed the villein rights denied him by common law. It set carefully defined bounds to the “renders” he owed for his holding, whether in cash, produce, or labor, and assumed that his money and goods were his own property. Usually, however, the lord took a “heriot,” the villein tenant’s best beast (sometimes some other chattel or cash), when he died and required the villein to have his corn ground in the lord’s mill, to the profit of the lord or his lessee.

Local custom usually allowed the villeins holding to be sublet or transferred, by gift or sale, and always to be inherited according to local custom, which might give it to the eldest son, the youngest, or to all the sons. The villein might even purchase manumission—freedom from villeinage—which was technically an absurdity, for the money paid already belonged in strict law to the lord. These were the rules by which the villeins day-to-day life was conducted, and though the lord of the manor could lawfully override them at any time, this seldom happened. When it did, the strenuous resistance that was often put up suggests that many villeins had little notion of the weakness of their position under common law. At the same time the depths of resentment are revealed by the extent of protest: corporately against the disabilities of villeinage, individually against the stigma of the name of villein.

These protests are most in evidence in the 14th century, but by then the distinctive features of villeinage were fast disappearing. Unspecified labor services (an inefficient form of rent from the lord’s view) had mostly vanished by the 1340s and payment of merchet, together with other obligations peculiar to villeins, was in decay in the second half of the century. Declining population (particularly from the plagues of 1348–49, 1361–62, and 1369) forced lords to admit local tenants on easier terms, rather than leave holdings unoccupied, and protest was often against particular lords’ insistence on obligations increasingly seen as archaic. Yet the law still maintained a distinction between free tenants, with access to the royal courts regarding their holdings, and customary tenants, whose holdings lay solely in the manorial lords jurisdiction.

There was no formal abolition of villeinage. In the 15th century manorial lords continued to relax the disabilities and obligations of customary tenants. A significant change occurred in the 16th century, when courts, first of equity and then of common law, began (without overt change in the law) to hear cases brought by copyholders, customary tenants who held documents giving extracts (“copies”) of the entries of their tenure on the manorial court rolls. This formalized and universalized what had been merely one of a number of kinds of customary tenure. However, isolated instances of the obligations

characteristic of 13th-century villeinage—especially specified labor services, heriots, and particular customary rents—continued into the 16th century and later. Copyhold continued in existence as a distinctive form of tenure until the Law of Property Act of 1922.

Sermons and Homilies

Strictly speaking, since preaching is an ephemeral art that vanishes into air with the preacher’s words, it is impossible ever to know what medieval congregations actually heard in the sermons they attended, and we certainly cannot be sure that sermons preserved in manuscript were preached exactly as recorded. Many patently were not. Some sermons would never even have reached so finished a form; their written existence would have been no more permanent than as a set of notes. No doubt much has vanished. Yet despite the many reasons for the elusiveness of medieval preaching it is still possible to

form some impression of its fortunes between the conversion of the Anglo-Saxons and the eve of the Reformation.

Old English Period

Old English homilies and sermons, along with all of OE prose, have begun in the last half-generation to take their proper and significant place in a total view of OE literature and culture. The major advances have come in the study of sources, the editing of texts, and to some degree the study of homilies and sermons as religious literature, but many major questions and problems remain. Perhaps the foremost difficulty is the need for a set of intellectual operations to eliminate preconceived notions and stock assumptions brought to the subject by a knowledge of later medieval sermons or even postmedieval religious literature. Unlike ME homilies and sermons OE works did not have a strong rhetorical or legislative impulse, but it is not true to say that neither rhetoric nor conciliar decrees existed. There is nothing in the earlier Middle Ages to match the rhetorical intricacy of Robert of Basevorn's *Forma praedicandi*, the exemplary medieval manual, but Augustine, Gregory the Great, and Martin of Braga had much to say about preaching and preachers. Augustine's *De doctrina christianagives* advice, particularly in book 4, on how to preach, but Augustine's antipathy to classical rhetoric turned his would-be preacher away from style to truth-content. Gregory the Great is virtually obsessive in his concern, voiced in *Curapastoralis* and *Moralia in lob*, that above all the preacher must himself be a good man. Martin of Braga offers a rather more practical model for preaching in his brief *De correctione rusticorum*. Carolingian councils, such as the series of councils in 813, established the importance of preaching to the laity, while Carolingian writers and anthologists, notably Paul the Deacon and Smaragdus, assembled important collections useful as precedents and models.

It is now a virtual consensus that early-medieval preaching developed from the monastic night office, readings for which appear in anthologies known as homiliaries, such as Paul the Deacon's *Homiliary*, extant in later versions in Anglo-Saxon England. The discovery of the importance of homiliaries corrected the previous erroneous notion that the wide range of sources used in the OE homiletic tradition implied well-stocked libraries. Paul the Deacon's collection contains the homilies of Bede, Maximus of Turin, Leo the Great, and Gregory the Great, among others, while the Carolingian sermonary, represented by Cambridge, Pembroke College 25 (a form of the *Homiliary* of St. Père de Chartres, dated after 820), offers even the works of Alcuin (though

unattributed to him).

The indebtedness of OE homiletics to Latin sources does not preclude original vernacular writing, but it is a rare sermon that, like Wulfstan's *Sermo Lupi*, responds to contemporary conditions. What remains as comparatively uncharted territory is the interactivity of vernacular and Latin or bilingualism, as in Ælfric, who composed in both languages. Parenetic writing (sermons that exhort the audience to do good) is particularly common, as are sermons urging penitential practices like fasting and almsgiving, but contemporary behavior is hard to see through the formulaic expression. It seems clear that the extant body of vernacular homiletic literature is the result of one of the impulses of the Benedictine Reform, but there is enough to indicate that before the late 10th century there may have been a flourishing tradition. Vercelli Homilies I and X (= Pseudo-Wulfstan 49) may in fact be witnesses to this earlier tradition.

The setting and audience for vernacular homilies and sermons are not all that clear. Were extant homilies and sermons delivered primarily in a liturgical setting like the mass, or were there other occasions, say before a council or a synod, where a given piece might have been delivered? Ælfric believed that there should be no preaching on *swigdagas*, "days of silence" (Holy Thursday, Good Friday, and Holy Saturday), but others clearly preached on those days, and their works fill the gap in collections that contain mainly Ælfric. Is there a line between the lay audience and the monastic audience that so far is hard to see? Ælfric had learned and literate lay patrons who appreciated his efforts at writing saints' lives, and the adaptation of monastic literature for them was certainly unstartling. What, finally, is the role of silent reading or private devotional use, if any? Whatever the answers to these many questions, it is clear that the work of Ælfric, Wulfstan, and anonymous figures had a major role in cultural life even into the 12th century, as the many manuscripts bear witness.

The matter of genre needs more work. It is customary for scholars to distinguish between *homilia*, an exposition on a passage from the Bible, and *sermo*, a more general exposition often featuring exhortation, but OE writers do not themselves observe such a hard distinction in practice. Ælfric's "homilies" often move easily within and beyond the two ideal forms, and the application of a biblical lesson to the moral life of the audience is easy and natural. The famous fourfold method of scriptural exegesis seems absent from most homilies where exegesis is prominent; at best there are explanations that are literal, broadly allegorical (i.e., nonliteral), and moral. There are no tight, comparatively rigid rhetorical structures imposed on the biblical text such as are often invoked in the analysis of Chaucer's *Pardoner's Tale* or explained in Robert of Basevorn.

One clear generic form is the running gloss. Vercelli Homily XVI is an

exposition of Matthew 3:13–17, for the Epiphany, celebrating not the Magi but rather one of Christ's other manifestations, the Baptism in the Jordan. After a brief introduction the homilist goes line-by-line through the biblical text offering explanations and discussions, including an interesting discussion of the Trinity, which manifested itself at the Baptism, and of the miraculous flow of the Jordan. The homily ends with an exhortation to right Christian observance, but who, precisely, are the "men" urged to do good and avoid evil? Ælfric, who may be considered the master of the form, shows a somewhat differing practice in his *Catholic Homilies*!. BL Royal 7.C.xii, a version of the series that Ælfric clearly authorizes with his own annotations, offers translations of the pericopes, or biblical readings for the day, and the apparatus of the manuscript links the homilies more closely to the liturgical occasion. As yet no one has made the case for other homiletic genres or variations within the form.

The recent appearance of D.G. Scragg's edition of the Vercelli Homilies, M.R. Godden's edition of Ælfric's Second Series, the example of J.C. Pope's magisterial edition of the *Homilies of Ælfric: A Supplementary Collection*, the promised editions of Ælfric's *First Series* (by the late Peter Clemoes) and the Blickling Homilies (by Milton Mc C. Gatch and William Stoneman as successors to the late Rowland Collins), and the source work by *Fontes Anglo-Saxonici* and *Sources of Anglo-Saxon Literary Culture* will combine to offer a proper foundation for studies of the questions entertained here and new questions to arise. Even the movement to include theory in the discussion of OE literature welcomes the presence of prose as part of the cultural record.

Middle English Period

In the years following the Conquest that giant of Anglo-Saxon preaching, Ælfric, still commanded attention. His work was recycled in collections like the *Lambeth Homilies* (ca. 1200). The Augustinian canon Orm, who at about the same date wrote a versified set of ME sermons, the *Ormulum*, seems to have been in touch with an Ælfrician homiletic tradition, if not indeed with Ælfric's work firsthand. However, it would be wrong to conceive of the 12th century as merely a conservative transmitter of earlier preaching tradition. By the late 12th to early 13th century preaching was receiving a renewed seriousness of attention, witnessed, for example, in the attitude of a writer like Odo of Cheriton (ca. 1180-ca. 1246). Preaching for him was evidently almost sacramental in stature.

Attitudes like Odo's were a preview of the massive endorsement that

preaching would receive a few years later. The Fourth Lateran Council of 1215 was concerned that preaching be as effective as possible. The tenth canon of the council reminded bishops that they were preachers *ex officio* but that they must recruit additional help from suitable deputies in order to carry out their duties adequately. Lateran IV linked preaching with confession, an association apparent in the many 13th-century manuscripts where material of interest to preachers and confessors alike is brought together.

One of the earliest steps taken to implement Lateran IV in England was at the Council of Oxford in 1222, held under Archbishop Stephen Langton, himself a notable preacher. The council enjoined on parish priests the instruction of the laity, and as the century progressed the content of this instruction was further specified. By 1281 the Council of Lambeth, held under Archbishop John Pecham, could require in its ninth canon, *Ignoranda sacerdotum*, that four times a year, straightforwardly and in English, priests must preach to their congregations the fourteen articles of faith, the Ten Commandments, the two evangelical precepts, the seven works of mercy, the seven deadly sins and their offspring, the seven principal virtues, and the seven sacraments. From Anglo-Saxon times catechetical material had always had its place in preaching to the laity, but the stress laid on it during the 13th century renewed its importance as a staple for sermons. In the 14th and 15th centuries preachers in English, mindful of the injunctions about the preaching of catechesis, would explore different ways of reconciling them with the traditional requirement to preach upon the pericope of the day.

The 13th century was one of exciting developments in several other respects: its earlier years saw the foundation of the Franciscans and Dominicans, orders that from their inception were charged explicitly with the task of preaching. The guides to sermon composition, the *artes praedicandi*, were now illustrating how sermons might be crafted according to the “modern” form, in which a theme was announced and divided into a number of principal parts, each of which was then discussed. “Modern” sermons were thus more structurally self-conscious and symmetrical than those in the “ancient” form (essentially a plainer procedure based on methodical exegesis of scripture). Although “ancient” sermons would tend to be eclipsed by enthusiasm for the “modern” until the later 14th century, they were of too distinguished a pedigree ever to be entirely supplanted, having been used by no less than the Fathers of the Church themselves. Their comparative simplicity recommended itself to anyone contemplating preaching to the laity. Perhaps these were some of the reasons why, for example, the late-13th-century author of a substantial set of versified ME Gospel sermons known as the *Northern Homily Cycle* used a variety of “ancient” rather than “modern” form at a time when the “modern” was much in vogue.

It is not until the later 14th and early 15th centuries that sermons in ME start to appear in any bulk, no doubt partly as a result of the general upsurge of confidence in this period about writing in the vernacular. And their quantity is matched by a broadness in quality. In style the sermons of this period range from the sensational to the restrained to the austere (compare the *Festial of John Mirk*, the ME version of Robert of Gretham's *Miroir des évangiles*, and the Wycliffite sermon cycles, respectively, all of which were composed in these years). By 1400 sermon style and content were no neutral matter but had almost become politicized in the wake of the Lollard heresy. Lollards, for whom stringently Bible-based preaching was a point of principle, frequently accused the friars of adulterating "Godis lawe" with trivial exempla and fables when they preached, and though not all Lollards were similarly minded, Wyclif himself disliked the "modern" form, with which the preaching of the friars was often associated.

In an attempt to curb seditious Lollard preaching Pecham's *Ignoranda sacerdotum* would soon receive a powerful new sanction. It had remained in force throughout the 14th century—Archbishop John Thoresby reissued it in 1357 for his diocese of York—but now it was to be more controversially urged in the constitutions, or decrees, of Archbishop Thomas Arundel's Oxford Convocation of 1407. As part of the campaign to eradicate heresy preaching licenses were required of those to whom the constitutions were deemed to apply; henceforth unlicensed preachers must confine themselves to the catechesis of *Ignoranda sacerdotum*. But even if they helped to bridle heretics, Arundel's constitutions provoked the resentment of some orthodox preachers for the way they inhibited many for the sake of silencing a few. No doubt in some quarters the constitutions also led to a sense of first- and second-class preaching: a Passion Sunday sermon by the monk Hugo Legat, preached possibly sometime after the constitutions of 1407 had taken effect, puts indiscreet and untutored preachers firmly in their place by reminding them that "thei schulde not preche to hure pareschon, but onlich swiche thing as tei knowe skel upon, as te 5 wittis, the 7 dedly synnes, Pe 10 comaundementis and swich oPur Pat longen to here estat for to preche of." Anyone confining his sermons to catechesis would have been seen to proclaim himself as an unlicensed preacher.

ME sermon collections continued to be produced throughout the 15th century, but few were new compositions; texts that had already been written in the early 15th-century tended to be edited and adapted and so kept in circulation. Even originally heterodox material might be defused for orthodox preaching purposes. Consequently the content of many ME sermon manuscripts from about the 1450s on may give the impression that preaching was living off its capital. Yet this is not to imply that preaching on the eve of

the Reformation was moribund. There is evidence that the laity showed considerable appetite for it, in some cases even leaving preaching endowments for its maintenance. The legacy that medieval preaching left to the Reformation was sizable. Many ME sermon manuscripts show clear signs of having been read and used well into the 16th century, and occasionally medieval sermons might still be preached, to the understandable displeasure of the reformed authorities.

Though most surviving ME sermons are dominical (based on Sunday Gospels), some no doubt for use at mass, a substantial number of the rest are for other occasions, like saints' days, weddings, or funerals. Many medieval men and women, then, would have had the opportunity to attend preaching not just at mass on Sunday. The other occasions were diverse: for example, the opening of parliament was normally marked with a sermon, sometimes in English; ecclesiastical synods might include vernacular preaching to the laity; and if the set of sermons known as *Jacob's Well* was ever preached, its congregation had the chance to hear a sermon every day for 95 days, probably from Ash Wednesday to the vigil of Pentecost.

The pervasiveness of preaching in medieval life has profound implications for our understanding of medieval English culture. If we wish to recover the dimensions of the spiritual, moral, and political ideologies to which the ordinary men and women of England were repeatedly exposed, sermons are an obvious place in which to look for them.

Sheriff

In Anglo-Saxon England the king's reeves, officers of justice who ranked below the ealdormen, were among his principal agents in local government. By the late 10th and early 11th centuries reeves were being appointed to specific shires, responsible to the king for financial, judicial, military, and executive tasks.

The usefulness of the shire reeve (sheriff) was immediately recognized by the Norman conquerors. William I and William II enhanced the status of the post by repeatedly appointing leading barons. In the 12th century kings generally preferred men of lesser rank, familiar to the royal court and of proven administrative ability. From the 13th century most kings were content

to leave the selection of local knights to their councillors or barons of the exchequer. A year's term of office became common in the 14th century and normal thereafter.

The typical early Norman sheriff, in person or through deputies, had numerous duties. He tried civil and criminal cases in shire and hundred courts; he policed his shire through the pursuit, arrest, and imprisonment of criminals and could summon a posse to help him; he commanded shire levies against rebels and invaders; he had custody of crown estates and sometimes held a royal castle; he was the king's chief executive, proclaiming warnings and commands in the shire court and responding to instructions in royal writs; he collected and paid to the treasury the king's revenues from the shire, chiefly from royal estates, profits of justice, and taxation.

In later centuries his power gradually diminished, as many of these duties were entrusted to specialists whom he was required to assist. In particular the introduction of the itinerant justices in eyre in the 12th century (alongside the acquisition of hundred jurisdiction by many feudal lords) deprived the sheriff of much of his importance as a trial judge. However, Henry II's procedural reforms gave him a crucial role in facilitating the justices' work; the sheriff received chancery writs to initiate pleading, heard preliminary presentments of suspects (often at the special twice-yearly sessions of the hundred courts, the sheriff's tourn), empaneled juries, ensured that defendants appeared for trial, and executed judicial decisions.

Sheriffs continued to service the new judicial commissions after the collapse of the eyre system in the late 13th century, finally losing significant jurisdiction of their own in 1461, when the preliminary hearing of presentments was transferred to the justices of the peace. Otherwise the 15th-century sheriff remained important for policing the shire, fulfilling administrative duties for king and justices, and supervising the return of knights of the shire to parliament.

Ships and Shipbuilding

Seafaring in the British Isles has a long history predating the medieval era. Many vessels were oared, but some did have a mast and sail for propulsion. The large seagoing *curraugh*, of several thicknesses of hides stretched over a wooden frame, was capable of deep-water sailing. St. Brendan is said to have sailed such a vessel from Ireland to Greenland or America. The Romans also brought their vessels to Britain, large sailing craft common to the Mediterranean.

But the most important traditions of seafaring and shipbuilding were established by northern peoples. The Saxons and Angles crossed the North Sea regularly before the 5th century in clinker-built rowing barges, but they may have had mast and sail also. The Saxon burial ship of ca. 610–40 found at Sutton Hoo represents the oared-vessel type. Other finds, like the Kvalsund ship in Norway, are precursors of the oared sailing ship of the Viking era that influenced British ship construction. The hulk, a banana-shaped vessel with a sail, had no keel. The cog was similar, with a broader look and a flat bottom for more cargo. Keels were Viking-style vessels with true keels and a sail for propulsion.

The most dominant war vessel of the early-medieval era was the Viking longship, which gave the Scandinavians unmatched superiority at sea. Following their 9th-century invasion of Britain new elements of ship technology were developed and borrowed. The Anglo-Saxon Chronicle states that Alfred the Great built longships of 60 oars and more to challenge the Danish fleets. His victory allowed the Anglo-Saxons to recover much of Britain from the Danes.

Seafaring practices were influenced after 1066 by the Norman Conquest. The Normans were originally Danes who settled in France in the 10th century. Their successful conquest of Britain linked the island to the Continent. Viking-style vessels were used in the attack, shown on the visual record—the Bayeux

Tapestry. Like other northern vessels they were clinker-built (the planks forming the hull overlapped one another), with stem and stern posts, and navigated by the use of a side steering oar. A single mast with a square sail propelled these vessels, some of which were large enough to carry horses for the knights.

In the succeeding two centuries the Norman or Viking-style vessel was modified and a larger sailing ship emerged without oars. A wider and deeper hull provided greater cargo capacity necessary for the bulk-carrying trades. Cargoes included salt, wool, wine, furs, timber, fish, and grain. A vessel's size was measured by its carrying capacity, usually in tuns of wine. Each wooden wine tun (a huge barrel) contained 252 gallons.

Vessels were constructed for trade with capacities of well over 100 tons. Such ships could not be rowed; for greater control and sailing power a second mast was added. This carried a lateen sail, triangular in shape and imported from the Mediterranean. The lateen sail on a mizzen mast greatly facilitated control of the ship and the ability to sail into the wind. Control was aided by the invention of the stern-post rudder, operated by a tiller. This was a much more efficient means of steering a vessel, provided greater stability, and enabled the construction of larger, taller vessels.

The principal cargo vessel of the late-medieval period was the cog, which evolved into a large, high-sided clinker-built vessel, flat-bottomed with a stern-post rudder and single mast with a square sail. Records from the 14th century contain lists of cogs up to 300 tuns transporting cargo, troops, and horses along the northern seas. Bulky and slow, the cog remained a mainstay of both commercial and naval fleets.

The principal changes in ship design after 1400 were the increase in size of vessels and their rigging. Ships grew to a capacity of hundreds of tuns, and multiple masts were added to support sails that propelled the large vessels. Combinations of square sails and lateen sails were employed. With the coming of the Tudors in 1485 ships were heavily utilized in war and trade. The carrack was a carvel-built ship, meaning that the planking on the hull was placed edge to edge, leaving a smooth surface. A square main and fore sail and a lateen sail on the mizzen mast propelled the ship. Vessels of this type were used by merchants, the king's navy, and explorers who sailed the Atlantic and Pacific oceans.

Shires

The word “shire” (OE *scir*, originally meaning something separated off) was used of a variety of small governmental districts in the pre-Conquest period. Shires in the later sense of administrative counties apparently existed south of the Thames, in Wessex, by the end of the 8th century; here they were based closely on early tribal areas. Farther north most were created in the 10th century or early 11th, after the kings of Wessex had extended political control over England as a whole, often in succession to the Danes. These shires were deliberately imposed, many without reference to previous tribal groupings, and most (like Cambridgeshire and Oxfordshire) taking the name of the town that was the administrative and military focus. After the Conquest the Normans recognized the value of the shire and equated it with the term for the basic Frankish administrative unit: *comitatus*, or county. Cumberland, Westmorland, and Lancashire were the last to be organized as counties, in the mid-12th century.

The shire played a vital role in medieval government, particularly through its court, which (by the 13th century) met every four weeks and at which most tenants-in-chief were represented. The shire court was essential to the process of civil and criminal law, the sheriff dealing with lesser cases himself and preparing the way for the hearings of the justices in eyre (from the 12th century) and the justices of the peace (from the 14th). The court was also the place where announcements were made on behalf of the king, juries were empaneled, land transactions witnessed, outlawry proclaimed, and (from the mid-13th century) knights of the shire elected to parliament.

Central government found shires the most convenient unit for assessing, collecting, and recording financial dues, including the “shire farm” (covering income from royal estates and certain customary payments) and various sorts of taxation. It is significant that Domesday Book (1086), though a record of landholder’s estates, is arranged by shires; without the administrative machinery provided by sheriff and shire court the survey would have been impossible.

Shirley, John (ca. 1366–1456)

An important copyist of the works of Chaucer and others, of particular significance for his copies of a number of Chaucer’s works and for his ascriptions of some of those works to Chaucer. After service with Richard Beauchamp Shirley seems to have become involved with the London book trade. The terms of his involvement remain unclear. What is clear is that he copied a number of important collections of contemporary or near-contemporary literary works and that these and other collections copied by him (now lost) circulated extensively. His main surviving collections include Bodl. Ashmole 59; Cambridge, Trinity College R.3.20; BL Add. 16165; and Sion College Arc. L 40.2/E.44. These manuscripts include a number of Chaucer’s shorter poems and his prose *Boece*. Some short poems, like “Adam Sciveyn” and “Gentillesse,” are included in Chaucer’s canon solely on Shirley’s authority.

Shirley's manuscripts—and those derived from them—often have lengthy circumstantial rubrics that provide our only sense of the occasions of a number of works by Chaucer and Lydgate. How Shirley acquired his information and the purposes that led him to copy his manuscripts are uncertain. Although he evidently had connections with the London book trade, his activities may not have been commercial in impulse. But whatever his motivation, he played a major role in the consolidation of the reputations of Chaucer and Lydgate in the 15th century.

Siege of Jerusalem, The

An unrhymed alliterative romance (ca. 1390) narrating in graphic detail the destruction of Jerusalem by Titus and Vespasian in the 1st century A.D. Its author is unknown, but the original dialect of the poem was probably Northwest Midland. The poem survives in eight manuscripts, all differing significantly in length and content. The widely varying dialects and dates of these manuscripts suggest broad dispersal across England throughout the 15th century.

The poem is approximately 1,300 lines long and is written in four-line units. It depicts in anachronistically chivalric terms the war fought by the Romans to avenge Christ's death. The poem begins with events preliminary to the war: Titus learns of the miracles of Christ, becomes a Christian, and is healed of cancer; he orders Veronica, who possesses a sacred veil bearing Christ's image,

to be brought to Rome, where her veil cures Vespasian, Titus's father, of wasps in the nose. Titus and Vespasian vow revenge on the Jews who killed Christ, and the rest of the poem concerns the siege of Jerusalem, the Jews' terrible suffering from famine, and their defeat.

The primary source for the *Siege* is the Latin prose text *Vindicta salvatoris*, but the poet also borrows extensively from Higden's *Polychronicon*, the *Legenda aurea* of Jacobus de Voragine, and the French Bible of Roger d'Argenteuil. Related works include *Titus and Vespasian* (a longer but less effective couplet version of the story, written ca. 1400 and extant in eleven manuscripts), and a prose version (ca. 1470).

Signet

When the privy seal, its keeper, and associated paraphernalia passed out of the royal household to permanent headquarters at Westminster in the reign of Edward III—as had the great seal and chancery earlier—there arose a need for a seal immediately available for the king's use.

A small or secret royal seal was not a novelty, but in the latter part of Edwards reign a seal, gradually known officially as the signet, emerged as a

regular cog in the administrative machine. It required time and experimentation before the signet seal, in the custody of the secretary (a recognized dependent of the king), was fully accepted in the administrative routine of the kingdom. The development was uneven but apparent from the reign of Richard II into the 15th century, and Edward IV used the signet extensively. Under Edward IV and Richard III it gained importance at the expense of the privy seal, although the glory days of the signet would come under the Tudor monarchs. No clear line was drawn between the competence of each seal; but more important matters, such as might come before the king's council or the exchequer, would more likely be set in motion by privy-seal letters, and less important matters or business more private to the king would be initiated by signet letters. The seal used would often even be a matter of mere convenience.

Signet letters were used for diplomatic letters, communicating instructions to individuals and local units of government, appeals for troops, setting the privy-seal office in motion, instructions related to chamber finance and royal revenue, the administration of crown lands, and the distribution of royal patronage or any other private business.

The duties of the secretary, beyond keeping the signet seal, were not clearly defined, though his work was necessarily confidential and he was a member of the king's household. The Black Book of the household, compiled in the early 1470s, indicated that the staff of the signet office, in addition to the secretary himself, included four senior clerks, three lesser or apprentice clerks, and servants. This entire staff would travel with the royal household. The signet records not regularly needed were initially stored in Windsor Castle and then at the Banqueting House at Whitehall, where they were destroyed when that building burned in 1619; thus no extensive signet archive survives.

Simon de Montfort, Earl of Leicester (ca. 1208–1265)

A younger son of the Simon de Montfort who led the crusade against the Albigensian heretics in southern France, he first came to England in 1230 to pursue a family claim to the earldom of Leicester. Simon quickly won King Henry III's favor, secured the family inheritance, and married the king's sister in 1238. He thus aroused the resentment of established baronial families, who saw him as a self-seeking interloper. But his political career followed a path different from that of Henry's other favorites.

Simon was a proud, ambitious, and self-confident man who developed strong ecclesiastical friendships. Although he was at the center of affairs in the 1240s and 1250s, he came to despise Henry's military incapacity and to condemn his conduct of government. In 1258 he joined other magnates in imposing baronial government upon the king in the Provisions of Oxford. When Henry plotted to regain his power, Simon emerged as the chief advocate of the Provisions and Henry's implacable enemy. He rejected the arbitration of Louis IX of France and, though outnumbered, defeated Henry at the Battle of Lewes, 14 May 1264.

Simon now virtually ruled England, with the king as his prisoner, but he could not legitimize his authority. Faced with the hostility of the pope and most of the barons, he tried to strengthen his position by including representatives of the towns and counties in the parliament of January 1265, the first time they had been convened together. Simon's position weakened as some of his supporters deserted him, complaining of his arrogance and use of power to enrich his family; he was defeated and killed at the Battle of Evesham, 4 August 1265.

For some years he was popularly venerated as a saint who had died for the liberties of the realm. It was, in reality, the king's need for taxation that ensured the development of the medieval parliament, not Simon's novel expedient of convening all the interested parties, simultaneously, in 1265.

Sir Orfeo

An anonymous narrative poem of about 600 lines in octosyllabic couplets, composed in the Westminster-Middlesex area, probably in the early 14th century. It survives in three manuscripts: Auchinleck (Edinburgh, National Library of Scotland Advocates’ 19.2.1), ca. 1330–40; BL Harley 3810, early 15th century; and Bodl. Ashmole 61, late 15th century. The poem tells the story of Orfeo, king of Thrace, identified in the Auchinleck text as Winchester. Orfeo’s queen, Heurodis, falls into the power of the fairies by sleeping under an orchard tree in the middle of the day and is carried off by them. Distraught, Orfeo leaves the kingdom in the hands of his steward and goes to live in the forest, where his only pleasure is in playing his harp to an enthusiastic audience of wild creatures. One day he sees the fairy ladies and Heurodis with them. He follows them through a cliff into fairyland, where he plays his harp so beautifully that the fairy king offers him anything he chooses as a reward, and in this way he wins Heurodis back. They return to their kingdom, to the joy of the faithful steward and the people.

A prologue identifying the poem as being based on a Breton lay occurs in the Harley and Ashmole texts and may once have existed in the Auchinleck copy. The poem seems to be more immediately derived, whether directly or not, from a French-language original, perhaps the *lai d’Orpheus* referred to in three French works. The names indicate an indebtedness to the classical story of Orpheus and Eurydice, but the fairy apparatus is Celtic. Both Orfeo’s kingship and Heurodis’s safe return can be paralleled in Celtic folktales of stolen women. Both, however, can equally be accounted for by Christian

developments of the Orpheus tradition: since Orpheus was used as a figure variously for Christ and for David, he could have been regarded as a king by a typological analogy with either, and success in saving his wife would have followed from the doctrinal imperative that Christ should succeed in saving his bride, the church. Either the Celtic or the christianized classical background may thus appear dominant. There is of course a general fondness in folktale and romance for royal protagonists and happy endings; and the fact that Orfeo is a king contextualizes the central story in an exemplary account of the relationship between a king and his subjects, an issue of great concern in medieval England. Other major themes explored, though without overt didacticism, include love, honor, and the impact of the irrational on the rational world. Various allegorical readings have been suggested. The basic appeal of the poem, however, probably continues to lie in the skillful handling of the plot, maximizing the inherent interest and suspense, and the imaginative depiction of psychologically credible characters in crisis.

The story of *Sir Orfeo* is also found in fragments of a Scots narrative poem, *King Orphius*, and in two versions of a Scots ballad, *King Orfeo*.

Skelton, John (ca. 1460–1529)

Tudor satirist and panegyrist. Born of a northern, possibly Yorkshire, family, Skelton was educated first at Cambridge and may be identified with the “Skelton” who was recorded as about to take his B.A. in 1480. Later he was at Oxford, where in about 1488 he was granted the title of “laureate,” a degree or diploma in rhetoric. The universities of Louvain, in 1492, and Cambridge, in 1493, granted him the same title. He came to prominence in the royal service, where he was tutor to Prince Henry (later Henry VIII) ca. 1496–1501. He became a priest in 1498 and left court in about 1503 to become rector of Diss (Norfolk), a living he retained throughout his life. But he returned to court in 1512–13 and lived the rest of his life in or around Westminster.

His earliest known work is an English prose translation of Poggio’s version of Diodorus Siculus’s *Bibliotheca historia*, finished probably in 1488 and praised by Caxton in the Prologue to the *Eneydos*. Skelton’s surviving works are mostly in verse, and since he was essentially a public poet he dealt in praise and blame, panegyric and satire, in both Latin and English. His earliest known poem, *Upon the Dolorous Death... of the... Earl of Northumberland*, laments in rime royal stanzas the murder of Henry Percy by a Yorkshire mob in 1489. From the 1490s come two collections of lyrics dealing mainly with the courtly and metropolitan underclass of aspiring courtiers, musicians, servants, soldiers, and prostitutes, and *The Bouge of Court*, an accomplished and devastating anticourtly satire in dream-vision form.

The poems written during Skelton’s residence at Diss are again satiric, but in them he abandons rime royal for the more demotic “Skeltonic” form—leashes, or groups, of short rhyming lines, usually having two or three stresses. When he returned to court, he styled himself *orator regius* and, as the title suggests, wrote mainly propaganda on Henry VIII’s behalf—principally satires against the Scots and French. But from this period, from 1519–20, also comes his elaborate morality play *Magnificence*, an affectionate warning to the king to beware of flatterers and to control the expenditure of his household. From 1521–23 come three remarkable satires attacking the policies, style, and personality of Henry VIII’s chief minister, Cardinal Thomas Wolsey: *Speak Parrot*, *Collyn Clout*, and *Why Come Ye Not to Court?*

In the autumn of 1523 Skelton returned to rime royal and the dream vision in *The Garland of Laurel*, where he reviews his poetic career and seeks to establish his claim to fame. Surprisingly the poem is dedicated to Wolsey, so there must have been a rapprochement, though in what circumstances is not known. And Skelton’s last two poems—written on behalf of state and church, against a failed Scottish invasion in 1523 and against two Cambridge heretics

in 1528—are again dedicated to Wolsey.

In a typical 15th- or early-16th-century manner Skelton invokes Gower, Chaucer, and Lydgate as his masters, but he sees himself in other roles, too—the English Juvenal or the divinely inspired *vates* (poet-prophet). His restlessness and capacity for bold innovation make Skelton one of the most original and interesting late-medieval poets.

Slavery and Slaves

Already known in Roman and Celtic Britain, slavery continued to exist in England from the coming of the Anglo-Saxons until the 12th century. Yet we know of no document written by a slave; only an imagined conversation with a plowman lamenting his lot in Ælfric's *Colloquy* permits us a brief moment of empathy.

Slavery under the Anglo-Saxons was essentially an agrarian phenomenon. Little is known about the living conditions of slaves in the early period, but by the 11th century they resided in their own dwellings. Alfred's laws permitted them to keep what they earned on certain holidays, and the *Rectitudines singularum personarum* (ca. 1000–50?) reveals that they were entitled to food rations. Though slaves had thus acquired certain rights by the 11th century, theirs was the lowest rank in the social hierarchy. Instead of being permitted by law to make a monetary compensation for a wrong committed, they were usually punished by a lashing. This distinctive penalty shows that the law considered them "outsiders," devoid of many of the rights of the humblest free person. In legal terms they were largely chattels. There are reports of slaves being stolen.

The *Rectitudines* indicates that male slaves could be beekeepers and swineherds. Domesday Book implies that their most characteristic role was that of a plowman. Usually such plowmen worked in pairs on the lord's home farm or demesne. Female slaves performed domestic tasks and were dairymaids. These were mostly occupations with daily responsibilities.

People became slaves in several ways. Warfare was a fruitful source throughout the Anglo-Saxon period. Crime and debt led others into slavery. Sheer starvation caused by agrarian disaster or social upheaval must also have prompted some to enslave themselves to survive.

Slaves were freed or manumitted in various ways. Manumission at the altar was a common form. Slaves were also liberated symbolically at crossroads, a practice derived perhaps from Lombard Italy. Manumission documents exist from the 10th century on, and evidence from East Anglian wills shows that manumission was common in the early 11th century. By the time of Domesday Book (1086) slaves formed only 10 percent of the recorded population, though they were unevenly distributed, with the largest percentage being in the southwest, an area conquered rather late by the Anglo-Saxons.

Thereafter slavery disappeared rapidly. There are several probable reasons for this. Opposition from prominent clerics discouraged the slave trade. Norman control and subsequent domination of the surrounding seas inhibited enslavement through capture in raids. A rise in population perhaps encouraged Norman overlords to have their demesnes farmed by free labor in return for rents and services, rather than by slaves who had to be fed daily. Foreign landowners, furthermore, probably had little grasp of the outsider status of slaves and instead regarded those on their estates in terms of occupational function rather than legal status. The institution was almost extinct by the end of the reign of Henry I.

Solomon and Saturn

Solomon and another wise man named Saturn figure in a number of so-called dialogues in OE literature. The two verse texts, *Solomon and Saturn I* and *II*, copied in a mid-10th-century hand in Cambridge, Corpus Christi College 422, are separated from each other by a fragmentary prose "dialogue." (The first 93 lines of *Solomon and Saturn I* also appear in Cambridge, Corpus Christi College 41.) Another text, the prose *Solomon and Saturn*, was copied in the mid-12th century in BL Cotton Vitellius A.xv, fols. 86v–93v. The single point of agreement among these works is the names of the participants in the "dialogues," but this agreement distinguishes the English works from analogues (in Latin, French, and German) on the Continent. Continental dialogues, considerably postdating those in OE, generally match Solomon with an opponent called Marcholfus or Marcol, and their subject matter is humorous or even ribald.

Solomon and Saturn I and its following prose fragment explore the powers of the Pater Noster (the Lord's Prayer or Our Father) in putting the Devil to flight. While both works conceptualize the Pater Noster as a material being, their emphases are significantly different. *Solomon and Saturn I* focuses on the Pater Noster as a written prayer, whose correct recitation will vanquish the Devil. The prayer's power resides in its individual letters, which the poem visualizes as attacking the Devil with various weapons. The prose fragment enumerates the shapes the Pater Noster will assume in its struggles with the

Devil and ascribes to it a fantasized body of enormous proportions. *Solomon and Saturn II* is less clearly focused than the two “dialogues” that precede it in the manuscript. The encounter between the two wise men begins as a riddle contest but changes, in the latter part of the poem, into a dialogue where Saturn poses difficult questions for Solomon. The subjects of the exchange include the exotic (the whale-bodied bird called “Vasa Mortis”), the traditional (fate, old age, death), and what might loosely be termed “theological” (the fall of the angels and the origin of evil). The poem has been substantially affected by losses in the manuscript at three points.

The late OE text generally known as the prose *Solomon and Saturn* has no connection with the previously discussed dialogues other than the names of the participants, mentioned only in the opening sentence of the piece. This work is a collection of 59 questions and answers, generally cast in the form “Tell me. ... I tell you....” They demonstrate a broad, detailed knowledge of the Bible as well as of apocryphal material, and many questions are related to the *Joca monachorum*, a Latin collection of puzzling questions and answers. The prose *Solomon and Saturn* shares a number of questions with another late OE collection, the *Adrian and Ritheus*, but the different phrasings of the shared questions and answers indicate that the two texts did not have a common exemplar.

Songs

Pre-Conquest

Anglo-Saxon musical life has left us little tangible evidence. There are no musical settings of OE texts and no genuine vernacular lyrics. The surviving OE poetry is a lettered and learned corpus, sober and bookish. Yet this poetry gives us several points of entry into the faintly heard world of song. It may itself contain traces of lost songs—words, phrases, verse types, rhetoric, or expressions that provide embedded glimpses of lost lyrical traditions.

Though some genres of OE poetry always may have been spoken aloud to—or read privately by—their aristocratic and monastic audiences, the public (often ceremonial) performance of epic narrative by gleoman or scop was musical. Here a pair of critical problems still vex modern scholars and remain open questions. If narrative poems were songs, then how were they performed (recited or fully sung, with metrical or free rhythms, with some kind of accompaniment on the harp)? And are epics like *Beowulf* likely to have been sung in their surviving forms, or are these monumental written formulations one or more steps removed from previous singable versions in an oral tradition (and indeed, to what degree does the use of formulas or oral-formulaic methods of composition necessarily imply musical delivery)?

Stepping back onto firmer ground, we can see that OE poetry, along with other vernacular and Latin literature of the period, documents the breadth and variety of musical practice in Anglo-Saxon England. The scop, teller of heroic deeds, sang songs of the ancient heroes, war songs and victory odes, laments at the death of kings and warriors, and praises for hosts, their present families, and their forebears. The gleoman had such eulogistic and narrative songs in his repertoire but added a wide range of convivial songs to be sung purely for entertainment (and remuneration) by the hearth in hall or tavern. And amateurs, from rustics to kings, sang their songs in court, town, and countryside, at work or play, including metrical charms and incantations, and the dance songs of women.

In later Anglo-Saxon England trained clerical singers entertained themselves with Latin songs drawn from an international tradition. A unique glimpse of this nonliturgical music is afforded us by the “Cambridge Songs,” 49 lyrics plus a few other scattered additions copied into a Schoolbook from a German exemplar at St. Augustine’s, Canterbury, in the mid-11th century (CUL Gg.v.35). Only a few of the lyrics are provided with musical notation, and their neumes are imprecise as to pitch; however, four lyrics have a tune name attached, and the general impression is that all were intended to be sung. They show a variety of verse types, prominent among which is paired-versicle or sequence form, and from limited evidence it would seem that although some of the tunes were florid, the prevailing style was syllabic (one note to one syllable). Subject matter ranges from love songs, narrative fables, and celebratory or political songs, to hymns of Prudentius and settings of the meters from Boethius’s *Consolation of Philosophy*. The overall impression is of a serious and learned Latin art song.

1066–1380

There are virtually no extant traces of secular song during the first 100 years of Norman rule, when the new aristocracy introduced its own familiar forms of domestic and public music making. The brilliant court and lavish patronage of Henry II and Eleanor of Aquitaine, however, attracted a stellar group of writers working in Anglo-Norman, Middle English, and Latin. Much of their output, both lyric and narrative, was intended in the first place for musical delivery. The notorious domestic and dynastic struggles of Henry, Eleanor, and their progeny became the subject of a substantial repertoire of songs by the leading troubadours and trouvères of the later 12th century, writing in Provençal, French, and even Italian. Richard I was himself an active poet-musician.

Over the next century and a half, despite copious documentation for the activities of Anglo-Norman trouvères and minstrels, some itinerant and some attached to households of the secular and ecclesiastical aristocracy, little Anglo-Norman courtly poetry survives with musical notation—just some twenty-odd Anglo-Norman lyrics with monophonic melodies found on flyleaves, binding strips, and isolated stray scraps of parchment. (These songs have yet to be collected, edited, and studied as a group.) In only a single instance (Bodl. Rawlinson G.22) does any of the fragments appear to have originated in a substantial chansonnier. Another leaf, now preserved at the Public Record Office in London (E163/22/1 /2), records a prize-winning song

crowned at a meeting of the London *puy*, a kind of middle-class guild active at the end of the 13th century that promoted the art of courtly love song. Like many medieval lyric genres, including the Latin conductus, the French motet, and continental trouvère song, collections of texts without music also survive, assembling Anglo-Norman lyrics (of widely varied subject matter and tone) along with English verse in well-known anthology manuscripts.

The survival rate for polyphonic settings of courtly Anglo-Norman lyrics in the 14th century is even worse than for the earlier monophonic songs—none at all was known until the discovery in the 1980s of a single fragmentary mid-century insular source (BL Add. 41340 [H]) containing two-voice settings of *forme fixe* poetry, apparently mainly rondeaux. Thus, though there may have been no figure at the English court comparable to the great French poet-musician Guillaume de Machaut, from whom Chaucer and Gower learned so much (as lyric poets, not musicians), we have tantalizing evidence that the lively court culture under Edward III and Richard II may not have been as barren of high-class courtly secular polyphony as it once appeared to be.

Songs with English words from before ca. 1400 are comparable in some respects to those in Anglo-Norman. The known repertoire is similar in size (some twenty-odd songs, only recently collected and edited by Dobson and Harrison), in circumstances of preservation (fugitive traces on scattered leaves), and in the existence of a larger body of lyrics not copied with music (secular, religious, devotional, historical, political) that are found systematically assembled in large anthologies—often in conjunction with Anglo-Norman verse. Strikingly at odds with the Anglo-Norman songs is the lack of refined poetry in the high style dealing with courtly love. The predominant tone of these ME settings is one of pious devotion, particularly to Mary, or a concern with Christ's suffering on the Cross (e.g., "Edi beo thu, heven quene" or "The milde Lomb, isprado roode"). Only four songs (or five, counting the canon "Sumer is icumen in," which also has a sacred contrafact text in Latin) are on secular rather than sacred subjects. Two of these are monophonic ("Miri it is while sumer Hast" and "Brid one breere"), and two are in simple two-voice polyphony ("Fuweles in the frith" and "Lou, lou, lou! wer he goth!"). None adopts a courtly register or approaches the compositional sophistication of the Sumer Canon. Only at the end of the 14th century, in the Winchester Songbook, do we find songs in English related musically to an international tradition of courtly polyphonic song.

Songs of courtly love and religious devotion are most likely to have been committed to paper together with their melodies by clerks who possessed the necessary training to do so. Less apt to be preserved is the vast corpus of less refined popular song, about which our principal sources of knowledge are conventionalized literary descriptions and hostile clerical fulminations. Most

frequently described and decried were the dance songs, the *karoles* in French and English, which constituted one of the principal forms of secular entertainment music in the later Middle Ages. These survive mainly as texts, though there are a fairly small number of notated refrains and refrain songs from this genre in continental sources. Other shorter popular lyrics, the staple of amateur and minstrel alike, are known only from scraps and snatches. Franciscan sermons are a rich source of lyric fragments. In the Red Book of Ossory Bishop Richard Ledrede of Ossory (d. 1360) provides text tags in English and Anglo-Norman for twelve of his 60 Latin hymns, thus preserving in Latin verse only the poetic form and accentual stress patterns of the vernacular original. Insular motets of the later 13th and early 14th centuries often use a popular song as their tenor, sometimes providing the whole text though more often identifying the melody simply by a short tag (e.g., “Dou way Robin”; “Wynter”; “Va dorenlot”; “Mariounette douche”).

Balancing the stock of refined and popular lyrics in the repertoire of the itinerant minstrel was narrative song. Minstrel versions may be mainly lost to us, but the vast hoard of lengthy metrical romances in Anglo-Norman and ME surviving from the later 13th century onward is testimony to the enduring popularity of narrative genres, and though this literature survives without melodies, some of it may originally have been sung rather than spoken. Even closer to the oral tradition are shorter narrative songs, the ME ballads, whose roots go back at least into the 13th century and which begin to emerge into the written record, stripped of their melodies, in the 15th century.

The last major repertoire to be mentioned here is nonliturgical Anglo-Latin song, a rich but understudied topic. Latin song flourished in England particularly from the later 12th century through the 14th; its poets deployed rhyme, accent, and syllable count to fashion complex verse in a wide variety of strophic, refrain, and sequence-type forms. Subject matter is of tremendous range, from contemporary politics and propaganda to religious devotions, philosophy, moral satire, love poetry, humorous stories, and drinking songs. As with the vernacular songs Latin lyrics survive in major insular sources of varied character and contents, some with, but most without, notation. This material still needs to be sorted out historically and geographically and studied in relation to the well-known continental anthologies with which it shares many concordances. Latin song was international in character, with wide circulation of *conductus* and *cantio*, Latin *lai*, *planctus*, and devotional song. This makes it difficult, and perhaps an issue of only limited interest or potential, to separate out the distinctively insular features of Anglo-Latin poets writing for a transnational, often university-educated, *latinate* readership. There were, however, two purely local genres setting Latin texts but not circulating abroad: the insular motet and the Latin carol.

Apart from the carol the vernacular song repertoire of these years is almost entirely of secular love lyrics, in or related to the fixed forms, with polyphonic music in two or three voices. The music belongs both in style and in function to a relatively unified repertoire reaching across Europe and numbering well over 2,000 pieces for these years. But the surviving insular sources are few. From the first quarter of the 15th century are four parchment leaves in the Bodleian (Douce 381, fols. 20–23), containing five English songs, two French songs, and one Latin piece, perhaps for keyboard; and a group of songs in Cambridge (CUL Add. 5943, fols. 161–169), with ten English songs, four French songs, and three Latin pieces. From the middle years of the century there are a further six leaves in the Bodleian (Ashmole 191, fols. 191–196), containing all or part of seven English songs, and eight songs assembled together within the Ritson Manuscript (BL Add. 5665, fols. 65v–73). A handful of songs were added later to the Ritson Manuscript, two added to the Seiden Manuscript (Bodl. Seiden arch, B.26, fols. 32v–33), and some in the Fayrfax Manuscript (BL Add. 5465) that could date from before 1485. The rest is a group of widely dispersed fragments or single leaves, adding perhaps a dozen more songs in varying states of completion. They make a scattered bunch.

But the picture can be expanded by cautious reference to continental sources in an age when English music circulated widely abroad. Some pieces appear with bits of garbled English text. Rather more have ascriptions to English composers (John Bedyngham, John Dunstable, Walter Frye, Robert Morton, Robertus de Anglia, Galfridus de Anglia, John Hothby), often with music for which the surviving Latin, Italian, or French text has obviously been grafted on. A few are concordant with material actually known from English manuscripts. And the context of this body of music often makes it possible to suggest English origin for other pieces. Caution is important here, but a few outlines can be suggested.

Virelai form, or something loosely resembling it, tends to predominate in the two early-15th-century insular sources. Continental concordances and their context, particularly in the Reina Manuscript (Paris, BN n. a. fr. 6771), suggest that the years around 1400 saw the cultivation of a relatively coherent genre with gently flowing lines over a formalized tenor. The music is considerably simpler than that of most continental virelais of the time, though it comes closer to the style of Machaut (d. 1377), whose influence on Chaucer is well attested. So far as the sources permit a judgment, it seems that this genre went out of favor in England around 1415, that is, at about the time when a different adaptation of the virelai form, the carol, began suddenly to appear.

Rondeau form dominated French song during the years 1420–50, and there seems a good case for thinking that it did so in England. French music was known and widely circulated in England. There is increasing evidence of contact with the Burgundian court composer Binchois (ca. 1400–1460), some of whose works were known in England or are found in English sources; a song by Grenon (d. 1456) has been found in an English manuscript. Rondeau music appears in several English fragments from the years 1415–40, though none of them now provides a complete piece of music. These were the years when Charles of Orleans was imprisoned in England and had a substantial influence on English culture: his own poetry from those years survives in both French and English versions, with musical evidence occasionally suggesting that the English may at least have had his authority. He shows a marked preference for the rondeau, apparently influencing William de la Pole, duke of Suffolk, to use the same form. The relatively few rondeaux in the surviving English poetry sources may well conceal a wider cultivation of the genre during those years.

But the ballade and rime royal seem to have dominated English song writing from ca. 1440. This is the form of all eight songs in the Ritson Manuscript and, more loosely, of most songs in the Fayrfax Manuscript. It is also the most common form among English secular lyrics of the later 15th century. The ballade seems to have fallen out of favor with continental composers after 1440, and current thought is that many later songs in ballade form in the continental sources are of English origin. Several are ascribed to English composers, and others are so similar in style as to make English origin all but certain. Using these and similar criteria, a volume of English song, 1400–85, in preparation for the series *Musica Britannica*, will include over 140 pieces.

A few examples of this continental transmission are worth specifying. *O rosa bella*, probably by John Bedingham (though it is also ascribed to John Dunstable), appears in over a dozen continental sources from the 1440s onward; but, more important, material from it was used as the basis for almost 30 further compositions over the next quarter-century. Its Italian text, by Leonardo Giustinian, had been set earlier and seems to have been misapplied to the English piece, which may therefore have had an English text that is now lost for lack of any insular source. The ballade “So ys emprentid in my remembrance,” also probably by Bedyngham (but possibly by Walter Frye), does have a garbled version of its English text in the Neapolitan Mellon Chansonnier, but it also appears in a frenchification that opens “Soyez apprentis en amours,” with another French text opening “Pour une suis desconfortee,” and with the Latin text “Sancta Maria succurre.” Walter Frye’s *Ave regina celorum*, in ballade form and also perhaps originally composed for an English text, survives in over twenty continental sources (including the roof of a Loire

chateau chapel), thus having more sources than any other piece of its generation. And one of the most stylistically puzzling songs of the century is the ballade-form work in one of the Trent codices with a text opening, apparently, “Agwillare habeth standiff.”

Soul and Body I and II

An important exemplar of the soul-and-body theme in medieval literature and one of the few OE poems to survive in two separate manuscript collections of poetry—in the Vercelli Book (*Soul and Body I*) and in the Exeter Book (*Soul and Body II*).

The poem recounts the address of a damned soul to its body, after death but before the Last Judgment. The damned soul berates the body for not thinking of the soul’s fate and delighting only in worldly pleasures. The soul describes the body’s corruption and looks ahead to the terrible judgment it will receive; the body cannot answer, being torn apart by worms. Finally the poet describes in grisly detail the worms’ attack on the body. In *Soul and Body I*, there follows a briefer, corresponding address of a blessed soul to its body: the blessed soul praises the body for its self-denial and looks forward to their glorious reunion in heaven.

Soul and Body I dates from the second half of the 10th century and may be of West Saxon or Kentish provenance; *Soul and Body II* dates from the second half of the 10th or the first half of the 11th century and is also West Saxon. Both texts show signs of corruption; neither is the exemplar of the other. Scholars differ on how the separate versions came into being: some argue for oral transmission, others for written transmission. It has also been suggested that the address of the blessed soul is a later addition to an already finished poem.

No immediate source for either version is known, although parallels to other works have been noted, including homilies, vision literature, and Egyptian lore assimilated by early Christians. The poem did not have any direct influence on later poems, although the *Souls Address to the Body* in the Worcester Fragment and later ME poems show continued use of the theme.

Criticism of *Soul and Body* is scarce and not always sympathetic. Scholars consider the poem primarily a didactic piece but frequently express distaste for its strident tone and gruesome details. However, some critics have praised the poem's construction or argued that the damned body's silence is logical and even eloquent testimony to the justice of the soul's complaint (see Frantzen, Ferguson). Anderson sees the poem as a part of a long triple riddle that includes *Deor* and *Wulf and Eadwacer*.

Southampton

The Anglo-Saxon settlement of *Hamwih* was situated on the east side of a small peninsula at the head of Southampton Water, with its harbor on the River Itchen. By 1000 this site had been abandoned in favor of higher land to the west, with a harbor on the River Test. Southampton’s sheltered roadsteads, its unique double tides, and its proximity to Winchester (the administrative capital of Wessex) guaranteed its early growth as a commercial center and headquarters for pre-Conquest kings.

Domesday Book records Southampton as a royal borough of 76 tenants-in-chief in 1066, plus 63 “Frenchmen” and 31 English-born burgesses who had settled there by 1086. The accession of the Angevins in 1154 drew Southampton into a trading partnership with southwestern France, one of the bases of the port’s later prosperity. The Angevin kings regularly visited Southampton on their way to and from the Continent and were concerned to improve the royal castle (built in the mid-12th century) and its adjacent quay. In the 14th and 15th centuries Southampton was the natural embarkation point for military expeditions to France, the most famous being Henry Vs fleet, which sailed on 11 August 1415 at the start of the victorious Agincourt campaign.

Lacking industries of its own and with competing market centers at Winchester and Salisbury, Southampton’s prosperity depended largely on overseas trade, ranging from the Baltic to the Mediterranean. By the early 14th century the Gascon wine trade (in exchange for wool and cloth) formed a large part of the town’s livelihood and made it the major port on the south coast. The arrival of Genoese vessels at the beginning of the 14th century and of Venetian galleys in 1319 placed the port, for the first time, on the direct trade route between Italy and northern Europe, so important to it over the next two centuries.

Southampton’s trade was depressed by war and plague in the mid-14th century, but prosperity returned in the late 14th century with the resumption of regular visits by Italian carracks and galleys. The town became London’s principal outpost for cloth and wool exports to Italy. In return Mediterranean dyestuffs, spices, sweet wines, and other luxuries were sent by cart from Southampton to London and elsewhere.

Italian agents were resident in the town to handle the trade. In the 1480s the Florentine galleys and Genoese carracks ceased to visit Southampton, and only the Venetian galleys still appeared, albeit with decreasing frequency, until 1532. English ships established a new trade between England and Italy that was largely under English control, although Italian merchants had a major share in the boom in Southampton's cloth exports in the early 16th century. Thereafter overseas trade became increasingly centered on London, and Southampton stagnated until its 19th-century trade revival.

Speculum Vitae

A long, didactic ME verse treatise on the Lord's Prayer (16,396 lines in rhyming couplets), generally attributed to William of Nassington. The poem is of northern provenance and dates from the mid-14th century. Its popularity is evidenced by the survival of 40 manuscripts.

William of Nassington is named as the author in a colophon in two manuscripts. Another names Richard Rolle as the author. Modern scholars regard Nassington as the more likely candidate, not least because his position as an advocate in the archiepiscopal court at York would fit well with the interest in canon law demonstrated in the *Speculum Vitae*. If Nassington was the author, the poem must have been written before 1359, the year of his death.

The work was examined for heresy at Cambridge in 1384. No defects were

found. This is a comparatively early date for examination, which suggests that the poem was already popular and widely circulated. The history of the extant manuscripts shows that the poem circulated in religious houses and among the nobility. It was intended for both private study and for reading aloud.

The poem has a complex, carefully organized structure. It begins with some 2,000 lines devoted to *Pater* ("Father"), *Noster* ("Our"), *Qui es* ("Who art"), and *In celis* ("In heaven"); the commentary includes discussion of the Ten Commandments, the twelve articles of the Creed, the sacraments, the seven gifts of the Holy Spirit, the theological virtues (faith, hope, charity), and the cardinal virtues (justice, fortitude, prudence, temperance). The main argument of the poem is then outlined, in a passage of about 1,000 lines explaining how each of the seven petitions of the Pater Noster (e.g., "Thy kingdom come") is related to one of the gifts of the Holy Spirit. The final and longest portion of the poem expands on this outline, showing how each gift combats one of the seven deadly sins and replaces it with one of seven additional virtues (e.g., humility, mercy). Each virtue brings one of the Beatitudes and its associated reward (e.g., "Blessed are the poor in spirit for theirs is the kingdom of heaven"; cf. Matt. 5:3–10).

Despite its didactic categorizing the poem is readable and often entertaining, with exempla that bring to life characters from all social stations. The language is always simple and direct, even when the subject matter concerns difficult theological or legal points. The meter, contrary to earlier opinion, is not quite the same as that of *The Prick of Conscience*, the *Speculum* being metrically much more regular. Lines are usually seven or eight syllables long, alternating stressed and unstressed syllables.

Attempts to identify a single source for the *Speculum Vitae* have proved unsuccessful, although parallels may be drawn between the 13th-century *Somme le roi* by Friar Laurent, the several English derivatives of the *Somme*, and Richard Rolle's *Form of Living*. The colophon mentioned above cites a Latin source by John de Waldeby, a contemporary of Nassington's at York, but his *Commentary on the Paternosteris* certainly not related to the *Speculum Vitae*, nor is any other of his surviving works. There is a prose version of the *Speculum Vitae*, the *Myroure to Lewde Men and Wymmen*. It is likely that the poem is the source of the prose version rather than vice versa. Authorship of the prose version is unknown.

Nassington may also have written *The Bande of Louynge* and the *Stimulus Conscientiae Minor*. *The Prick of Conscience* has been attributed to Nassington, but differences in meter, in the distribution of some frequently occurring half-lines, and especially in tone between the vivacious, if didactic, *Speculum Vitae* and the unrelievedly solemn *Prick of Conscience* make common authorship unlikely.

Square

A musical term, current for about two centuries from the 1440s on, referring to short, mensural parts of tenor-bass range derived from the lowest voices of compositions of the mid-14th to the mid-15th century that originated in variously composed ways. Squares were extracted from discant settings of plainsongs, from free (cantilena-style) settings of sacred texts, from settings in faburden, and from secular, vernacular ballades; some collections of these monophonic mensural parts survive. Squares were used as the structural basis for new compositions, including pieces for mass and processions, and settings of the Magnificat at Vespers. Musically their later use in written polyphony is varied, and their impromptu use in a kind of extemporized partsong is justified by archival references, although possible techniques for this improvised practice are not documented. Compositions based on squares are often said to

be “upon the square,” and there are literary and archival references to the copying of squares, to books of squares, and to the teaching and singing of “squarenote” and “square song.”

Stained Glass

The construction of decorative windows in a “mosaic” of colored, painted glass held together by strips of grooved lead (calmes or comes), is one of the medieval arts discussed at length by Theophilus in *De diversis artibus*, written in the first quarter of the 12th century.

Window glass, used extensively in the Roman world, was reintroduced into England only in the 7th century. The earliest documented references to its use in Anglo-Saxon churches concern the north of England; in about 670 Bishop Wilfrid beautified his church by replacing linen cloths and pierced slabs, or *transennae*, with glass. Bede describes how, in 675, Benedict Biscop imported Frankish glaziers to work at Wearmouth, for the craft of glazing had been lost to the Anglo-Saxons. Excavated fragments from the sites of Wearmouth and Biscop’s second foundation, Jarrow, reveal these early windows to have consisted of colored, unpainted fragments. A surprisingly wide range of colors was available, probably arranged in decorative rather than figurative compositions. Fragments of similar date have been found at Escomb (County Durham), and all are characterized by their high soda content, typical of the highly durable glass of the Roman world. The earliest painted fragments have also been recovered by excavation: tendrils of foliage ornament at Winchester of late Saxon or early Norman date and three blue fragments from Archbishop Thomas of Bayeux’s Minster in York (ca. 1080–1100).

Although the use of window glass thus has a long history in medieval England, it is only in the 12th century that extant evidence for glazing with painted glass becomes more plentiful. In York a number of figurative panels and decorative borders have survived from the Romanesque Minster, reused as “belles verrières” (“beautiful glass”) in the 14th-century nave. These panels have been dated ca. 1180 and attributed to the patronage of Archbishop Roger of Pont l’Évêque. Although in a fragmentary condition, the figurative scenes and their foliage borders (approximately fifteen survive) are evidence of a sumptuous glazing scheme in the late-12th-century choir.

Of a slightly later date and representing a separate stylistic evolution is the glazing of the new choir of Canterbury Cathedral ([fig. 129](#)). The Canterbury scheme, begun as the York program drew to a close and executed from ca. 1180 to ca. 1220, with an interruption during the Interdict of 1208–13, provides a valuable insight into the evolution of English monumental painting in the period of transition from Romanesque to Gothic. The earliest figures, including those of the ancestors of Christ and the Jesse Tree, convey an almost classical monumentality particularly marked in the work of the Methusaleh Master. Features like the profile head of the prophet Semei and the nude idol in the first typological window even suggest a familiarity with late Roman antiquities, such as those collected by Henry of Blois at Winchester.

The later windows, especially those designed for the ambulatory of the Trinity Chapel dedicated to the life and miracles of Thomas Becket, display an elegance, small-scale delicacy, and liveliness characteristic of the Gothic idiom. The Canterbury artists were familiar with French stylistic trends exemplified by the work at Chartres, Bourges, and Sens, and some may even have worked in France during the years of Stephen Langtons exile. Recent research has even suggested that the glass by the Petronella Master was the product of a workshop responsible for glass in Canterbury, St. Remi in Reims, and St. Yved in Braine.

Fig. 129. Canterbury Cathedral, choir clerestory (now west window). RCHME, © Crown copyright. Reproduced by permission.

Compared with the wealth of French 13th-century glazing, English survivals are disappointing. Apart from Canterbury no extensive scheme remains in reasonable condition, a loss particularly serious in a period that saw such a transformation of styles. From the first half of the century Lincoln preserves the fragmentary vestiges of a once impressive scheme that included the Last Judgment, Life of St. Hugh, Life of the Virgin, and the Old Testament, perhaps in a typological sequence, now confined to the north rose, east windows of the

choir aisles, and north-transept lancets. The Lincoln glass, ca. 1200-ca. 1230, displays affinities with Canterbury but is unlikely to be by the same workshop.

Apart from the figurative glass Lincoln also preserves some grisaille panels, that is, panels executed in shades of grey, a type of glazing increasingly favored for the clear silvery illumination it provided. More impressive remains are to be found at Salisbury (glazed ca. 1200–58 and ca. 1270), where an appreciation of the surviving panels is enhanced by the wealth of antiquarian material. Salisbury preserves both types of grisaille favored in 13th-century England: the unpainted geometric or vegetal variety and the more costly type decorated with trails of painted foliage. In both types color is used sparingly. This type of glazing was not confined to cathedrals; parish churches preserve examples, as at Brabourne and Hastingleigh (Kent) and Marston (Oxfordshire). All are characterized by a preference for regular rather than interlacing designs, as favored on the Continent.

The scant remains at Westminster Abbey suggest that a combination of figurative medallion and grisaille was also favored by Henry III's glaziers. The figurative panels now in the Jerusalem Chamber are all that survives of the glazing of the apsidal chapels of the choir (glazed ca. 1246–59); a single panel of foliage grisaille photographed before World War II has now disappeared. It is clear from documentary references that Henry III was an important patron to glass painters. His commission for the hall of Rochester Castle in 1247 is the earliest documented reference to heraldic display in stained glass, and a small quantity of heraldry survives in Westminster Abbey. The extensive use of heraldry in stained glass is one of the important new features to emerge in the 13th century. Another feature that owed much to the influence of Westminster is the use of naturalistic foliage forms, which appeared in Westminster sculpture ca. 1250. This only emerges in a fully developed form in English glass in the 1280s (Wells Cathedral Chapter House stair, York Chapter House, Merton College Chapel, Chatham [Kent]), although in tentative ways naturalism can already be seen in some of the grisaille in the Five Sisters Window at York and at Salisbury.

A further innovation was the abandonment of the earlier medallion-type frame exemplified by Canterbury and Lincoln and the introduction of architectural canopies. The canopied figures were positioned in a horizontal band that alternated with zones of lighter grisaille to create the so-called "band window," a balance of narrative decoration and illumination of the interior. An early experiment in the "band" effect is found in a single light in the York Chapter House (ca. 1285–90), but the most perfect 13th-century expression of this new aesthetic is the choir scheme of Merton College Chapel, Oxford, of ca. 1294. The gift of Henry de Mamesfeld, chancellor of Oxford University and subsequently dean of Lincoln, the windows contain stylized images of the

donor, whose physical presence in stained glass is yet another innovative feature in glass from the end of the 13th century on.

The nave aisles of York Minster offer the best-preserved early-14th-century scheme to unite all these features. With their variety of donors, secular as well as clerical, the windows express a range of devotional tastes and reflect the careers and fortunes of their originators. The donor himself or herself is often prominently depicted, as in the window given by Peter de Dene, canon of the Minster (glazed ca. 1307–10), and the Bell Founders Window given by Richard Tunnoc, bell founder and goldsmith of York.

It is in Peter de Dene's Heraldic Window that the most important technical innovation of the 14th century makes probably its earliest appearance in English stained glass. Yellow stain is a liquid solution of silver nitrate or sulfide, which when painted onto the surface (usually the exterior) and fired will turn white glass yellow. This revolutionary new technique freed the glass painter of the need to cut and lead small fragments of pot-metal glass every time he wanted to give a figure a golden halo or silvery beard. This freedom is perfectly illustrated in the delicate decoration of the arms and arrow of a king of England in the canopy of the Heraldic Window.

The palette of the 14th century, which exploited the qualities of yellow stain to the full, was a rich one. The predominance of red and what Suger called the "sapphire blue," so noticeable at Chartres, was balanced by the frequent use of purple, a rich brown, and a warm green. Tracery lights, grisaille panels, and borders abound with motifs derived from the natural world, augmented by many creations of the imagination, the parallels of the grotesque and hybrid forms found in the margins of illuminated manuscripts (e.g., the Lucy and Latin chapels at Christ Church, Oxford).

In addition to the great cathedral and monastic schemes—York, Wells, Tewkesbury, Gloucester, Exeter, Ely, Bristol, Oxford—numerous windows of 14th-century date are to be found in parish churches throughout the country: Eaton Bishop (Herefordshire), Stanford on Avon (Northamptonshire), Kempsey (Worcestershire), Newark (Nottinghamshire), and Grappenhall (Cheshire), to name but a few, all attest to the vigor of English glass painting in the first half of the 14th century. When, in the 1350s, Edward III sought craftsmen to work on the now lost glazing of St. Stephens Chapel, Westminster, writs were issued to 27 counties. The names of many of those employed reveal this to have been a successful trawl.

The loss of St. Stephens Chapel has robbed us of what was undoubtedly the most important glazing commission of the 1350s. Without question the most significant surviving window of the mid-century is the east window of Gloucester Cathedral (formerly the church of the Benedictine monastery; [fig. 130](#)). Executed in sparkling white glass and heavily modeled with painterly

washes, the figures are conceived with an almost sculptural grandeur. The only substantial color is provided by the yellow stain and counter-changing red and blue backgrounds. In its palette, and its interest in painterly modeling and spatial effects, the Gloucester glass anticipates developments that are fully realized only in the 1380s. Gloucester stands in splendid isolation in the middle of the century, an experiment with no immediate imitators.

Fig. 130. Gloucester Cathedral, east window. RCHME, © Crown copyright. Reproduced by permission.

Stained glass of the third quarter of the 14th century is scarce and often of a disappointing quality. Squat figures with large heads and beady eyes survive at Wormshill (Kent), St. Thomas's Church in Salisbury, and Aston Rowant (Oxfordshire). In a style reminiscent of the slightly later Lytlington Missal, with broader faces and heavy-lidded eyes, are panels at Birks Morton (Worcestershire), West Horsley (Surrey), and the panel of William Cele and his wife in the Victoria and Albert Museum (said to have come from a church in Suffolk). A panel in identical style, and probably a companion to it, is in the Burrell Collection in Glasgow.

Some of the most important glass of the late 14th century was that commissioned by William of Wykeham, bishop of Winchester and chancellor of England. Wykeham's two educational foundations, New College in Oxford (founded 1372 and built 1380–86) and Winchester College (founded 1382, glazing in progress 1393), were glazed by the Oxford workshop of Thomas Glazier. In Thomas's work for New College an evolution away from a hard, linear style to a softer, more painterly and plastic International Gothic style can be discerned. The Jesse Tree executed in this soft style was removed from the college in the 18th century; vestiges are now preserved in the south choir aisle of York Minster. The later Winchester College glass is entirely in this International Gothic idiom. The Winchester Jesse has a sculptural quality and an interest in spatial effect only tentatively explored at New College. Thomas of Oxford's working life was a long one. He was active until 1421–22, and his workshop was probably responsible for the east window of Merton College Chapel, Oxford, and the choir clerestory glazing at Winchester Cathedral.

Recent research has added greatly to the corpus of stained glass conceived in the new "soft" style: the west window of Canterbury Cathedral (1396–1411), four figures in the east window of Exeter Cathedral by Robert Lyen (executed 1391), and the western choir clerestory of York Minster (perhaps by John Burgh) are all now recognized as evidence of an English response to International Gothic.

In many respects Thomas's stylistic heir was John Thornton of Coventry, employed in 1405 to glaze the east window of York Minster ([fig. 131](#)). Thornton, contracted on 10 December 1405, was in receipt of a salary of £46, with a bonus of £10 promised should the work be completed within three years. He was authorized to employ additional craftsmen and formed a special Minster workshop for this exceptional commission. By 1410, with the commission complete, he established an independent workshop and was admitted to the freedom of the city. Although no other documented work is recorded, many other windows in the Minster and city churches can be attributed on stylistic grounds to his workshop. The figures most confidently attributed to Thornton's own hand display a masterly command of painting

techniques, combined with a lively interest in the real world. Faces are almost coarse, with bulbous noses, shaggy brows and beards, and heavy limbs. They are remarkably expressive, displaying great realism.

Fig. 131. York Minster, east window. RCHME, © Crown copyright. Reproduced by permission.

The most expensive commission of the 15th century was undertaken for the king. In 1402 Henry IV paid William Burgh 3s. *Ad.* per foot for windows “diapered and worked with broom flower, eagles and scrolls inscribed *Souveraigne*” for his private apartments at Eltham Palace. These windows do

not survive, but the description and their recorded price suggest their splendor. No royal commissions survive from this period, and the study of English medieval stained glass is hampered by the almost total loss of glazing schemes associated with royal patronage. The king was the most important patron other than the church, and the post of king's glazier the most prestigious. In the Beauchamp Chapel in St. Mary's Church, Warwick, is a glazing scheme executed in 1447 by the king's glazier, John Prudde, for the executors of Richard Beauchamp, earl of Warwick. The scheme is characterized by sumptuous color with white glass used relatively sparingly and the effect enhanced by the use of "jewels" leaded into hems and trimmings. The contract stipulated the use of only the finest imported colored glasses and reveals that the designs from which the craftsmen were to work were supplied as paper patterns by the patron.

The directing hand of the patron can also be discerned in the choir glazing of Holy Trinity, Tattershall (Lincolnshire), founded by Ralph Cromwell, lord treasurer of England, and executed 1466–80 under the direction of William Waynfleet, bishop of Winchester. This ambitious scheme has been shown to be indebted for its typological scenes to the 40-page block-book edition of the *Biblia pauperum* of 1464–65. Familiarity with this source so soon after its continental publication is more likely to reflect the reading habits of patrons than the literary sophistication of the glass painters, although one of the Tattershall glaziers, Richard Twygge, was later employed to glaze fourteen clerestory windows at Westminster Abbey.

Fig. 132. Church of St. Peter and St. Paul, East Harling, Norfolk. RCHME, © Crown copyright. Reproduced by permission.

By the 15th century most major towns in England supported a community of glass painters. London, York, Chester, Norwich, Canterbury, King's Lynn, Oxford, and Colchester were all important centers, and the Tattershall records reveal that the towns of Stamford, Peterborough, and Burton-on-Trent also had produced significant workshops. Recent research has challenged the traditional idea of "regional styles," although it is clear that certain prolific workshops exerted considerable influence on the character of a region.

The stylistic characteristics of International Gothic were long-lived in English stained glass; in the southwest they remained current into the third quarter of the 15th century. The harsher, mannered style typified in manuscript illumination by the work of William Abell can also be found in stained glass, particularly in East Anglia (fig. 132), although wood-cut illustrations with strongly accentuated linear modeling were no doubt equally influential. In common with native illuminators native glass painters of the close of the 15th century were poorly equipped to counter the challenge of continental and particularly Netherlandish competition. The appointment in 1497 of a Fleming, Barnard Flower, to the post of king's glazier marked the formal recognition of the eclipse of the native craft. In 1474 the London guild had successfully petitioned the mayor and aldermen against foreign competitors settled outside the limits of guild jurisdiction. A quarter of a century later the battle against foreign incursion had been lost. The unregulated Southwark glass painters, among whom Flower was the leading figure, worked in styles that reflected the most avant garde developments in European painting of the day. The patronage of the king and the court circle secured the most lucrative commissions: for the foreigners and for Flower himself a string of royal work that culminated in 1515 with the contract for the greatest enterprise of all, the Chapel of King's College in Cambridge.

Staple

The term "Staple" denotes the monopolistic organization that in the later Middle Ages largely controlled the export of wool. Its members were known as merchants of the Fellowship of the Staple, or simply Staplers. It was the first of the English regulated trading companies whose heyday was the second half of the 16th century, though the exemplar itself was by then virtually defunct.

The Staple came of age in the last years of Edward III, but it grew up slowly and fitfully during the previous 100 years. The germ of the organization existed in the early 1270s, when merchants looked for ways to continue selling wool to Flemings, in defiance of a ban imposed by their government. Progress may have been checked over the next two decades but speeded up during the Anglo-French war (1294–97), when the wool trade played a major part in the crown's financial and diplomatic strategies.

By the beginning of the 14th century some merchants trading with the Low Countries had adopted a semicorporate structure and sought to focus their business on a staple town in that region. The first element of compulsion came in 1313. Because of hostility to Englishmen in Flanders a staple was set up in the neutral town of St. Omer, and it was decreed that all wool exported from England, whether by natives or aliens, must be taken there. Englishmen soon found that a compulsory staple guaranteed them a greater share of exports and they persisted with this policy. For a period the staple was at Antwerp, but in time of peace Bruges was found to be the most favorable location.

An alternative policy directed wool through specified towns in England (home staples) but allowed it to be exported to any place abroad. This was implemented briefly but unsuccessfully three times in the 14th century. Before the outbreak of the Hundred Years War the Staple was promoted chiefly by the wool merchants in their own interest. Thereafter its continued existence was ensured by royal interest, which also determined the choice of the staple town. At first Edward III favored Bruges, but in 1363 he had the staple removed to Calais, where it remained, except for two brief intervals, until the town was recaptured by the French in 1558.

The enforced routing of wool through Calais guaranteed a livelihood to the

English inhabitants, while customs revenue, combined with loans from the Staple company, largely financed the garrison. It was now that the export of wool became virtually a monopoly of the English staplers. The only exceptions were exports by Italian merchants to the Mediterranean and, in the 15th century, of inferior north-country wool dispatched from Newcastle to the northern Low Countries. Most cloth manufacturers in the Low Countries, still wishing to use English wool, had to obtain it at Calais. The supply of wool to the Staple and the terms of sale there were controlled by the company, with the intention of upholding prices and supporting the bullionist policy of the government. The staplers traded individually or in small partnerships, taking their own profit or loss, but bound by the company regulations.

Latterly the chief *raison d'être* of the company was to provide support for English rule in Calais; this disappeared in 1558. The few surviving members tried for a time to maintain a staple at Bruges, but this did not survive long on account of friction with Spain. The company maintained a tenuous existence as long as Englishmen continued to export ever-declining quantities of wool. It was not formally wound up even when export was legally prohibited in 1614; in the end it simply atrophied.

Statutes

The term used by modern historians to refer to instances of lawmaking,

distinguishing the legislature's enactment of new law from the application of existing law, which is the province of the judiciary. The word "statute" (*statutum*) began to appear in something like the modern sense of the term during the later 13th century. Even then, however, the modern distinction between legislation, as lawmaking, and adjudication, as the application of law, was vague in the Middle Ages. The state's legislative and judicial functions both had their roots in a single institution, the king and his advisory council of barons and prelates.

During the 11th and 12th centuries there seems to have been little recognition of a difference between the power of the king and his council to decide a dispute between two litigants and the power to ordain a new remedy or otherwise change the law. J.H. Baker has summarized the issue: "What in later times were seen as two distinct features of the constitution—the king as head of the legislative assembly in parliament, and the king as head of the judicial system—had their origins in a less sophisticated notion of kingship in which legislation and adjudication were not distinguishable."

A functional separation emerged in the early 13th century, with the extensive though not total delegation of judicial authority to a corps of professional judges. The king and council retained lawmaking responsibility, though during succeeding centuries the nature of the legislative process changed, as did the composition of the lawmaking body.

While we can refer to many medieval mandates or ordinances of the king and council as statutes because of their innovative, general, and prospective character, it was some time before anyone thought that their lawfulness depended on popular assent. The king's legislative authority originated in his duty to receive the petitions of aggrieved subjects. Where appropriate, king and council might choose to formulate responses that not only addressed the specific request for relief but also sought to prevent, or to afford remedies for, similar injuries in the future.

These legislative proceedings did not conform to any set procedural routine. By the later 13th century some such meetings included representatives of the Commons, but this occurred for reasons of expediency rather than constitutional propriety. In Plucknett's words, "A statute in the reign of Edward I simply means something established by royal authority; whether it is established by the King in Council, or in a Parliament of nobles, or in a Parliament of nobles and commons as well, is completely immaterial."

During the 14th century "parliament" came to imply an assembly of king and council including the Commons, consisting of knights and burgesses as elected representatives. The Commons gradually assumed a greater role in the initiation of legislation and in its approval. Petitioners increasingly addressed their requests to the Commons rather than to the king directly. If approved by

the Commons, the petition was then forwarded to the king and council. In this way the principal locus of legislative initiative gradually shifted from the king and council to the Commons, from above to below. Nevertheless, the assent of the Commons to particular legislative items probably was not considered indispensable until after 1400.

The modern bill-debate-amendment procedure did not become settled until a century or so after that. Only with the advent of the Tudors do we witness the careful attention to public-policy considerations and use of language that characterize modern statutes. Plucknett has observed that these statutes were “no longer the government’s vague reply to vaguely worded complaints, but rather the deliberate adoption of specific proposals embodied in specific texts.”

As sources of innovation in the law, statutes played a significantly more limited role than they do in modern legal systems. Some scholars have suggested that the medieval theory of legislation restricted statutory activity to the mere declaration of existing custom. Others have argued that medieval statutory practice differed little from judgments rendered in disputes between private parties. Under either view the central idea is that there was no inclination to change existing law in a deliberate, self-conscious way or, perhaps, no awareness of the power to do so. However, these interpretations are difficult to square with the many clear examples of medieval activity that is legislative in the modern sense of the term.

While Henry II’s reign witnessed important remedial innovations that contributed to the development of the common law governing real property (i.e., real estate), it was Edward I who most boldly exercised the legislative prerogative. Plucknett described these initiatives as “the greatest outburst of legislation in England during the middle ages; it was only equalled in extent and importance by that of the first half of the 19th century.” Important examples included the Statute of Mortmain (1279), restricting the right to alienate real property to religious corporations. The primary objective seems to have been to preserve the financial value to feudal lords of the customary incidents of tenure, though the crown soon indicated a willingness to license grants in mortmain upon payment of a fee.

Similarly motivated was the statute *Quia emptoresterrarum* (1290), which required that grants of real property be by means of substitution rather than subinfeudation, or vassals enfeoffing subvassals. By prohibiting the grantor from creating a new tenancy by which the grantee would hold of him, the statute aimed to preserve the value of the feudal incidents to the grantor’s lord. The statute known as *De donisconditionalibus* (1285) restricted the rights of certain owners (tenants in fee tail) to alienate real property to the prejudice of their heirs.

After Edward I there are several instances of legislation designed to address

important social problems, like violence and the effects of the Black Death on labor markets, though the bulk of statutory activity related to relatively narrow and trivial matters. George Sayles stated the matter: “The statutes between Edward II and Henry VIII exhibit few great monuments of legislation.”

Stephen (ca. 1096–1154; r. 1135–54)

The third surviving son of Stephen, count of Blois and Chartres, and Adela, daughter of William the Conqueror. It was his mother’s family that was to shape his career. Nothing is known of his life before he was sent to the English court sometime between 1106 and 1113. There he became a magnate because of family ties rather than military or administrative service.

Between 1113 and 1125 his uncle Henry I made him count of Mortain, gave him extensive lands in England and Normandy, and married him to the heiress Matilda of Boulogne, making this younger noninheriting son one of the richest of the Anglo-Normans. In 1126 Stephen was joined at court by his younger brother Henry of Blois, a Cluniac monk elected abbot of Glastonbury and, in 1129, bishop of Winchester, the wealthiest English see and site of the royal treasury.

The major change in Stephens career came when Henry I died, 1 December 1135. Henry's designated heir was his daughter, the empress Matilda, but she was handicapped by her gender, her education at the court of the Holy Roman Empire, and by her second husband, Geoffrey of Anjou, a traditional enemy of many of the Anglo-Norman barons. Stephen was in Boulogne; he hurried to England and was acclaimed king by the people of London and Winchester. He and his brother Henry convinced key men in the royal administration of his claim and took control of the treasury. Then Hugh Bigod, the future earl of Norfolk (1140/41–77), returned from Normandy, telling of a deathbed designation of Stephen by Henry I—neither supported nor contradicted by others present. Stephen was crowned on 22 December 1135. By April 1136 he had gained the support of most of the nobles and clergy in England.

Stephen's right to the throne continued to be disputed by Henry's daughter, who provided a rallying point for opposition. Between 1137 and 1141 many nobles—some having lost faith in Stephen's capability, others seeking particular gains—switched allegiance. The clergy also began to withdraw their support as they came to doubt the sincerity of his early Gregorian measures. He lost control of the kingdom in 1141, when he was captured at the Battle of Lincoln and held prisoner for nine months. He regained power as a result of Empress Matilda's alienation of her own supporters and of adroit negotiations by Stephen's wife, Queen Matilda. The queen's role was central, as she organized crucial military ventures and handled many negotiated truces.

Stephen's support among the barons continued to erode. In January 1153 the empress's son, Henry Plantagenet, invaded England, and Stephen agreed to a negotiated settlement, completed in November, three months after the death of Stephen's eldest son, Eustace. Henry, not Stephen's younger son William, was to be the next king (as Henry II). Stephen died on 25 October 1154.

In a time of personal rule Stephen's character is central to any discussion of the period. Many contemporary and modern historians have faulted him not because of cruel or dictatorial tendencies but because of perceived nonroyal weaknesses. The Anglo-Saxon Chronicle damns him as "a kindly man" of whom the nobles took advantage. Henry of Huntingdon wrote that his voice was too weak to deliver the battle speech before the Battle of Lincoln. Even Stephen's victories were credited to the merits of others, and no king who lost

battles could be seen as a leader. Unable to win by military victory, he persistently refused to accept negotiated peace. He seems to have constantly misjudged individuals or situations, such as accepting advice from Waleran Beaumont over Henry of Blois on clerical appointments, or deciding to purge his administration by arresting unarmed bishops during court in 1138, thus breaking the king's peace. Acts like these lost Stephen his alliance with the church.

Stephen was also unable to check the building of unlicensed castles or to control subinfeudation, or vassals enfeoffing subvassals. Whether the alienated nobles were reacting to the previous reigns of strong kings or to disappointment that Stephen was not stronger, he could not hold their loyalty and instead relied on mercenary troops from Flanders, an act that triggered more alienation. He was the first Anglo-Norman king to give power away in any significant measure, in return for military support, when he created seventeen new earldoms to reward followers. In spite of this there was administrative continuity in record keeping and royal justice, though neither flourished without the peace or cooperation his predecessors enjoyed. It is in contrast to the successes of Henry I and Henry II that his reign palls. He lacked the innovation in administration and justice and the political tact that characterized both Henrys.

Stockholm Gospels

An illuminated copy of the Gospels assigned to mid-8th-century Canterbury, also called the *Codex Aureus* (Stockholm, Royal Library A. 135; [fig. 133](#)); it is a major example of southern Anglo-Saxon manuscript art.

Fig. 133. Stockholm Gospels (Stockholm, Royal Library A. 135), fol. 11. *Christi Autem*. Courtesy of the Royal Library, Stockholm.

The two surviving evangelist portraits, Matthew and John, display the romanizing art style of Southumbrian Christianity. The architectural settings with spatial references derived from late-antique art, the three-dimensional drapery and faces firmly modeled with carefully placed stripes of gradated values, and the luxurious but naturalistic colors appear in other 8th- and 9th-century examples. The evangelist figures, seated under tympana presenting symbols of winged man and eagle, possibly are based on those in the “Gospels of St. Augustine” (Cambridge, Corpus Christi College Cod. 286). Although additional Mediterranean models have been posited to account for the style, the portraits probably represent a later version of that found already in the Vespasian Psalter.

Alternating undyed and purple-stained leaves present the Gospel text. The purple folios are written in gold, white, and silver; the colors sometimes being varied on a single page to form a pattern, such as a cross or the Chi-Rho. The elegant, patterned pages emulate a specialized late-antique luxury page treatment, *carmina figurata*.

The beginnings of some sections of the text are given full-page decorative treatment, with multicolored display capitals set in panels of burnished gold or gold capitals in panels of plain vellum or of lacertine (interlaced) animal ornament, vinescroll, and Celtic trumpet spiral. The use of display capitals appears to escalate that seen in the Vespasian Psalter, and the lacertine animal ornament resembles that of later Southumbrian examples, such as the Barberini Gospels.

The massive use of gold probably had consequences for the manuscript’s history, the book having been ransomed from Vikings, according to an inscription on fol. 11.

Stonework as Ecclesiastical Ornament

Little ornamented stonework remains *in situ* in Anglo-Saxon ecclesiastical contexts, but numerous fragments of carved architectural decoration and church furnishings have survived, to provide some indication of the original appearance of the buildings.

From much of the material it is clear that carved stonework was often used to enhance entrances and doorways. The two-storied western entrance porch of Benedict Biscops foundation at Wearmouth (added to the church by 689) provides us with a rare and early *in situ* instance, with its monumental low-relief figure set under the gable, its decorated stringcourse, and the western opening into the porch. This is flanked with lathe-turned baluster shafts and square soffits decorated with interlaced ribbon animals reminiscent of those found in earlier 7th-century metalwork, as well as insular manuscripts, such as the Book of Durrow (Dublin, Trinity College A.4.5[57]). Somewhat later in date, at Lastingham (North Yorkshire), vinescroll- and interlace-decorated door jambs survive from the 8th- or early-9th-century church, while the door between the nave and north porticus of the 9th-century church at Britford (Wiltshire) is set with carved panels of vinescroll; at Deerhurst (Gloucestershire) hood moldings framing entrance ways terminate in sculptured animal heads dated to the 9th century. In the 10th and 11th centuries carved stonework was also used to decorate the western towers that were added to many church buildings at that time. At Corhampton (Hampshire), for example, some of the pilaster strips are carved with an elaborate foliate motif (see also Barnack, Northamptonshire).

Apart from providing such decoration, stonework was also used to ornament

the church walls. Sundials were set into the exterior fabric of some Anglo-Saxon churches, as at Escomb (County Durham), while (often extensive) friezes of figural, zoomorphic, vinescroll, and geometric ornament decorated interior walls (e.g., at Jarrow and Hexham in 7th-century Northumbria and, ca. 800, Breedon in Leicestershire [figs. 134–36]). In the 10th and 11th centuries the interior walls of several southern churches were further decorated with large-scale reliefs, often of the Crucifixion. The fragmentary remains of just such a rood survive in situ over the chancel arch at Bitton (Gloucestershire); more substantial remains occur (although not in their original settings), at such sites as Romsey (Hampshire; fig. 110: see ROMSEY ROODS) and Langford (Oxfordshire; fig. 124: see SCULPTURE, ANGLO-SAXON).

Fig. 135. Breedon-on-the-Hill, Leicestershire. Architectural frieze, plant scroll. Courtesy of A.J. Hawkes.

Fig. 136. Breedon-on-the-Hill, Leicestershire. Figural frieze (part of a shrine?). Courtesy of A.J. Hawkes.

Stone was also used for church furnishings. Stone altar tops, incised with a

cross at each corner, were required in all churches, and in some cases stone fonts have survived (e.g., at Potterne [Wiltshire], and Deerhurst); ornamented stone altar screens may also once have existed. At Jarrow a number of lathe-turned baluster shafts were probably incorporated into just such a screen with narrow friezes of small-scale relief balusters in the late 7th or early 8th century; similar friezes of contemporary date survive elsewhere at Hexham and Simonburn (Northumberland). Other carved remains from Jarrow suggest stonework was also used for a lectern, and elsewhere stone was used for elaborate seats, as at Bamburgh (Northumberland); animal-decorated panels from Wearmouth may have functioned as bench ends. Complete bishop's or abbot's seats have survived from Hexham and Beverley (East Yorkshire).

Apart from providing some indication of the original appearance of Anglo-Saxon churches the decoration of ecclesiastical stonework has also been seen as significant by those attempting to establish the overall chronology for Anglo-Saxon sculpture. The carved motifs used in the decoration of the earliest stone churches are viewed as the starting point in the sculptural development of those motifs and so are crucial to the chronology of the material as a whole. So few pieces of ecclesiastical stonework have survived in clearly datable contexts that this body of material can provide only a general chronological basis on a local level.

Sub arturo plebs

The motet is one of the most complex and artful forms of medieval polyphony, and *Sub arturo plebs vallata/Fonscitharizandum/In omnem terram* is one of the most ingenious motets to survive from the 14th century. It is noteworthy both for the complexity of its underlying construction, which makes it one of the most technically advanced motets of its day (it is a three-section isorhythmic motet with proportional diminution of the tenor in the ratio 9:6:4), and for its musical subject matter (it is perhaps the only fully secular motet in the English tradition).

Sub arturo plebs is one of an interlocking series of English and continental “musicians’ motets.” It appears to have been directly modeled on the first of the series, the anonymous continental motet *Apollinis eclipsatur/Zodiacum cum signislustrantibus/In omnem terram*. The text of the duplum (the middle voice) gives a brief history of music, explains the proper rhythmic interpretation of the tenor, and names the composer (J. Alanus). Alanus can be identified as John Aleyn, who was a chaplain of Edward III’s Chapel Royal from 1361 to 1373, the year of his death. In the text of the triplum (the top voice) Aleyn names fourteen English musicians with careers collectively spanning three successive generations between the 1340s and 1380s, either in service to Edward III or Richard II in the Chapel Royal, or in service to the Black Prince (Edward, Prince of Wales). Trowell proposed 1358 as the date of composition of *Sub arturo* and suggested that it was written for a famous

gathering of the Knights of the Garter at Windsor Castle that year. More recent scholarship now accepts a date in the very early 1370s to be more likely, in the years just prior to Aleyn's death. Another English motet of similar complexity and ingenuity, *Oamicus /Precursoris*, survives adjacent to *Sub arturo* in the latter's only insular source (Ipswich, Suffolk Record Office HA30:50/22/13.5, *olim* Yoxford). Bent suggests this may be a companion piece to *Sub arturo* by the same composer.

Sumer Canon

Also known as “Sumer is icumen in” after the beginning of its text, or as the Reading Rota after its probable place of origin, this composition of ca. 1250 is the most famous piece of medieval music. It is, further, one of a mere handful of secular ME lyrics with surviving musical settings from before ca. 1400. The Sumer Canon is uniquely structured as a *rota*, or round canon at the unison, over a *pes*, which in this case is an essential two-voice supporting substructure. The result is a hybrid, in some respects motetlike, form. By no means *sut generis* in respect to musical structure, the Sumer Canon has affinities with a rich literature of 13th-century English polyphony employing the techniques of voice exchange, rondellus, and rota. In its only source (BL Harley 978, fol. 11v) the Sumer Canon is written as a single upper voice, which yields the canonic parts, over the two voices of the *pes* in score. An elaborate accompanying rubric provides performance instructions—recommending, for instance, that two to four singers make the round over the *pes*. Two texts are written under the upper voice, the English (“Sumer is icumen in”) in red and an alternative Latin text (“Perspice christicola”) in black.

There is a large literature on the Sumer Canon. It has engendered controversies surrounding its date of origin, the original state of its notation in respect to both rhythm and melody, and the status of the vernacular text as original or contrafact.

Sutton Hoo

Basil Browns 1939 excavation of the Mound 1 ship burial at Sutton Hoo, Suffolk, was a turning point in the study of early medieval art in England, as the richness of the find permanently changed the evaluation of the scope and quality of pre-Christian Anglo-Saxon art.

The clinker-built ship, traceable by the imprint of its timbers and by the placement of surviving iron rivets, was an open rowing boat approximately 90 feet in length, the longest vessel yet found from the early-medieval period. The burial chamber amidships contained a princely treasure, including both locally made and imported luxury objects, demonstrating both the quality and techniques of indigenous craftsmanship and the extent of the contacts of early East Anglia with other cultures of the British Isles and the Continent.

The hoard of jewelry found along the keel line was mostly produced in a local workshop, probably under the direction of a single master craftsman. The jewelry is made of gold, often inlaid with various materials. These include garnets, linking this workshop to others in Kent and on the Continent, such as the center that produced the treasure found in 1653 at Tournai in the tomb of the Merovingian king Childeric, and *millefiori*, a technique brought to England by the Romans and continued locally by Celtic craftsmen, including those who made the largest of the three hanging bowls found at the west end of the burial chamber at Sutton Hoo. The great gold buckle (fig. 137) is ornamented with interlacing snakes and small quadrupeds typical of contemporary Germanic art in England and on the Continent and has a hidden compartment possibly for an amulet or relic.

Fig. 137. Great Gold Buckle, Sutton Hoo (London, British Museum MLA 1939, 10–10, 1). Courtesy of the Trustees of the British Museum, London.

A purse contained 37 continental gold coins, three blank slugs, and two plain ingots. Its hinged lid survives, showing *cloisonné* motifs set in white

enamel, of which the outer pair closest to the clasp shows an upright man between two attacking animals. This closely parallels a stamp used for embossing bronze plates for decorating helmets found at Torslunda (Öland, Sweden), and on the helmet from boat grave VII at Valsgärde (Uppland), one of the many instances where the Sutton Hoo workshop had access to imported Scandinavian models.

Also along the keel line were a silver Byzantine salver with the stamps of Emperor Anastasius I (491–518); the remains of a banqueting assemblage, including two large drinking horns and six maplewood bottles; and a sword with gold and garnet fittings.

Across the west end of the burial chamber was an iron stand originally thought to be a portable flambeau but now widely considered to have been a standard. Nearby was a stone bar in the shape of a whetstone 2 feet in length, with carved human heads and metal fittings at either end, too large and unwieldy to have been used as a hone and so probably ceremonial, possibly functioning as a scepter. With these objects was an heirloom leather-covered wooden shield, repaired with metal zoomorphic mounts. Also here was an eastern Mediterranean footed bronze bowl containing the largest of the hanging bowls, which in turn held the remains of a lyre with silver-gilt bird-head mounts. Three feet from the west wall were eight eastern Mediterranean nested silver bowls with ornamental motifs in a cruciform layout, and two imported silver spoons inscribed in Greek with the names “Saulos” and “Paulos.” On the north side of the keel and about a yard from the west wall was a shattered iron helmet originally covered with thin plates of bronze. Its design has been linked both to helmets from Vendel and Valsgärde in Sweden and to sub-Roman helmets from England and the Continent. A pattern of dancing warriors embossed on a surviving bronze plate shows definite links to Swedish workshops.

The richness of the burial and the possible symbolism of several objects (“standard,” “scepter,” and drinking horns) and of the animal motifs decorating these and other objects (helmet, purse lid, shield) have led to the hypothesis that Mound I honored one of the East Anglian kings who resided at nearby Rendlesham or Kingston, and with whom the extensive group of at least fifteen mounds at Sutton Hoo has been associated. As no human remains were preserved there, possibly owing to acidic soil conditions, it is uncertain whether Mound I was an inhumation, a cremation, a cenotaph, or a traditional burial ceremony for a convert buried elsewhere in a Christian context. Identification of the king remains hypothetical, as the coin dates are inconclusive; current scholarship suggests a date between about 610 and 640, a period including the reigns of the East Anglian kings Rædwald (d. 616/27), Earpwald (d. 627 or 628), and Sigeberht (death date uncertain).

The Sutton Hoo Research Project, under the direction of Martin Carver, undertook a new campaign of excavations from 1983 to 1992. The Project worked to a preset agenda that left the cemetery only partially excavated, thus conserving part of the site for exploration by future generations. The new campaign revealed an extensive cemetery consisting of twenty mounds (seven left unexcavated) and 44 burials without mounds. The latter group included both cremations and inhumation, as well as possible evidence of human sacrifice. The cemetery as a whole has been provisionally interpreted as a dynastic statement of “defiant pagan politics” (Carver, 1992: 365).

Swein (d. 1014; R. 1013–14)

Dubbed “Swein Forkbeard” in the 12th-century Roskilde Chronicle, he was king of Denmark and, for a few months, king of England from late in 1013 until his death on 3 February 1014. The son of Harald Bluetooth, he gained the

Danish throne by rebelling against his father, probably in 987. An Anglo-Saxon charter implies that he made his first incursion into England in the early 980s, and the Anglo-Saxon Chronicle records that he was certainly there by 994.

Swein invaded England in 1003–04, possibly to avenge the death of his sister, killed with her husband in the St. Brice's Day massacre of Danes on 13 November 1002. In 1013, leaving his son Harald as his vicegerent in Denmark, he again invaded England with a second son, Cnut (later king), and an army. After landing at Sandwich in Kent he sailed to East Anglia and then up the River Trent to Gainsborough, where the Northumbrians submitted to him, as subsequently did those in the Danelaw north of Watling Street, the inhabitants of Oxford and Winchester, the western thegns, and, finally, the citizens of London.

The Chronicle says that the people then considered him to be “king in all respects,” and King Æthelred II went into temporary exile after Christmas with his brother-in-law, Richard II, duke of Normandy. The German sources tend to be hostile to Swein, portraying him as an apostate who once or twice had to be ransomed by his supporters and who had been driven into exile for fourteen years. In fact he gained hegemony over Norway and may well have wielded some control over Sweden. The *Encomium Emmae reginae*, composed in Flanders in 1040–42, portrays him more favorably, declaring him to have been “the most fortunate of kings,” a person of power who had the support of his army and his people.

T

Tacitus (ca. 55-ca. 117)

Roman historian, of interest to medievalists mainly for his *Germania*, written in A.D. 98. From it is taken the term *comitatus*, commonly used by scholars to designate the aristocratic warrior bands of Germanic heroic poetry. The treatise has also often been juxtaposed with these poems as if it can be read as a straightforward historical witness to the sociological organization and ethical code that the literary tradition exemplifies. But the poems have their own rationale and in their present forms come from many hundreds of years later and from varied geographical and cultural backgrounds, while the *Germania* must itself be understood as a complex literary document that draws extensively upon older written models and sources.

The *Germania* is shaped, particularly in chapters 1–27, according to the conventions of the long-established genre of the ethnographic essay (chapters 28–46, which deal with individual tribes, have their own geographically determined arrangement). There are further complications in that Tacitus's understanding of Germanic social organization is influenced by Roman concepts and that he uses some of his material for moral and political purposes concerned chiefly with the Romans' supposed decadence and the topical (and perennial) issue of confrontation with and control of the Germanic tribes.

Tatwine (d. 734)

The few known facts about Archbishop Tatwine of Canterbury (731–34) derive largely from Bede's brief account toward the end of his *Ecclesiastical History* (5.23). Tatwine's death is recorded in the Anglo-Saxon Chronicle as occurring within a year of Bede's, and it is remarked that these deaths were signaled by portentous events, as the moon appeared suffused with blood. Tatwine's 40 *Aenigmata* ("riddles" or "mysteries"—the number is fixed by a complicated acrostic) can be shown to be modeled closely on Aldhelm's in style and diction, although the range of subjects covered is rather different.

Tatwine may be credited with introducing the abstract into Anglo-Latin *aenigmata*. The opening three riddles deal with Philosophy; Hope, Faith, and Charity; and the Historical, Spiritual, Moral, and Allegorical Senses of Scripture. We also find riddles on Love, Evil, Humility, and Pride. The ecclesiastical background of the author is easily discerned in the riddles on Bell, Altar, Christ's Cross, Lectern, and Paten. In the same way Tatwine clearly celebrates his literary and grammatical interests in his riddles on Letters, Parchment, Pen, Lectern, and Prepositions with Two Cases. His *Ars Tatwini*, a detailed elementary grammar that seems to have been popular on the Continent in the late 8th and early 9th centuries, is extant.

Taxes and Taxation

Medieval monarchy was dependent on taxation, but the form of tax levied was a matter of expediency. Methods of assessment were adopted, exploited, and then abandoned as they became ineffective. The picture is therefore a complex one of overlapping impositions, with innumerable variations and exemptions, and with an inevitable progression toward a series of set formulas or rates, as approved by parliament.

Two main levels of taxation may be distinguished: nationally raised taxes, payable to the king, and local taxes, paid to the lord or to the borough.

National Taxation

The Anglo-Saxon kings instituted the first land tax in medieval western Europe, the geld that continued in use until the reign of Henry II. Then the basis of assessment was changed, from land to the services due from a knight's fee, often rendered in cash terms: scutage, aids, and tallages. Overintensive exploitation of these feudal dues generated resentment under the Angevins. The revenue raised was completely inadequate to fund the growing cost of war. Hence the reign of Edward I saw the introduction of parliamentary

granted taxes on movables, an attempt to tap the resources of the realm more effectively. These taxes or subsidies were converted in 1334 into a fixed levy on each county, which in turn proved inadequate. Various unpopular expedients, such as the poll taxes of the late 14th century, were used to supplement the subsidies. During the 15th century resistance to the parliamentary granting of subsidies became so great that they were effectively abandoned between 1460 and 1513, when a new assessment was made on the basis of income.

The clergy were taxed separately from the laity. Initially the king was granted monies from papal revenues levied in England, but from the reign of Edward I the clergy began to be taxed in parallel with the laity, while papal taxation decreased in significance.

An alternative source of royal revenue was indirect taxes, particularly customs dues. The crown had ancient rights to levies, on wine and hides, for example, but from the late 13th century these were developed into a comprehensive national system. In 1275 a national custom on wool and hide exports was imposed to fund Edward Is wars; it was extended in 1303, and levies were placed on cloth exports in 1347. Tunnage was levied on wines, poundage on general merchandise. The Jews were taxed heavily until their expulsion in 1290.

Local Taxation

In rural areas a lord could demand a tallage, often an annual tax, from his unfree peasants in addition to their services and rents. Peasants also paid tolls on produce brought to market. Some townsmen benefited from exemption from tolls but made other forms of payment (renders) to the lord of the town. From the late 12th century towns began to compound with their lord to pay these as an annual lump sum known as the farm. Such revenues as the town needed for this and other purposes were raised in part from local taxes. A town could be granted the right to levy specific taxes, such as murage or pontage (for the maintenance of walls and bridges). The church also raised local taxes, the heaviest of which was the payment of a tithe on all produce.

Technology

Medieval technology was more a matter of expansion and development than of invention; techniques and devices already known to antiquity or the Orient spread throughout western Europe, were improved and adapted to meet local requirements, and were often used more extensively than ever before. Improvements usually reached England later than other parts of Europe, and this sometimes had significant consequences, perhaps none more far-reaching than those of the simple foot stirrup.

Recorded in China by the 5th century, the stirrup was known in the West within 300 years. Germanic tribes on the Continent exploited its military advantage, and the superiority of mounted cavalry over infantry soldiers was demonstrated decisively at Hastings. Though many Anglo-Saxon troops rode horses equipped with stirrups, they dismounted for the battle and, in spite of numbers and position, proved no match for William's cavalry and crossbows. After this the military use of the stirrup was quickly introduced into Norman England.

The Middle Ages also witnessed two significant improvements in connection with the nonmilitary use of horses: the nailed iron shoe and the modern harness. Horseshoes had probably reached western Europe from Siberia by the end of the 9th century and were quite common by the 11th. They helped bring about the replacement of oxen by horses as draft animals in northern Europe, including England, where the damp climate made horses' hooves much more prone to damage than those of oxen.

The second improvement, the modern harness, was known to Germanic

peoples by the 8th or 9th century. It represented a significant advance over the ancient yoke harness, which pressed against the horse's windpipe and jugular vein, restricting breathing and blood flow. Consisting of a stiff collar that pressed against the horse's shoulders instead, the modern harness allowed horses to pull heavier loads than with a yoke harness. As usual this innovation apparently spread throughout much of northern Europe before reaching England. Although horses were used in England by the 11th century—mainly for carting and hauling—they were not common as plow animals until the late 12th century, whereas some 300 years earlier Alfred the Great had expressed his surprise at their use for plowing in Scandinavia.

In addition to the introduction of horse power there were two other innovations in agriculture. A wheeled plow, much larger and heavier than that used in the south, was developed for the richer alluvial soils of the north. This plow eliminated the need for cross plowing, thus giving rise to the northern method of strip farming. A change from the older two-field system of crop rotation to the vastly superior three-field system began at the end of the 8th century, between the Seine and Rhine, but was apparently not used much in England until the 12th century. This new method increased the amount of land under cultivation at a given time, as well as its overall productivity, and led to a greater diversity of crops, including legumes, barley, and especially oats for the increasing number of horses.

A dramatic increase in the use of other kinds of power also took place in the Middle Ages, particularly mechanical power generated by water and wind. Watermills and windmills were known in the ancient and oriental worlds, but they were modified, improved, and used extensively in industrial processes throughout western Europe. Domesday Book (1086) lists 5,624 mills powered by water, up from fewer than 100 a century before. While its earliest use was probably for grinding corn, water power was applied to a great variety of industries and processes, from operating the bellows and hammers of forges to pulverizing ocher and other pigments for paints and dyes. In connection with textiles, for example, the fulling of cloth was one of the first processes to be mechanized during the 13th century, an important factor in the movement of the textile manufacturing industry from the southeast to the northwest in order to satisfy the increased need for water power.

Although there were windmills in Persia and Afghanistan possibly as early as the 7th century, their sails turned on a vertical axle and they do not appear to have any direct connection with the windmills of western Europe several centuries later. The European variety, perhaps patterned after watermills with vertical waterwheels—since their drive mechanisms were quite similar—had its sails on a horizontal axle, an arrangement that required the development of the post mill, on which the entire mill apparatus pivoted. This resulted in greater

efficiency, as the sails always faced into the wind.

A subsequent improvement by the late 14th century was the tower mill; only the upper part of the structure bearing the sails turned. Although windmills undoubtedly existed in the West earlier, the first one to be documented stood in Yorkshire in 1185, and several others are known to have been in use prior to 1200. By the early 14th century mechanical power from both water and wind had become widespread and had relieved human beings from some of the drudgery associated with domestic and industrial processes.

In general the Middle Ages were much more familiar with mechanical devices than is usually thought. Nowhere is this more striking than with the mechanical clock. The unsuccessful attempts to construct a simple mechanical clock were described in detail in a treatise written by Robert the Englishman in 1271. These attempts possibly succeeded not long afterward, and the earliest mechanical clock may have been one made about 1286 by Bartholomew the Orologist of St. Paul's Cathedral and another in 1292 at Canterbury. Two of the first known mechanical clocks, probably already third-or even fourth-generation instruments, were Roger Stokes tower clock with an astronomical dial, built in 1321–25 at Norwich Cathedral, and Richard of Wallingford's astronomical clock, begun about 1330 at St. Albans. Not only did the mechanical clock lead to the standardization of the length of the hour, which had previously varied between about 39 and 82 minutes at London, but it also gave rise to the metaphor of the mechanical universe, a cosmic clockwork set in motion by God, an idea already gaining currency by the end of the 14th century and providing the metaphysical basis for the impending Scientific Revolution.

Tenures

We have only fragmentary information about the ways land was held before 1066. *Bocland* (“bookland”) was land granted by the king or other magnate with a written document, probably with some restrictions on the grantees right of alienation. *Folcland* (“folkland”), seldom mentioned, is more mysterious. It seems likely, however, that smaller properties were regarded in some sense as belonging to the family as a whole and on the death of the head of the family may have been divided among all his sons. That land might be leased for a determined period (*Unland*) is shown by surviving leases from the mid-10th century; whether military service was a specific rent for land has been long disputed, but service in war and the tenure of five hides of land were both seen as belonging to the dignity of a thegn.

After 1066 we are on surer ground, though it is disputed whether the changes that had occurred by the mid-12th century were made as a direct result of the Conquest itself or in the ensuing 50 years. All land was ultimately considered to be the king's. The royal estates were reserved for his direct financial profit; most other land was held of him in return for knight service. The magnates (tenants-in-chief) who owed this service secured it by subtenfeoffment (or subinfeudation), granting portions to individual knights in return for their service.

Some lands were held, both of the king and of magnates, in sergeanty, that is, in return for nonmilitary personal service. Clergy and ecclesiastical institutions could hold land in free alms (*frankalmoign*) for spiritual services,

mainly prayer. And a little land was held of the king, much more of other landlords, in socage, that is, simply for money or other rents, often more or less nominal. Besides these four kinds of free tenure—knight service, sergeantry, free alms, and socage—a fifth distinctive form had emerged by the 13th century: burgage tenure, characteristic of towns and the only form of tenure that permitted bequest to whomsoever the tenant wished.

The right of the eldest son to inherit lands held by military service was probably established only in the mid-12th century. Earlier the lord might regrant the land on the tenant's death as he wished. New procedures in the second half of the 12th century gave added legal protection to all tenures classed as free. In the course of the 13th century they became the subject of elaborate definition and precedent in common-law courts.

Over the same period tenures underwent other changes. Sergeantry virtually died out, and changes in military organization effectively replaced the actual service of knights with a money payment (scutage) that the king used for mercenaries. Military tenure was thus much more flexible; a knight's holding (i.e., a knight's fee) might now be divided into minute fractions, encouraging further levels of subinfeoffment. This process ceased in 1290, when the statute *Quia emptores* forbade further subinfeudation. Other legislation (the Statute of Mortmain, 1279) restrained new tenure in free alms by forbidding grants of land to corporations (primarily monasteries), which, being eternal, would not produce the perquisites due to the superior lord on a tenant's death. This statute, however, was often evaded by special royal license. Thereafter the formal structure of free tenures scarcely changes until the Statute of Uses of 1535.

Serfs or villeins held by unfree customary tenure, also defined by the royal courts in the 12th century and elaborated in the 13th, the forerunner of copyhold. It should be remembered that all land held unfreely by villein tenants was at the same time held freely by their manorial lords, and local custom often, in practice, allowed these tenants to acquire free land besides their villein holdings. Unfree tenants could thus participate in the buying and selling of land, and this land market increasingly extended to their unfree holdings, technically unsellable.

Even more widely these unfree holdings might be sublet; leasing, for a fixed period or for the successive lives of one, two, or three tenants, was normal in all forms of free tenure. Domesday Book shows that by 1086 some tenants-in-chief were letting out portions of their estates to each other, and leasing out individual manors to local lessees (or farmers) for rent, in produce or money, as the method whereby large landholders normally drew profits from their estates. The exception was from the early 13th to the mid- or late 14th century, the period of so-called demesne farming, when lords mostly ran them through

their own officials. In the mid-14th century portions of a manor were often leased to local tenants, foreshadowing the leasing out of the manor as a whole.

Textiles and Embroideries, Anglo-Saxon

There is a significant amount of material and textual evidence for the production of a wide variety of textiles in Anglo-Saxon England. Textiles were produced primarily by women, and Anglo-Saxon women were renowned for their work. The number of objects associated with spinning, weaving, and embroidery that have come from the graves of Anglo-Saxon women suggests their identification with textile work from an early date. Fragments of the textiles themselves survive from 1,038 graves in nineteen counties. The most common types of cloth produced were varieties of tabby (plain weave) and twill. In the early period regional variations exist that are in accord with Bede's traditional division of the country into areas of Anglian, Saxon, and Jutish settlement (fig. 138). Fragments of woven gold braid from some pagan graves provide evidence of higher-quality dress. Fine silk was imported from the Mediterranean and worn by both the secular and ecclesiastical elite. Aldhelm criticized the wearing of fine clothes by both men and women of the

church, mentioning specifically linen shirts and blue tunics, embroidered sleeves and colored headdresses.

Fig. 138. Anglo-Saxon regional fashions: Anglian (left), Kentish (center), Saxon (right). Drawing by Peter Dunn, in M. Welch (1992). Courtesy of B. T. Batsford, Ltd.

Embroidered wall hangings and furnishings were also produced. Portions of late-8th- or 9th-century embroidered vestments or altar cloths from the south of England are preserved in the Church of St. Catherine, Maaseik (Belgium). The decoration consists of interlace patterns, monograms, and animals and birds within arcades and roundels. The embroideries are worked on linen in surface-couched gold-wrapped threads and colored silks (red, cream, light blue, dark blue, green, and yellow). One, the “*velamen* of Harlindis,” includes blue

and green beads, pearls, and gilded sugar-loaf bosses.

Literary sources suggest that such luxurious items were often commissioned for presentation to the church. The stole, maniple, and girdle of St. Cuthbert were commissioned by Ælflæd, wife of Edward the Elder, for Bishop Frithestan of Winchester between 909 and 916. The vestments are decorated with foliate ornament and figures of prophets, saints, and popes worked in colored silks and gold-wrapped thread on a ground of red silk. The style of both figures and acanthus ornament is related to the “Winchester style” of manuscript illumination, suggesting a degree of cross-fertilization between the media. They were presented to the shrine of St. Cuthbert by King Æthelstan in the second quarter of the 10th century. Æthelstan is also recorded as having donated three altar cloths to Chester-le-Street. Other donations include a golden cloak that King Edgar gave to Ely to be made into a chasuble in the third quarter of the 10th century and two gilded altar cloths given to Peterborough by Bishop Æthelwold.

In the late 10th century Edgar’s daughter, St. Edith of Wilton, is said to have embroidered an alb with figures of Christ and the apostles that included an image of herself in a penitential pose, kissing the feet of Christ. The figures were worked in gold thread embellished with jewels, margarites, and pearls. Edith was herself rebuked by Bishop Æthelwold for her luxurious clothing.

Embroidered wall hangings also adorned the homes of the secular elite. The Bayeux Tapestry is the only such work to survive, though there are records of many others. Wall hangings adorned Hrothgar’s hall, Heorot, in the poem *Beowulf*. The *Liber Eliensis* records that after Byrhtnoth’s death in the Battle of Maldon (991) his widow, Ælflæd, presented the monastery of Ely with a tapestry depicting his deeds. Ely may have been something of a needleworking center, as the *Liber Eliensis* also informs us that in the early 11th century Ethelswinth, a noblewoman, retired from the world in order to devote herself to making gold-embroidered vestments for the monastery with the help of her maidservant. Tapestries and wall hangings are also mentioned in the wills of women from the late Anglo-Saxon period, though they are not generally described in any detail.

While much, if not most, of the Anglo-Saxon textiles, wall hangings, and embroideries may have been made by women for domestic use, accounts like that of Ethelswinth suggest that by at least the 11th century many women may have been working professionally. This was clearly the case after the Conquest; both Domesday Book (1086) and the will of Queen Matilda mention professional Anglo-Saxon embroideresses in the employ of the new court. The tradition begun by these women would see its ultimate development in the *Opus Anglicanum* of the Gothic era.

Textiles from St. Cuthbert's Tomb

A number of silk textiles were recovered in 1827 from the tomb of St. Cuthbert (d. 687) in Durham Cathedral. None appears to date back to the 7th century, but as a group they confirm the importance of St. Cuthbert's shrine and cult. The embroidered stole and maniples and the tablet-woven bands are Anglo-Saxon and of high quality. In addition there are two full-width silks of ca. 800—the first, Byzantine with a design on the theme of Earth and Ocean, and the second, central Asian of uncertain decoration—and two textiles that are probably of 11th- to 12th-century Spanish origin—a figured twill with a double-headed peacock and a twill with a stamped gold design of a mounted falconer.

The stole and its matching maniple were almost certainly among the gifts made in 934 to the shrine of St. Cuthbert at Chester-le-Street by Æthelstan, king of Wessex. Inscriptions show that they had been made in Winchester between 909 and 916. The fragmentary stole, measuring overall ca. 6.6 feet by 2.4 inches, is decorated with the standing figures of eleven prophets; the style is fluid and shows the influence of Byzantine manuscript illumination. The

maniple, ca. 32.3 inches by 2.4 inches, with the figures of two popes and two deacons, is more robust and local in style. Figures, inscriptions, and foliage are in colored silk thread worked in split and stem stitch and the background is in surface-couched gold thread (in technique and organization the embroidery looks forward to later *Opus Anglicanum*). The borders are narrow tablet-woven bands.

A second, smaller maniple was originally a strip ca. 48.8 inches by 1 inch with wedge-shaped tabs, but at some point it was cut in half and sewn edge to edge. This may be another of Æthelstan's gifts, since its acanthus-leaf decoration resembles closely the lower borders of the frontispiece of the copy of Bede's *Lives of St. Cuthbert* donated by the king on the same occasion. Here the embroidery is two-sided with the same design either in couched gold thread against a split-stitch purple silk ground or with the colors reversed.

Three pieces of gold-brocaded silk tablet weaving must also date to the 10th century. One, ca. 24 inches by 0.8 inch, has been referred to as a "girdle" and the others, circles of 7.9 inches in circumference and 0.8 inch in width, as "wrist bands"; all were probably once sewn to a garment. The designs of acanthus leaves and so on again recall the borders of the Bede manuscript.

Among fragments possibly added to the relics while they were still on Lindisfarne are the remains of a garment, probably an ecclesiastical dalmatic, of the 8th to 9th century. This was made principally from two similar white silks edged with a brightly colored band, ca. 1.3 inches wide. The white silks, decorated with cross motifs, were perhaps imported from Italy. The design of the band, of repeating stylized palmettes and heart-shaped buds, relates closely to borders on contemporary Sogdian full-width silks. But the technique, tablet weaving with soumak brocading, shows it was locally made, at the time the garment was made up.

Textual Criticism

Old English

The traditional aim of OE textual criticism, in the words of S.O. Andrew, is “the ‘making of a text,’ that is, the restoration of the form presented by the MS. to that intended by the author” (145). Like all statements of first principles this one entails certain assumptions: first, that a given manuscript does not preserve exactly the text as authorized for circulation; second, that reliable methods are available for restoring the text of the author’s intention from the surviving evidence; and third, that the text of the authors intention claims priority over all other versions.

When holographs survive in medieval literature, there is no need to assume anything about the accuracy of scribal transmission. Scholars can edit a work directly from the original document, and other copies (which still claim interest) can be compared directly with the original. But in the general absence of known authorial documents in OE it is reasonable to suppose that few surviving copies fully preserve authorial texts as originally recorded. Support for the assumption comes from the fact that any two copies of an OE work show differences or variants.

One class of variants, sometimes called “accidentals,” consists of differences in format, morpheme division, capitalization, accentuation, punctuation, and spelling. Such variants are copious among the twenty-odd manuscript copies of Cædmon’s Hymn—including the two earliest, Northumbrian versions—and seem inevitable in scribal transmission; most editors (rightly or wrongly) disregard all accidentals except spelling variants.

The more important class of variants consists of differences in the actual words, or “substantives.” It is difficult to generalize about this category. In the case of Cædmon’s Hymn the wording of the two 8th-century Northumbrian versions is virtually identical, and a 10th-century West Saxon version agrees with them apart from a single word. Other versions, however, show a freedom in copying substantives that suggests either the influence of oral tradition, in which wording is not regarded as final or fixed, or dictation from memory.

Prose works display similar variety. Some manuscripts of Alfreds translation of Gregory’s *Pastoral Care* show what seems conservative copying, but others show deliberate lexical and syntactic modernization of the text. Hence, although no manuscript is likely to preserve the accidentals of the archetypal copy, some manuscripts may preserve, or come close to preserving, the original words. Each witness—including early-modern transcripts or early printed

editions—must be judged on its own: on occasion the evidence is sufficient to permit drawing up a stemma, showing relations among witnesses; usually definitive judgments on particular witnesses are not possible.

Textual critics suspect that a reading is not authorial when it makes little or no sense or when it is somehow uncharacteristic of or inconsistent with the rest of the work (including, in the case of poetry, alliteration or meter). The underlying assumption is that poor readings are more likely to originate from copyists than from authors. To restore what they believe to be authorial readings textual critics employ collation (where possible), paleography, philology, history, source study, or stylistics—in short, whatever may illuminate a text. Scholars working with a text attested by more than one manuscript enjoy a decided advantage, as one copy may serve to correct another. (The advantage is rare in OE poetic texts, however; only about 7 percent of the extant 31,000 lines of OE verse survives in more than one copy.) But multiple copies may complicate matters when alternative readings make sense; even so—given the revising habits of many scribes—there is no guarantee that one of the readings is the author's.

In view of such uncertainty E.G. Stanley concludes, “We cannot get back to the authors original” (273). A less daunting formulation is that, in passages where we suspect there are nonauthorial readings, we have fairly plausible methods for attempting to return to the author's substantives but no certainty that we have actually restored them or even, in the case of emendations made for purely stylistic or aesthetic reasons, that the attempt is warranted.

Although recovering the text of the author's intention can be complicated by the fact that some authors (Ælfric most notably) issued different versions of their work, perhaps the majority of OE scholars would agree that an “authorial text” should in principle have priority over all other versions. The indeterminacy inherent in trying to establish the authorial ideal, however, has suggested to some critics a less speculative, more documentary approach. Those who provide a “scribal text” do not try to reconstruct the author's archetype but accept for practical purposes a given manuscript version, emending substantives only where they do not make sense. Reconstructing the author's archetype has also been challenged by “social text” theorists (e.g., McGann), who argue that a work is not created by an author alone but by all those contributing to the production of the text as we have it; in the field of OE such collaborators would include the scribes as well as any others whose editing, correcting, or glossing can be distinguished from that of the scribes.

In practice a social text may closely resemble a scribal text, but the underlying critical motives differ. In theory scribal and authorial texts are related, in that the editor of a scribal text typically selects a version believed closest to the authors. Authorial and social texts are at opposite ends of the

spectrum, however, in both theory and practice: the authorial critic aims to restore an ideal text transcending any particular witness; the social critic selects and edits a particular witness on the basis of its historical importance or influence.

Middle English

Just as ME literature is different in subject, tone, and language from OE, so are the texts in which the two cultures are preserved. Like OE most ME occurs only in manuscript, but in the late 15th century some works (e.g., Malory's *Morte Darthur*, for which no manuscript was known until the 20th century) achieve wider distribution in print. ME manuscripts are written in a variety of scripts (unlike the single "pointed minuscule" of OE), and the linguistic range (by period and dialect) is similarly greater than OE. Although some important ME works resemble OE texts in that they survive in a single manuscript (e.g., the *oeuvre* of the *Pearl/Gawain*-poet), much ME literature appears in multiple manuscripts. Furthermore these manuscripts are often heavily reworked by their scribes, sometimes producing recognizably different "versions" (e.g., the three versions of *Piers Plowman*). Even works that have less internal variability (like the *Canterbury Tales*) are often multiform in intention, with each manuscript or group of manuscripts representing a different "state."

Unlike virtually all OE authors some ME authors are definitely not anonymous and in rare cases were scribes of their own works, which thus exist in holograph (e.g., Orm's *Ormulum*, possibly Chaucer's *Equatorie of the Planets*, many of Hoccleve's poems, and some of Capgrave's works). And finally ME encompasses a wider definition of "literature" than OE, with some genres (e.g., drama and extended prose fiction) that do not exist in the earlier period. Thus the multiplicity and complexity of ME literary documents mean that ME editors—like biblical, classical, and later vernacular scholars, but unlike OE editors—are typically confronted with problems of textual filiation, the attempt to discover the relations among documents.

The earliest editors of ME were the scribes themselves, who often practiced what Pearsall has called "creative engagement" with their authors (1985: 103). Some works, like *Piers Plowman*, seem to have been especially receptive to such treatment, but others, like Hoccleve's *Regement of Princes*, are comparatively stable. In some cases, even where only two manuscripts survive, there are essentially two scribal or possibly authorial versions, so comprehensive is the reworking (e.g., *The Owl and the Nightingale*). Following the scribes, the early printers "edited" the texts they printed, thereby both

reflecting and helping to create the literary taste of their day. Caxton's dissatisfaction with the exemplar for his first edition of the *Canterbury Tales* and his decision to use another for his second, and Wynkyn de Worde's change of copy text for his edition of Trevisa's translation of Bartholomaeus Anglicus's *Deproprietatibus rerum*, are well-known examples.

Early printers usually modernized and normalized their texts, and this practice, together with an impressionistic "improvement" of the language, was the norm until Maddens editions of romance and the Wycliffite Bible in the early 19th century. Even W.W. Skeat, the great philologist, had a "confidence that he knew what Chaucer meant even when the manuscripts did not" (Edwards, 1987: 47), a persuasion followed by Kane and Donaldson in the *Piers Plowman* B text. The opposite approach—documentary fidelity—is often associated with the Early English Text Society, begun by F.J. Furnivall to provide materials for the *Oxford English Dictionary* and hence disposed to preserving manuscript orthography. The EETS editions of the *Ancrene Riwe*(or *Ancrene Wisse*), where every scribal oddity is reproduced, leave the reader to create an edition out of the surviving copies.

There is thus a range of documentary fidelity available to the ME editor. At one extreme is the photographic facsimile, for a record of the bibliographical features of the work (e.g., its makeup or foliation) or as a register of taste, especially in anthology manuscripts. Next is the diplomatic transcript, where orthographic features are preserved, but in a modern typography. The next level of fidelity is the best-text edition, often described as being "in the form of" a specific manuscript witness, selected for its provenance or position in the descent of the text. Best-text editions will usually correct "obvious" errors but will otherwise remain conservative. Thereafter comes the "critical" edition created by recension, the comparison of errors in manuscripts and the arrangement of the manuscripts into a family tree, or stemma. And finally there is "deep editing" of the sort practiced by Kane and Donaldson, where recension will not yield a consistent descent and thus the editor attempts to construct a text impressionistically. "Eclectic" editing (conflated from various documents), "synoptic" or "genetic" editing (showing the growth of a work through its states), and "social" editing (charting the postauthorial states), associated with textual scholarship in later periods, have not yet had much effect on ME editing.

Thegns

The word *thegn* was part of everyday Anglo-Saxon vocabulary and only slowly came to acquire a specialized meaning. Connected with the verb *thegnian* ("to serve"), originally simply signifying a servant, it was used in that sense in poetry and prose late in the period.

Prestige was attached to royal service, and already in the laws of Ine (ca. 690) the heavy penalty of 60 shillings was exacted from anyone breaking into the fortified dwelling of a king's thegn, significantly more than the 35-shilling penalty if an ordinary nobleman were affected. The Alfredian translators used *thegn* to render a variety of Latin words, especially *miles* ("soldier, warrior") and *minister*, and to express a wide range of service, from members of the royal hearth troop to the lad who ran errands for an abbeſs.

The last phase of Anglo-Saxon England, however, from Alfred to the Conquest, ſaw a ſignificant tightening of uſage, reflecting ſubſtantial as well as terminological development. Thegns flouriſhed, eſpecially king's thegns, as the function of kingship itſelf became more ſophiſticated. By the end of the period a thegn was normally a landowner with precise military duties and ſpecial reſponſibility for keeping order within the ſhires. In the Danelaw, by the reign of Æthelred II, the twelve moſt prominent thegns in a *wapentake* (a ſubdiviſion of a ſhire) took ſolemn oaths to enforce juſtice; a thegn could loſe his thegnſhip for bringing in a falſe verdict.

To be a thegn meant to enjoy a ſpecific ſtatus. There are many indications of

an evolution, as Anglo-Saxon thegnage became akin to manorial lordship and the county gentry of later times, as well as being close in many respects to the royal vassals of the rudimentary feudal order on the Continent. A man could be “thegn-born” or “ceorl-born.” In the laws of Cnut (1020–23) thegns were distinguished by special heriots (the property returned to a lord on a tenant’s death), and something of a hierarchy within the thegnage itself was suggested by the differentiation between the thegns in immediate relationship to the king and the others. A royal thegn was to have no other lord.

Mobility still existed within society. An 11 th-century private compilation tells how a ceorl would be entitled to the rights of a thegn if he prospered to the point where he possessed fully “five hides of his own, a church and a kitchen, a bell and a castle gate, a seat and a special office in the king’s hall.” A merchant who made a trip overseas three times at his own expense was said to be worthy of thegn-right. In turn the thegn himself could flourish so that he became an earl. Some of the old generalized feeling of service was preserved in poetry and everyday speech, but by the end of the period the thegn with his rights and status was in many of his attributes the recognizable ancestor of the knight of the shire of the high Middle Ages.

Theodore of Tarsus (602–690)

Archbishop Theodore of Canterbury (668–90) was one of the most learned men ever to hold that see. The outline of his career is known from Bede (*Ecclesiastical History* 4.1–2; 5.8) but can now be supplemented by incidental biographical details contained in recently published biblical commentaries composed in his school at Canterbury.

Born at Tarsus in the Greek-speaking province of Cilicia (now southern Turkey), Theodore probably received his early training at nearby Antioch and

at Edessa in Syria; he subsequently went, as a young man, to Constantinople, which was then the center of learning in the Roman Empire. During these years Theodore acquired training in Roman civil law, philosophy, astronomy, medicine, rhetoric, and ecclesiastical computus. He later went to Rome, where he became involved in theological controversies and the Lateran Council of 649.

Appointed archbishop in 667, Theodore arrived in England in 668 and swiftly set about restructuring the English episcopal dioceses. He established a school at Canterbury, where, with his colleague Hadrian, he gave instruction in biblical exegesis and ecclesiastical computus, as well as astronomy, meter, and Roman law.

The results of this instruction are seen principally in the recently published biblical commentaries on the Pentateuch and Gospels, the record of Theodore's (and Hadrian's) oral teaching on the text of the Bible as written down by a group of English students. These commentaries, revealing an astonishing range of learning in Greek patristic exegesis, may represent the high point of Anglo-Saxon scholarship. Other texts from the Canterbury school of Theodore and Hadrian illustrate other aspects of their learning: a collection of glossaries known as the "Leiden Family"; some octosyllabic poems in a distinctive trochaic rhythm; a collection of *Iudicia*, or pronouncements, by Theodore on matters of penitence and canon law; and a chronographical-exegetical text known as the *Laterculus Malalianus*, translated in part from the Byzantine chronicle of John Malalas.

Theodulf of Orleans (ca. 760–821)

A Goth born in Spain, Theodulf was forced to flee his homeland, coming to the court of Charlemagne in 780. By 798 he was named bishop of Orléans by Charlemagne. In 801 Pope Leo III honored him with the title of archbishop. Theodulf enjoyed high visibility and favor in the courts of Charlemagne and his successor, Louis the Pious. His luck changed, however, in 817, when he was accused of conspiring against the emperor, whereupon he was removed from his bishopric and imprisoned. He died, thus disgraced, in 821.

Although Theodulf is best known today as one of the preeminent poets of the Carolingian renaissance, he was probably more valued among his contemporaries for his theological and pastoral works. Around 800 he composed his first *Capitula*, a manual for parish priests, in an attempt to institute a reform within his diocese, and a second somewhere between 800 and 813. Forty-one copies survive throughout Europe and England, written between the 9th and 12th centuries, attesting to the popularity of the work. At Charlemagne's request he wrote the *Libri Carolini* under the pretense that it was actually the emperor's work. He also wrote *De ordine baptismi* and supervised a revision of the Bible at his scriptorium.

Theodulf's *Capitula* was widely used during the Anglo-Saxon monastic reform and survives in four English manuscripts. In Latin and English it became a standard work for the clergy and a source for Anglo-Saxon prose. Vercelli Homily III and Assmann Homilies XI and XII draw from the *Capitula*; Ælfric seems to have used it in his pastoral letters; and Wulfstan used it in composing his homilies. The *De ordine baptismi* was also known to the Anglo-Saxons. The text, surviving in BL Royal 8.C.iii, was used by Wulfstan in Homily VIII.

Thomas of Canterbury, Office for

One of the first strictly rhymed offices written in England, and probably the most important, the *historia* for Thomas Becket was written between 1170 (the year of Thomas's martyrdom) and 1177 or 1193. Its original form was no doubt monastic, surely intended for use at St. Augustine's Abbey, Canterbury. The author of its texts and composer of its chants was Abbot Benedict of Peterborough, a former monk at Canterbury. But, adopted by the newly emerged Sarum Use, it is best known in its secular form. The high quality and distinctive features of the office have recently been described and may have been partly responsible for its wide distribution. Like the veneration of the saint, which quickly spread across the whole of Europe, the office itself was similarly distributed and used and formed the basis for dozens, perhaps hundreds, of later offices. Several of its chants were used as the tenors of polyphonic compositions, in the Notre Dame School, in the 14th century, and in the early-15th-century Old Hall Manuscript. One of its texts was set to polyphony by Palestrina. Interesting is its use of melisma for stressed and syllabic setting for unstressed syllables, what seems to be a motivic emphasis for important words, and two or three passages in which a subtle word painting may occur.

Some of the items in the office had different chants on the Continent, and, together with lesser variants in the sources, it is possible to isolate regional or local versions. Several other offices to the saint also exist, including two for his translation in 1220, and the complex relations between them have yet to be explored. In many English liturgical books the office has been torn out, blackened, or otherwise defaced, in an attempt by Henry VIII's commissioners to remove all traces of the saint.

Tiberius Psalter

BL Cotton Tiberius C.vi is a Latin psalter in the Gallican version, complete only to Psalm 113. Each psalm has a continuous interlinear gloss in OE and is followed by a Latin collect. Prefatory text gatherings contain common psalter prefaces, instructions for the use of the psalter in private penitential devotions, a long confessional *ordo*, an OE homily on the seven gifts of the Holy Spirit, and extracts from a Pseudo-Jerome treatise on musical instruments, as well as computus tables. Its lavish illustration includes 24 full-page colored line drawings, two fully painted miniatures, five painted initial pages with "Winchester School" frames, and six smaller painted initials. Attribution to Winchester ca. 1060 is supported by paleographic, textual, stylistic, and iconographic evidence.

In accord with insular tradition Psalms 1, 51, 101, and 109 are marked with framed, painted initial pages, with the innovative addition of a similar initial page at the start of the prefatory texts. A clear hierarchy of images faces these pages. The two painted miniatures, an intercessory image of Christ the Judge

and a portrait of the psalmist David with his musicians, form major visual stops in the manuscript at the opening pages of the two major textual segments, the prefatory matter and the psalter proper. Full-page line drawings of St. Jerome (?) and Christ trampling the beasts face initials to Psalms 51 and 101, and a half-page drawing of the Trinity faces Psalm 109. The initial psalms of the remaining liturgical divisions of the psalter are marked with smaller painted initials.

The manuscript is renowned as the first surviving psalter with a prefatory cycle of Old and New Testament miniatures. The cycle commences with illustrations associated with the computus: Christ/*Vita* triumphing over *Mors* (fig. 139), a horologium and paschal hand, and the Creation. Sixteen colored line drawings illustrate episodes from the lives of David and Christ and are chosen to emphasize the typological relationships between them. A drawing of St. Michael fighting the dragon concludes the cycle, echoing its major theme of the conquest of evil. Though Wormald speculated that the cycle might reflect a 10th-century model, recent research shows that it was assembled in the 11th century as a complement to the psalter's prefatory texts. Text choices and thematic emphases suggest compilation primarily for the private penitential devotions of an ecclesiastic, with occasional communal use a secondary function.

Following the St. Michael drawing are three pages of illustrations of musical instruments, annotated with extracts from the Pseudo-Jerome letter and accompanied by a full-page portrait of King David enthroned. Found in only a few early manuscripts, these arcane pictures closely reflect a Carolingian source.

Fig. 139. Tiberius Psalter (BL Cotton Tiberius C.vi), fol. 6v. Vita and Mors. Reproduced by permission of the British Library, London.

The Tiberius Psalter compiler inventively synthesized a remarkable range of

source materials and influences. The strong David-Christ typology is derived from the Irish world, and that milieu was the ultimate source of inspiration for the intercessory miniature of Christ the Judge. Three of the five narrative David scenes closely follow pre-Iconoclastic Byzantine sources, while one draws on contemporary Anglo-Saxon ruler imagery. The portrait of David with his co-psalmists combines Carolingian features with elements from an earlier Anglo-Saxon picture. The Christ cycle is assembled from a range of contemporary and earlier predominantly Anglo-Saxon pictorial sources, enriched with details reflecting monastic vernacular writing and Winchester iconographic traditions. This eclectic selection balances the equally eclectic prefatory texts. The function or purpose of this assemblage is reasonably clear, but the impetus for such a wide-ranging and comprehensive selection of contents remains a mystery. The numerous examples of rare or unique iconography combine with a forceful and accomplished, if somewhat static and eccentric, late "Winchester style." When executed in full body color, as in the miniature of David and his musicians, this style presages the Romanesque.

Tiles

Ceramic tiles were used to make decorative floors for secular, monastic, and ecclesiastical buildings. Their use can be traced back to the 10th century, but the real development of tile floors begins in the 13th century under the patronage of Henry III and his half-brother Richard of Cornwall. Tiles, popular through to the 16th century, are an essential component of Gothic architecture.

Kiln sites have been located throughout England, and no doubt many remain to be discovered. The craft began as a luxury industry, providing tiles for a wealthy secular and ecclesiastical elite, but with the rise of a wealthy merchant class in the late 13th and 14th centuries demand grew and commercial workshops began to appear. Tilers produced roof tiles and floor tiles, using the same clay for each. By the late 13th century shaped tiles were created by scoring the design into square tiles and separating the pieces after the tile was fired. The variety of colors required for the more decorative floor tiles was achieved through the use of different lead-based glazes, inlay, and slips of different-colored clays. Decoration varied from simple geometrical or foliate forms (e.g., the ca. 1480–1515 pavement from Canynoges House, Redcliffe Street, Bristol, now in the British Museum), to heraldic motifs (e.g., the royal arms included in the Westminster Chapter House pavement of ca. 1250–80), and narrative subjects, exemplified by the famous tiles from Chertsey Abbey (fig. 140) produced 1250–80. The Chertsey tiles include scenes from the romance of Tristan and Isolde, the combat between Richard the Lionheart and Saladin, and the labors of the months. This range of subject matter suggests that they were originally designed for a palace rather than an abbey.

Fig. 140. Chertsey Tiles, Richard and Saladin (London, British Museum MLA designs 467, 468, 602, 611, 614, 616–18, 648). Courtesy of the Trustees of the British Museum, London.

Tiles were made by pressing the clay over a square wooden frame or shaped template, trimming the pieces with a wire bow or knife, smoothing the tops, and drying in a shed. When dry the tiles were decorated and fired. Basic designs of individual tiles were commonly either stamped or molded. More elaborate designs could be individually cut. In the 14th century a *sgraffito* technique, in which lines were cut through the slip, revealing a second color beneath, was used to achieve fine details.

The design of a tile floor consisted of an overall pattern divided into panels, with the decorative design of each panel formed through the juxtaposition of the individually decorated tiles. Alternatively tiles could be cut into different shapes and combined to form a tile mosaic, a technique possibly developed in imitation of Italian floor mosaics. The technique could be used for the creation of elegant geometric patterns (e.g., the mosaics from Rievaulx Abbey, Yorkshire, some of which are in the British Museum), as well as more complex designs composed of panels incorporating figural or animal motifs (*opus sectile*). The ca. 1324 Adam and Eve panel from Prior Crudens Chapel, Ely, is a fine example of this technique. The subject is highly unusual in this medium and is no doubt based on similar scenes in manuscript illumination.

The most elaborate series of narrative tiles to survive are the ten Tring tiles now in the British Museum (eight) and the Victoria and Albert Museum (two). Decorated with scenes from the infancy of Christ, they have close parallels in manuscript illumination. Their excellent condition suggests that they may have been made for a wall rather than a floor.

While many tile floors were purely decorative, others had a didactic function. The positioning of the Adam and Eve panel in front of the altar in Prior Crudens Chapel provides a lesson in fall and redemption. The pavement of the old refectory at Cleeve Abbey, Somerset, includes the arms of England, Clare, and Poitou and is likely to have been laid in celebration of the 1271/72 marriage of Margaret of Clare to Edmund, son of Richard of Cornwall (also count of Poitou) and nephew of Henry III. The depiction of Richard the Lionheart's defeat of Saladin on the Chertsey tiles carried an obvious political message whose meaning was made explicit by the accompanying Latin inscriptions.

Tile pavements remained a popular type of floor throughout the Middle Ages. They fell out of favor in the 16th century, when a taste for Italian-influenced architecture and black-and-white paneled floors developed.

Tin Industry and Trade

English tin was the purest and most abundant in Europe. From the middle of the 3rd century (when production collapsed in northern Spain) until the middle of the 13th century (when deposits in Bohemia and Saxony began to be

exploited) Devon and Cornwall possessed a virtual monopoly of European tin production. Even after the development of alternative sources England dominated the international markets of Europe and the Middle East until well into the 17th century.

Alluvial deposits, from which tin was extracted by “streaming,” that is, washing away the accompanying stones and earth, were the richest source of English tin until the mid-16th century, although deeper mining occurred from the 14th century on. Many of the works were substantial, with up to 50 laborers (often employed by wealthy tin merchants), and the number of tanners in Cornwall and Devon must have reached 6,000 to 8,000 (including a large proportion of women and children) when production was booming. The industry was on a much larger scale in Cornwall than in Devon.

The tanners of Cornwall and Devon enjoyed extensive privileges, the most important of which was the right to search and dig freely for tin (granted in a royal charter of 1201) in return for giving a proportion of the tin to the lord of the soil. Civil and criminal jurisdiction over the tanners was in the hands of a warden of the “stannaries” (the districts comprising the tin works and smelting plants). In 1305 the tanners were granted exemption from most general taxation and freedom from tolls and market dues. In return they paid a heavy tax on production, called coinage duty.

Most tin went into the manufacture of pewter (an alloy of two or more metals, with tin predominant). The demand for pewter increased steadily, and by the late 15th century it was used by all but the poorer classes, for drinking pots, flagons, plates, spoons, and other tableware. Tin was used with copper for church bells and organs and for the casting of bronze cannon. Vast numbers of tin medallions and mementoes, especially of pilgrims’ badges, were produced. There were pewterers’ guilds in York, Bristol, Coventry, Norwich, and London, which was by far the largest center of production.

Tin was exported from England both unworked and manufactured into pewter; the greater part went overseas in large rectangular blocks weighing 100 to 300 pounds. From the 14th century Italian merchants (especially Venetians) exported large quantities of tin and pewter from London and Southampton directly, by sea, to the Mediterranean. This was to meet the enormous demand for tin in southern Europe and the East. English, Hanseatic, Dutch, and Zealand merchants also engaged in the trade in tin and pewter with a peak (approximately 500 tons per annum) in the first decade of the 16th century. English merchants took over most of the trade as Italian vessels ceased to visit England later in the 16th century.

Towns and Urban Life

Perhaps the first thing to note about the condition of towns in medieval England is their small size in relation to towns in many other parts of western Europe. Even as late as 1500 London—by far the largest urban center in the realm—had but 50,000 to 65,000 inhabitants. Only a few others, including York, Norwich, Bristol, Exeter, and Newcastle, had as many as 5,000 to 10,000. Most of the 600 or 700 other towns in the realm had fewer than 1,500 inhabitants. Some straddled the functional divide between town and village, while most continued to exhibit characteristics of the countryside: livestock, pasture, orchards, and fields, both tilled and fallow, remained common in and immediately around most English towns.

The second striking point is that the condition and number of the towns changed dramatically during the medieval period, and not always toward the bigger, better, and more prosperous end of the scale. Determinants of such changes included seigneurial (including royal) policy, commercial prosperity, and the ebb and flow of population.

When William I surveyed his newly won domain, he found an urban network of sorts well in place. There is little to suggest that Roman towns continued to operate or to be inhabited continually after the departure of their founders in the 5th century. Yet the Saxons resettled some Roman towns between the 9th and 11th centuries and founded others in the same era. These pre-Conquest settlements emphasized fortifications and administration (ecclesiastical as well as civil) in addition to trade. Such centers as York, Canterbury, Carlisle, Coventry, Gloucester, Winchester, and London enjoyed

particular strength, prosperity, and complexity by the 11th century. Though the Normans supported the urban growth already underway, it is difficult to see their role as innovative. In the century after the Conquest town growth seems more related to the general European revival of trade and population than to deliberate acts of royal policy.

Riding this wave of population growth and prosperity, English towns grew in number and size through the 12th and 13th centuries. Royal policy came to play an increasingly large role in these years. The need for administrative centers, military fortifications (especially in the underpopulated southern tier of the realm), and concentrations of taxable wealth led to royal support for the planting and settlement of new towns and the expansion of existing centers. Support by the nobility, anxious to establish towns on poorer parts of their lands in the hope of increased personal revenue and prestige, and by ecclesiastical authorities seeking revenues and support services, followed suit. Landlords of all types—royal, lay, and ecclesiastical—offered numerous privileges to induce settlement.

By around 1250 several hundred towns enjoyed considerable prosperity and growth. Many enjoyed substantial privileges as well, granted by charter, including burghage instead of feudal tenure, rights to elect some officials, rights to pay fees directly to the crown, and rights to administrative and economic self-regulation. A few towns gained recognition of their autonomy from feudal lordship on the basis of pre-Conquest precedents for self-rule.

Especially in economic terms the late 13th century may well represent the high point of medieval urban society. Shortly thereafter northern Europe experienced a climatic cooling, followed by widespread harvest failures and the beginning of population decline. Warfare, too, took its toll, as did shifts in foreign demand for raw wool. The *coup de grace* of this downturn came with the Black Death in 1348. This led to an astounding biological disaster. The population now fell by as much as a quarter or a third by 1350. With periodic recurrences of plague, as well as warfare and economic decline, it continued to stagnate for nearly two decades thereafter.

Despite patchy documentation it appears that increased rates of migration from the countryside offset the greater death rates characteristic of towns, allowing urban society to come through these times more successfully than agrarian society. As there was now a smaller net population to share the fruits of agriculture, trade, and handicraft manufacture, personal living standards may have risen. This seems to have sustained domestic demand and thus generated some continued level of prosperity in many towns through the first half of the 15th century. Port towns and towns with well-developed manufacture or trade in cloth seem often to have survived reasonably well. On the other hand many of the smaller market towns, especially those that had

come into being in the prosperous period prior to the 14th century, proved marginal and fared poorly. A substantial minority ceased to function as towns altogether.

The condition of towns in the decades prior to the Reformation is the subject of a sustained debate. “Optimists” point chiefly to evidence of substantial building and economic prosperity in specific towns, to increases in cloth sales abroad and subsidy payments to the crown, and to a slight upturn in the population replacement rate by the end of the 15th century.

Against these claims we must balance the pessimistic reports of physical decay, from foreign visitors and townsmen themselves, the evidence of sympathetic government reaction to claims of inability to pay certain taxes, the widespread evasion of civic office because of high costs of officeholding, and the continued stagnation in rents. While this debate continues, few would argue that the economic condition, size, or number of English towns was as impressive in 1500 as in some earlier periods.

Trade, Internal and External

Indications of English trade abound throughout the medieval period. Although none are as organized or as clear as one might hope, many observations can be made. One is that throughout the Middle Ages imports generally exceeded exports in variety, value, and perhaps even volume. Imports were largely luxury goods, manufactured or else obtainable only from other climates: silken and damask cloths from the Middle East and Italian producers; luxury woolen cloths from Flemish cities; glassware from the Rhineland and later from Italy; furs from the Baltic; wines from continental Europe, with an increasing emphasis on Gascony; spices from the East; dyestuffs and alum—used in the manufacture of cloth—from various places. Nearly all of this import trade was handled by alien merchants, although Englishmen, particularly Londoners, began to function as middlemen from the 11th century on.

Exports were mainly of raw materials. During the Anglo-Saxon period agricultural products seem to have predominated, although the volume of trade is unclear. In the 11th century grain appears as a major export, though it is rapidly overtaken by wool. English wool was the ideal basis for the high-quality cloths produced in such Flemish towns as Ypres, Arras, and Douai, and the heyday of the Flemish cloth industry—the 12th through the 14th century—coincided with the period of massive wool exports from England.

By 1275 wool was such a voluminous and lucrative export that it became the foundation of a whole new scheme of royal financing, in the form of the first regular customs duty: 6s. 8 d. per sack of wool, each sack weighing 364 pounds. This “Great and Ancient” custom brought the king over £43,800 in its first four years of operation; it also has left excellent records for observing the volume, and even the location and personnel, of this trade. In the late 1270s around 26,750 sacks of wool were exported annually; by the mid-14th century (with some vicissitudes caused by sheep scab, murrain, or war) exports averaged 40,000 sacks. They decreased to about 8,500 sacks a year after 1439, partly because of disputes with Burgundy, which now controlled Flanders, but mainly because of the coming of age of the cloth industry in England.

The major ports for foreign trade were Boston and London, at least until the political wrangling over locations for collecting the tax began to disrupt export patterns. During the 12th century and certainly through the mid-13th wool

exports were handled primarily by Flemish drapers, replaced in turn by Italians in the late 13th century and finally by Englishmen from about 1300, the result of wars with Flanders, of royal dependence on Italian bankers for deficit financing, and of the eventual shift to royal dependence on English commercial and industrial interests to support wars and other extraordinary enterprises.

The other major export was cloth. It would appear that this trade had begun by the 9th century, and by the early 13th century an indigenous industry in quality cloths, centering on eastern towns (Stamford, Lincoln, Beverley) was supplying exports found in Genoa and Sicily. This industry, at least as a source of exports, was squelched by the 1270s by the success of the Flemish cloth industry and the constraints imposed by urban guilds. However, early in the 14th century English cloth reappears, after the self-destructive internal and foreign wars of the Flemish cities and major reorganization of the industry within England. Now a range of medium- to lower-priced weaves, produced in localities both great and small, equaled wool in export value by the end of the 14th century and by 1470 exceeded wool even in volume of exports.

The increased value to internal trade and industry of this triumph of English cloth on the European market was enormous; internal trade, however, was still primarily agricultural in nature. There was some retailing of luxury imports, and marketing of the products of indigenous industry: salt, fish, and metal (iron, lead, coal, tin: the last two sufficiently developed and in demand to constitute major exports). Nonetheless, most of the crafts whose marketing constituted the bulk of trade in towns and fairs were closely related to rural pursuits: baking, brewing, butchering, tanning and leatherworking generally, smithing, and working with wood. The marketing of produce and livestock constituted much of the rest of the activity in internal trade.

The greatest general trend in trade is its unmistakable increase. There was a proliferation of markets, turning many villages into small towns and small towns into larger centers. A temporary but significant innovation was the use of fairs for trade, both internal and external. Located in a half-dozen towns in eastern England, they constituted an annual cycle of two- to four-week marketing events in each location. They lost much of their importance, especially for international trade, by about 1320, the result of more sophisticated trading techniques and political developments.

The other general trend is the increased percentage of trade handled by Englishmen. Most of the internal trade was always in English hands, but imports and exports alike were handled by Frisians, Flemings, Brabanters, Italians, and the Hanse, more or less in succession, in varying degrees and lengths of time. Londoners were the first and always the most prominent but by no means the only denizens to take over internal retailing and then

exporting of the products of international importance.

In England, as elsewhere, trade was encouraged by many developments: business companies, the law merchant, with special merchants' courts providing justice with great efficiency, and the promissory note (a double-edged sword). English kings were helpful in establishing a system of standard weights and measures and maintaining a stable currency: efforts in which they largely succeeded. On the other hand trade was hampered by royal purveyance, whereby the king could make purchases in such bulk that corruption was encouraged among his buyers, and many suppliers gained firsthand knowledge of the evils attendant upon abuses of payment by credit.

There are many sources for the study of medieval trade. Royal records are the most constant and reliable, since kings always claimed to regulate trade to some extent at least, and both royal wealth and royal needs operated on a scale far beyond that of any others. Royal accounts and chancery records, as well as many royal decrees, charters, and writs, constitute the core of our understanding of medieval trade. To those can be added, particularly from the 12th century on, the contents of municipal archives: market records, acknowledgments of debts, rolls of merchant and guild courts. The account records of abbeys, bishoprics, and other households are increasingly sought after and studied, with a view to understanding not only what was bought but also what marketing and transport facilities were involved.

Translation and Paraphrase

Methods of text production that may account for more medieval English works than does original composition. Despite their importance, however, they elicited little direct theorizing, and the distinction between the two processes from a medieval perspective is not always clear either in theory or in practice.

In the Middle Ages the fountainhead of translation theory and indeed of translation itself was St. Jerome, who produced the Vulgate translation of the Bible in which most of the medieval period directly or indirectly knew the word of God. In a letter to Pammachius (Epistle 57) Jerome articulated the famous theory that underlay his work—that he translated not word for word but sense for sense. This phrase became axiomatic in medieval discussions of translations and is echoed by one of the earliest English translators, King Alfred, in the prefaces to his translations of the *Pastoral Care* and the *Consolation of Philosophy*. Because translation of the Bible involved recasting the word of God, Jerome's axiom was a way of avoiding heretical mistranslation. In the preface to his translation of Genesis the monk Ælfric observes that “the book is organized just as God himself dictated it to Moses, and we do not dare to write any more in English than the Latin has,” but he also cautions translators to respect English idiom lest the translation prove misleading for those who do not know Latin idioms.

Ælfric's *Heptateuch* is actually a selective translation, and works like Ælfric's versions of Gregory the Great's homilies and the OE translations of the *Consolation* and Orosius's *History* also contain many interpolations and abridgments; the latter has a famous passage in which the travelers Ohthere and Wulfstan recount to King Alfred their voyages to the north and east. The OE translation of Bede's *History* is a close one—so close that parts of it are intelligible only through consultation of the Latin original. Also close are the later West Saxon Gospels and the prose version of the life of St. Guthlac, so it is clear the OE translators could in fact practice what they preached. But the preference seems to have been for a looser approach, perhaps on the grounds that some Christian concepts were so alien to Anglo-Saxon culture that they required a form of glossing.

Emblematic of this kind of translation is that practiced by the ignorant cowherd Cædmon, who, according to Bede, was able to ruminate on learned explanations of sacred history and transform them into vernacular poetry. A

number of poetic biblical paraphrases survive, including ones of Genesis, Exodus, Daniel, Judith, and the apocryphal *Acts of Andrew and Matthew* (*Andreas*). These are decidedly Anglo-Saxon in orientation, however, and often the resemblance to scripture is minimal. In the poem *Judith* the heroine is portrayed as a warrior-queen whose victory over the army of Holofernes is accompanied by the conventional “beasts of battle,” while in *Exodus* the Israelites descending into the Red Sea are described as Germanic retainers brandishing shields, helmets, and spears. *The Phoenix*, which generally speaking is a translation of a Latin work by Lactantius, opens with the characteristic “I have heard” formula of Germanic epic poetry and employs the martial vocabulary of that tradition. This sort of general reworking of a source received formal sanction from King Alfred, who, in the preface to his translation of Augustine’s *Soliloquies*, portrays himself as a builder who has constructed his house from a variety of trees available in the forest of books. Indeed a patchwork pattern of translated texts, oral tradition, and poetic invention is apparent in works like *Guthlac B*, a poetic account of St. Guthlac’s life, and *Christ and Satan*, which sketches Christian history from Creation to Judgment Day.

The absence of an extensive, explicit theory of translation in the Anglo-Saxon period may also account for the way translation and paraphrase overlap in it. In any case the transfer of texts from one language to another was an important activity, as the number of texts so produced indicates; in addition to those already noted a variety of riddles, homilies, and saints’ lives can also be mentioned here. One of the lasting achievements of King Alfred (and Anglo-Saxon England in general) was the program of translation he introduced in the preface to his translation of the *Pastoral Care*: “It seems better to me... that we should also turn into the language that we all know [English] certain books that are most essential for all men to know.” Numerous copies of these works—Gregory’s *Dialogues* and *Pastoral Care*, Orosius’s *History*, Bede’s *History*, Boethius’s *Consolation*, and Augustine’s *Soliloquies*—survive, and the memory of what Alfred accomplished lasted into the time of William of Malmesbury (ca. 1095–ca. 1143), who in his *History of the English Kings* spoke highly of Alfred’s love of learning and mentioned most of the Alfredian translations by name.

By William’s time, however, French was becoming as important a source language as Latin. Moreover, during the course of the later Middle Ages, greater attention came to be paid to translation theory and practice themselves. This was perhaps inevitable, for by the time of the Wycliffites the very use of the vernacular was potentially controversial: it was the fact that the Wycliffites rendered theological arguments in English, rather than the arguments themselves, that was most troubling to their contemporaries.

Throughout the ME period both paraphrases and translations continued to be produced in great numbers. Many romances, such as *King Horn*, *William of Palerne*, *Floris and Blancheflour*, and much of Malory's *Morte Darthur*, are loosely based on French originals, while encyclopedic works like the *South English Legendary*, *Cursor Mundi*, and *Handlyng Synne* reflect the patchwork composition style observed in some OE texts. Works that would more strictly be considered translations include the first Wycliffite Bible, Chaucer's *Boece*, and some of Caxton's compositions. But a work like the *Boece* reflects the complexities involved in sorting ME translations from paraphrases, for though it is a close translation, its "source" is actually four texts that Chaucer selectively and uniquely combined: a version of the Latin text, a French translation, and commentaries by Nicholas Trevet and Remigius of Auxerre.

Certain aspects of medieval literary culture help to account for these complexities in the process of translation. For instance, in late-medieval rhetorical theory, translation was seen as an act of *inventio*, which originally meant the discovery of literary matter but came to mean interpretation. This interpretation was made possible through *dispositio*, or textual arrangement, and *elocutio*, the mastery of language. Translation, in other words, explicitly involved the interpretation of a source, perhaps through interpolations and glosses. Chaucer's insertion of Trevet's glosses in the *Boecethus* was entirely consistent with medieval translation theory, for he thereby delimited the meaning of the original as he understood it. Similarly the remarks on contemporary England that Trevisa incorporated in his translation of Higden's *Polychronicon* specified his interpretation. Though Nicholas Love is careful to mark his own insertions to the Pseudo-Bonaventure's *Mirror of the Blessed Life of Jesus Chnst* with a marginal "N" and to use a marginal "B" where the original resumes, most ME translators provide no such way of distinguishing source from addition. While writers as diverse as Trevisa, Chaucer, and Gavin Douglas continued to echo Jerome's sense-for-sense dictum, translation into ME, far from being a mechanical exercise, had the potential to be itself a creative act.

Such potential assumed great importance in the context of medieval literary theory, which precluded vernacular writers from sharing in the authority of the ancient and patristic writers. Almost all of Chaucer's compositions could arguably be called translations by medieval standards, though his creative stamp is evident on each. Close translations like the *Boece* or the *Parsons Tale* may reflect sources that Chaucer compiled himself, while more original compositions, like the *Knight's Tale* and *The Book of the Duchess*, nonetheless derive from source texts. Works like Lydgate's *Fall of Princes* and Henryson's *Moral Fables* also exploit the creative potential inherent in translation. The distinction between this kind of theoretically sanctioned translation and

entirely original composition could become tenuous, of course—a fact that was not lost on medieval writers. In *Troilus and Criseyde* Chaucer validates his imaginative reworking of Boccaccio's original by creating the fiction of an *auctor* named Lollius, whose text he claims to be translating.

If it is fair to say that works like the first Wycliffite Bible and some of Richard Rolle's translations are overly literal, perhaps even slavish, it is equally fair to say that for many ME writers translation was a useful opportunity for realizing their creativity. In light of this factor and of the gradual rise in prestige of the vernacular it is perhaps not surprising that the technicalities of translating vocabulary and syntax also received attention in the late ME period. In contrast to translated OE works late ME translations frequently contain prologues that indicate what is being translated and, quite often, how. In one of his prologues John Capgrave announces that he will translate the life of St. Gilbert as it appears before him, save for some additions that he has been directed to make.

Especially insightful in this regard are Trevisas two prefaces on translation and the preface to the second Wycliffite Bible. In Trevisas "Dialogue between a Lord and a Clerk on Translation" he argues at length for the validity of translation into English, while in his "Epistola" to Thomas, Lord Berkeley, he specifies his actual techniques: "In a certain place I shall set word for word, and active [voice] for active, and passive for passive in a row, just as it stands, without changing the order of the words." The Wycliffite Bible preface is similarly specific, indicating, for instance, how participial and absolute constructions will be expanded. This specificity was undoubtedly conditioned by the sacred nature of the text being translated and by the fact that the idiomatic style of the second version is a potentially heretical departure from the procedure of the first, where these constructions are in fact imitated in ME. But the syntactic expansions described in the preface to the second version, along with the similar expansion of a single source word into a doublet in ME, constitute a style that the preface indicates will make the meaning of the Bible "whole and open," a style through which most late ME translators rendered their sources.

In the Middle Ages translation and paraphrase overlapped much more than they do today. Most of the works that would be considered translations by medieval standards would be judged paraphrases by modern ones. The proliferation of translations, like the techniques used by the translators, reflect the distinctive but changing cultural contexts of the OE and ME periods. The final achievement of all the translations was at least threefold. First, translation introduced to English a number of texts, like Orosius's *History* or the Bible, that were part of the essence of medieval culture, and it thus helped to make England a part of that culture. Second, in the later Middle Ages, translation

provided creative opportunities for writers like Chaucer who aspired to the authorial status culturally denied them. And third, the techniques of late-medieval translation introduced to English many of the words and structures that would subsequently become essential to literary style.

Treason

Both medieval and modern concepts of treason share the essential notion of betrayal. The modern concept is embedded in the system of international

relations, where the nation or the state has the status of a (fictive) corporate person; a traitor betrays and thus endangers his country. Treason in the Middle Ages, however, only slowly and partially developed this level of abstraction; betrayal remained identified as conduct toward real, individual persons: one's feudal lord, especially the king. Medieval treason remained more an internal than an "international" concept and as much a private as a public offense. Precisely for these reasons it was viewed with as much repugnance as it is nowadays.

The English common law recognized and distinguished between "high" treason, betrayal of the king, and "petty" treason, betrayal of a feudal lord. Those convicted of either suffered forfeiture of property and gruesome capital punishment; both the law and actual example are much fuller for high treason. Both the personal inviolability of the king—stressed, for example, in Magna Carta—and the development of the public attributes of the royal office contributed to an elaborate body of law, culminating in the Statute of Treasons (1352). The statute groups treasonable offenses under three broad, interconnected headings.

The first of these is "personal," that is, planning or plotting the death of the king, the queen, or their heir or sexually violating women of the royal family. "Public" treason was counterfeiting the king's seal or coinage or killing certain classes of officials while engaged in governmental tasks. Then there was "political" treason, that is, waging war against the king in the kingdom or aiding and abetting his enemies.

It is clearly this last category that comes closest to, or prefigures, the modern doctrine. Those accused of high treason could not be protected by claims of sanctuary or benefit of clergy, nor could they obtain bail. Trial by battle remained on the books and was occasionally used, though jury trials were the norm. It has been calculated that the conviction rate in treason cases was much higher than in other, lesser categories of criminal charges, such as felonies. Parliamentary legislation subsequent to the Statute of 1352 dealt with limits on, and exemptions from, property forfeiture, or procedures for pardons for traitors. Left unchanged, however, were the savage forms of corporal punishment, including drawing (dragging), live disembowelment, and quartering of limbs.

In the 15th century the process known as parliamentary attainder came to the fore as a swift and ruthless instrument of dealing with real (or fabricated) instances of treason. Attainder involved a summary charge and guilty verdict, normally without any sort of hearing, and besides sentencing the accused to death, it deprived his entire family and heirs of any and all property. Acts of attainders were frequently sought and employed in the dynastic struggles of Lancaster, York, and Tudor at the end of the Middle Ages.

Next to blasphemy or sacrilege treason was the gravest offense medieval society could imagine; that judgment remains largely unchanged today.

Trevet or Trivet, Nicholas (ca. 1258-after 1334)

Dominican commentator and historian. Educated at Oxford, where he later taught, Trevet was primarily concerned with providing literal explanation of classical and Christian texts. He wrote commentaries on the older and the younger Seneca, Livy, Augustine's *City of God*, the Pentateuch and the Psalter, Boethius's *Consolation of Philosophy*, and other works. The Boethius commentary, of which over 100 manuscripts survive, directly influenced Chaucer's *Boece* and *Troilus*, John Walton's verse translation of Boethius, and Robert Henryson's *Orpheus and Eurydice*.

Trevet's histories include the Latin *Annales* and *Historia* and the Anglo-Norman *Cronicles*. The *Cronicles* were used by Chaucer in the *Man of Law's Tale* and by Gower in the *Tale of Constance*; they were translated into ME in the mid-15th century.

Trevisa, John (early 1340s?-1402)

Translator of informational works. Born probably in Cornwall, Trevisa entered Exeter College, Oxford, in 1362 and remained there until 1365. In 1369 he entered Queens College and subsequently became a fellow. He was ordained priest in 1370. Trevisa was expelled from Queen's in 1378 for alleged misuse of college property but appears to have returned there for lengthy periods in 1383–86 and 1394–96. It was possibly after his expulsion from Queen's that he became vicar of Berkeley in Gloucestershire and chaplain to Thomas, Lord Berkeley. He was also a nonresident canon of Westbury-on-Trym, near Bristol.

Trevisa's major undertakings were his translations of several lengthy Latin works. The first that can be securely dated is his translation of Ranulf Higden's *Polychronicon*, a universal history, which he completed in 1387. His translation of the *De proprietatibus rerum*, the medieval encyclopedia of Bartholomaeus Anglicus, was finished in 1398. He produced this translation, as well as one of Giles of Rome's *De regimine principum*, a treatise on kingship, under the patronage of Thomas, Lord Berkeley. Trevisa also translated several shorter works: the apocryphal *Gospel of Nicodemus*, Richard Fitz Ralph's antimendicant sermon *Defensio curatorum*, and William Ockham's *Dialogus inter militem et clericum*. His only original works seem to be two brief essays on translation that preface some manuscripts of his *Polychronicon* translation: the "Dialogue between a Lord and a Clerk on Translation" and the "Epistle... Unto Lord Thomas of Barkley upon the Translation of *Polychronicon*. ..."

Trevisa's achievement as a translator has several important aspects. Most obviously, he made accessible to an English audience such widely popular Latin informational works as the *Polychronicon* and *De proprietatibus rerum*. The influence of these translations was considerable. Both appear to have circulated widely (given their massive sizes) in manuscript and were printed by Caxton and de Worde, respectively, in the late 15th century. The

Polychronicon was reprinted in the 16th century, while the *De proprietatibus* achieved an extended influence through Thomas East's revised edition in 1582 of *Batman vppon Bartholome*, a commentary on the work by Stephen Batman. In the latter form it was still being read and used in the late 17th century.

Trevisa also had a valuable role as neologizer. His translations expanded the lexical range of English, particularly in his use of new scientific and technical terminology. His fluent and generally accurate renderings of Latin prose demonstrated the possibilities of English prose as an instructional medium, thereby extending his influence into form as well as content.

Trevisa has also been credited with a role in the translation of the Wycliffite Bible. He was certainly at Oxford at the same time as Wyclif and Nicholas Hereford. However, his involvement in the Wycliffite translation remains uncertain, although there is at least some circumstantial evidence for it. His authorship has also been urged for a translation of Vegetius's *De re militari* into ME, but this seems unlikely.

Tribal Hidage

The earliest surviving English administrative document of substance; a list of 35 territories or peoples set out in OE, followed by an assessment measured in hides of their obligation in the way of tribute to an overlord.

Its origins are obscure. The most likely explanation for the present shape is as a document drawn up for the Northumbrian rulers of the third quarter of the 7th century, brought up to date by an 8th-century Mercian king, either Æthelbald (716–57) or Offa (757–96). Mercia appears first on the list, assessed at 30,000 hides, the entry referring to the central heartland of historic Mercia, the land of the Middle Trent, based on Lichfield, Tam worth, and Repton.

Then follow 29 entries relating to peoples, most of whom can be identified as constituent parts of Greater Mercia. They ranged from big groups—the *Hwicce* around Worcester, Lindsey with Hatfield Chase, and the settlers in the Wrekin, for whom an assessment at 7,000 hides was appropriate—to clusters of small folk assessed at a modest 300 hides (Hitchin or the dwellers around Whitlesey Mere in Huntingdonshire). There are some anomalies, such as the presence of the Isle of Wight and the district of Elmet around Leeds, both assessed at 600 hides. At least fourteen of the smaller groups, such as the North Gyrwe, the South Gyrwe, the *Spalda*, and the *Gifle*, can be identified with settlers who moved in from the Wash into and through the Fen country.

Unidentified peoples include the substantial *Noxgaga* and the *Ohtgaga* (7,000 hides between them), placed by scholarly inferences south of the Thames, mostly in Surrey. The document finishes with entries relating to five ancient kingdoms: East Anglia (30,000 hides), Essex with parts of Hertfordshire and Middlesex (7,000 hides), Kent (15,000 hides), Sussex (7,000 hides), and Wessex (100,000 hides). These assessments for East Anglia and Wessex appear to be truly penal.

The Tribal Hidage is important in all manner of ways. It shows that an elaborate system of assessment of tribute existed at an early stage in the development of Anglo-Saxon kingdoms. It also provides our only firm literary

evidence, apart from what can be deduced from place-names, for the small political units of pagan times that preceded the historic kingdoms of England.

Trope

In the broadest sense tropes are all the later musical and textual accretions to the Franco-Roman nucleus of antiphonal and responsorial chants for mass and offices that we call Gregorian chant, a repertoire primarily fixed by the early 9th century. A trope might be a newly added textless melody (a melisma), text added to a preexistent melisma (a prosula), or newly composed text and melody added to an older item as an introduction or interpolation (a trope per se). The term is also applied to Ordinary chants of the mass, especially the Kyrie, that appear in early sources in two formats, either with just the words of the Ordinary (i.e., untroped) or with a lengthy Latin text (a Kyrie trope or prosula). The term is further extended by some to apply to polyphonic settings of chants and to some independent compositions that are liturgical additions (e.g., the sequence, viewed as an addition to the Alleluia) or substitutions (e.g., a polyphonic offertory or sequence substitute).

A major Anglo-Saxon repertoire of prosulae and tropes per se survives in three related pre-Conquest versions of the later 10th and early 11th centuries, two from Winchester (the Winchester tropers) and one from Canterbury (the Caligula troper). These contain tropes to Gregorian mass Propers (variable texts like the Introit, Offertory, Communion) and mass Ordinaries (the constant texts of the Kyrie, Gloria, Sanctus, Agnus Dei), forming a little over a

third of the contents of the Winchester volumes, for example. While the majority of the material is of French or Rhenish origin, about a third of the repertoire was composed in England, and many continental tropes have been reworked textually and musically. The insular tropes exhibit the distinctively ornate literary Latin of late-10th-century Anglo-Saxon authors; their plainsong melodies, unfortunately, are untranscribable.

From the 11th century on there is a sharp decline in the popularity of tropes for the Proper of the mass, but tropes for the Ordinary survive longer, especially in England. The rich 12th-century St. Albans repertoire in Bodl. Laud misc. 358 and BL Royal 2.B.iv is a case in point, as is the early-13th-century monophonic repertoire of troped ordinaries probably from London or Canterbury in Paris, Bibliothèque de l'Arsenal 135 (Ars A). Such collections have no such extensive plainsong counterparts after ca. 1250, but Kyrie prosulae, the *Spiritus et alme* and *Regnum tuum* tropes for the Gloria, and the *Marie filius* insertion for the Sanctus continue to appear in English service books down to the end of the Middle Ages.

In the later 13th and 14th centuries the troping impulse is sustained in England principally in the realm of polyphony. There are, in the first place, two- and three-voice polyphonic settings of troped mass Ordinary plainsongs, the richest source of which is the Marian music of the eleventh fascicle of the early-13th-century manuscript W1; these form a polyphonic counterpart to the monophonic troped chants in Ars A, for instance. In addition there is a distinctive English repertoire of three- and four-voice polyphonic settings of untroped plainsongs (including Kyries, Alleluias, and Marian Gradual verses, Introits, and Proses) in which the upper parts have been given new texts that trope the original chant text; these pieces are designated by musicologists as "troped chant settings." In the case of the Gloria this textual troping is applied to its tropes themselves, producing a small number of motetlike settings of the *Regnum tuum* prosula and a much larger number of paraphrases of the *Spiritus et alme* interpolations. Another manifestation of the troping impulse in the English polyphonic repertoire is the new composition of Latin-texted Kyries set in three-voice polyphony not constructed on any preexistent chant; a Durham piece, *Kyrie Cuthberte prece*, is perhaps the most striking example. Finally there is an isolated instance of a troped lesson for Christmas midnight mass (Harrison et al.: no. 82), in which the first and last sections are set in a simple two-voice style, framing plainsong delivery of the rest of the reading, a technique that adumbrates a wide range of extemporized practice for which no other traces remain.

Truelove, The, or The Quatrefoil of Love

An alliterative poem (ca. 1390) written in 40 thirteen-line stanzas, one of a small group of related poems including *The Awntyrs of Arthur*, *Susannah*, *Summer Sunday*, and *De Tribus Regibus Mortuis*. *The Truelove* survives complete in two northern 15th-century manuscripts, one of which was copied by Robert Thornton (BL Add. 31042). Wynkyn de Worde printed it in London ca. 1510 under the title *The .iiii. Leues of the Trueloue*—the first known printing of an alliterative poem. Unaware of the early print, modern editors Gollancz and Weale edited the Thornton text, including some variants from the Oxford manuscript (Bodl. Add. A 106), and named the piece *The Quatrefoil of Love*.

The poem's dominant emblem is the four-leaf truelove plant (herb paris), whose cruciate form was popularly associated with the Cross and with the truelove knot signifying marriage. Drawing upon a contemporary tradition of allegorizing the plant for religious instruction, the poet expounds the meaning of divine love by likening the four leaves to the Trinity and Virgin. The poem's frame exploits the *chanson d'aventure* form of some medieval lyrics, in which a speaker wandering in the country encounters a woman; the *Truelove* narrator overhears a turtledoves counsel to a maiden seeking truelove—both the plant (a token of good luck in love) and a faithful lover. The bird's counsel is to seek true-love not in mortal companionship, which fades like the plant, but in God.

The Trueloveés 40 stanzas may have a numerological meaning associated with the four leaves and the Cross. The central eight stanzas portray the Crucifixion and Resurrection, beginning with a depiction of Mary mourning Christ's death and ending with her Assumption and coronation as queen of heaven. The sixteen stanzas on either side explain this event from the different perspectives of the living and the dead: mercy versus judgment, the conditional promise of salvation and the inescapable effect of continuing in one's sins. Taken as a whole, the poem works as a diptych, divided by the bursting of hell's gates in stanzas 20–21. The first half recounts biblical history as a demonstration of God's love; the second half narrates the soul's lonely plight on the day of doom. The interplay of contrastive themes—friendship and loyalty versus disruptive acts of cruelty and treason, or the enactment of truth and love versus their perversion—creates an imagery of union broken by disunion but ultimately reunited, suggestive of an interwoven knot.

The poem thus develops its religious themes through a skilled manipulation of the herbal conceit and its associations. The frame anticipates the Crucifixion imagery of the central section: the narrator watches the forlorn maiden behold the bird on the tree; later the reader pictures the sorrowful Mary behold Christ on the Cross. The poet also exploits a latent medicinal metaphor: the Trinity and the Virgin provide the “grace” (punning on “grass, herb”) that actually cures the maiden's love-longing. The presence of the poem among herb-als and medical recipes in the Oxford manuscript underscores this meaning. In its rich emblematic shaping of scriptural and popular traditions *The Truelove* stands as an elegant blend of pious didacticism and serious alliterative art.

Truth in Middle English Literature

Truth (spelled variously as *trouthe*, *treuthe*, *troth*, *trawthe*) is one of the major literary themes in late-14th-century England. “*Sir Gawain* is a poem about *truth*, in the medieval sense of the word” (Burrow, 1965: vii). *Piers Plowman* proclaims, “Whan aile trésors arn tried truj^e is beste” (B. 1.135). A Vernon lyric turns the words into a refrain, “treuj^e is best.” Chaucer’s *Franklins Tale* centers on the same proposition, “Trouthe is the hyeste thyng that man may kepe” (*Frank T*1479); the *Clerk’s Tale* celebrates the “trouthe and... obeisance” of patient Griselda (*CIT* 794); and inasmuch as the frame story depends upon the sworn agreement between the Host and the pilgrims, truth is arguably the theme of the *Canterbury Tales* as a whole.

The word was popular in part because of the rich variety of meanings it had accumulated by the 14th century. Langland uses it “in at least a dozen distinct senses” (Kane, 1980: 9). From its primary meaning of “faith or loyalty” (particularly as pledged in a promise or agreement) the word expanded to include such concepts as “honesty,” “integrity,” “justice,” and even, as in modern usage, “true statement or account, that which is in accordance with the fact.”

The word came to embody certain social values. Truth was the chivalric virtue par excellence. Knights “sweren on hir swerd to seruen tru Pe euere, / That is pe profession apertli Pat apendej) to knyztres” (*Piers Plowman* B. 1.99–100). Among Arthur’s knights Gawain is the paragon of *trawthe*. Chaucer’s knight “loved chivalrie, / Trouthe and honour, fredom and curtesie” (*Gen. Prol.* 45–46). In time this chivalric virtue was extended as an ideal for society as a whole. The word *truth* thus came to carry with it a specific worldview, at the

center of which is that social system known to us as feudalism. Truth is not simply an abstract loyalty, such as any society in any age could embrace, but a loyalty manifested concretely in the obligations of status, in the duties of knighthood, in the subordination of one individual to another.

By the late 14th century, however, the breakup of this system had become obvious. Truth emerged as a battle cry at the very moment when the passing of the old order was felt most keenly. Writers of the period singled out “meed” (money, reward) and “will” (willfulness, ambition) as the two main causes for the decay of truth. Chaucer’s complaint in *Lack of Steadfastness* is typical:

Somtyme the world was so stedfast and stable
That mannes word was obligacioun,
And now it is so fais and deceivable
That word and deed, as in conclusioun,
Ben nothing lyk, for turned up-so-doun
Is al this world for mede and wilfulnesse,
That al is lost for lak of stedfastnesse.

Yunck’s analysis of the situation can hardly be bettered: “The theme becomes ... a vehicle of protest against a new world of nationalism, money, taxes, and collectors, in favor of a world long past and idealized, of feudal obligations and privileges, of settled class-distinctions, of personal mutual devotion between lord and vassal (such was the idealization) as the basis of social order” (1963: 219).

Even so, the protest might have been less vehement and widespread if the impetus had been only social. But the cry for truth was moral and religious as well. The church had taught for centuries that the “three estates” had been ordained by God. The doctrine is expounded as late as 1388 in Thomas Wimbeldon’s famous sermon at Paul’s Cross, London: “In Pe chirche bee P nedeful Pes Pre offices: presthod, knyztod, and laboreris” (ed. Knight, 1967: 63). In *Piers Holy Church* herself presents the celestial hierarchy as a model for human society: God taught the angels “(J) e treusee to knowe: / To be buxom at his biddyng” (B. 1.109–10). Later in the poem Rea son addresses a sermon to each estate in turn, in which he explicitly connects class obligations to the reward of salvation, concluding with the words:

And ye Pat seke Seynt lames and Seyntes at Rome,
SekeP Seynt Trufje, for he may saue yow alle. (B.5.56–57)

Truth is the virtue upon which both social and personal salvation rest. The two realms merge. The lesson for medieval readers was that to obey any rightful authority on earth was to obey God himself; to disobey was to risk his wrath and damnation. It is this premise that gives such urgency to the cries for truth

in late-medieval English literature and such poignancy to complaints that it has fled England.

Tunnage and Poundage

Parliamentary subsidies, usually voted together, as customs duties levied on

wine and the value of general merchandise, excluding wool, imported and exported. A specific rider was attached that the yield should be used for “the safekeeping of the seas.” This rider shows that although both duties had earlier origins in the prise of wine (buderage), in King John’s levies on general merchandise, and in the petty custom of 3*d.* in the pound on alien merchandise, it was the needs of war, particularly the protection of Channel shipping, in 1346–47, that led to their imposition.

As with other subsidies a struggle ensued as to whether the king could levy them with the limited consent of the merchants or whether he had to seek general parliamentary approval. By 1359–60 the question had been settled. Thereafter they were granted by the Commons for specific terms (not always continuous, from year to year) and for life in 1415, 1453, and 1465, and then, from Richard III on, in the first year of each reign.

The general rates were 3 *s.* a tun (252 gallons) on wine and 12*d.* in the pound on general merchandise, though both could be varied, as in 1431, when, as part of a search for money for the war in France, an extra 3*s.* a tun was imposed permanently on alien sweet wine and poundage was temporarily raised to 1*s.* 6*d.* The main problem was liability to poundage on general merchandise and the value of cloth exports. Aliens paid on both. Hansards claimed exemption on cloth exports and general merchandise—on the latter until at least 1425 and at times after that—while natives seem to have paid on both until 1422. When poundage was granted again, in 1425, native cloth was exempted, and the merchants thereafter strenuously resisted its reimposition, particularly in 1453–54. The payment of poundage on native cloth would not have offset declining yields from the wool subsidy, but it might have established a precedent for the levying of further duties on what was now England’s chief export.

U

Universities: Oxford and Cambridge

Oxford and Cambridge, the only universities of medieval England, were not specifically founded. In common with the archetypal universities of Bologna and Paris they evolved; no precise dates can be ascribed to their origins. Oxford, which developed in a piecemeal fashion in the course of the 12th century, was regarded as a fully fledged *studium generale* (the medieval designation for a university) toward the close of that century, specializing in arts, civil and canon law, and theology. It thus belonged to Europe's primary group of universities, ranking alongside Bologna, Paris, and Montpellier.

The nascent university at Oxford was reinforced in the 1190s by the presence of a galaxy of prominent scholars, including Daniel of Morley, a student of Arabic science, and Alexander Neckham, the theologian and Aristotelian enthusiast. In the early 13th century Oxford's intellectual life was extended by the activities of scholars who are known to have taught at the university and who promoted in England the logical, metaphysical, and scientific works of Aristotle. The most important of these Aristotelian scholars were Robert Grosseteste, who was to become bishop of Lincoln, and Edmund of Abingdon, later archbishop of Canterbury. As a result of these intellectual developments Oxford was a European focus for those areas of Aristotelian science and philosophy that were suppressed at Paris in 1210 and 1215 and that were not taught openly there until the 1230s. It was thereby able to forge ahead in these invigorating spheres and was seen to be a university capable of participating in some of the most advanced realms of European scholarship.

Cambridge University had more modest beginnings. The evidence for the origins of Cambridge is of the most elusive kind. It does not appear to have been an outgrowth of either the town's grammar schools or the intellectual activities of the regional monastic houses. The university seems to have crystallized as a consequence of a migration of Oxford scholars in 1209, arising from the temporary closure of the Oxford schools following the hanging of several scholars by the mayor and burgesses in retaliation for the murder or manslaughter of a woman by a scholar. The years immediately following the

reopening of Oxford in 1214–15 saw the emergence of Cambridge as a *studium generale*. It may thus be accounted a member of the second wave of universities. A Cambridge chancellor is first recorded in 1225, only sixteen years after the Oxford exodus. Initially Cambridge specialized in arts, theology, and canon law, there being no faculty of civil law until the mid-13th century and no faculty of medicine until ca. 1270–80.

In organizational terms Oxford and Cambridge were broadly based upon the Parisian magisterial model, in which the faculty (masters, or *magistri*) governed the institution, as opposed to the student-controlled type of university exemplified by Bologna. The English universities, however, made notable constitutional adaptations to the Parisian archetype; and they exhibited important differences from each other. Cambridge was no mere derivative of Oxford, and in the course of the 13th century its degree of indigenous growth is striking. In 1318 Pope John XXII officially confirmed its legal status as a *studium generale*. Despite royal petitions to the papal curia Oxford never received a comparable official confirmation as a fully fledged university.

Oxford was by far the larger of the universities in the 13th and 14th centuries. In the late 14th century it has been reckoned that its academic population was around 1,500, while that of Cambridge may have ranged between 400 and 700. By the mid-15th century the number of scholars at Oxford may have settled in the region of 1,700, while Cambridge may have reached about 1,300. In the late 15th and 16th centuries Cambridge came close to rivaling Oxford in terms of size, and it probably achieved parity around 1600.

One reason for the increasing popularity of Cambridge in the later period was the differing stances of Oxford and Cambridge toward the heresies of Wyclif and the Lollards. Although every effort had been made to eradicate Wycliffite ideas and Lollardy from Oxford, traces of heresy persisted there throughout the 15th century. Cambridge remained largely orthodox and was regarded as a sound investment for patrons of learning and a safe harbor for undergraduates. The persistence of the heretical problem at Oxford may help explain why Cambridge obtained a complete exemption from ecclesiastical authority in 1433, some 46 years before Oxford acquired its comprehensive emancipation in 1479, although the struggle for autonomy from ecclesiastical dominion had been fought with a far greater intensity at Oxford than at Cambridge.

Secular colleges within the universities were later developments than at Paris. They first materialized in the form of Merton College, Oxford, and Peterhouse, Cambridge, founded in 1264 and 1284, respectively. Until the late 15th and early 16th centuries English colleges served primarily to accommodate graduate fellows, studying for advanced arts degrees or in one

of the superior faculties. Exceptions were the royal College of the King's Hall, Cambridge, and New College, Oxford, which from the 14th century both admitted undergraduate members. The unendowed Oxford halls and Cambridge hostels provided the normal university environment for the majority of undergraduates and for many graduates until well into the 16th century.

At Oxford ten secular colleges were founded before 1500: three in the 13th century, four in the 14th, and three in the 15th. Cambridge harbored only one college in the 13th century but realized seven in the 14th and five in the 15th, making a total of thirteen secular colleges. Of these the most celebrated, unusual, and—until the mid-15th century—largest was the King's Hall, with origins in a detachment from Edward II's chapel royal set in the University of Cambridge. This settlement brought into being the first colony of royal clerks established in the English universities.

The Oxford colleges were more exposed to ecclesiastical influences than those of Cambridge. Of the ten secular colleges at Oxford by 1500 no fewer than nine had ecclesiastical founders. The thirteen Cambridge colleges had a preponderance of lay founders and were fiercely jealous of their independent status with regard to the university and ecclesiastical authorities. In addition to secular colleges Oxford maintained five monastic colleges, whereas Cambridge had only one. Both universities also contained houses of friars and regular canons.

The secular colleges of Oxford and Cambridge came to have a seminal impact on the evolution of the universities. In the later medieval period the colleges fell heir to the declining system of public instruction of the university schools. Through the growth of college lectureships and tutorial systems the colleges, from the late 15th century, could cater to basic undergraduate needs; the undergraduate populations began to infiltrate the colleges in some numbers. The attempts made by the universities to regenerate the ailing system of public instruction given by the regent masters met with limited success.

By the reign of Elizabeth the colleges had become the natural venues for undergraduate accommodation and teaching. With teaching largely decentralized in the colleges Oxford and Cambridge were transformed from universities of a centripetal nature to those of a centrifugal character. This decentralized structure has remained intact down to the 20th century.

The universities were insular; neither one recruited extensively from the Continent. Only about 2 percent of scholars at Oxford and 1 percent at Cambridge were drawn from abroad. Of those recruited from the Continent many were friars who came to study and take degrees in theology. In this regard the English universities had a peculiar attraction because, until 1359, only Paris, Oxford, and Cambridge had the right of promotion to the doctorate

in theology. Within England Oxford recruited largely from the west and north, and Cambridge relied mainly upon the east and north. Cambridge drew only about 1 percent of its scholars from Wales, Scotland, and Ireland, compared with the 6 percent drawn by Oxford.

Although Cambridge was less prominent before the 16th century, several eminent scholars, including Thomas of York, Duns Scotus, John Bromyard, Robert Holcot, Roger Marston, and Thomas Cobham, as well as the mystical writer Walter Hilton, are known to have studied or taught there. In comparison with Oxford, however, the evidence for original speculative thought at Cambridge in the Middle Ages is limited.

The traditional curriculum was modified by the onset of humanist learning. The gradual humanist infiltration began piecemeal in the second half of the 15th century and became institutionalized in the course of the 16th. The impact was most extensive within the arts faculties. In general the universities incorporated those ingredients of humanism deemed to be compatible with the inherited corpus of learning. The humanist impact did not cause major reorientations from the traditional patterns of intellectual life. Oxford and Cambridge were not humanist centers compared, for example, with the universities of Germany, where curricula were radically reconstructed according to humanist criteria.

The tenor of life in the universities was less prone to disruption than in some of the more turbulent cosmopolitan continental universities, although the relative stability was occasionally punctuated by such events as Wycliffism at Oxford or the disturbances at Cambridge during the Peasant Rebellion of 1381. From the 13th to the 16th century they benefited from the sustained support of the monarchy and, intermittently, the papacy. They became highly privileged corporations and dominant forces within their towns and surrounding areas. The chancellors exercised a more extensive authority—spiritual, civil, criminal, and economic—than their continental counterparts, and their aggregate of powers made their office unique among Europe's university towns.

Usk, Thomas (d. 1388)

Author of *The Testament of Love*, a Boethian prose dialogue once attributed to Chaucer, in which the author's persona is instructed by Love about true happiness, free will, and predestination.

Born of a London family, Usk served as secretary to John of Northampton, mayor of London 1381–83. After the mayor's defeat in the election of 1383 Northampton and Usk were imprisoned by Northampton's successor, Sir Nicholas Brembre. Usk extricated himself by turning prosecutor against his former master (see *The Appeal of Thomas Usk*). He composed the *Testament* in the period 1384–87, partly as a way of clearing his name. In 1387 Usk was

implicated in Brembre's arrest by the king, under pressure from the Appellants. On 4 March 1388 he was executed.

Usk's primary debt in the *Testamentis* to Boethius's *Consolation of Philosophy* (or perhaps to Chaucer's translation) and to a work of Anselm on free will; he also draws on *The House of Fame* and *Troilus and Criseyde*. The work has been dismissed as totally derivative. But though its debts are obvious, this dismissal underrates the sophistication of the work in these respects: its awareness of literary theory, its philosophical vocabulary, and the paradox at the heart of the work, which seeks to reinstate its author's good name by professing Boethian detachment from worldly fame.

Utilitarian Writings

In the broadest sense utilitarian writings may be defined as those "useful" to

the extent that they convey practical information. In the narrower sense employed here, however, utilitarian writings must be defined as only those works that apply information toward some tangible end, whether doing, using, or making. Obvious examples—and those to be discussed here—are writings on arithmetic, astronomy (especially as it concerns the calculation of liturgical feasts), judicial astrology (prognostics), professional skills like codicology (book making) and cooking, and various household activities. Other examples might include applied aspects of medicine (e.g., phlebotomy or surgery), sports, music, courtesy books, herbology, alchemy, grammar, charms, veterinary medicine, warfare, navigation, travel writing, weights and measures, or agriculture. Several of these topics are discussed under other entries in this volume.

An important category of utilitarian writings in OE is that related to the astronomical calculation of liturgical feasts (also called *computus*), not surprising in view of the church's interest in such calculations from at least 243, when the *De pascha computus*, once attributed to St. Cyprian, attempted to resolve the problem of calculating the date for Easter. The most important OE *computus* is Ælfric's *De temporibus anni* (ca. 993), which draws heavily on Bede's Latin work *De temporum ratione* (725). It explains how to calculate the movable feasts of Septuagesima, Lent, and Easter and discusses Egyptian days (days of ill omen) as well as such technical concepts as the concurrents and epacts. In turn, Ælfric's work provided the basis for Byrhtferth's *Manual* (1011). The number of manuscripts of these works attests to their consistent use, although monastic rather than lay. In addition OE notes and glosses throughout other ecclesiastical manuscripts calculate the position of the moon and its relation to the tides, days of fasting, names of the days of the week, the number of days and weeks in the year, and the length of days, nights, seasons, and shadows. The late-10th-century OE calendar poem, or *Menologium*, reflects this concern for time in its mnemonic presentation of the feasts and seasons of the year. The verse "Seasons for Fasting" focuses upon a single aspect of the *computus*. A related category of material consists of the various OE prognosticary texts, which offer predictions of the future based on the phases of the moon, the weather (especially thunder) on New Year's Day, dreams, the alphabet, and so on.

Another important area of OE utilitarian works concerns cryptic writing. *The Rune Poem* (ca. 950–1000) mnemonically instructs its audience on the use of runes, giving first their names and phonetic values, then their various meanings, which illuminate their significance for OE riddles and other poems using runes. Other forms of cryptography also appear, as in the secret letters of Riddle 36 in the (*Exeter Book*) or the more theoretical text found in a Latin psalter of ca. 1050 in BL Cotton Vitellius E.xviii, fol. 16v.

In the ME period utilitarian writings grow in both number and variety. This becomes especially true toward the end of the 14th century, as more and more vernacular translations and adaptations were made from Latin works. By the time that printing was introduced in the late 15th century, such works had found widespread lay ownership and use.

In arithmetic ME examples belong largely to the area of computational mathematics known as algorism (from a corruption of al-Khwarizmi, author of an Arabic treatise on how to calculate with Hindu numerals, written ca. 825 and translated into Latin ca. 1140). *The Craft of Numbenng* (ed. Steele) appears to be an early-15th-century translation of a gloss on Alexander of Villadien's *Carmen algorismo* (ca. 1220), while *The Art of Numbering* (ed. Steele) is a translation from the same period of John of Sacrobosco's *De arte numerandi* (ca. 1230). Many manuscripts contain variants and extracts of similar texts, as well as such brief notes as "On how to write up to 100,000" (BL Egerton 827, fol. 51v).

Astronomy is well represented in ME writings by a wide range of both theoretical and applied works. While the many versions of *De theoricis planetarum* belong to the former category and should not be discussed here, the descriptive *Wise Book of Astronomy and Philosophy*, which circulated widely, is an important popular transition from astronomical data to judicial astrology (the application of astronomical data to human actions and decision making). It defines the nature of the heavens and the properties of the planets and signs and indicates their influence upon the microcosm. Two late-14th-century treatises on the astrolabe and equatorium, the first certainly and the second possibly by Chaucer, teach the construction and use of instruments for calculating the positions and movements of celestial bodies. Slightly later technical treatises include instructions for making a quadrant (Cambridge, Trinity College R. 14.52, fols. 215–238v) and for making a sundial known as "the little ship of Venice," a geometrico-mechanical computing device, based upon spherical projection derived from Hellenistic theories described in Ptolemy's *Planisphaerium*. Although these two treatises do not appear to have been particularly popular or influential, they do indicate some of the variety of ME utilitarian writing.

In addition to such highly technical works are many popular works on the computus, representing—as in OE—a significant body of material, but now designed for the layman outside an ecclesiastical context. Calendars, tables, figures, volvelles (movable parchment or paper wheels), and verses containing astronomical or astrological and religious matter may all include computus matter. It is significant that the Dominican friar Henry Daniel includes in his *Dome of Urynes* or *Liber uricrisiarum* (based on Giles of Corbeil's uroscopy treatise, ca. 1350) a digression on how to calculate computistical date—the

dominical letters, bissextile years, and concurrents—using mnemonic verses and a wheel with a pointer attached by a thread. Many other ME notes and verses, often added in the margins of books of hours or other private devotional works, offer mnemonic methods for calculating Easter or other feasts and defining the occupations and lengths of the months (e.g., “Thirti dayes hath nouembir”).

Judicial astrology evaluates, or “judges,” astronomical data, advises on proper action as a result of such data, and predicts or prognosticates on the future. Such works constitute a large part of ME utilitarian writing, and the majority were certainly not regarded—at least until the mid-16th century—as occult or pseudo-science. There are many categories. The most important is that dealing with the elections of times, that is, the relationship between such astronomical conditions as the position of the seven planets with regard to each other and to the twelve signs of the zodiac (aspect) and the times when certain events take place—birth, illness, travel, and so on. Treatises on elections aid their users in “electing” the most favorable times in which to perform a given activity. This was a popular topic among early Arabic writers, and it entered the Latin tradition by way of such influential works as John of Seville’s translations of Haly Abenrudwan’s *De electionibus* and Albumasar’s *Flores astrologiae* and the various adaptations of and commentaries on Ptolemy’s *Tetrabiblos*. These were in turn the main sources for John of Eschenden’s (or Ashenden’s) *De prognostica summula*, translated into ME ca. 1450 (Bodl. Ashmole 396, fols. 92–125v), and Richard of Wallingford’s *Exafrenon pronosticationum temporis*, translated into English about the same time. The ME *Treatise on the Elections of Times* (found together with the *Exafrenon* in one manuscript; ed. Matheson and Shannon in Matheson, 1994) sets out the theoretical bases for this system, such as whether a sign is mobile, fixed, or mixed, whether masculine or feminine, and which planets are in which aspect within it.

In its applied forms the notion of election is most frequently represented by the many verse and prose variations of the lunary. Such texts, which may be called anything from *Decursione lune* to *The Dream of Daniel (Somnia Danielis)*, are based upon the lunar month of 28.5 days and prognosticate on the nature of the moon’s influence in each of its “mansions” or days for a wide variety of activities, such as birth, marriage, agriculture, travel, dreams, commerce, imprisonment, profession, illness, or phlebotomy. Another popular form of lunary election prognosticates on the basis of the moon’s influence in each of the twelve signs, Aries to Pisces.

Related to the lunary are works on nativities, based on various versions of *De nativitatibus* attributed to Arabic originals by Alfraganus, Haly Abenragel, Messahala, and others. One of the more popular is the *Book of the Destinary of*

the *Twelve Signs*, predicting the physiognomy and destiny of both men and women according to the sign under which they were born and advising on health and choice of profession, which follows the *Wise Book of Philosophy and Astronomy* in twelve of its 27 known manuscripts.

Works on interrogations (ultimately derived from, among other sources, Latin translations of Dorotheus of Sidon's *De interrogationibus*, originally in Greek) ask questions and propose answers about such topics as illness, fortune, birth, journeys, the location of lost objects, and "urine not seen" (e.g., Bodl. Ashmole 210, pt. 2, fols. 22–23v). Important for the accuracy of the answer are both the hour when the question is asked (related to another prognosticary genre called the Horary) and the natural house within the horoscope governing the topic in question.

Geomancy texts also constitute a form of interrogations, based upon the practice of deriving sixteen figures from dot patterns and using these according to astrological principles to answer certain questions. The most complete ME treatise and handbook derives from Martin of Spain's *De geomancia* (ed. Means in Matheson, 1994) and appears in a mid-15th-century manuscript (Bodl. Ashmole 360, fols. 15–26v). Another form of applied prognostics is chiromancy or palmistry, a topic on which three major ME treatises have thus far been identified, including one by John Metham (ca. 1448). These are based upon Latin works in the Pseudo-Aristotelian tradition of physiognomy (the relation between bodily forms and character, summarized in such works as the *Secreta secretorum*), represented by the anonymous *De chiromantia*.

Prognosticary texts include weather predictions and dream books, a genre already represented in OE, although they descend through intermediate Latin sources. These include the *Erra Pater* or *Prophecies of Esdras*, with versions in both verse and prose, which predict the events of the coming year according to which day of the week Christmas (or New Year's) Day falls, or whether there is thunder on that day (Craig, 1916: 146–47, 157–58; Robbins, 1955: 63–67). While the outcome of dreams is also covered by lunaries, separate dream books, usually entitled *Somnia Danielis*, may be found, such as BL Lansdowne 388, which lists dreamed objects and their significance (ed. Bühler, 1962).

A number of utilitarian texts relate to crafts and professions. Among these are codicological texts, which describe how to make books: recipes are given for making parchment, ink, paint for illumination, glue, sizing for gold leaf, and leather for binding. For chefs culinary recipes abound in many manuscripts. Apart from many isolated recipes there appear to be at least four major collections, based ultimately upon popular Latin collections known as *De coquina*. One of the earliest in English, the *Diuersa sercicia tam de carnibus quam de pissibus* (ca. 1381), contains 59 recipes for cooking meat and

33 for fish; the slightly later *Forme of Cury* (ca. 1390) contains over 200 recipes and was compiled for Richard II (ed. Hieatt and Butler).

The range of helps and recipes for stewards and other members of a household—such as “How to drive fleas out of a chamber”—is wide. Many of these are found in compendia, which may include agricultural, medical, culinary, or even religious matter and which were used—often until the early 17th century—as standard household reference works. The *Treatise on Lacemaking* may form part of a household reference book for a women’s cloister. “How to Purchase Land” advises on legal aspects of land ownership and from its fourteen known manuscripts appears to have been one of the most popular pieces of utilitarian verse (Robbins, 1955: 70–71).

There are other related and important categories of ME utilitarian writing on aspects of household economy—for example, the widely circulating translations of works on horticulture by Gottfried of Franconia (ed. Cytkowski in Matheson, 1994) and Nicholas Bollard. Also important, especially for noble households, are the hunting and hawking treatises, the most popular of which was Edward duke of Yorks *Master of Game* (extant in 24 manuscripts).

V

Vainglory

An 84-line poem in the Exeter Book, appearing on folios 83r-84v of the manuscript, between *The Seafarer* and *Widsith*. The poem has been given various titles, all in some way reflecting upon a central concern with the need to avoid vainglorious pride. Because of its firmly didactic tone *Vainglory* is often termed “homiletic,” and stylistically its nearest analogue within the corpus of Anglo-Saxon poetry is Hrothgar’s “sermon” in *Beowulf*. Its main thrust is toward the fostering of wisdom, with argument conducted through the examination of contraries.

The narrator presents himself as having something of true value to impart, for he has learned how to distinguish God’s own son from his weaker contrary (a contrast based on 1 John 3). His vivid presentation of dissension within this world, whether sparked by drunkenness or malice, is complemented by an account of how, long ago, paradise was lost to those angels among whom pride arose. The contents are tightly organized, with attention held by the simple device of addressing a listener directly. The poet’s clear exposition of the distinction between good and evil leads neatly to the ironic half-line “if the prophet did not lie to me.” The simple ending looks heavenward, its focus on the “best ruler of victories” following naturally from the constant comparisons set up throughout the poem.

Critics have emphasized the poet’s use of rare words, but some forms identified as unique are attested elsewhere and the compounds generally would not seem out of place in many an OE homily. The *ic*, “I,” of *Vainglory*’s opening eight lines has put readers on profitless trails. Some, disappointed that it is not followed by further autobiographical musings, find the poem without overall unity. Others are eager to identify both the speaker’s wise informant and that wise man’s source of teaching. As a result the poem’s contents have been variously blocked out, to accommodate putative sources that are supposed to reveal its structure. However, none of the proposed sources accounts for the whole content and ordering of the poem.

Vaulting

So far as we can tell, vaulted Anglo-Saxon buildings were nonexistent, and the story of English medieval vaulting begins with the Norman Conquest. Barrel, groin, and rib vaults all appear frequently in English Romanesque architecture, in a wide range of buildings and positions.

Barrel vaults were used less frequently than they were in many parts of the Continent, but they were popular in the West Country in the years around 1100 and probably covered originally the choirs, transepts, and possibly naves of Tewkesbury and Pershore abbeys and perhaps the choir of Gloucester Cathedral (formerly St. Peter's Abbey). The only high barrel vault that survives in England is that of St. John's Chapel in the Tower of London, of the late 11th century. Barrel vaults, usually pointed, were also used in some chapter houses; Gloucester preserves a good example, and there was originally another at Reading Abbey.

Groin vaults, almost always constructed of rubble, were the normal means of covering crypts and aisles in English Romanesque great churches. Good examples of the former still survive at Worcester and Canterbury cathedrals, and of the latter at Norwich and Ely cathedrals, or in the priory churches at Blyth and St. Bartholomew, London. High groin vaults seem to have been

infrequent, although there is some evidence for their use in the choir of St. Albans Abbey and, although less certainly, Lincoln Cathedral. Groin vaults appear frequently outside of churches as well, particularly in the undercrofts or ground-floor ranges of dormitories (Canterbury, Lewes), refectories (Worcester, Durham), west ranges (Chester, Kirkstall), or even castle keeps (Castle Rising).

Durham Cathedral, begun 1093, contains the earliest examples of rib vaults in Europe. As completed in the 1130s, Durham was an entirely rib-vaulted building, but no other English great church preserves high rib vaults of the Romanesque period. Romanesque rib vaults are found frequently, however, in aisles (Winchester, Romsey, Peterborough), and chapter houses (Durham, Bristol, Forde). High rib vaults of French Gothic style appear at Canterbury in the rebuilding after the Fire of 1174 and quickly become common in the south, appearing at Rochester and Chichester before 1200. In the west Gothic rib vaults were used at Wells and Glastonbury from the 1180s and quickly became the rule in large churches there as well. But in the north, in spite of completely vaulted churches like Beverley, many important buildings, including Whitby, Hexham, or Glasgow, continued to combine rib-vaulted aisles with wood-roofed main vessels. Even York Minster lacks high stone vaults, being covered instead by wooden facsimiles.

Canterbury introduced the French style of six-part vaulting to England, but although copied at Rochester and Lincoln, such vaults quickly disappeared from the English scene to be replaced by more elaborate types. Lincoln Cathedral, begun 1192, was the crucial catalyst in this change. The earliest surviving high vaults at Lincoln, in the east transepts, are six-part vaults over single bays, but in St. Hugh's Choir the master introduced an asymmetrical system with extra diagonal ribs meeting on a longitudinal ridge rib at two points of intersection, instead of the usual one point. These "crazy vaults," as Paul Frankl dubbed them, are the beginnings of an English fascination with the decorative possibilities of ribs that was to last until the Reformation and that represents an important break with the chaste French adherence to four- and six-part systems.

The Lincoln choir vaults could count no successors in their use of asymmetry but many in their use of extra diagonal and ridge ribs. The designer of the Lincoln nave kept both the latter features to create a vault with a regular pattern with two extra diagonal ribs per every one, reaching a boss on the longitudinal ridge rib and the other a boss on the transverse ridge rib. The visual effect of such cones of multiple ribs was to deny any emphasis to the bay defined by the normal four-part vault in favor of an emphasis on the point of bay division. The most extreme example of a tierceron vault can be found at Exeter Cathedral, begun ca. 1270.

At the end of the 13th century English masons began to connect diagonal

ribs, tiercerons, and ridge ribs by shorter lengths of ribs known as liernes to create still more complex linear patterns. Early examples include the West Country choirs at Pershore and Bristol and the lower story of St. Stephens Chapel in Westminster Palace, London. The visual results could be staggeringly complex, as in the choir vaults of Tewkesbury Abbey and Gloucester Cathedral, both of the mid-14th century. Structurally, however, these vaults are often simple pointed barrel vaults with interpenetrations for the windows; the ribs have simply become an applied surface pattern. The same is true for the so-called net vaults, such as the choir of Wells Cathedral, where diagonal ribs spanning double bays form a repetitive mesh texture.

The last English contribution to the history of medieval vaulting was the development of fan vaults. Although these develop formally out of the cones of tierceron ribs common from the 13th century, they embody new geometrical and constructional premises. A fan vault consists of multiple ribs springing from a single point that maintain equal spacing among themselves as they rise vertically. The ribs and webs between them form conoids that are generally concave in vertical section and convex in horizontal section. These fans were frequently constructed out of cut-stone masonry, where ribs and webs were fashioned from single blocks instead of the more traditional method of constructing them separately in a frame-and-panel technique, although this method was still used in some fan vaults, particularly those covering larger spans. The crown of a fan vault was a flat or slightly domed spandrel; these could be reduced in size or eliminated by intersecting the cones of ribs. Decorative pendant blocks might be combined with fan vaults, positioned in either the central spandrels or along the line of the transverse rib.

The earliest fan vaults surviving are those in the cloister of Gloucester Cathedral, built in the last twenty years of the 14th century. They long remained popular for smaller spaces, such as tomb canopies, chantries, porches, or towers, but their first use over large spans came only in the second half of the 15th century at Sherborne Abbey. The most spectacular examples of their use are in royal buildings of the late 15th and early 16th centuries, especially King's College Chapel in Cambridge and Henry VII's chapel at Westminster Abbey.

Vercelli Book

A late-10th-century codex of 135 folios in a single, unpolished hand (Vercelli, Biblioteca Capitolare CXVII), containing 23 prose homilies and six passages of religious verse (*Andreas*, *The Fates of the Apostles*, *Soul and Body I*, a fragmentary poetic adaptation of Psalm 28:3 A.V., *The Dream of the Rood*, and *Elene*). The contents are all in English, although six homilies have Latin headings; the order of items appears to be random. The writing becomes smaller in the last third of the book, where the number of lines per page increases significantly.

Ker defines the script as Square Anglo-Saxon Minuscule of the second half of the 10th century. A case has been made for a later date on grounds of content, but some of the letter shapes used are archaic in the later 10th century, especially the very open form of *g* used throughout the codex, the “double” form of *a*, and *f*-shaped *y*, both used occasionally. There is little ornament in the book: zoomorphic (animal-shaped) initials open two items, with a third part way through another item. Four items are rubricated. Loss of leaves shows that the book is an original compilation put together by the scribe, who drew upon a variety of exemplars.

On the basis of language and the analogy of contents with those of other books of known provenance it has been suggested recently that the Vercelli Book is of southeastern origin and specifically that it drew upon the resources of the library at St. Augustine’s, Canterbury. There has been much speculation

about how the book reached Vercelli, in northern Italy. Marginalia, including the pen trials of later copyists, show that the book was not taken abroad when first written, but a verse from a psalm in Latin was entered on a blank halfpage in an Italian hand at the end of the 11th century. Vercelli was on the pilgrim route to Rome, and it seems likely that the book was taken as suitable reading matter for such a traveler, perhaps a member of the entourage of an 11th-century archbishop visiting Rome for his pallium.

A number of entries in later medieval and Renaissance catalogues of the cathedral books might refer to the Vercelli Book, but the manuscript was effectively lost to the sight of modern scholars until a German law professor published quotations of it in the 1820s. News of the book reached England only in 1832, after which a student, C. Maier, was sent from Tübingen to make a complete copy of it, now London, Lincoln's Inn Library Misc. 312. Maier is generally assumed to have been responsible for applying reagent to faded or erased passages of text, reagent that has since blackened the affected areas.

Vercelli Homilies

Twenty-three prose items in the Vercelli Book, forming the earliest surviving collection of homiletic prose in English. They are neither an ordered collection nor uniform in format. The items appear to have been put together piecemeal as the scribe or his master gathered material. Some were clearly copied in groups: Homilies VI–X form a numbered series, XIXIV are rubricated in a distinctive way, and XIX-XXI are by a single author. They are probably of diverse dates and origin. Homilies XIX-XXI seem to have been composed only shortly before the Vercelli Book itself was made, while I, II and perhaps III are much older, possibly representing a vernacular homiletic tradition as old as the first half of the 10th century, or even earlier.

The content is also varied. Eschatological homilies predominate: Homilies II (in part in doggerel verse) and XV stress the terrors of the Last Days, IV and VII report dramatically the trial of the soul at Judgment, and III, VII, IX, X, XIV, and XXII are general exhortations to repentance because judgment is at hand. Two Rogation series, XI-XIII and XIX-XXI, also stress judgment. Each is a set of three intended for the days prior to Ascension Day, with the emphasis on the third day being on preparing now to meet God. By contrast there are few exegetical homilies: Homily I tells the Passion story from the synoptic Gospels, with little homiletic comment, but only V, VI, XVI, and XVII explain biblical texts, the first two set for Christmas, the latter two for Epiphany and Candlemas. And there are only two saints' lives, XVIII (Martin) and XXIII (Guthlac), the latter being no more than a few excerpts from the life by Felix of Crowland rounded off with a perfunctory homiletic ending.

Some of the pieces are based on earlier vernacular material and may well have been composed by the "scissors-and-paste" method so favored by 11th-century homilists. A large section of Homily XXI, for example, is a verbatim copy of an earlier version of Homily II, while II itself has awkward transitions that suggest that it, too, may have been compiled in the same way at an earlier stage. Most pieces are heavily dependent on Latin. Homilies III, XI, XV, VIII, XXII, and XXIII rarely depart from a literal rendering of known Latin sources. But there are also pieces that treat source material with great freedom. Homilies XIX-XXI are competently put together from a Latin anthology, while X, long known from the version printed from another manuscript by Arthur Napier as "Pseudo-Wulfstan homily XLIX," is a highly sophisticated creation. Although its ultimate sources are three brief paragraphs in Latin authors, its construction shows the application of a shrewd mind, one that can express ideas in highly wrought and often beautiful language. Vercelli Homily X thus marks one of the highest achievements of the anonymous homiletic tradition

of the 10th century, paving the way for the work of Archbishop Wulfstan in the 11th.

Versification

From the point of view of the writer of verse, a great change overtook the literary language at the end of the OE period. OE poets had no choice of meters when embarking on poetry. After the Norman Conquest poets could choose between two kinds of meter: the traditional English *alliterative meter*, inherited from the Anglo-Saxons, and by them from their continental

ancestors; or from a variety of meters, most of them with *rhyme*, borrowed from either medieval Latin verse or from the verse of Normandy and France. Alliterative meter continued to be used well into the 15th century, especially in the west Midlands and the north.

Old English Meter

The native alliterative tradition lacks the regular alternation of stress and unstress of meter derived from Latin or Norman or French models. Alliteration involves the commencement of at least two stressed syllables with the same sound in a verse line; one or two alliterating syllables occur in the first half of the line, and one only in the second half. In OE alliterative verse, rhyme, not always exact, is rare (other than in jingles of perhaps more popular origin than is attested in the largely monastic or formal manuscripts now extant); exceptions include the *Riming Poem* and Cynewulf's Epilogue to *Elene*. Stanzas are rarely used in OE; exceptions include *Deor* and *The Seasons of Fasting*. In early ME rhyme is sometimes found in combination with meters that (like OE verse) lack regular alternation of stress and unstress; these meters are sometimes regarded as descended from OE.

No ancient treatise of how to scan OE verse is extant; all systems in use are derived by modern scholars by inspection of the verse. Some systems are thought applicable to all Germanic verse and are derived from the widest range of alliterative poetry in all the Germanic dialects. Some are derived from OE alliterative verse only, often with special reference to *Beowulf* which is regular, or "strict." Many prosodists do not believe Germanic verse to be *isochronous*, that is, with every half-line taking the same amount of time in recitation. Others have held that isochronism is essential in reading verse.

Some OE poetic manuscripts mark off each *half-line* with a point. Such *metrical pointing* is found, for example, in the Junius Manuscript (Bodl. Junius 11). That teaches us to recognize these metrical units. Two half-lines, joined by alliteration, form a "long line." Verse is written continuously in the manuscripts, like prose.

The distribution of *stress* and *unstress* matters in OE verse. Stress is at two levels: full stress must fall on the stem syllable of nouns, adjectives, and adverbs preceding their verb and can fall on the stem syllable of all but function words; *half stress* often falls on stressable words that are not given full stress in a particular line and that may include the stem syllable of the second element of nominal compounds. Half-stress also falls on the penult (second-to-last syllable) of trisyllabic words. Stress falls on long syllables (long either by

virtue of vocalic length or because a short vowel is followed by a consonant in the same syllable). When a stressed syllable immediately follows a long stressed syllable, the second stressed syllable may be short. A stress may be *resolved*—that is, a short stressed syllable immediately followed by an unstressed syllable may, by *resolution*, be measured as if the two combined amounted to a long syllable. Function words, inflexional endings and other suffixes, and verbal prefixes and some nominal prefixes are unstressed. Finite verbs are often unstressed. At the end of a half-line only one unstressed syllable can occur, except when the first of two is used for resolution. Sense stress governs metrical stress, so that exceptional emphasis on a function word and exceptional positioning may lead to its taking metrical stress and alliteration.

Some lines of verse are distinctly longer than the norm; the purpose of these *hypermetric* lines is not understood, and there is no agreement on how to scan them. In one way of looking at them they might be regarded as similar to lines with a long initial nonalliterating element, except that they do alliterate. They often occur in groups. Some poems use hypermetric lines frequently, such as *Judith* (almost one line in five) and *The Dream of the Rood*.

Multisyllabic *dips* (“dip” means a position in the half-line to be filled by one or more unstressed syllables), hypermetric lines, oddities of alliteration, and rhymes are occasional features in OE. Some metrists have, unconvincingly, used linguistic changes to explain the metrical changes resulting in less “strict” verse. Reduction to zero of most inflexions, as a result of which English ceased to be—in a generalizing simplification—a language of disyllables and became a language of monosyllables, occurred in southern English verse no earlier than the 15th century. Perhaps an explanation might be sought in the syntactic changes of the *Transitional* period, as a result of which prepositions and articles were more often used, often in positions not permitted in “strict” OE meter. There is no known single explanation, certainly no simple linguistic explanation, for the changes that overtook English meter beginning before the Norman Conquest and continuing after the 12th century.

It is sometimes suggested that side by side with strict verse, of which *Beowulf* and most of the longer poems are examples and which may have been products of monastic scriptoria, there was a more popular form of less exact verse, of which the “Finnsburh Fragment” and some of the Chronicle poems are examples. It is thought that in the reforms of the later 10th century the monasteries ceased to be the nurseries of vernacular poetry so that popular, less exact forms prevailed. We have no evidence for such generalizations about the causes; all we have is the outcome, however caused: the metrically lax verse of the late period. The metrical psalms of the Paris Psalter of the 10th century, *Judgment Day II*, and the liturgical verse of the manuscripts

Cambridge, Corpus Christi College 201, and Bodl. Junius 121 of the 11th century are less “strict” than *Beowulf* yet they must be monastic.

Transitional and Middle English Verse in Native Meters

The Grave (in Bodleian Library, Bodley 343) and the alliterative verse in Worcester Cathedral F 174 belong to the Transitional period; the writing is dated as late 12th or early 13th centuries, and their composition is probably not much earlier. They represent a continuing alliterative tradition. Judged by the standards of “strict” OE verse, these Transitional poems illustrate various inexactnesses. Rhyme becomes common, especially in nonalliterative verse. In contravention of what in OE was a basic rule alliteration may fall on the second stress of the second half-line. Some lines comprise three half-lines alliterating on the same sound.

The Latin *Physiologus* (of about 1200) presents a range of metrical forms. The early ME translation of the 13th century traditionally called *The Bestiary* imitates the variety of meters by making use of the vernacular resources then available, including alliterative meter; but even when the alliteration is consistently maintained, the rules governing “strict” OE meter are not followed. The manuscript has metrical pointing and the lines are written continuously like prose. The text has rhyming verse with alliteration as well as other meters, including four-stress and three-stress *rhyming couplets*, *ballad stanzas* or *common meter* (consisting of four lines, the first and third having four stresses, the second and fourth lines rhyming and having three stresses), and the *septenarius* (a seven-stress line). The poet shows a prosodic freedom and delight in metrical variety not found elsewhere in early ME.

The *Proverbs of Alfred* are in rhyming alliterative verse, but the rhymes and the alliteration are used inconsistently. One of the problems of ME prosody is that texts often survive in several manuscripts, none written by the poet, and in metrically different versions. There are four versions of the *Proverbs of Alfred*, the earliest (now fragmentary) of the early 13th century. With such textual variation it seems impossible to arrive at any precise conclusion about the meter of early ME alliterative rhyming verse. Scribes in general show little respect for the integrity of the texts they are copying; they leave out or add little words, and make other changes involving the count of syllables.

By the end of the 13th century the four-stress couplet without regular alternation of stress and unstress became a common metrical form. An example is *Havelok the Dane*; its poet tolerated two unstressed syllables where the meter requires one; omission of the initial unstress is not infrequent;

alliteration is an occasional added feature. *Havelok* and *King Horn* (one copy of *Horn* is preserved in the same manuscript as *Havelok*, Bodl. Laud Misc. 108, and in two other manuscripts), differ substantially in meter. That of *Horn* is not to be readily reduced to a system, except that it is rhyming verse in short lines of two, three, and occasionally four stresses. Alliteration occasionally binds the two lines of a couplet. The three versions of *Horn* have many variants, and the poem is malleable in the hands of a textual critic or prosodic theorist. It seems unwarranted to see French influence (other than perhaps in the rhyming) and equally unwarranted to derive its meter from OE alliterative verse.

Lines of irregular length, but mainly with four stresses, rhyming in couplets, with occasional touches of ornamental alliteration, form the meter of *Kyng Alisaunder*, which survives in three widely differing manuscripts and one early print, the earliest of which (with only fragments of this poem) is the Auchinleck Manuscript (Edinburgh, National Library of Scotland Advocates' 19.2.1; ca. 1330–40). The manuscripts differ considerably. Other romances, too, are in loose, rhyming couplets. They are written out in verse lines in the manuscripts, as became usual for rhyming verse; the first letter of each line is a capital, in many manuscripts rubricated. The rhythms within the line are held to be the speech rhythms normal in the language, as is thought to be true of the rhythms of the native alliterative tradition (in OE and ME). The rhythms were not, however, sufficiently regular or insistent to guide the scribes when copying these texts, and in most lines there are syllabic differences among the extant versions.

ME alliterative verse exists both early and late. Our information is to some extent disjointed, and because there appears to be a gap between early and late ME alliterative verse, some scholars have spoken of an Alliterative Revival in the late ME period. In early ME Lazamon's *Brut* is the foremost example of the continuance of an alliterative tradition going back to OE. The poem survives in two BL Cotton manuscripts, Caligula A.ix and Otho C.xiii, both of about the last quarter of the 13th century. Again the texts differ from each other; Otho has fewer of the poeticisms found in Caligula. The *Brut* uses alliteration frequently, as if to bind together the two half-lines into the long line as was done before the Conquest; but unlike OE poetry the *Brut* is not wholly and consistently alliterative. Instead of alliteration, and sometimes in addition to alliteration, it uses rhyme or near-rhyme. The length of the half-lines varies considerably. Lazamon's *Brut*, especially in the Caligula version, often seems to echo the poetic effects of diction and rhythms of OE poetry at its most heroic. The rhythms, however, lack the precision of OE verse. The strict OE rules of alliteration cease to apply: the second as well as the first stressed syllable of the second half-line may share in the alliteration, and alliterative stress may fall on function words; alliteration on the last stress of the second

halfline is not uncommon.

Alliterative verse without rhyme shows many varieties of line structure in late ME and Middle Scots. The form is not confined to romances; *Piers Plowman*, *Cleanness*, and “The Blacksmiths” (*Swarte smekyd smepes...*) also use alliteration without rhyme in lines in which stress and unstress do not alternate regularly. The manuscripts are often late. It is not possible to establish a chronological order for the metrical varieties in use.

An obvious departure is the use of alliteration for onomatopoeic effects, as in “The Blacksmiths,” or the scene when the axe is ground in *Sir Gawain and the Green Knight* 2201–04. (Onomatopoeia is not demonstrable for OE or early ME, though critics have pointed to a few possible examples.) In some poems alliteration on the same letter over three lines was not avoided, as it had been in OE. Oddities (including occasional absence) of alliteration occur in many poems; in some cases editors have emended them away. It is not always clear if normally unstressed words can share in the alliteration. Most lines have two or more alliterative syllables in the first halfline and one or two alliterative stresses in the second half-line.

Because the alliterative poets of later ME inherited a system that had more alliteration in the first half-line than the second and because double alliteration supported heavier rhythmical structures in OE and later, the first half-line usually contains more syllables than the second. The ME first half-line, therefore, often looks as if it were descended from the OE hypermetric half-line; the second half-line is tighter.

Middle English Verse in Foreign Meters

ME verse in foreign meters is fundamentally different from verse in the native alliterative tradition and different from the short irregular lines in rhyming couplets of, for example, *Havelok*, *King Horn*, and *Kyng Alisaunder*. Foreign meters demand the regular alternation of stress and unstress. Most use rhyme; they may use alliteration as an added grace.

The earliest longer poem in a foreign meter is the *Ormulum*. Uniquely for poetry in OE or early ME, the manuscript, Bodl. Junius 1, of the late 12th century, is in the author’s own hand. The verse is written continuously like prose, with metrical pointing. Orm, the poet, is aware that syllables matter for the meter he has chosen, the unrhymed *iambic septenarius*. The first half of Orm’s line consists of eight syllables, the second of seven (x and / represent unstressed and stressed syllables, respectively):

x / x / x / x / | x / x / x /

Icc hafe sammneddo Piss boc: Pa goddspelless neh alie·

Orm admits some variety in his use of meter, but generally his meter is so exact and his manuscript so reliable that he provides firm linguistic and

prosodic evidence of a kind we usually lack for early English. His system of scansion allows of no half-stress, so that it is significant that he usually stresses the middle syllable in a word of three syllables; usually *goddspellessx* / x, rarely / x / as in the line quoted, and always *goddspell(/ x)*:

x / x / x / x / l x / x / x / x

Icc hafe sett hero piss bocȝ amang goddspelless wordess·

Iambic tetrameter rhyming in couplets is a common meter in ME. It is hardly ever used with rigorous regularity, so much so that it is sometimes more apt to refer to the meter as consisting of four-stress lines in rhyming couplets. The meter of *The Owl and the Nightingale* is a skillfully varied four-stress measure. Both Chaucer, in *The Book of the Duchess* and *The House of Fame*, and Gower, in *Confessio Amantis*, were accomplished poets in this meter. In *The House of Fame* 1094–98 Chaucer shows himself aware that, for easy, unpedantic verse, having one syllable less than the meter demands may not be disagreeable.

Later Chaucer chose for his nonstanzaic verse *iambicpentameter*'m rhyming couplets, the English form of the heroic couplet, first in *The Legend of Good Women*. In the 15th and 16th centuries many poets use this meter, with varying degrees of exactness and skill. A particular feature of iambic pentameter in late ME is the clash of contiguous stresses in mid-line, characteristic of Lydgate's prosody, often combined with omission of the unstressed syllable at the beginning of the line. Such variation of the underlying, standard pattern often gives effective expression of movement beyond the confines of a single line: for example,

X / x / / X X /(x)

And in my hert quakyng for drede

(*The Title and Pedigree of Henry VI*, line 59)

/ x / x / x / x / (x)

Suffre hem boylle and taake of hem noon heede

(*A Mumming at Herford*, line 103)

Stanzas go with rhyming foreign meters rather than with alliterative meter. Stanzas exist in many forms, various in the number of lines in each stanza, in the length of the lines, and in rhyming pattern. A basic problem in arranging ME stanzaic verse for the printer arises when the lines have a marked break at mid-line but rhyme only at the end, as in the *ballad stanza*:

Iudas, go Pou on Pe roc

heie upon Pe ston,

Lei Pin heued i my barm,

slep Pou Pe anon.

In many manuscripts of the 14th century and later the arrangement of lines on the page and bracketing of rhymes indicate rhyme schemes with great clarity. *Tail rhyme*—a stanza form in which selected lines are “tailed,” or shorter than the rest—is common in ME, especially in verse romances. The rhyme scheme within a single poem may vary considerably, as does the number of lines, and there is flexibility within the line. Chaucer parodies tail-rhyme romances, including their metrics, in *Sir Thopas*.

Chaucer uses a variety of stanza forms, including a six-line stanza (rhyming ababcb, with five stresses to the line) at the end of the *Clerk’s Tale*, an eight-line stanza (rhyming ababbcbc, with five stresses to the line) in the *Monk’s Tale* and in “An ABC,” and a nine-line stanza (with five stresses to the line) in much of the second half of *Anelida and Arcite*. “A Complaint to His Lady” has several metrical schemes, including a ten-line stanza (with five stresses to the line) in part IV; in parts II and III he uses Dante’s *terza rima* (with five stresses to the line). In the first part of “A Complaint to His Lady,” in the first half of *Anelida and Arcite*, and in *The Parliament of Fowls*, *Troilus and Criseyde*, the *Man of Law’s Tale*, most of the *Clerk’s Tale*, the *Prioress’s Tale*, the *Second Nun’s Tale*, and some of the minor poems Chaucer wrote in *rime royal*, the seven-line stanza (rhyming ababbcc, with five stresses to the line). No English poet seems to have used that stanza form before Chaucer; in Chaucer’s use and throughout the late ME period after him it became one of the most important stanza forms among English and Scottish Chaucerians, including King James I of Scotland in *The Kingis Quair*, and it has been suggested that the king’s use of the form may have given rise to its name.

Many other stanza forms were in use by English and Scottish Chaucerians; William Dunbar’s practice exemplifies the range (usually with five stresses to the line, but sometimes with only four): a seven-line stanza rhyming aabbcbc; a stanza of nine lines, rhyming in various patterns, for example, aabaabbab; the *Monk’s Tale* stanza of eight lines rhyming ababbcbc (occasionally ababbaba); a different eight-line stanza rhyming ababbcca; a five-line stanza rhyming aabba; a twelve-line stanza rhyming aabccbddbeeb like a tail rhyme stanza; and even a stanza of 24 lines rhyming aaabcccbdddbeeebfffbgggb. Among his many stanza forms, Dunbar uses refrains or similar repetitions of the end of stanzas, in a four-line stanza rhyming aabb; and an eight-line stanza rhyming ababbcbc like the *Monk’s Tale*. Others repeat the same rhymes throughout. He uses also a *sestet* consisting of two triads rhyming aaabbb.

Dunbar occasionally uses alliteration ornamentally in stanzaic poems. That combination belongs to a widely diffused tradition of ME and Middle Scottish poetry. From the 13th century onward many ME lyrics in many stanza forms have ornamental alliteration with varying regularity. The lyrics of BL Harley 2253 include some of the most elaborate, among them “Blow Northern Wind,”

a carol, that is, a lyric with a *refrain* or *burden* following each stanza. *Pearl*, in BL Cotton Nero A.x, is written in stanzas of twelve four-stress lines rhyming ababababbcbc with concatenating repetitions.

In the *Pearl* manuscript *Sir Gawain and the Green Knight* combines in the body of the stanza a form of the native alliterative meter without rhyme, ending in a *bob line*, that is, a short line that introduces and rhymes with the antepenultimate (third-to-last) and the final line of the *wheel*, that is, four three-stress lines rhyming abab. *Bob* and *wheel* are nowhere else appended to nonrhyming alliterative verse. There are about 40 English and Scottish poems with bobs. The Towneley Plays have no fewer than sixteen varieties of stanzas, and the York Plays seven varieties, some of them with bobs. Chaucer uses bobs in five of the stanzas of *Sir Thopas*.

The meter of John Skelton's poetry in short lines (usually of two or three stresses), *Skeltonics*, is idiosyncratic. Couplets or triads or longer runs rhyming on the same sound follow each other in cascading succession, seemingly without order.

ME stanza forms are very varied, yet fourteen-line stanzas are exceptionally rare. The *sonnet* is not known as a metrical form before Sir Thomas Wyatt.

Fig. 141. Vespasian Psalter (BL Cotton Vespasian A.i), fol. 30v. David with musicians and dancers. Reproduced by permission of the British Library, London.

Vespasian Psalter

BL Vespasian A.i is a luxurious copy of the book of Psalms, made in southern England, most probably at Canterbury, during the second quarter of the 8th century. Usually considered the earliest of the “Tiberius” or “Canterbury” group of manuscripts from southern England, the Vespasian Psalter is

important because of its decoration, script, and mid-9th-century gloss.

One full-page illustration survives, probably created as a frontispiece but now placed opposite the beginning of Psalm 26 (fig. 141). It depicts David enthroned as author of the Psalms, composing on his harp. He is aided by the accompaniment of musicians and clapping dancers and by the busy hands of scribes, who record his lyrics on tablet and scroll. The opulent, delicately painted picture combines Byzantine, Ravennate, East Mediterranean, Hiberno-Saxon, and perhaps Frankish elements, an expression of the romanizing Christian culture of Southumbria. The manuscript probably included at least two other full-page images: a carpet page and an incipit of Psalm 1, historiated with an image of Samuel.

The Vespasian Psalter may present the earliest surviving examples of historiated initials, letters with scenes placed within them. Historiated initials begin Psalm 26, showing David and Jonathan, and Psalm 52, David with a lion and a lamb. The historiated letters mark two of the eight liturgical divisions of the Psalter. The initials of the other divisions are decorated with animal and human figures independent of interlace, and the letters following are sometimes empaneled, both features of the Southumbrian “Tiberius” group. Historiated initials may be an insular invention, arising from a concern for integration of script, decoration, and illustration.

Other important features include the self-conscious, romanizing uncial script, especially appropriate to Canterbury, and the OE gloss, the oldest known English translation of any part of the Bible.

Vikings in Britain

The Scandinavian impact on Britain did not begin with the first Viking raids in the 8th century, nor did it end with the death of the last Danish king of England in 1042. Invaders and settlers had come from Denmark and Norway in the 5th and 6th centuries, and the threat of Danish invasion was last felt as late as 1085.

Nevertheless, there were ten generations during which the history of Britain was particularly determined by Vikings. Norse (Norwegian) raids on England began not long before 800. Their tempo and seriousness increased with Danish involvement from about 835. The most critical phase began in 865, with the arrival of the Danish "Great Army." By 886, when Alfred of Wessex made peace with the Danish Guthrum, the political geography of England had been transformed. Of the four major kingdoms only Wessex had survived: East Anglia and most of Northumbria were under Danish rule, and Mercia had been divided between Alfred and Guthrum.

Between 911 and 919 Alfred's son Edward conquered all the lands the Danes held south of the Humber. These conquests were permanent (though temporarily lost, 940–44). The position north of the Humber was less stable, complicated by invasion and settlement by Norse from Ireland. An intermittent series of Viking rulers, often strongly connected with the Scandinavian colony of Dublin, ruled from York until 954, when Northumbria came permanently under English rule. A period of relative peace followed, but from 991 Viking raids on England began again. The Danish king Swein became involved. In 1016 his son Cnut became king of England, which thus became part of an Anglo-Scandinavian empire.

The most lasting effect of the Viking invasion was reactive; the ultimate union of England under the West Saxon dynasty was a consequence of the unique effectiveness of West Saxon resistance to the Danes. Hardly less important was the Scandinavian impact on the areas that they settled and, for a time, ruled. The distinctiveness that they brought about in the large part of northern and eastern England was recognized in the 11th and 12th centuries by the application to this area of the term "Danelaw."

The effect of Scandinavian settlement and influence in the Danelaw is controversial. Two points are agreed upon. First, its extent and nature must have varied from one area to another. Second, the influence of the

Scandinavians upon the English language was strong. Some of the most basic words in modern English are of Norse origin—for example, “husband,” “knife,” and “their.”

A maximum view of Scandinavian settlement in the Danelaw would stress the likelihood of extensive, though not precisely quantifiable, peasant settlement in wide areas, especially in Yorkshire and Lincolnshire. The evidence for this would be seen largely as follows. Within the areas concerned many places have names of Scandinavian origin (e.g., those ending in *-by*); and perhaps even more significantly names of Scandinavian origin for fields and minor features are common. A wide variety of Scandinavian personal names was in use even into the 12th century. In much of the Danelaw evidence from the 11th century and later shows a distinct social structure with many more freemen than elsewhere in England. The legal customs of the Danelaw are marked by distinct Scandinavian influence.

These views, argued forcefully by Frank Stenton, have been controverted. It is suggested that place-names may be indicative of lordship rather than of extensive settlement. Even field names may reflect the linguistic rather than the demographic circumstances. Social differences may be the product of Scandinavian rule rather than of settlement, while the legal integration of the Danelaw with the rest of England is much more conspicuous than are the admitted differences in legal custom.

Some of the elements in dispute have been settled. Attempts to argue that the Scandinavian invaders should be numbered in hundreds rather than in thousands have not been accepted. Nevertheless, the question of the scale of Scandinavian settlement remains unsettled. What is certain is that its influence was great. This is to be seen not only in important elements in the modern English language and in the abundant place-names but also, more tangibly, in the numerous pieces of stone sculpture from the north, showing strong Scandinavian influence. Occasional pagan elements in this body of sculpture are among our limited evidence for the religious history of the Danelaw; the conversion of the Scandinavians there, completed before the Norman Conquest, is a lost story.

One of the most important aspects of Scandinavian influence is urban. For Vikings trading went with raiding. There were major trading places in Scandinavia when the invasions began. The invaders founded others, most strikingly in Ireland, where they founded all the major towns: Dublin, Waterford, Wexford, Cork. In England York was both a Viking capital and a major trading place. Further south the Scandinavians were regarded as the “men of the Five Boroughs” (Lincoln, Stamford, Derby, Nottingham, and Leicester). Their urban influence extended beyond their area of control and was strong in London. The rise of Chester in the 10th century and of Bristol in

the 11th has much to do with their relationship to Viking Dublin.

The understanding of Viking settlement in Britain should be set into a wider context. For example, there is a likely connection between Edward the Elder's successful campaign in the second decade of the 10th century and the simultaneous foundation of the Scandinavian colony in Normandy, as Viking enterprises and resources were directed elsewhere.

The Scandinavian influence on Wales and Scotland had effects that contrasted with those in England. In Wales the Vikings made coastal attacks and settlements. For a time it looked as if the Viking threat might drive Welsh rulers into a closer relationship with those of England than ever before. But when the dangers passed, it is remarkable, not how much, but how little Wales had been affected. In Scotland the northern and western lands and the far north of the mainland became largely absorbed into the Scandinavian world; a relationship that would endure for the Orkneys and Shetlands until they passed from Danish to Scottish control in 1468. Otherwise the most important effect of Scandinavian activity on Scotland was indirect; by weakening the power of English rulers in northern Britain it helped to increase that of the kings of the Scots.

Virtues and Vices, Books of

Treatises of religious instruction popular in the Middle Ages, compiled primarily by listing basic elements of Christian belief and morality, often with considerable elaboration. Such works generally cover, among other things, the fourteen articles of faith, the Ten Commandments, the two evangelical precepts of charity, the seven deadly sins, the seven virtues, and the seven sacraments; they are frequently enlivened by a variety of exempla. English works of this type include *Handlyng Synne*, *Of Shrift and Penance*, and Peter Idley's *Instructions to His Son*, all deriving from the Anglo-Norman *Manuel despéchés*; and the *Ayenbite of Inwit* and *the Book of Vices and Virtues*, which translate Friar Laurent's *Somme le roi*, a handbook originally intended for Philip III of France. The *Speculum Vitae*, *Jacob's Well*, and *Mirror of the World* also depend, at least partly, on the *Somme*, while the *Lay Folk's Catechism*, *Manuale Credendum*, *Mirror of Holy Church*, and *Poor Caitiff* treatises spring from still other sources. Treatises on virtues and vices also occur as parts of other instructional, devotional, or even secular volumes.

The popularity of these treatises in the late Middle Ages can be explained in part by the desire of the bishops after the Fourth Lateran Council (1215) to educate both priests and laypeople. The council had determined that annual confession would henceforth be mandatory, and church officials feared that their flocks might lack the knowledge necessary to take full spiritual advantage of their confessions.

To assist with the enormous task of providing this knowledge 13th-century religious writers in England (and other countries) produced a substantial amount of educational literature pertaining to faith and morals. The first step was to enlighten the clergy, so that they might then illuminate their parishioners concerning basic points of Christian doctrine and behavior. Throughout the century diocesan and provincial statutes were enacted that required parish clergy to know—and teach their flocks—the commandments, the deadly sins, the sacraments, the Creed and other essential prayers, and so on. These mandates would become crucial for the sermon literature of the period and would contribute in an important way to the literature on virtues and vices.

Among the most influential sets of statutes were those of Richard Poore, bishop of Salisbury, issued shortly after Lateran IV (between 1217 and 1219); of

Robert Grosseteste, bishop of Lincoln, issued ca. 1239; and of John Pecham, archbishop of Canterbury (1281), and Peter Quinel, bishop of Exeter (1287). Many statutes specify that such teaching take place “frequently” and “in the mother tongue” or “in the native language.” By the time of Pecham’s Lambeth Statutes every pastor was being required, either by himself or with another’s help, to teach his parishioners on mass days four times a year, in their own language, about “the fourteen articles of faith, the Ten Commandments, the two evangelical precepts of love, the seven works of mercy, the seven capital sins and their offspring, the seven principal virtues, and the seven sacraments,” a set of lists that the statute goes on to define in some detail. As all of these topics could hardly be contained within a single sermon, it seems likely that more than four Sundays of the year would have had to be devoted to this instruction. This particular statute, also called the *Ignorantia sacerdotum* (*Ignorance of Pnests*) from its opening words, was enormously influential. For the rest of the Middle Ages both clerical manuals and religious tracts for the English laity would be based on the archbishop’s decree.

Despite their pedagogical utility many books of virtues and vices do not make for stimulating reading. No doubt influenced by the type of ethical listing often found in the Bible (see especially Col. 3:5–14 and Gal. 5:19–23 for enumerations of sins and contrasting virtues), some merely present *seriatim* the seven deadly sins—pride, envy, wrath, sloth, avarice, lechery, and gluttony, and their numerous progeny—or the four cardinal and three theological virtues—prudence, justice, temperance, fortitude, faith, hope, and charity—with little authorial comment. But anyone who has read Robert Manning’s *Handlyng Synne*, one of the liveliest works of this genre, knows the quality of entertainment such treatises could provide. With the use of exempla (popularized by the preaching of the friars after the Fourth Lateran Council) Manning portrays lecherous priests, hypocritical monks, wicked lawyers, and false accounters—all destined straight for hell. And such books are important for more than their didactic content or their engaging storylines. Tales of ostentatiously dressed aristocracy or fastidious women ultimately “smyten with canker,” for example, afford telling insights into the social history of the English Middle Ages.

Books of virtues and vices ultimately transcended their original audiences, leaving their mark on the major English poets of the day. John Gower’s *Confessio Amantis*, for example, employs the device of a lover’s confession to present tales of the sins and their corresponding virtues as they might be experienced in a lover’s life. William Langland’s *Piers Plowman* contains a confession scene in which each of the seven deadly sins is admonished to become its opposite trait—pride is thus to become humility; gluttony, abstinence; sloth, a pilgrim headed for Rome. And Chaucer’s *Parson’s Tale*

includes a lengthy section on the sins and their “remedies,” to “knytte up wel a greet mateere” of the *Canterbury Tales*. Pecham’s decree and similar official mandates ultimately contributed to the art of the Middle Ages, and while those decrees lost none of their proper force as stimuli to religious instruction, their initial pedagogical purposes were expanded by later writers to accommodate poetic talents and address more sophisticated secular readers. After the Middle Ages elaborated catalogues of virtues and vices were often adopted by Renaissance humanists, helping to shape such works as Marlowe’s *Doctor Faustus* and Spenser’s *Faerie Queene*.

Votive Observance

A term currently used widely by musicologists to signify certain categories of medieval devotion that are not directly related to the main pattern of daily liturgy laid down in the calendar. Some votive observances exist simply as appendages following items of the regular liturgy. Many take the form of additional antiphons or even complete hours modeled on the regular office. Others function as complete replacements for an office or mass and have a corresponding structure. Most votive observances are concerned with special intentions or are addressed to saints of particular local or devotional significance; the Blessed Virgin Mary was the subject of the greater proportion of the votive repertoire in England from the 12th century to the early 16th century. With the exception of the term *missa votiva* direct equivalents for the word “votive” are uncommon in medieval sources; the prevalence of the term in modern scholarship follows Frank LI. Harrison’s use of the word in *Music in Medieval Britain* (1958).

The adoption of additional devotions of a votive nature is first recorded in the 8th century, when the Carolingian monastic reformer Benedict of Aniane (ca. 750–821) promulgated a general expansion of liturgical observance. Many communities began to recite specially chosen groups of psalms (the seven penitential and fifteen gradual psalms are examples) before and after the daily offices, while contemporary sacramentaries testify to the multiplication of private masses for use in times of trouble and for other special intentions. Alcuin (ca. 730/35–804), an Englishman active in the Carolingian reforms, compiled a cycle of seven votive masses for weekly use, which achieved instant and enduring popularity. Each mass is offered for a particular intention, beginning with the Trinity on Sunday and concluding with the Virgin Mary on Saturday. Celebration of the Saturday *missa principalis* in honor of the Virgin was ubiquitous in England by the 12th century. There is also evidence that a daily Lady Mass (often celebrated privately) became a standard liturgical feature in many English establishments from the same period: Giraldus Cambrensis (Gerald of Wales) states that the Benedictine house of Rochester adopted a daily *Missa de Domina* during the reign of King Stephen (1135–54). From the early 13th century several English foundations provided an endowment for a small number of trained singers to attend the daily mass and hours in honor of the Virgin, usually in a separate Lady Chapel. Both archival evidence and surviving musical sources establish that such masses were often celebrated with vocal polyphony or the organ.

A parallel votive office, recited before or after the hours of the regular *cursus*, was adopted increasingly as a daily communal observance from the 12th century. The roots of this custom are of considerable antiquity, for a votive Office of the Dead (consisting only of Vigils, Lauds, and Vespers) is mentioned as a regular feature of some monastic liturgies in the early 9th

century, while several 10th-century sources testify to the daily recitation of Vespers and Lauds of All Saints. But more prominent than either of these parallel observances was the Little Office of the Virgin, which began as a private devotion in the 11th century and ultimately achieved extensive popularity as the nucleus of the most widely owned of all medieval books, the book of hours. The exact origins of the Little Office are obscure, but examples appear as early as the 11th century, and there are references in 13th-century sources from the Benedictine establishments of Bury St. Edmunds, Worcester, Norwich, and Christ Church, Canterbury, and in the Sarum Customary (ca. 1270).

The commemorative office, unlike the daily votive office, was usually a weekly observance replacing the calendar liturgy. The earliest English examples appear in the Worcester Portiforium (ca. 1065), which contains an Office of the Holy Cross (Friday) and an Office of the Virgin (Saturday). Virtually all establishments seem to have adopted the Saturday commemorative office of the Virgin by the 13th century, and frequently at least one further day was set aside for another office, usually with particular local associations: Worcester celebrated a commemorative office of St. Oswald and St. Wulfstan (Thursday), and Christ Church, Canterbury, an office of St. Thomas of Canterbury. Like the daily Little Office of the Virgin most commemorative offices contained little genuinely new material but were compiled by rearranging existing texts for related feasts.

The form of votive observance of greatest interest and familiarity to the musicologist is perhaps the votive antiphon. This was normally sung after Compline as a short, self-contained ceremony, consisting of antiphon, versicle with response, and collect. It was almost invariably addressed to the Virgin Mary until the 16th century, when the decline in adoration of the saints (and in particular the Virgin) led to a shift of emphasis to a Jesus or Trinity antiphon. In some institutions the singers moved out of choir for its observance, gathering in front of an appropriate statue or altar: the votive antiphon was not always sung in church. Text and melody were usually elaborate; frequently the antiphon doubled as a processional antiphon or Magnificat antiphon for one of the major Marian feasts, and there are also instances of antiphons being borrowed from commemorative offices. The Roman Church standardized the use of four seasonal votive antiphons in 1350 —*Almaredemptoris*, *Salve regina*, *Regina celi*, and *Ave regina*. *Salveregina* remained by far the most popular of the Marian antiphons and was set polyphonically on countless occasions by English and continental composers until well into the 16th century.

W

W1

The manuscript Wolfenbüttel, Herzog-August-Bibliothek 628 (hereafter W1), is the most significant single musical document that testifies to the cultivation of sacred polyphonic music in the British Isles between the Winchester tropers and the Old Hall Manuscript. It is one of the principal sources for the music of the so-called Notre Dame School, and it contains a version of the *Magnus liber organi* written by the Parisian composer of the late 12th century Leoninus. Its central position in the scholarship on late-12th- and early-13th-century sacred music is clear from the fact that it was selected as the source for the first edition of the *Magnus liber organi* (Waite, 1954).

The interrelated subjects of the manuscript's date and provenance have been matters of debate. Originally it was thought to have been copied in France and to be the earliest of the surviving copies of the *Magnus liber organi* (the other two copies are in Florence and in Wolfenbüttel also). It was Handschin (1933) who identified the manuscript's home as the Augustinian priory of St. Andrews, Scotland, and this has usually been accepted in subsequent inquiry. Estimations of W1's age range from the 1230s to the early 14th century; the most recent survey suggests the earliest of these dates, a fact that reinstates W1 as the earliest of the three "Notre Dame" manuscripts (the Florence manuscript has been dated to the period 1245–55). The curiosity of essentially Parisian music appearing in a manuscript copied in St. Andrews has been explained (Everist, 1990) by reference to the *familia*, or household, of the francophile bishop of St. Andrews Guillaume Mauvoisin (1202–38).

The music in W1 is divided, mostly according to genre, into eleven fascicles as follows: I: four-part organa; II: three-part organa and conducti; III: two-part organa for the office; IV: two-part organa for the mass; V: two-part clausulae; VI: two-part clausulae; VII: three-part organa; VIII-IX miscellaneous three- and two-part compositions; X: monophonic pieces; XI: two-part mass music. This, however, is to ignore the layered makeup of the volume and its contents. The nucleus of the manuscript consists of fascicles I-V and VIII-IX, which represent two groups of works organized in terms of a decreasing number of voice parts

(I–V: four-part, three-part, and three fascicles of two-part music; VIII–X: three-part, two-part, and monophonic works). To this nucleus were added three further layers: additions at the ends of gatherings in fascicles I–V and VIII–X as layer 2, fascicles VI and VII as layer 3, and the eleventh fascicle as layer 4. The layer 2 additions comprise tropes of the Ordinary of the mass in fascicles III and VIII and a group of three-part organa in fascicle III. This last group contains two responsories for the Feast of St. Andrew that have been at the center of discussions of the manuscript's provenance. Fascicles VI and VII can be seen as supplements to fascicles V (clausulae) and II and VIII (three-part organa), respectively. Fascicle XI, the final addition to the manuscript, is codicologically and repertorially discrete; there is a scribal colophon at the end of fascicle X.

The principal contents of W1 are French; the manuscript preserves a copy of the *Magnus liber organi* that exhibits notational and musical idiosyncrasies explained by its local compilation. Despite the fact that it may now be the earliest of the three sources of the *Magnus liber organi*, much of its interest lies in the music that falls outside the orbit of the Notre Dame School. This music falls into three categories: locally composed organa in two parts, conducti, and Ordinary tropes both in the eleventh fascicle and added to the third and eighth fascicles.

The organa appended to fascicle III include the two St. Andrew responsories: *Vir iste* and *Vir perfecte*. These do not form part of the main Notre Dame repertoire as found in other sources and must have been composed specifically for St. Andrews. Roesner believes all the layer 2 additions including these responsories to have been copied by the main text scribe but at a later time. Musically they bear comparison with other two-part organa preserved in fascicles III and IV and were written in imitation of French models.

Falck (1981) invited the consideration of a group of specifically English conducti in fascicle IX. Although the manuscript is key in discussions of the little-explored subject of the conductus in England, many of Falck's observations rest on dubious identifications of English pieces. The balance between French and insular material in the conductus collections in the manuscript is still uncertain.

The greatest importance of W1 to the history of music in the British Isles lies in the music of fascicle XI. Notre Dame or Parisian musical styles encompassed only the Gradual and Alleluia for the mass and responsories for the office, as well as settings of the *Benedicamus Domino*; by contrast the music in fascicle XI of W1 contains a wide variety of liturgical genres. There are only Alleluia settings in common between the two repertoires, and W1 also includes tropes to the Ordinary of the mass, a Tract, sequences, and Offertories troped and untroped. The stylistic division into organum, discantus, and copula

that is the basis of the musical style of the *Magnus liber organi* is completely lacking in fascicle XI, where the music is organized in a neume-against-neume style, and sometimes note-against-note.

Wace (after 1100-ca. 1175)

Norman verse chronicler who served Henry II; appointed canon of Bayeux by Henry by 1169. Wace's best-known work, the *Roman de Brut* (almost 15,000 octosyllabic lines in couplets), paraphrases and in places expands on Geoffrey of Monmouth's *Historia regum Britanniae* (*History of the Kings of Britain*). Written in Norman French and presented to Eleanor of Aquitaine in 1155, the *Brut* uses direct discourse, lively narration, and descriptive scenes and characters to tell the story of the British kings of England, and particularly of Arthur. Wace's work survives in over twenty manuscripts and inspired much later Arthurian literature, especially that of Lazamon and Chrétien de Troyes.

Wace also wrote the unfinished *Roman de Rou* (the story of Rollo, ancestor of William the Conqueror) and several saints' lives.

Wærferth of Worcester (d. 915)

Bishop of Worcester (872–915) and favored friend and scholar of King Alfred the Great, who invited Wærferth to court in the late 880s. Little documentation survives regarding Wærferth's personal life or activities as bishop of Worcester, though he issued a lease and witnessed several charters associated with the Worcester estates and is identified specifically in two of the king's most important documents; Alfred names Wærferth in his will and addresses the preface of his translation of Gregory's *Pastoral Care* to him.

In his *Life of King Alfred* Asser refers to Wærferth as the translator of Gregory the Great's *Dialogues*, saying that he made the translation at Alfred's request. Given the precise dating of Asser's work to 893, the translation of the *Dialogues* must have already been finished. Scholars suggest a completion date from the early 870s to the early 890s and conjecture that it was the first in a series of OE translations from Latin specifically done for Alfred, though not necessarily commenced after the invitation to Alfred's court. The translation survives completely in two 11th-century manuscripts: Cambridge, Corpus Christi College 322, and BL Cotton Otho C.i.

Wærferth's style is sophisticated even as it closely follows the Latin original, and his syntax, also found in his charters and leases, shares common components with the OE translation of Bede's *Ecclesiastical History*. While some attempts have been made to establish Wærferth as translator of this text, no conclusive proof exists save a close syntactical association that suggests only a connection to the Mercian scholars associated with Alfred's court. Florence of Worcester records Wærferth's death in 915. A revision of Wærferth's translation survives, probably completed at Worcester between 950 and 1050, though similarities in vocabulary to that of the Winchester group suggest an association with Æthelwold's school.

Wainfleet, William (ca. 1393–1486)

Bishop of Winchester. Born into a gentry family at Wainfleet, Lincolnshire, Wainfleet studied at Oxford and became headmaster of William of Wykeham's college at Winchester (1429–42). Henry VI noticed him while inspecting Winchester as a model for his own foundation, Eton College, and made him provost of Eton (1442–47) and bishop (1447–86). He was also chancellor (1456–60), playing a moderating role at a time of civil war, and remained in favor when Henry was overthrown by Edward IV in 1461.

Wainfleet was a notable educational patron himself, using his wealth to found Magdalen College, Oxford (1458), a large, well-endowed institution for 30 undergraduate scholars and 40 graduate fellows. It included a grammar school providing free education for all comers, and the bishop erected a similar school at Wainfleet. Magdalen was important in the evolution of colleges from small graduate societies into larger communities with undergraduates. Besides the 30 scholars Wainfleet allowed outsiders (commoners) to enter at their own expense, and this became a standard feature of colleges later on. Magdalen College School was also notable (ca. 1481–1500) in pioneering the teaching of humanist Latin grammar in England.

Waits

“Wait” probably derives from the Old French *gait* or *guet*, a watchman. The word was used as early as the 13th century for the watchmen at the gates of cities and castles. Some English castles, like many French châteaux, had a watch tower from which the approaches to the gate could be surveyed. It is clear that the watchmen used the ox horn, the usual signaling instrument of huntsmen and soldiers, to warn of the approach of visitors to the gate.

Castle waits had a second function, to patrol the building at night, calling the time and monitoring fires. By the late 13th century these household waits, called *vigiles* in the royal household accounts, used a musical instrument as well as the horn, and the royal waits were sometimes rewarded for minstrelsy. It seems logical to suppose that their instrument was the “wait-pipe” (shortened to “wait”), which was probably the treble shawm. The royal waits, known as *vigilatores* from the mid-14th century, were rarely musical in the 15th. It is impossible to tell why they lost their status as supplementary minstrels. From the mid-15th century on the royal household waits—there is no evidence for other households—seem to have been watchmen only: Edward IV’s *Black Book of the Exchequer*, ca. 1471–72, describes the wait’s duties in detail, but no musical function is mentioned.

The use of “wait-(pipe)” to denote the wait’s instrument meant that any player of that instrument might be called a “wait.” The majority of waits in the 13th and 14th centuries were household watchmen, although the term “wait” could be applied to huntsmen and others: in what capacity these latter played the instrument it is impossible to say. The most important use of the term however was due to its transference, early in the 15th century, to the newly formed bands of civic minstrels.

The account books of English towns show that as early as the 14th century some towns made considerable use of minstrels for civic occasions. These seem to be local minstrels hired on an ad hoc basis. In the first decade of the 15th century, however, towns began to employ a band of minstrels on a full-time basis, apparently for the provision of loud ceremonial music at civic and

mayoral events. These bands were roughly analogous to the loud minstrels of noble households, being given regular wages, liveries, and so on. Their precise functions were different, but only insofar as the mayor's public life differed from that of a noble.

Norwich probably employed town waits first, in 1408, but other towns and cities quickly followed suit. In a few cases the waits formed an occasional marching watch, but their duties were certainly analogous to those of the old household *vigilatores* rather than to the security patrols of the major cities, which were maintained by rosters of citizens. Where the information is available, we find that the town waits formed a shawm-and-trumpet band, the standard combination for loud music. Only in the 16th century did a considerable change take place, with the waits taking up many other kinds of instrument (including soft instruments, such as the lute) or earning money regularly as singers.

Waldere

The two single-leaf fragments of the OE heroic poem *Waldere*, now in the Royal Library, Copenhagen, are the only evidence for knowledge of the Walter legend in Anglo-Saxon England, although it was known throughout the Germanic world over a long period. Judging from the 10th-century continental Latin verse epic *Waltharius* (which evidently differed from the Anglo-Saxon version in some particulars), it seems that the OE poem, originally at least 1,000 lines long, described how two Germanic hostages, Waldere and Hildegyth, fled from Attilas court in order to preserve their betrothal, taking treasure with them. For the sake of this treasure they were pursued by

Guthhere, king of the Burgundians, and his vassal Hagena, who had sworn brotherhood with Waldere when he was also a hostage. It is clear that the OE fragments preserve details of the ensuing confrontation. The order of the fragments is debatable: Hildegyth's address to Waldere is usually printed as "fragment I"; "fragment II" is part of a taunting exchange between the men. The manuscript is from ca. 1000, but the date of the poem's composition is unknown. Although brief, the fragments are rich in their expression of heroic values.

Wall Painting, Romanesque

Relatively few cycles of Romanesque wall paintings remain today; yet we can be certain that many, if not most, Romanesque churches originally received painted decoration. Original images have been lost through the ravages of time, rebuilding, changes in taste, and the wholesale destruction of the Reformation era, though a good number of paintings have managed to survive the centuries, and the corpus is growing with the recovery of Romanesque frescoes from beneath the plaster and paint of later generations.

The picture has been complicated by the discovery that Anglo-Saxon wall paintings were far more common than previously suspected. Anglo-Saxon paintings have been recovered from Winchester, Wearmouth-Jarrow, Colchester, St. Albans, and St. Oswald's, Gloucester, to name but a few of the better-known sites. Many of these works are attributable to the late Anglo-Saxon period and are often similar in style and iconography to Romanesque paintings. This has caused a reevaluation of the extent to which Romanesque artists were indebted to their Anglo-Saxon predecessors, as well as heated

debate over the proper attribution of a number of paintings (e.g., Clayton, Sussex).

In terms of technique most English Romanesque wall paintings are thought to be examples of true fresco, with the pigments applied directly to the fresh plaster. Further analysis has shown that the *secco* technique (pigments applied to dry plaster) was also used, particularly for the addition of detail. Technical studies currently underway promise to refine our knowledge of the processes and techniques employed by Romanesque mural artists.

The majority of the known Romanesque wall paintings are located in the south of England, with a significant cluster in Sussex. This early-12th-century group, traditionally known as the “Lewes Group,” comprises the churches at Clayton, Hardham, Coombes, Plumbton, and Westmeston. In recent years it has come under increasing scrutiny. Originally linked together because of their proximity to Lewes Abbey, one of the primary Cluniac priories in England, the paintings in these churches were thought to reflect Cluniac emphasis on artistic patronage and possibly Cluniac iconography and promotion of the First Crusade. Yet iconographically the programs of the Sussex churches have only general parallels (apocalyptic imagery) with Cluniac houses elsewhere in England and on the Continent; crusader iconography (i.e., warrior saints), if present, is inconsistent at best; and only fragments of paintings survive from Lewes itself, so that there is little to suggest a direct participation of the priory in the decoration of the churches. There is still much debate as to whether these churches do form a group, their paintings possibly the products of a local workshop, or whether their differences outweigh their similarities and whether some of the group might indeed be transitional between the Anglo-Saxon and Romanesque eras and styles.

Most scholars agree that whatever the exact chronology of the churches, and whatever their relation, or lack of relation, to one another, English Romanesque wall paintings do reflect a variety of stylistic and iconographic sources. The influence of Byzantine art is evident in the damp-fold draperies, fully modeled faces, and dark outlines of the Canterbury figures ([fig. 37](#): see [CANTERBURY WALL PAINTINGS](#)). Ottonian influence can be seen in the exaggerated poses of figures at Hardham and elsewhere. The red and white outlines used in the Clayton frescoes may reflect the influence of Anglo-Saxon “Winchester School” manuscripts, such as the Benedictional of Æthelwold (BL Add. 49598; [fig. 26](#): see Benedictional of Æthelwold). We know that English artists traveled, and did so in increasing numbers during the Romanesque era, so that the influence of art from elsewhere in Europe is to be expected.

Perhaps the most interesting, and one of the least studied, aspects of these paintings is their inclusion of unusual iconographic details. At Coombes, for example, Joseph is included in the Annunciation, while at Hardham a dragon

replaces the usual serpent in the Temptation, and Eve's postlapsarian labor is milking a cow rather than spinning.

While individual scenes may differ, by far the most popular overall iconographic program was the Last Judgment. Apocalyptic schemes are found at Hardham, Clayton, Coombes, and Westmeston (paintings destroyed in 1862); St. Mary's, Kempley (Gloucestershire); Swyncombe (Oxfordshire); and Canterbury, among other places. Their meaning and function would have been similar to the apocalyptic wall paintings of France (e.g., St. Savin sur Gartemps) or the portals of the pilgrimage churches (e.g., Moissac).

Many of the Romanesque wall paintings can also be linked directly to the liturgy. At St. Mary's, Kempley (1120–40), the episode of the Three Marys at the Sepulcher and other scenes have been linked to the influence of Easter sepulcher rites. The Easter liturgy also provides the key to understanding the wall paintings in the Chapel of the Holy Sepulcher at Winchester. The subjects of these paintings, the Deposition, Entombment, and Three Marys at the Sepulcher, provide visual narrative parallels for the rituals associated with Good Friday: the burial of a symbol of Christ, its return and elevation, and the story of the Three Marys.

English Romanesque wall painting is not confined to England. A gentler, more classicizing version of the Winchester mural style can be seen in the paintings on the choir vault of the chapel of the leper hospital at Le Petit-Quevilly, commissioned by Henry II in the later 12th century. Some of the finest English Romanesque paintings known were produced for the chapter house of the convent at Sigena, founded by Queen Sancha of Aragon in Huesca in the 1180s. The artists, also working in a style associated with Winchester, are thought to have arrived in Spain via Sicily, their travels again associated with the interests of Henry II. The Sigena paintings included Old and New Testament scenes from the Creation to the Harrowing of Hell, the ancestors of Christ, and a wealth of grotesque animals and other forms of marginal imagery. The frescoes were destroyed during the Spanish civil war. The restored fragments now housed in the Museum of Catalan Art, Barcelona, are all that survive of what many consider to be one of the finest masterpieces of English Romanesque art.

Wanderer, The

Sometimes called an elegy (though not in the classical sense), sometimes a wisdom poem, sometimes a *consolatio*, *The Wanderer* survives with similar poems (e.g., *The Seafarer*, *The Ruin*) in the Exeter Book. It is a 115-line poem about loss of community, the fall of human accomplishment into decay, and loneliness. Extensive scholarship and criticism on the poem have examined the integration of Christian and secular themes, the development of such themes as exile and the impermanence of worldly happiness, and the richness of the poem’s diction and imagery.

The number of speakers in the poem is disputed. Some editions and translations present one long speech beginning in line 1 or 8 and continuing to line 110 or the end of the poem, with that speaker presenting a second point of view in lines 92–110, a famous *ubi sunt* (“where are they [now]?”) passage. Others see the poem as a dramatic monologue with narrative interventions at lines 6–7, 88–91, and 111. Shifts between first-person and third-person points of view add to the controversy.

Nevertheless, the poem powerfully depicts the impermanence of worldly joy and accomplishment. Bereft of companions, lord, and homeland, the Wanderer invites the reader to see his plight as a clear instance of the stark reality of earthly existence. The poet employs vivid imagery to contrast the joy of the meadhall with the icy misery of a life of exile and the former joy of having his lord as a companion with the current misery of having grief as a companion. While some critics argue that the main contrast is between the instability and misery of worldly existence and the *faestnung*, “stability” or “place of

security,” of God’s mercy, many see more nuanced contrasts: between former worldly joy and present misery, between former signs of secular security and present evidence of the transitoriness of all things mortal, between the harshness of fate and the mercy of God, as well as between the security offered by the secular lord and the heavenly Lord.

Drawing not only on the Anglo-Saxon poetic tradition but also on the classical Latin rhetorical devices that Christianity brought to England, the diction, imagery, and rhetoric of the poem are especially powerful. An important repeating image is that of locking or binding. The poet uses frequent metaphors of the heart and mind as places where thoughts must be locked up as though in treasure chests. Wintey waves are depicted as *gebind*, “bound.” Grief and sleep together bind or enchain the solitary wanderer. At the same time binding on earth cannot prevent the loss and decay of earthly things. The end of the poem, however, offers a different binding in the *faestnung* of God, related etymologically to *faestnian*, “fasten, fix, secure, or bind.” Throughout the poem appear classical rhetorical devices, such as *repetitio* and *interrogatio*, which, like the Latin-derived *ubi sunt* motif, are integrated beautifully with the Anglo-Saxon rhetorical devices, such as alliteration, variation, and the clustering of images, often formed through unusual compounding.

Wardrobe

All branches of government ultimately derive from the royal household. Kings originally kept their treasure in their bedrooms (chamber); the royal robes were kept in the adjacent dressing room (wardrobe). The chamber therefore came to be the financial department of the household, though by the reign of Henry II the wardrobe had become the place where valuables (including money and royal records) were kept. Locations of other royal departments, such as the exchequer, became fixed, but the wardrobe continued to accompany the king on his travels.

At the beginning of the 13th century the wardrobe was still subordinate to the chamber. However, the wardrobe, which stored money, could also conveniently disburse it and so began its own record of expenditures. It was thus performing the same functions as the chamber, and for a time the two departments overlapped. By the early years of Henry III, for reasons not now clear, the wardrobe became separate from the chamber and then superior to it. By the 1220s, as T.F. Tout wrote, “It is evident... that the wardrobe was responsible for the whole finance of the kings household, and therefore had... become the accounting and directive department of the palace.”

Under Edward I the wardrobe’s functions and staff were stabilized. When the king and household were far from the fixed branches of government, as during Edwards military campaigns, the wardrobe played a key role in the organization and execution of the war effort. The keeper of the wardrobe had overall responsibility for its activities; his subordinate, the controller, acted as the king’s private secretary and kept the wardrobe, or privy, seal.

To keep the household running and to pay Edward’s ongoing military expenses the wardrobe received regular, large payments from the exchequer, collected revenues in areas through which the king traveled, and negotiated loans with English and foreign merchants and bankers. By acting directly and bypassing the normal, slow process of tax collection the wardrobe enabled Edward to operate more flexibly and efficiently.

The growing size of both wardrobe operations and Edward's war effort caused sections of the wardrobe to set up permanent fixed treasuries. The great wardrobe, which bought cloth, furs, spices, wax, and other goods for the household, became first a subdepartment and later an independent one; a privy wardrobe, to store arms and armor, was established in the Tower of London. Expansion of the wardrobe made it less responsive to royal demands under Edward II, and personal royal finances were administered through the chamber.

In Edward II's time the wardrobe lost custody of the privy seal, and its main business came to be domestic accounting. A brief resurgence of wardrobe activity occurred in the early years of the Hundred Years War, but the war's financial demands were too great for the wardrobe and the exchequer took over financial administration. After the mid-14th century the wardrobe became a minor department whose main function was the day-to-day operation of the royal household.

Wardship

In the modern meaning a wardship exists when a young person is in the care of a guardian. In medieval England there were several kinds of wardship, most notably feudal and socage wardship, all of which governed a minor who was an heir to land or to an inheritance under a will. A permanent form of custody

over the land and property of incompetents, termed idiots or lunatics, was exercised by the crown through appointed guardians.

The chief form of wardship was that enjoyed by a feudal lord during the minority of a vassal's heir. The lord, as guardian, received the profits of the estate and the right to arrange the heir's marriage. The prototype of modern wardship is that which governed minor heirs to socage lands—free tenures that owed nonmilitary service, now commuted to a money rent. This was in contrast to tenure by knight-service, which, while deemed more honorable, was more onerous. Socage tenure, including burgage or town tenure, and gavelkind (the customary form of tenure in Kent), was free from the feudal incidents of wardship and marriage.

Socage wardship was designed to benefit the ward, as the guardian was the closest relative who could not inherit the property; "the wolf would not have been left to guard the sheep" (an argument also used to justify the lord's guardianship as safer than that of possibly greedy relatives). The guardian of the socage ward was often the mother. The estate of the socage heir was to be managed for the heir's benefit; should the marriage be sold, the money accrued to the heir; an accounting was due upon majority.

Feudal guardianship arose as a necessary characteristic of the heritable fief. This type of guardianship compensated the lord for accepting a minor as the heir, since such an heir could not perform military service. And from the heir's view it was better to be a ward than deprived of an inheritance.

Control over marriage was justified by the personal nature of the feudal contract; the lord could not be expected to accept homage from a stranger or an enemy. This control was first seen in the crown's claim over the marriage of heiresses and widows of tenants-in-chief, but by 1185 rules of feudal marriage governed minor heirs of both sexes. Lesser lords exercised concomitant rights over the heirs of their vassals.

Feudal wardship was primarily a benefit to the lord and therefore nonfiduciary in modern terms. The guardian was to provide suitable maintenance for the ward and was not to disparage the heir by an unsuitable marriage. The ward had the right to refuse all offers, though this "forfeiture of marriage" had a monetary penalty. The guardian was to care for the estate and was forbidden to make capital depredations: cutting down the forest, selling off buildings, or driving away the manorial workers. Actions of waste were suable in common-law courts.

There were few complaints about the theory and practice of feudal wardship. Perhaps the self-interest of the lord often served to benefit the ward; if the lord or his assignee successfully sued to bring into wardship lands of a vassal taken by other claimants, they would belong to the heir at majority. In the long run a feudal lord and the heir had a similarity of interest in the

inheritance.

The age of majority varied according to tenure. Male heirs to feudal property came of age at 21; females at fourteen if married, sixteen if unmarried. Socage heirs of both sexes came of age at fifteen or sixteen. As families often held both socage and feudal land, it was possible to have two kinds of guardian and different ages of majority. In regard to wardship of the body the rules of the superior tenure of knight-service would apply and the wardship and marriage would belong to the lord, together with the feudal land, while the socage tenure would be in familial custody. Should the same minor have been heir under a will, the ecclesiastical court might appoint yet another guardian, a tutor, in regard to the bequest.

Wardship law was complicated by the fact that freeholders held land by a variety of tenures and feudal land from several lords. Thus many disputes reached the royal courts. There were four actions protecting feudal wardship rights: *quod reddat custodiam* was the remedy for detention of ward or lands; ejectment, for ouster from a custody; ravishment, for abduction of the ward; the last plea, forfeiture, was sued against the ward for failure to pay for disobedience about marriage. Socage guardians could bring the first three actions, but not forfeiture, as the socage guardian had no pecuniary interest in the ward's marriage.

Wardship applied only to persons possessing property. Children who were not heirs to their father's property were probably left to the care of the widow on her dower lands. The true orphan or poor lunatic presumably was a case for charity. During the plague in the 14th century there were many children in need of guardians, and studies of manorial records reveal instances of ad hoc provisions for care made within individual estates.

Wars of the Roses

The civil strife originating in the reign of Henry VI and ending with the establishment of the Tudor dynasty. Traditionally regarded as a struggle for the crown between rival branches of the royal family (see [fig. 142A](#) and [142B](#)), the name is derived from their reputed emblems, the Red (Lancaster) and White (York) Roses. Though the term is a later invention, apparently first used by Sir Walter Scott in *Anne of Geierstein* (ch. 7), the thinking behind it can be traced back to at least 1485. It is misleading. That the rose emblems were little used in the wars is a point of detail. More seriously misleading is the implication that the wars were basically about rival claims to the crown.

At the outset the main issue was the ineptitude of Henry VI. By the late 1440s he had allowed a narrow faction, led by the duke of Suffolk, predominance in government. In 1450 dissatisfaction with corruption and mismanagement of the French wars led to Suffolk’s indictment for treason and to a popular revolt that sought to rehabilitate the king’s cousin and heir presumptive, Richard duke of York. On his return from Ireland York continued to find himself excluded from court, where the duke of Somerset now held sway.

Houses of Lancaster and York

Fig. 142a. Houses of Lancaster and York. Simplified genealogy.

In 1450 a move in parliament to have York acknowledged as heir to the throne backfired. In 1452, prompted as much by fear as by ambition, York raised an army but failed to dislodge Somerset from his position of influence. The king's mental collapse in August 1453 made possible York's appointment as protector of the realm, but Henry's recovery at Christmas 1454 led to the return of Somerset. It was feared that York would be charged with treason at a parliament to be held at Leicester. York and his Neville allies (the earls of Salisbury and Warwick) intercepted the royal entourage at St. Albans (22 May 1455) and, in a bloody affray, captured the king and butchered Somerset and other lords.

Fig. 142b. Major battlefields. After W.P. Hall et al., A History of England and the Empire-Commonwealth, 5th edition (1971). Reprinted by permission of Xerox College Publishing.

Politically the Battle of St. Albans led nowhere. York did not claim the throne, and his resumption of the protectorate was short-term. Whatever his personal aims, the Yorkist coalition sought only to purge the government. Factionalism at court and rivalries in the country had fed off each other for some time; York had the support of the Nevilles because their North Country rivals, the Percys, had influence at court. From 1456 a broadly based royal council achieved a degree of harmony, but the real legacy of St. Albans was a blood feud.

Margaret of Anjou, Henry VI's queen, emerged as a steely champion of their son Edward (b. 1453), and a new generation of Lancastrian lords, some bent on vengeance, gathered around the court. In 1459 the queen and her party were clearly intent on the destruction of York and his allies, by legal means or otherwise. York marshaled his forces at Ludlow, while his allies recruited in the north. At Blore Heath (23 September 1459) the royal host mauled Salisbury's troops as they crossed the Midlands to join York at Ludlow, and in an encounter at Ludford Bridge it forced the Yorkist leaders to fly overseas.

The period from 1459 to 1464 was the time of most sustained conflict. From their base at Calais Edward earl of March, York's son, and the Nevilles invaded England in 1460, capturing the king at Northampton (10 July 1460). Returning from Ireland, York made a bid for the crown, but his allies conceded only that Henry should accept York as heir. The queen, raising a large army in the north, was not about to accept the disinheritance of her son. Lancastrian forces won a surprise victory at Wakefield (30 December), where York and Salisbury were slain.

The queen's advance on London early in 1461, however, was checked at the second Battle of St. Albans (17 February) by Warwick, while Lancastrian forces from Wales were defeated at Mortimer's Cross (2 or 3 February) by Edward, York's son, who on his return to London was hurriedly proclaimed as Edward IV. His position was strengthened by his destruction of the main Lancastrian army in a snowstorm at Towton on Palm Sunday (29 March 1461). The following years saw a gradual reduction of Lancastrian bases in the far north (1464–65) and in Wales (where Harlech held out until 1468) and the capture of Henry VI (1465).

Edward IV made progress in the restoration of order, but political stability proved elusive in the 1460s. While Henry VI remained alive, and while Margaret and Prince Edward were at large, the Yorkist regime was precarious. Edward IV made matters worse for himself; his secret marriage to Elizabeth Wydeville (1464) was political folly. With his influence waning Warwick "the Kingmaker" resorted to force to reassert his dominance in the king's council in 1468–69, and in 1470, after further intrigue, he fled overseas. With a cynicism remarkable even at the time the Kingmaker came to terms with Margaret in Paris, invaded England, drove Edward into exile, and restored the witless Henry VI. In his turn Edward, in a stunning series of moves, landed in Yorkshire, gathered an army, defeated and slew Warwick at Barnet (14 April), and then destroyed the Lancastrian army at Tewkesbury (4 May).

After 1471 Edward IV was undisputed master of his realm. The house of Lancaster was extinguished in the male line. Prince Edward was killed at Tewkesbury and Henry VI met his end in the Tower of London shortly afterward. A few diehard Lancastrians preferred exile, notably the earl of Oxford and the Tudors. Henry Tudor, nephew of Henry VI and heir of the Beauforts, survived as an improbable Lancastrian pretender. In England the Lancastrian cause was dead, the Wars of the Roses seemingly at an end. What led to a resumption of conflict was a crisis that split the Yorkist establishment in 1483.

The crisis, whose roots can be traced to the 1470s, surfaced with Edward IV's death. The regency council for the young Edward V was bitterly divided, not least between his maternal kinsmen (the Wydevilles) and his paternal

uncle, Richard, duke of Gloucester, who usurped the throne as Richard III (26 June 1483). Generally held responsible for the murder of Edward V and his brother ("the Princes in the Tower"), Richard had to face a major rebellion in the south, suppressed only at great political cost. In promoting a marriage between Henry Tudor and Elizabeth, Edward IV's daughter, Richard's opponents set the stage for Henry's invasion of 1485 and the defeat and death of Richard III at the Battle of Bosworth (22 August). The accession of Henry VII, whose title was weak, was an incitement to other adventurers, and the Tudor regime was far from firmly established at the turn of the century. The defeat of the earl of Lincoln and the capture of the Yorkist imposter Lambert Simnel at the Battle of Stoke (16 June 1487) are usually taken to mark the end of the dynastic conflict.

Modern assessments of the Wars are at some variance with traditional views, especially as popularized by Shakespeare. The dynastic issue has certainly been overemphasized. It is not useful to talk about rival claims to the throne until 1460, and even then there were few diehards on either side. Modern scholarship has toned down the popular image of 30 years of bloody conflict, anarchy, and destruction. Warfare was far from continuous; there was serious campaigning in only ten of 30 years, and in all but a few years it was restricted to a few weeks.

While the civil strife, broadly defined to include feuding and lawlessness, had an adverse impact on English life in the 1450s and early 1460s, it is hard to sustain such a view with respect to the 1470s and 1480s, a time of increasing prosperity and cultural vitality. Another apparent "myth" is that the old nobility destroyed itself in the civil wars, clearing the way for a new political order characterized by a strong monarchy taking into partnership a newly independent gentry class.

Yet revisionism has perhaps gone too far. The traditional view has 15th-century roots. Tudor myth making after 1485 merely amplified and developed attitudes expressed in the 1460s and 1470s. The Yorkists, like the Tudors, had a clear interest in emphasizing the nation's tribulations prior to their restoration of order, and government propaganda must have accorded somewhat with popular perceptions. Balanced or not, perceptions play their part in history. Limited though its actual impact was by comparison with other civil wars, the Wars of the Roses clearly made a deep impression on English political culture and seem to have prepared the ground for the strengthening of central government and the virtual apotheosis of the monarchy in Tudor times.

Wearmouth-Jarrow and the Codex Amiatinus

A pandect (one-volume) manuscript of the Bible, the Codex Amiatinus (Florence, Biblioteca Medicea-Laurenziana Amiatinus 1) was the most splendid and important product of the scriptorium of the twin monasteries founded in 674 (Wearmouth) and 681 (Jarrow) by Benedict Biscop. Major sites for the cultivation of Mediterranean art forms introduced by the well-traveled founder, Wearmouth-Jarrow's scriptorium and library formed an important link with Rome for Anglo-Saxon monastics. Their house author, Bede, saw over his lifetime at Jarrow the familiarization of Mediterranean book art, wall painting, and stone architecture and sculpture.

The monastery's cultural achievements were shaped by the romanizing monastic forms set down by Benedict Biscop and also by the Bible-study program of Ceolfrid, who became abbot in 689. According to the two *Lives of the Abbots* Ceolfrid, like Biscop, brought many books from Rome, including an Old Latin pandect of the Bible. Although no longer extant, this pandect is usually believed to be identifiable as the Codex Grandior, a copy of the Vetus Latina translation described by Cassiodorus in his *Institutiones*. Cassiodorus tells of having inserted into this manuscript plans of the Temple in Jerusalem and the Tabernacle and diagrams showing the divisions of scripture. These correspond to the plan of the Tabernacle (fig. 143) and three diagrams presented in the first quire of the Codex Amiatinus.

Fig. 143. Codex Amiatinus (Florence, Biblioteca Medicea Laurenziana Amiatinus 1), fols. 2v-3. Tabernacle in the Temple at Jerusalem. Reproduced by permission of the Biblioteca Medicea Laurenziana, Florence.

For this reason much modern scholarship considers the Codex Amiatinus a copy of Cassiodorus's pandect, updated with a Vulgate text, although it could

as well represent a creative emulation or interpretation. Amiatinus is, however, clearly identical with one of three pandect Bibles produced by Ceolfrid's monks. Its original dedication inscription reproduces exactly the verses given in the anonymous *Lives of the Abbots* as those written in the third pandect, which was taken to Rome for presentation to the pope.

Besides being one of only a few early Anglo-Saxon manuscripts of documented origin, it is the earliest surviving complete Latin copy of the Bible, and its text, except for the Psalms and Epistles, is one of the best witnesses of the Vulgate. Formidable in scale, the manuscript is also visually impressive in its classicizing script styles and illusionistic full-page frontispiece depictions of Ezra copying the Bible and, preceding the New Testament, Christ in Majesty, both of which imitate late-antique art. Nevertheless, possibilities for selection and modification might have remained, allowing creation of an interpretation of Mediterranean forms, perhaps relating them to Anglo-Saxon monasticism. For example, inclusion of the diagram of the Tabernacle seems to fit a general insular fascination with the structure of the Temple and Tabernacle, present in the writings of Bede and in manuscript illustrations in the books of Kells and Armagh. But to whatever degree its textual presentation and illustrations represent copy or creative interpretation, the Codex Amiatinus documents a close adherence to late-antique exemplars and speaks less eloquently of a cultural mix than of the authority of continental, especially Roman, forms of monasticism, learning, and manuscript production at Wearmouth-Jarrow.

Wearmouth-Jarrow: Architecture

St. Peter’s Church at Wearmouth (now in Sunderland, County Durham) was built, according to Bede, within one year, between 674 and 675 (fig. 144). The Church of St. Paul’s in the twinned monastery at Jarrow (fig. 145) was founded in 681 and dedicated in 685 (the dedication slab survives today although not in its original position). Both churches are then potentially very accurately dated structures. Unfortunately only the west wall and the porch survive of the early church at Wearmouth. At Jarrow, where there were two churches end to end, the small eastern church (now the chancel) survives, while the larger—the “basilica” mentioned in the dedication—is covered by the 19th-century nave. Excavation within the modern nave has revealed foundations of an independent church in the same technique as the excavated monastic buildings to the south.

PHASE 3

Fig. 144. Plan of Wearmouth, Saxon Phase 3. After Cramp (1994). Courtesy of R.J. Cramp.

Fig. 145. Plan of Anglo-Saxon Jarrow, excavated stone buildings. After Cramp (1994). Courtesy of R.J. Cramp.

The dimensions of both major churches are similar: Wearmouth nave 18.5 feet wide and 64 feet long; Jarrow, 18.5 feet wide, 65 feet long. Jarrow had in its first phase a square-ended chancel and a narrow north aisle. In a subsequent phase there is evidence for chambers flanking the nave. Each church probably had a western porch, although only Wearmouth's survives. This was flanked by two side chambers. Both churches apparently had a structure to the east that may have served as a funerary chapel.

Wearmouth's church and monastic buildings are constructed with limestone rubble blocks set in poured concrete; Jarrow's buildings are of sandstone ashlar, but at both sites the buildings have massive quoins laid in an alternate fashion, as in other Northumbrian churches, such as Escomb and Corbridge. Doors have roughly voussoired heads (using wedge-shaped pieces for the arch), but windows are formed with monolithic round heads and minimal upright and flat jambs. They are internally splayed, and at Jarrow the closure slabs to hold small areas of glass survive. Quantities of colored and plain

window glass have been found in association with the excavated monastic buildings. The floors of the monastic buildings, and presumably of the churches, were of brick-faced concrete (*opus signinum*). The buildings were decorated with external and internal stringcourses and friezes and internally with imposts, panels, and painted plaster. The motifs employed are balustrade ornament, interlace and animal ornament at Wearmouth, and at Jarrow also inhabited plant scrolls.

Wells Cathedral

Wells Cathedral contains work of essentially two periods. The western three bays of the choir arcade, the transepts, nave ([fig. 146](#)), and west front are part

of an early Gothic campaign stretching from ca. 1180 to ca. 1245; the chapter house (fig. 39: see CHAPTER HOUSES), Lady Chapel, retrochoir, and presbytery represent the Decorated period of ca. 1280 to ca. 1340.

Fig. 146. Wells Cathedral, nave from west. Courtesy of L. Hoey.

Wells is one of those rare English cathedrals built on an unencumbered site. The Anglo-Saxon and Norman churches lay south of the present cathedral and on a different axis. The lack of any major Anglo-Norman reconstruction at Wells can be explained by the historical circumstance of Wells losing its *cathedra* (status as episcopal seat) ca. 1090, when Bishop John de Villula moved the see to Bath. The chapter was reconstituted by Bishop Roger of Lewes in the mid-12th century, but Wells did not officially regain its cathedral status until the 1240s. Nevertheless, it is likely that the decision to rebuild on a fresh site and in the grand manner was predicated on the chapter's assumption that their church would regain its episcopal status, or was itself meant to be one of the arguments for regaining that status.

The new building was begun under Bishop Reginald ca. 1180 and was built continuously until the entire east arm, transepts, and five nave bays were completed. At this point there is evidence in the masonry of a break in construction, although there is no discernible change in the design. The break may be connected with the Interdict of 1208–12. It is not clear when work resumed, but the nave was probably complete by ca. 1225 and the west facade by 1239, when the church was dedicated, although some work was still underway in 1242.

The early Gothic work at Wells has long been recognized as one of the first and most distinctive statements of a particular style of English Gothic associated with the West Country. The massive piers with their eight groups of triple shafts and lavish foliate capitals, the broad and immensely complex arch moldings, the triforium with its continuously molded pointed arches, and the high-set vault shafts (at the triforium sill in the choir and transepts, in the triforium spandrels in the nave) are all characteristic features of the Wells design that combine to give it a strong horizontal impetus and a rich, sculptural texture. Wells retains the thick wall of the Anglo-Norman tradition, with wall passages at triforium and clerestory level. There are buttressing arches hidden under the triforium roof; these, with the thick wall, are sufficient to sustain the four-part high vaults with crowns 66 feet above floor level.

The west towers of the cathedral are set beyond the western aisle bays, and the whole west front formed a screen of uniform height before the addition of the Perpendicular towers. This screen facade ([fig. 122](#): see SCREEN FACADES) is covered with gabled tabernacles supported by shafts of contrasting blue lias (a kind of stone) and filled with sculpted figures. The difference in style between the Wells west facade and the rest of the early Gothic church has led many to assume the arrival of a new master, but it may also be that the west facade was felt to demand a contrasting stylistic vocabulary from the interior and the exterior flanks of the church.

The original east end of the early Gothic cathedral terminated in a squared

ambulatory with a Lady Chapel of undetermined form. This was all swept away in the Decorated rebuilding and extension of the early 14th century. The reasons behind this eastern extension may have had to do with a felt need for more processional space and a grander chapel for the Virgin Mary connected with the introduction of the Revised Use of Sarum in 1298, or they may have been connected with the chapter's hope that their recently deceased bishop, William of March, whose canonization they sought between 1324 and 1329, would need a suitable shrine in an appropriately elegant and modern architectural setting. The precise dating of the Decorated work at Wells has been controversial, with John Harvey arguing for a beginning in the first decade of the century and Peter Draper for a later beginning (ca. 1323). Given that the tower is documented as under construction from 1315, the latter dating is more likely, as it seems improbable that the sequence of Lady Chapel, retrochoir, and choir would have been interrupted to raise the central tower farther west. The new work seems to have been complete by ca. 1340.

The Decorated work at Wells has always been seen as the most sophisticated and complex example of an unusual interest in spatial manipulation evident among English builders in the early 14th century. Although constructed from east to west, the visitor experiences the spaces west to east. The three western arcade bays of the early Gothic choir were left intact but crowned with a new triforium of ogee-arched niches and a clerestory with Decorated window tracery. The three eastern bays of the choir were built *ex novo*, and although they continue the general proportions of those to the west, they alter the terms of the normal separation between arcade and upper stories by basing the pinnacles of the triforium niches on the extrados of the arcade arch itself. The whole choir is covered by what is structurally a pointed barrel vault with interpenetrations over the clerestory windows but that reads as a net vault with interlocking diagonal ribs broken by cusped lozenges.

From the choir aisles the visitor enters the retrochoir, arguably the most complex and disorienting space in Gothic architecture. Clustered Purbeck marble piers of varying shape are spaced in seemingly random fashion (they actually form an elongated hexagon) and support a bewildering vault of asymmetrical ridges and tierceron ribs. The lowness of the retrochoir adds to the feeling of spatial density and contrasts with the higher, more open spaces of choir and Lady Chapel to west and east. The latter is itself an unusually formed octagon, elongated toward the east and vaulted with a tierceron vault of daunting complexity. Five great reticulated windows light this easternmost part of the cathedral.

The chief Perpendicular work at Wells was the building of two west towers above the 13th-century screen facade by William Wynford in the late 14th century. The flat tops of these towers, perhaps inspired by the *ad quadratum*

design of the earlier screen, twice as long as it is high, were extremely influential locally. The central tower was rebuilt after a fire in 1439. Earlier than this last alteration was the interior construction of the famous strainer arches in the crossing about 1350, which were designed to combat ominous deformation in the crossing piers.

Westminster Abbey

The coronation church of English monarchs and the frequent burial place of medieval kings; also the chief relic setting for the shrine of Edward the Confessor. The building itself was and remains perhaps the most magnificent constructed in medieval England (figs. 147–48). In the number and splendor of the tombs and effigies it is without parallel.

Fig. 147. Westminster Abbey, south choir and south transept, east elevations. Courtesy of L. Hoey.

History

While a monastery was probably founded at Westminster by St. Dunstan in 959, it is with Edward the Confessor that its history really begins. He endowed the monks with extensive estates and built an entirely new church, in which he was buried. Both the church and the burial are graphically depicted on the Bayeux Tapestry. After his victory at Hastings William the Conqueror was crowned there on Christmas Day 1066, probably following Harold's precedent. Thereafter every English king and queen who has been crowned has been crowned at Westminster. The Confessor had also built a royal palace just by the abbey, thus beginning Westminster's history as a royal residence and seat of government.

From the 11th century onward the rolls and charters preserved in the abbey's muniment room illustrate its history as one of the kingdoms most prestigious and wealthiest Benedictine monasteries. In 1535, just before the Dissolution, the net income was at least £2,800, second only to Glastonbury Abbey. The administration of the estates has been analyzed by Barbara Harvey, and we know that the normal establishment of monks was just under 50.

Fig. 148. Westminster Abbey. After G. Webb (1956). Reprinted by permission of Yale University Press.

The reign of Henry III marked a decisive new stage in the abbey's history. The loss of most of the Plantagenet dominions in France meant that Henry, unlike his predecessors, lived almost exclusively in England. The palace of Westminster, which he extensively rebuilt, became his favorite residence, largely because of the proximity to the abbey. In 1220, as a youth of thirteen,

Henry laid the foundation stone of the new Lady Chapel; in the 1230s he developed an intense devotion to Edward the Confessor, canonized in 1161. In 1245 he decided to display his devotion by funding the complete rebuilding of the Confessor's church. All but the old nave was pulled down, and between 1245 and 1269 the present eastern chapels, presbytery, transepts, choir, and chapter house arose on the cleared site. His total expenditure was over £41,000, more than a year's royal income.

In its style the new abbey has been called "a great French thought expressed in excellent English." It showed extensive French influence in the plan of the eastern chapels, which came from Amiens, in the windows, modeled almost exactly on Reims, and the flying buttresses, which enabled the church to achieve its great height. At 103 feet to the crown of the vault it is the highest medieval church in England. But its decoration is overwhelmingly English. The desire to achieve an "all-over" decorative effect had long been a feature of English ecclesiastical architecture. At Westminster it reached a new degree of profusion and magnificence. At ground level ran a wall arcade, adorned with sculptures in the eastern chapels and with a series of heraldic shields in the choir. All the piers, columns, and shafts were in highly polished Purbeck marble, while the spandrels of the main arcade and triforium were adorned with diaper (cross-hatch, diamond-shaped decorations in different colors). Sculptures and the few plain surfaces were highly painted.

Henry III was no passive paymaster. He urged forward the work and exhibited a close interest in its design. He may well have taken major decisions, like that to have a stately galleried triforium, despite the huge extra expense. The various architectural possibilities were probably presented to him and the detailed plans drawn up by the master mason, Henry de Reyns, in charge of the works until his death in 1253. If he had worked at Reims, as his name and the abbey's design suggest, he clearly was also steeped in English taste and practice.

Alongside the work on the abbey itself Henry III constructed a new shrine for Edward the Confessor, to which the saint's body was translated in a splendid ceremony on 13 October 1269. Situated behind the high altar, the shrine was the focal point of the new church, and Henry was ultimately buried beside it. In the next 150 years his example was followed by his son and daughter-in-law, Edward I and Eleanor of Castile; by Edward III and his queen, Philippa of Hainault; by Richard II; and by Henry V in 1422, by which time all the places around the Confessor's shrine had been filled up. The tombs of these kings and queens, save that of Edward I, bore splendid effigies, although Henry V's is now virtually destroyed.

When Henry III died, his building had reached one bay west of the present choir screen, where it was tacked on, somewhat uneasily, to the nave of the

Confessor's church. It was not until 1376 that the latter was thrown down and work begun on a new nave. It continued slowly, funded largely by the monks themselves, until the early 16th century, when everything was complete save for the western towers, not added until the 18th century. The design of the nave is that of the church of Henry III, without the decoration; the difference that immediately strikes the eye is the absence of diaper. The architect "original enough not to seek after originality in his work" was probably Henry Yevele. No higher tribute could have been paid to Henry III's church. Even a hundred years later it could not be bettered.

It was the first of the Tudors, Henry VII, who made the last great addition to the interior. In 1503 he began work on a new Lady Chapel to replace the one commenced in 1220. Henry VII's Chapel, as it is called, with its extraordinary fan and pendant vault, is perhaps the most remarkable example of late Perpendicular architecture. It is also, with the Tudor badges of rose and portcullis studded over its surface, a testimony to the pretensions of the new dynasty and a reaffirmation of the ties between the abbey and the royal house. It was such ties, forged above all by Edward the Confessor, Henry III, and Henry VII, that made the abbey what it remains to this day—a house of kings.

Architecture

The history of the fabric of the church is straightforward. A church of St. Peter at Westminster probably existed as early as the 7th century. The importance of this once-island site outside the walls of London begins, however, when Edward the Confessor became its patron after 1042 and commenced the building of a great church. It was his intention that it become a royal "private abbey," directly dependent upon the crown in the same way Caen and other Norman abbeys were dependent upon their ducal founders. Known through archaeological remains and literary descriptions, it was built before the Conquest in a Norman Romanesque style—a style the Confessor became familiar with during his exile in Normandy. It was a large church with western towers, a long nave, transepts, a central tower with stair turrets (as pictured in the Bayeux Tapestry), a short presbytery of two bays with solid side walls, and a circular eastern apse. The nave possibly had six square bays, divided by cruciform piers, which in turn were subdivided by square piers, creating an *abab* rhythm, as at Jumièges. The monastic buildings were also rebuilt. Edward did not attend its consecration in 1065, just days before his death. He was buried in the church, which eventually became his shrine. Although the western towers may not have been complete in time for the consecration,

William the Conqueror was crowned at the abbey in 1066.

The Gothic church that we see today is largely the work of Henry III. Documentary evidence suggests that the idea to rebuild the abbey had appeared by 1220, when a new Lady Chapel—now replaced by Henry VII's Chapel—was begun by Henry III at the eastern end of the Confessor's church to accommodate the increasingly celebrated cult of the Virgin. This new Lady Chapel did not, however, set the style for the rebuilding of the whole abbey.

Ultimately the monastic hope to rebuild the entire abbey was connected to Henry III's offer to pay for it; the abbey must be understood as a royal enterprise, paid for and under the control of the crown. It was the most expensive and lavish English church of the 13th century. The ultimate cost per bay was two times that of Salisbury. More than the coronation church of his ancestors and personal piety motivated Henry to rebuild. Since he no longer ruled in Anjou, the abbey was planned to take the place of Fontevault Abbey as the royal burial place. It was to show that the House of Plantagenet had parity with the House of Capet. While reflecting Henry's extraordinary political ambitions, it also communicates the place of kingship in the divinely established order and the king's role as God's appointed vicar on earth. The massive building project coincides with the birth of parliament and the baronial movement to limit royal power. With royal funding ensured, the demolition of the old church took place in 1245 and construction started in 1246.

The initial financial organization of the work was under Edward of Westminster, and a "Master Henry" was the first master of the works. Little is known of his background, but after his death he was described as "Master Henry de Reyns, mason." Whether he was a Frenchman from Reims, or had just worked at Reims, or was from Raynes in Essex is not known. Since, however, the church has decidedly French characteristics, whoever designed it had firsthand knowledge of the important churches then rising in the Ile-de-France. Suggestions for some French details may have come from the king himself, who had visited Paris in 1254 and toured nearly all of the cathedrals in northern France.

French characteristics include an eastern chevet with polygonal apse and radiating chapels, north-transept facade with large portals and a rose window like Reims Cathedral, French bar tracery, trefoil-cusped lights in the tracery of the gallery that had appeared only a few years before in the Sainte-Chapelle, two-tier flying buttresses, and comparatively great internal height. By contrast many features of the design follow English models, such as the gallery—used to shout formal acclamations at coronations—conforming to the general scheme of Canterbury and Lincoln in its elevation toward the main vessels, standard high Gothic four-shaft piers close to those in the nave at Salisbury,

and use of Purbeck marble. Technical details, such as the construction of vaulting ribs in sloping courses forming angled meetings at the ridges (as opposed to the French technique of horizontal coursing), greater thickness of shafts in the gallery, and the greater thickness of walls, are consistent with English practice. Based on the available evidence, scholars agree that the designer probably was English.

No doubt the Sainte-Chapelle, with its walls inlaid with glass and gilded to simulate enamels in imitation of the shrine of the relic of the Crown of Thorns, inspired the extraordinary ornamental feature of Westminster's internal elevation—a carved diaper pattern of stylized flowers originally brilliantly gilded and painted. Since this diaper pattern is also thought to have appeared on the now destroyed shrine of Edward the Confessor, the interior was to have a brilliant, polychromatic appearance based on the shrine that it enclosed. Since this diapering pattern is absent on the first part built, the original conception for the church changed over time.

The chapter house, with its vaulted crypt, was completed well before 1259. Octagonal in plan, it follows the precedent of centrally planned English chapter houses. Conceived like a "glass cage," its windows were filled with heraldic glass. The original vaulting, supported by a slender central pillar, was destroyed in the 18th century and was later restored.

The church was unfinished at Henry's death in 1272. The nave was not completed until the 15th century, and the west facade, partially designed by Sir Christopher Wren, was finished in 1734 by Nicholas Hawksmoor.

Numerous tombs and additions were made to the abbey, the most spectacular being the Chapel of Henry VII. Begun in 1503, it was conceived as a vast architectural display to buttress Henry VII's dubious claim to the throne and as the mausoleum for the new Tudor dynasty. Its main architectural feature is a pendant fan vault, which is one of the wonders of late Gothic architecture. Its stylistic features are connected to St. George's Chapel, Windsor.

Westminster Chapter House Paintings

The Chapter House at Westminster Abbey (finished 1253) is an octagonal chamber with three different sets of paintings in the wall arcade on seven sides of the building and an entrance on the west side. Each arcade is composed of five trefoilheaded arches. The eastern arcade surrounds what remains of a fine Last Judgment, more accurately labeled a Majesty, since it lacks the separation of the blessed and the damned souls, as well as the heavenly host. This painting, which has Christ in the center, seated on an arc, his feet resting on a globe, and displaying his wounds, is executed in an English-italianate style. This is well demonstrated by the head of the seraph who stands on Christ's right, exquisitely painted in softly modeled forms. It relates broadly to Sienese work of ca. 1340–50, to that of Pietro Lorenzetti, and to the late work of Simone Martini, such as the sinopia, or fresco underdrawing, of Christ in Avignon Cathedral, which compares well with the seraph in question. Although now fragmentary, the Virgin can be made out on Christ's right; therefore it can be assumed that John the Baptist was once on Christ's left, thus forming the traditional iconographic type of the *deësis* (Christ flanked by Mary and John the Baptist). The scene is completed by a further seraph on Christ's left and angels, some of whom hold the instruments of the Passion.

This, and the Apocalypse cycle that originally occupied the arcades on the six other sides, were commissioned by John of Northampton, a monk at the abbey sometime between 1375/76 and 1404. The Majesty is generally considered to be earlier than the Apocalypse, but it is not possible to establish a precise date. There is little surviving monumental painting with which it can be compared. Both the tester over the tomb of the Black Prince in Canterbury Cathedral of 1394–97 and the wall painting in the Byward Tower of the Tower of London, which is undated, have been cited as possible, yet not wholly convincing, parallels; nor is the style found in illumination of the final quarter of the 14th century.

Whereas the Majesty is undoubtedly the work of an English painter under strong Italian influence, the Apocalypse stands in complete contrast and may have been carried out by foreign artists. The style, which is characterized by squat figures with rounded, vigorously highlighted draperies and large heads with long, round-ended noses, is remarkably similar on the one hand to that of the north German painter Master Bertram of Minden (German and other foreign artists are documented as working in London at this time), and on the

other hand it relates to certain manuscripts produced at Westminster between the 1380s and the early 1400s, namely the *Liber regalis* (Westminster Abbey Library 38) and Rickert's Hand B of the Carmelite Missal (BL Add. 29704–05), both strongly Bohemian in character. This link with the manuscripts is reinforced by the fact that each of the Apocalypse scenes is accompanied by explanatory scrolls with the text of the Apocalypse written on vellum, affixed to the wall; in addition the Apocalypse cycle has been convincingly shown by Noppen to have been based on the version now Cambridge, Trinity College B. 10.2. The artist of this work, whose style is unquestionably English, was one of the two principal hands of the Lytlington Missal (London, Westminster Abbey Library 37), illuminated for Westminster Abbey in 1383/84. The Trinity Apocalypse is datable to the 1390s, and the Chapter House Apocalypse could be of that decade or possibly of the early 15th century.

The Apocalypse originally occupied the entire wall arcade on the remaining six walls of the Chapter House, the cycle beginning in the northwest bay with scenes from the apocryphal life of St. John, continuing in a clockwise direction with the vision itself, bypassing the Majesty, to end in the southwest bay. It has been calculated that 96 scenes once occupied the 24 arches given over to the Apocalypse. The northwest, southeast, and southwest portions are the best preserved, the north and northeast are blank, and the south wall is almost destroyed. Where the paintings are intact each arch contains eight subjects, above which is a demiangeli playing a musical instrument, the style of which stands midway between the English-italianate Majesty and the German/Bohemian-styled Apocalypse. The space below is divided into six compartments: the upper four accommodate the Apocalypse scenes, while the lower two contain what little survives of a bestiary cycle, thought to be early-16th-century.

A final, enigmatic painting on the east wall comprises a number of highly individualized heads that are looking in the direction of the adjacent Majesty. Perhaps the closest existing comparison for the distinctive facial types, with their elongated noses, is found in the style of Siferwas, the Dominican illuminator of the Sherborne Missal (on loan to the British Library [loan MS. 82] from the Trustees of the will of the 9th duke of Northumberland of Alnwick Castle). Their iconographic role is unclear; if they are to be seen in the context of the Majesty, then they were possibly added slightly later and, as Rigold has suggested, they could represent purgatory and be portraits of contemporary political figures.

Westminster Retable

The Westminster Retable (Westminster Abbey, ca. 1280), despite its poor condition and lack of documentation, is impressive for its singular beauty and sophistication and for the fact that it is the only major 13th-century panel painting to survive from France or England. It was presumably intended as an altarpiece at the back of an altar. Its size, subject matter, and detail all support the theory that it was made for the high altar of Westminster Abbey.

The Westminster Retable is a complex construction of oak, measuring 37.7 by 131.3 inches overall, gilded and decorated with cameos, gems, and enamels (all imitations made of glass, paint, and paste) to evoke the appearance of a golden reliquary. The elaborate frame divides the panel into five vertical compartments. For the center and ends Gothic architectural niches, complete with stained-glass windows, frame standing figures. In between, eight-pointed star medallions against a dark-blue glass background create the Islamic star-and-cross pattern.

To this structure an anonymous artist painted figures and scenes in the courtly Gothic style developed in France during the reign of King Louis IX. The technique incorporates oil, a medium especially suited for subtle modeling. Iconographically the artist was innovative as well. In the center Christ stands blessing and holding an orb on which is painted a miniature landscape. He is flanked by the Virgin Mary and St. John the Evangelist, each holding palm

fronds, an arrangement alluding to the Crucifixion but unique. To either side biblical narratives fill the star medallions. The three to survive are rare scenes of Christ's miracles: the Raising of the Daughter of Jairus, the Healing of the Blind Man, and the Feeding of the Five Thousand. At the ends standing saints bracketed the composition: St. Peter on the left, patron saint of Westminster Abbey, was presumably paired with St. Paul on the right.

Compared most often with the Douce Apocalypse, the paintings in the south transept of Westminster Abbey, and other English works, the Westminster Retable also bears comparison with works in Paris and slightly later works by Duccio in Siena.

Widows and Widowhood

The widow was seen in medieval England as a person without normal familial supports, and many efforts were made to provide for that lack; kings and bishops were said to have a special obligation in her regard. The basic provision throughout the period—and this is true of different levels in society—was to ensure that she would control part of the property that had belonged to her husband and herself during their marriage.

Anglo-Saxon law, common law, and manorial custom all sought to bring this about. Anglo-Saxons of the landed class seem to have arranged for dower provisions and widows' rights in marriage settlements. After the Conquest widows of those who held by military service were provided with dower lands, either estates specified at the time of espousal (*dos nominata*) or a third of the properties held at that time (*dos rationabilis*). In the 13th century the reasonable dower was sometimes extended to mean a third of property that the husband had held during the marriage, thus providing for any increase of fortune that may have occurred in those years.

It was expected that dower be assigned to the deceased's wife within the first 40 days of widowhood. In addition property that she brought to the union and which had been controlled by her husband during the marriage, now returned to her use. Though there was much opposition to these arrangements, by the 13th century they were generally accepted and procedures were available to enforce them. Toward the end of the Middle Ages the marriage settlement came into more common use and removed some of the uncertainty attached to dower and its assignment. Where land was held in socage (free, nonmilitary tenure), the widow commonly received half of her late husband's holding. Among the peasants, much the largest part of the population, the widow was in a relatively better position than her free sisters; half, two-thirds, often all the family's property in land fell to her, at her disposition so long as she could provide the required services to the lord. She could also expect to receive a share of her husband's chattels.

By a custom that may have begun in Anglo-Saxon times and that was general for the first two centuries after the Conquest the widow's share, if there were a surviving child, was a third of his movable property. Where the couple was childless, she received half. Later, as testators obtained more control over their chattels, the custom weakened; sometimes she received more than the customary third, and on occasion she might receive much less. It is difficult to estimate what provision was made for widows at the poorest level of society, in the countryside and in towns. Rarely would there be rights in land, though she probably had a share in whatever chattels the couple possessed.

In the Anglo-Saxon and Norman periods the widow, especially if propertied, was subject to pressure not only to remarry but also to accept the spouse chosen for her. This was true at all levels of society. The king and other lords found control of widows' remarriage an important source of income; widows of the late 12th and early 13th centuries sometimes purchased permission to be free of these demands. In the laws of Cnut, before the Conquest, and later in Magna Carta efforts were made to allow her to remain unmarried or, should she choose otherwise, to select a spouse herself, though subject to approval by her lord. During the later Middle Ages the widow's right in these regards was accepted in principle, though she continued to be subject to pressure from family and lord as to her future state. Even in the late Middle Ages peasant widows, whose property usually required a male presence for its maintenance, were sometimes fined if they refused to remarry. On some manors spouses were chosen for them.

In the latter half of the Middle Ages the widow possessed many advantages. She enjoyed the income from property that had come to her from her family or other sources as well as the lands received in dower. Free from the legal

control of a husband and male members of her family, she was in a good position to decide her future and, within the restrictions provided by that choice, to control her person, movements, and properties as she saw fit. Many widows preferred the society of a husband and remarried soon after their bereavement. Here, as in any marriage, there were varied motives; it is clear that some found the administration of estates too arduous and sought a solution to this difficulty.

Some widows entered convents as regular members of the community or with special arrangements for their support and care. Others dedicated themselves to a semireligious life in the world by private vows to the bishop. Still others, and their number has yet to be estimated, continued as heads of households, exercising the rights and obligations proper to the level of society to which they belonged. The widow was free to bequeath all her movable property as she saw fit.

Widsith

An OE poem found in the Exeter Book, cataloguing a variety of Germanic legends in 143 lines. *Widsith* has commonly been regarded as a 7th-century poem, but the linguistic evidence for this is not compelling and the dating has been influenced by the assumption that, since the poet seems to have known a wealth of Germanic legends and apparently assumes similar knowledge in his audience, the poem must be relatively close to the period when the legend cycles originated. Yet the only certainty is that it survives in a 10th-century manuscript; even if we suppose that a 7th-century text existed, it is not likely that the extant *Widsith* would have been identical with the original. For example, it is generally agreed that the references to biblical and oriental tribes (at a minimum lines 75 and 82–84) are accretions.

The poem is shaped as if it describes the personal experiences of a poet “Widsith,” whose name means “far-traveler.” He is introduced in the third person as the man who accompanies Ealhild to be married to Eormanric, one of the great figures of heroic legend, but the first person is used thereafter as Widsith catalogues, and sometimes comments on, the kings, tribes, and heroes he claims to have known and visited. The poet is fictional, however, and so are his journeys, since the figures named lived at different times between the 4th and 6th centuries. In fact the poem is a kind of manifesto: the importance of the poet in establishing heroic reputation is emphasized and his ability to sing of legendary heroes is dramatically validated by being attributed to hard-won personal experience. An unspoken claim is thereby made for poets as men apart, who have special knowledge that comes from being able to “visit” the world of legend in their imaginations.

Yet the allusive nature of the text should not lead us to assume that the audience could have recognized all the names mentioned or that the poet could have related the adventures of each. Some may actually be common nouns passed off as tribal names in order to enhance the lists, and it is possible that, if *Widsith* originally functioned as a statement of repertoire, the poet was prepared to provide poems subsequently only on those figures to whom he draws attention by means of brief additional details: it may be no accident that these are the ones still known to us in history and legend. But this functional

dimension relates more to the genesis of the poem than to its preservation in the Exeter Book, where it was presumably included because it catalogued “historical” knowledge in encyclopedic form. For the modern scholar it is precisely this encyclopedic quality that gives *Widsith* its preeminent position in the study of Germanic legend.

Wife’s Lament, The

A 53-line poem in the Exeter Book, usually classified as one of the elegies, sharing with these poems an intensely personal voice that speaks of the transitory nature of life and happiness from the pain of a stoically endured present. Some scholars would place it (along with *Wulf and Eadwacer*) in the broad category of *Frauenlieder*, a term originally applied to continental popular women’s songs. The title *The Wife’s Lament* is a 19th-century attribution, and the poem’s enigmatic content has given rise to widely varying interpretations—among them that the speaker is a woman, a man, a revenant (someone returned from the dead), or a minor goddess. Grammatical endings

in the first two lines, however, indicate strongly that the speaker is female. In recent years the strong woman's voice in *The Wife's Lamentas* has provided an important locus for feminist strategies of interpretation. Though varied in theoretical approach and subject of inquiry, feminist readings of *The Wife's Lament* aim to defamiliarize the poem and in essence re-present the speaking woman (and by extension woman in OE literature) as an active and effective agent rather than suffering object.

The general line of interpretation for the poem reads the speaker as a woman unwillingly parted from her husband. A variation on this approach sees two men involved, the woman's husband and a lover. The speaker does not provide a detailed narrative of her hardships, but the depth of grief in her separate life is painfully clear. She speaks of her misery in terms of exile or banishment (*wracsip*). Most readers of the poem see the woman's misery in *The Wife's Lament* as a direct result of her enforced separation from her husband, to whom she refers in heroic terms as lord (*hlaforð, frea*). Her husband leaves, possibly going into exile, and in her distress she attempts to follow, describing herself (also in heroic terms) as a lordless exile. Although the causal connection is unclear, at this point in the poem her husband's family plots to separate the couple, and her husband apparently sends her away to live alone.

The woman's solitary dwelling place is vividly detailed in the poem. A cave or tumulus beneath an oak tree shelters her, but her surroundings are wild and alien. Her longing finds no relief in gloomy valleys, high mountains, sharp hedges, and thick briars. While it is possible that this place is as much refuge as exile, she highlights her loneliness by contrasting the happy image of lovers in bed with her own lonely pacing inside her earthen shelter.

The final twelve lines of the poem have been construed variously, depending on whether the speaker's statements about the *geong mon* ("young man") are read as gnomic reflections, reference to an enemy, or reference to her husband. Part of the difficulty of interpretation lies in syntactic ambiguities in lines 45–47. Whatever interpretation one gives these lines, however, the speaker's bitter gnomic conclusion—that one who longs for a beloved will always be unhappy (52b–53)—locates the poem firmly in this world and sets *The Wife's Lament* apart from the consolatory religious closures of both *The Wanderer* and *The Seafarer*.

Wilfrid of York (ca. 634–709)

Bishop and saint. The son of a Northumbrian thegn, Wilfrid entered Lindisfarne monastery when about fourteen. Between 653 and 659, while on a pilgrimage to Rome, he became acquainted with the Roman liturgy, the Easter question, and the Benedictine Rule. On his return to Northumbria King Oswiu’s son Alchfrid, a convert to the Roman ecclesiastical usage, provided Wilfrid land for a monastery at Stanford and about 661, expelling the Celtic monks of Ripon, gave him that house as well.

In 664, to resolve the dispute between the Roman and Celtic factions in the English church, Oswiu called a conference at Whitby. Wilfrid, as

Northumbria's main proponent of the Roman usage, was a leading spokesman. The victory at the Synod of Whitby went to Wilfrid and Rome.

About a year later Wilfrid was named bishop of York but, going to Gaul for his consecration, returned to find that Cedda had been named in his place. Wilfrid's remaining years were filled with disputes that frequently saw him deprived of his offices and forced to flee Northumbria. These controversies centered on the efforts of ecclesiastical officials and rulers of Northumbria to reduce his extensive see and on his personal conflicts with the Northumbrian kings.

Wilfrid twice appealed to Rome for support of his case (680, 703–04), the first Englishman to make such an appeal; on both occasions he received papal approbation. During his absences from Northumbria he served at various times as bishop in Mercia, Wessex, and Sussex and was deeply involved in missionary work, in establishing monasteries, and in church construction. He briefly conducted missionary work among the heathen Frisians. In 705 Osred restored Wilfrid to the Abbey of Ripon and made him bishop of Hexham. He died in October 709, at Oundle, Northamptonshire, en route to visit King Ceolred of Mercia, and was buried at Ripon.

Wilfrid's renown stemmed from his significant role in eliminating the Celtic church discipline from England and setting a precedent of appeal to papal authority. He also contributed greatly to the firm establishment of the Benedictine Rule and the revitalization of church architecture in England.

William I (1027/28–1087; r. 1066–87)

First Norman king of England; known as “the Conqueror.” Born in 1027 or 1028

at Falaise in Normandy, William was the only, but illegitimate, son of Duke Robert of Normandy. His mother, Herleva, was the daughter of a tanner or, more probably, an undertaker of Falaise. Subsequently Robert married her off to a minor noble from the Seine Valley, Herluin de Conteville, by whom she had two further sons, Odo, later bishop of Bayeux (from 1050), and Robert, subsequently (from ca. 1060) count of Mortain.

William became duke of Normandy at the age of seven, when his father died in July 1035 while returning from a pilgrimage to Jerusalem. That he became duke at all, given his age and illegitimacy, was probably due to the lack of other candidates. Though Robert had taken the precaution to have him formally designated duke before departing for the Holy Land, William's rule in Normandy was to face serious challenges for more than twenty years. Law and order collapsed in the duchy during his minority, ducal power and property were usurped by contending nobles, and several members of his court, including some cousins, were murdered in factional disputes. This disorder culminated in a serious rebellion in western Normandy in 1047, led by Count Guy of Brienne, suppressed only with the help of the French king Henry I, who assisted William in defeating the rebels at the Battle of Val-es-Dunes near Caen.

In the years immediately after this success the domestic situation in Normandy was stable enough for William to start aggressive operations on his southern border, capturing the frontier fortresses of Domfront and Alençon in 1051/52. This in turn brought him into conflict with the overlord of Maine, Count Geoffrey Martel of Anjou, and with his erstwhile ally King Henry, and was also followed by renewed revolt in Normandy by a hitherto loyal supporter, his uncle Count William of Arques. The duke's position was saved by his own military prowess and activity, and smashing defeats were inflicted on French armies at Mortemer in 1054 and Varaville in 1057. The latter marked the end of the young duke's struggle for survival.

From 1062 onward William's chief concern seems to have been the acquisition of the county of Maine, after the death of the childless Count Herbert II. He was aided in this by the fact that the new king of France, Philip I, was a minor, while Anjou was weakened by a succession struggle between the sons of Geoffrey Martel. By 1065 William had placed a garrison in Le Mans, installed a Norman bishop, secured the fealty of the leading nobles of the county, and had his eldest son, Robert, recognized as count. But his hold over Maine was never fully consolidated and was to remain a problem for the rest of his life.

In 1051 the childless king of England, Edward the Confessor, had designated William, his cousin, as his successor. One source suggests that the duke visited England in 1051. This seems unlikely, given how difficult his position was in

Normandy at that time; probably Archbishop Robert of Canterbury (a Norman) had acted as intermediary while on his way to Rome in that summer. Whether Edward persisted in his intention of having William as his heir also seems doubtful; he may have changed his mind several times. William's chance of securing the succession was much enhanced when his potential rival, Harold of Wessex, Edward's brother-in-law, visited Normandy in 1064 or 1065 and was persuaded or forced to swear fealty to the duke and to support his claim. Many details remain obscure; we cannot be certain why Harold went to Normandy, whether Edward sent him or not, or even the date of his visit.

Nor did it have any immediate effect on the English succession. When Edward died on 5 January 1066 Harold succeeded him. The designation of 1051 and Harold's oath had given William a *casus belli*, and he used them to orchestrate a propaganda campaign to secure recruits from all over France and to gain papal support. The invasion was launched, after some delays, at the end of September 1066, and on 14 October the Norman and English armies met a few miles north of Hastings. After a desperate struggle the English were defeated and Harold killed. Within two months the surviving English magnates and the church leaders had surrendered, and William was crowned king of England in Westminster Abbey on Christmas Day 1066.

This merely marked the start of the conquest of England. To begin with William sought to emphasize the continuity of his rule with that of Edward, and to use Englishmen in his government. His first earl of Northumbria, Copsi, was an Englishman, and even Archbishop Stigand of Canterbury, whose appointment had been canonically dubious and who was regarded with disapproval by the papacy, was retained until 1070. But widespread rebellion, in the west and north in 1068, and more seriously in the north and in the fen country of East Anglia in 1069 and 1070—the latter with Danish support—led to a major change in policy and the widespread replacement of English landowners by Frenchmen. The king was under obvious pressure to satisfy what Orderic Vitalis called "his envious and greedy Norman followers." So serious was the revolt of 1069 that William resorted to the harshest of measures to quell it, devastating much of Yorkshire to prevent further rebellion and thereby condemning many of the inhabitants to death by starvation. Inured as they were to violence, contemporary chroniclers were shocked by the barbarity of his actions.

But this drastic treatment worked. The last bastion of English resistance, the Isle of Ely, surrendered in 1071. Thereafter William's rule in England was not seriously threatened. There was admittedly another rebellion in 1075, led by the Norman earl Roger of Hereford and the Breton earl Ralph of Norfolk, but this was crushed by William's subordinates, under the direction of Archbishop Lanfranc, while the king remained in Normandy. Indeed, in his later years,

William was largely an absentee ruler, not visiting the country at all between 1076 and 1080 and spending eleven of his last fifteen years in Normandy. In his absence England was ruled largely by his half-brother Odo of Bayeux (until his disgrace and imprisonment in 1082) and Lanfranc. Queen Matilda played a similarly crucial role in Normandy until her death in 1083.

After 1070 renewed problems on the Norman frontiers helped to keep William in the duchy. The king suffered the only serious military setback of his life at Dol on the Breton border in September 1076. Relations with the king of France, Philip, deteriorated. Maine became restive under Norman rule. And worst of all, the king's son Robert Curthose rebelled, probably in the spring of 1078. There was an indecisive battle at Gerberoi in eastern Normandy in January 1079, in which William was slightly wounded. Although there was a temporary reconciliation early in 1080, relations remained difficult and Robert went into exile again in 1084. The root of the problem seems to have been Robert's wish to have an independent role in Normandy, of which he had been designated as duke before Hastings, and William's determination to keep his son firmly under supervision.

William's last visit to England came in 1085–86, to organize the defense of the kingdom against a threatened Danish invasion. But the most important result of this visit was the Domesday Book. Its purpose has been much debated. Probably it was a guide to both the resources of the country and the ownership of particular estates, made necessary by the large-scale redistribution of land caused by the Conquest.

The first draft of the Domesday survey was probably nearly completed when William held a court at Salisbury in August 1086, where he exacted a comprehensive oath of loyalty from his magnates and the more important of their undertenants. Eleven months later, when campaigning at Mantes on the Norman border, he was taken seriously ill. He was carried to Rouen, where he died on 9 September 1087. On his deathbed he agreed to Robert's succession as duke of Normandy, his second surviving son, William Rufus, succeeding as king of England. He was buried at the monastery of St. Étienne at Caen, which he himself had founded a quarter of a century earlier.

Much of William's success came from a partnership with a small group of Norman nobles, such men as William Fitz Osbern, Roger de Montgomery, and his own half-brothers. It was not surprising that this group of seven or eight men were the chief beneficiaries of the Conquest. In ecclesiastical matters his chief adviser was Lanfranc, abbot of St. Étienne at Caen in 1063 and archbishop of Canterbury in 1070. Though favoring the moral reform of the clergy, William was always concerned to vindicate his own control of the church and to limit papal interference. He was not above appointing his half-brother Odo as bishop when the latter was well below the canonical age. After

1066 he was generally content to adopt existing English laws and institutions but to exploit them to the full; contemporaries agreed that his government was harsh and predatory. The Anglo-Saxon Chronicle called him “stern beyond all measure to people who resisted his will.”

William was tall, strong, and of harsh voice and imposing appearance, tending to corpulence in later life. He married ca. 1050 Matilda, daughter of Baldwin V of Flanders, by whom he had four sons (one of whom, Richard, died young) and four or perhaps five daughters.

William II (William Rufus; ca. 1060–1100; r. 1087–1100)

The third of the four sons of William the Conqueror, duke of Normandy, and Matilda of Flanders. Like his elder brothers, Robert Curthose and Richard, Rufus (the sobriquet means “the Red,” for his ruddy complexion) was educated as a knight in his father’s household. In 1087 the Conqueror, on his deathbed, bequeathed England to Rufus—and may have wanted him also to have Normandy and Maine—because Richard had died and the disloyal Robert was in exile, owing to his premature attempts to succeed to the French fiefs. These, however, Robert obtained while Rufus was negotiating his coronation (at Westminster Abbey, 26 September 1087). The youngest brother, Henry, possibly his mother’s heir, got no land at his father’s death but succeeded Rufus as king in 1100.

William Rufus was a successful ruler. His basic ambition, to restore and extend the Norman Empire, was helped by his steadiness of character, courage, and chivalry but hampered by his lack of natural dignity. A homosexual, he never married, although it is possible that in 1093 he became engaged to Edith (Matilda), daughter of Malcolm III, king of Scots, and simply deferred the obligation for too long. No skeptic or pagan, he was a considerable benefactor to several English churches. But, like many soldiers, he was irreligious and profane.

With the Norman dominions divided between them, the two brothers Robert and Rufus fought a sporadic war of succession, mainly by seducing each other’s vassals and inciting rebellion. This ended in 1096, when Robert decided to go on the First Crusade and borrowed 10,000 marks of silver from Rufus on the security of the duchy. The king, without ever using French titles, effectively governed his disparate group of lands as a unit and began to rectify its damaged frontiers. In the British Isles he was unable to undo the great Welsh insurrection of 1094 but did tame Scotland. In 1092 he occupied Cumbria and Carlisle; after Malcolm’s death while raiding England in 1093, he established Malcolm’s son Edgar as a grateful client king (1097).

On the Continent Rufus aimed at recovering both his brother’s and his father’s losses. Campaigns in the Vexin in 1097–98 were inconclusive, but in 1098 he reconquered Maine. In 1099 he was toying with the idea of taking

Poitou in pledge for a crusading loan to William IX of Aquitaine. His wars, fought mainly by mercenaries and subsidized allies, were expensive, and he had to exploit his financial and judicial rights extortionately.

A generous master, Rufus was exceptionally well served. His ablest and most trusted minister in England, whom he inherited from his father, was the chaplain Ranulf Flambard, who rose to become chief justiciar and bishop of Durham. In Rufus's reign, after years of innovation, the Anglo-Norman governmental system was consolidated and efficiently developed. The quest for money pressed heavily on all classes, especially on the farmers, the main producers of wealth, and on the church, which was both rich and relatively defenseless. The enlargement of the royal hunting preserves, the forest, was resented by the barons.

Like his father Rufus was determined to remain head of the English church and as free from papal interference as possible. His appointments to bishoprics and royal abbeys, although usually bought, were generally respectable. In 1093, when he thought he was dying, he forced Anselm, the saintly and learned abbot of Bec, to become archbishop of Canterbury. This appointment Rufus lived to regret, for Anselm castigated his immorality and ill-treatment of the church. When Anselm, in despair at his failures, went into exile (1097), Canterbury and the other bishoprics and abbeys that fell vacant were plundered by royal custodians. Rufus avoided papal reprisals by diplomacy and bribes.

In 1100, with Robert Curthose on his way back from the Holy Land with a Sicilian bride and her dowry, Rufus had to decide whether to let his brother redeem Normandy. But on 8 August, when he and his brother Henry were hunting in the New Forest, he was killed by an arrow, shot, it is believed, by Walter Tirel, count of Poix, one of his guests. Although conspiratorial theories have been proposed to explain William's death, such accidents, particularly when deer were driven past hunters stationed at butts, were common. Cut off in his prime, William Rufus's most lasting monument is the great hall in the Palace of Westminster, still an impressive building.

William Marshal (ca. 1145–1219)

William served five kings—Henry II, Henry the Young King (Henry II’s eldest son), Richard I, John, and Henry III—and rose through their patronage from a landless younger son to earl of Pembroke. In youth he made his name for skill in tournaments; as a mature baron he was the leading authority on feudal custom and a byword for feudal loyalty.

Son of John Fitz Gilbert (also called John Marshal), the boy William barely escaped death as hostage for his father’s allegiance to Stephen. He later came to the attention of Henry II and was appointed guardian for his eldest son. When his young lord died prematurely, William carried out his crusading vow. On returning he served Henry II. In Henry’s last retreat before the pursuit of his rebellious son Richard, William saved the day by killing Richard’s horse under him.

A few days later Richard became king at his father’s death, but he recognized William’s loyalty to his feudal lord and took him into his own service. The new king even carried out Henry’s promise to marry William to Isabel de Clare, daughter of the earl of Pembroke. Under Richard I William was

justice, sheriff, and military leader and marshal in the royal household at the death of his elder brother.

On Richard's death William favored John for the throne over John's nephew Arthur of Brittany. He continued to support John in the Barons' Wars and took part in the negotiations leading to Magna Carta. In 1216 he became regent for the boy king Henry III as his final service to the Angevin line. The description of the Marshal's deathbed in 1219 provides a vivid picture of the values of a feudal baron and his society. His tomb effigy is in the Temple Church, London.

The main source for William Marshal's life is a lengthy poem in Norman French, composed by a professional minstrel at the behest of William's son, William Marshal the Younger, and based on the testimony of John d'Erley, a close companion of the elder William.

William of Malmesbury (ca. 1095–ca. 1143)

Historian and Benedictine monk. William extended the English historical tradition begun by Bede to the first part of the Anarchy (1137–42), in his *Gesta regum Anglorum* (*History of the Kings of England*), *Historia novella* (*Recent History*), and *Gesta pontificum Anglorum* (*History of the Bishops of England*). He attributed the Norman Conquest to a decline in Anglo-Saxon morals and religion. Other works include *Polyhistor* (an anthology of selections from

classical and patristic writers), lives of Sts. Wulfstan and Dunstan, a history of Glastonbury, and an account of the miracles of the Virgin. His histories had considerable influence on later historical writings in England and are of literary interest for their numerous biographical and legendary anecdotes.

William of Ockham (ca. 1285–1347)

Philosopher and Franciscan theologian. William studied in London and Oxford. His writings include commentaries on the *Sentences* of Peter Lombard and lectures on Aristotle's logic and physics and reflect the influence of his fellow Franciscan John Duns Scotus (d. 1308).

Ockham was an outstanding dialectician and theologian, but his outspoken views were not without controversy. Although summoned in 1324 to the papal court at Avignon to justify his teaching on transubstantiation, there was no formal condemnation of his doctrines. His study of the papal constitutions on apostolic poverty led to his involvement in the debate over Franciscan poverty and the attack on John XXII (1316–34) as a heretic. Under the protection of

Emperor Louis IV of Bavaria, the political opponent of the pope, Ockham wrote several political works, including the *Dialogue*, where he discussed his views on the errors of the papacy and its rights with respect to the Holy Roman Empire.

Ockham's doctrines marked a turning point in the history of philosophy and theology. He held that logic was separate from theology, that they are both true, and that they represent different kinds of truth. Thus theology cannot be proved by logic. This *via moderna* ("modern way") marked the separation between faith and reason and was a hallmark of late-medieval philosophy.

Ockham is usually associated with the rule of "Ockham's razor." Known also as the law of parsimony or economy, the dictum became a foundation stone of scientific method: the simpler a theory or explanation is, the less chance for error.

Ockham died 10 April 1347 in Munich and was buried in the Franciscan church. His nominalist philosophy, which emphasized the fundamental reality of individually existing things, and his political theory on the limitation of papal power, were to be highly influential in Reformation thought.

William of Palerne

An unrhymed alliterative poem of 5,540 lines, composed in the mid-14th century and thus one of the earliest datable poems of the Alliterative Revival. The author, who names himself William, declares he is writing for Humphrey

de Bohun, earl of Hereford and Essex from 1336 to his death in 1361. The poem is a courtly romance of the most exotic sort, rich in fantastic adventure, involving a prince transformed into a werewolf; a wicked stepmother; multiple disguises; and at its center two young lovers, the foundling William and the princess Melior. Its source is the French poem *Guillaume de Palerne* (written ca. 1200), which the English translator treats with freedom and intelligence. About 200 lines are missing from the beginning of the English poem, but the story may be reconstructed from the French text.

William, young son of the king of Sicily, is rescued from his treacherous uncle by a werewolf, who is really the enchanted son of the king of Spain, and is brought up by a cowherd. The emperor of Rome discovers him, admires his grace, and brings him back to his palace, where William and the emperor's daughter Melior fall in love. Their secret idyll is shattered when the emperor betroths Melior to the Greek prince Partenedon. The young couple elope dressed in bearskins and are guided to Sicily by the werewolf, who provides them with deerskins as a change of outfit to elude their pursuers. Once in Sicily, William rescues his widowed mother the queen from the Spanish king, who is attempting to win William's sister Florence for his own son Braundinis, and forces the king to summon his wife to disenchant the werewolf, now revealed as the king's son Alphouns. Alphouns falls in love with Florence, and Braundinis falls for Melior's cousin. Everyone gets married, Alphouns becomes king of Spain, while William succeeds as king of Sicily and emperor of Rome; he rewards his foster father, the cowherd, with an earldom.

Many of the incidents are recognizably drawn from folktales, but, exceptionally among poems of the Alliterative Revival, the central theme is love, touchingly expressed in a soliloquy by Melior (lines 433–570) and in passionate scenes between the lovers (e.g., lines 850–1040). By contrast the battle scenes, at which alliterative poetry characteristically excels, are undistinguished. The writing is at times clumsy, though some of the slackness and ineptitudes are probably due not to the author but to the scribe of the single defective manuscript (Cambridge, King's College 13, part I), copied not long after the poem was composed. From an early date the manuscript was bound with another by a Gloucestershire scribe, and although there are some indications that the author of *William of Palerne* was from the same county, the dialect of the manuscript itself is mixed.

William of Wykeham (ca. 1324–1404)

Bishop of Winchester. Wykeham came from a modest rural family at Wickham (Hampshire), attended school but not university, and entered the service of Edward III as a surveyor of buildings, rising to the top of the royal administration as chancellor in 1367. He also acquired numerous church benefices, culminating in his bishopric (1367–1404), and became rich. English defeats in France caused him to lose the chancellorship in 1371. He was tried for corruption and deprived of his possessions but returned to favor under Richard II in 1377 and served as chancellor again in 1389–91.

Wykeham used his wealth to endow Winchester College, a school for 70 pupils (founded 1382), and New College, Oxford (founded 1379), for 70 university students recruited from the Winchester pupils. His aim was to train skilled clergy to enhance the worship and learning of the church, and the colleges succeeded in doing so. In design his scheme was grand, original, and influential. It dwarfed all previous university colleges and school endowments, integrated a school and a college more closely than before, and was widely copied later on, notably at Eton College, Kings College (Cambridge), Magdalen College (Oxford), and the new cathedral foundations of Henry VIII.

Wills and Testaments

The practice of distributing property after death seems to have come to the Anglo-Saxons under the influence of Christian missionaries, who urged that individuals be allowed to dispose of some of their wealth by a post mortem gift of alms. By the 9th century many individuals, especially among the wealthier classes, exercised posthumous control over the devolution of at least part of their land and chattels. The element of “gift for the soul” is evident in virtually all testaments (*cwide* in OE) that survive. This religious motive was to remain strong throughout the Middle Ages.

With the coming of the Normans English usage came under greater influence from the testament as developed by canon law, and by the late 12th century the canonical testament, or last will, was becoming the norm. It involved simplified requirements for validity and the appointment of an executor to act for the deceased. As the use of the testament was extended to more and more of the population, the church court became the ordinary supervisor of implementation. It made a preliminary judgment as to the validity of the will, assigned administration of the deceased’s property to the executor, received the final account, and dismissed the executor when the will had been implemented. Where there was dispute, the church court usually settled the matter. In cases touching land and in some pleas of debt the matter was settled by the civil courts.

If they were of legal age and capacity, all who had the right to own property had the right to dispose of at least part of it. Children and mentally incompetent adults who owned property were excluded. Under ordinary circumstances members of a religious order were denied ownership of property, though they sometimes made wills that were implemented. Married women, who by common law owned no chattels, had no right to make a will, though their husbands might permit it and often did. Similarly the unfree—the

vast majority of the population—were deprived of this right; their lords claimed ultimate control of their chattels. On many manors, however, they were allowed to bequeath part of the movable property. All through the Middle Ages the church applied steady pressure to extend the right of bequest to all adults, and though common law never conceded the point, the teaching seems to have been of major practical importance.

Bequests of chattels were carefully distinguished from those of land. In the custom of the 11th century through the 13th the father of a family was usually allowed to control only one-third of his chattels. These could be given in alms or to other persons or purposes as the testator wished. Of the two remaining thirds one went to the widow, one to the children. Were there no children, the wife received one half and the husband could dispose of the remainder by will. Toward the end of the Middle Ages these restrictions were removed through much of England.

The bequest of land was forbidden by common law before the end of the 12th century. There were exceptions to this in some boroughs, on royal demesne, and on some manors where peasants were occasionally allowed to bequeath their holdings. Resistance to the common-law restriction by the landed classes was constant, and various expedients were developed to circumvent it. Of these the most important was the “use,” an act whereby property was granted during the lifetime of an individual to persons of trust who, when the owner died, were expected to deliver it to beneficiaries identified by the donor before death or in his will.

The use could not be enforced by common law, but after attempts by church courts to do so, relief was given by chancery. Many of the cases that appeared before this court from the late 14th century onward involved post mortem distributions of land in this way. In many cases the beneficiary of the use was indicated in the testament of the deceased. This practice was made illegal by the Statute of Uses in 1532, but the reaction to the restriction was so strong that the Statute of Wills was introduced in 1540 to give relief; tenants in fee simple were allowed to dispose of all land in socage tenure and two-thirds of that held in knight service. With this statute the medieval restrictions on the bequest of land came virtually to an end.

Wilton Diptych

The problematic Wilton Diptych ([fig. 149](#)), which belonged to Richard II and is now at the National Gallery in London, consists of two small panels (each wing measures 20.9 by 14.6 inches), hinged in the center, painted in egg tempera on oak. The righthand panel has the Virgin and Child surrounded by eleven angels, one of whom carries a small banner. In the lefthand panel

Richard kneels toward them supported by two other English kings—St. Edmund and St. Edward the Confessor—as well as St. John the Baptist, his patron saints. This iconography clearly relates to that of the Epiphany (Richard was born at this season) and is seen as emphasizing Richard's divine right of kingship. A further reading of the iconography suggests that he is in the process of being received by the Virgin into heaven to join the company of angels.

The exterior of the diptych has a white hart with golden antlers, gorged with a crown and chained (Richard's livery from 1390), adjacent to the arms of Edward the Confessor impaling the quartered royal arms of France Ancient and England. These devices clearly indicate that the diptych was made for Richard himself. Indeed the use of heraldry is strong in the panels: Richard wears his personal badge of the white hart, as well as a collar of broomcods (the angels wear almost identical collars) and his robe is powdered with a pattern of broomcods encircling white harts. The presence of the broomcods (husks or pods of the broom plant) is puzzling. As a traditional emblem of France their appearance has been taken as a reference to Richards second marriage. In 1396 he married Isabella, a daughter of Charles VI of France. However, her absence from the diptych has been cited as militating against this argument. Harvey has suggested that Richard deliberately chose this collar as a means of symbolically investing himself with the power and claims of the French king; Richard styled himself as Richard of Bordeaux. The broomcods (*planta genesta*, from which the word "Plantagenet" is derived) may be an allusion to Richard's ancestor, Geoffrey of Anjou.

The vexed question of dating hinges on these heraldic devices. Suggestions for its date range from Richard's succession in 1377 to the 1410s, several years after his death. Clarke and Harvey make a strong case for a date not earlier than ca. 1395/96 and before Richard's death in 1399. Although the emblem of the white hart had been used at the Smithfield tournament of 1390, there is no firm evidence that he assumed the arms of Edward the Confessor before ca. 1394/95–98. As stated, the broomcods could point to the period of the Anglo-French *détente* of the mid-1390s. Although Richard's youthful appearance in the panel might tell against a date late in his comparatively short life, the painter could have been intentionally idealizing the king, as is often suggested. Further reinforcing this date, however, is a Parisian manuscript, "Un Epistre au Roy Richard" (BL Royal 20.B.vi), written by Philippe de Mézières concerning the Order of the Passion. Clarke has convincingly demonstrated that the banner held by one of the angels in the diptych (representing either redemption or the crusading flag of St. George) resembles that in one of the miniatures in this manuscript, which, in turn, illustrates Richard young and beardless. The manuscript dates to around 1395, when Mézières was founding

the Order of the Passion and seeking Richard as one of its chief patrons. Harvey further narrows the date of the diptych to between summer 1394 and autumn 1395, before Richard grew a beard, and suggests that Richard's costume in the panel compares with that in the Mézières miniature.

Fig. 149. Wilton Diptych (London, National Gallery). Richard II presented to the Virgin and Child by his patron saints. Reproduced by courtesy of the Trustees, The National Gallery, London.

The above evidence may marginally strengthen the argument in favor of a French origin for the diptych. Surviving English wall and panel paintings of the 1390s show nothing exactly comparable; nor does English illumination of this date offer any closer parallel. In comparison with the painted figures in the Byward Tower of the Tower of London, those in the diptych are well articulated and show greater naturalism. This again raises the question of a date for the diptych, Wormald having made some convincing parallels with English miniature painting of the first and second decades of the 15th century. He has compared the style of the right panel with the Annunciation miniature in BL Royal 2.A.xviii of ca. 1403/04–10 and relates the faces to certain portrait heads of the Beaufort Hours (BL Add. 42131) of ca. 1414–20. Although this affinity cannot be denied, Wormald's theory—one supported by Panofsky—that the diptych was a memorial to Richard after his reburial at Westminster Abbey in 1413, is no longer widely accepted. Panofsky believed the work to be English, seeing it as an "Anglicisation of both the Flemish and French traditions."

If datable to the 1390s, it is with extant Parisian work that the closest stylistic correspondences exist. Not only does the often cited Brussels Hours (Brussels, Bibliothèque Royale 11060–61) have two adjacent miniatures that bear a striking formal parallel with the diptych, but like the diptych the faces have both the soft and more rugged types. This does not imply that the diptych is the work of more than one hand but suggests that these differences arose from iconographic factors. If a later date is thought tenable, then the extreme delicacy of the draperies and facial types so notable in the diptych compares with the work of the Limbourg brothers in the *Très riches heures* of Jean, duc de Berry, of 1413–16 (Chantilly, Musée Condé 65). The source of the style of the diptych might equally be sought in Burgundian painting of the 1390s of the circle of Jean Malouel. The sculptured facade of the Chartreuse de Champmol at Dijon by Claus Sluter, of the same decade, has two donors kneeling before the Virgin and Child, supported by their patron saints, and it is therefore reminiscent of both the Wilton Diptych and the Brussels Hours. Although the iconography of the Maestà is Italian, placing the Virgin and Child in a direct relationship with the kneeling donor, supported by a patron saint (or saints), is an idea that was current in French courtly circles at that date. Perhaps the enigmatic diptych was produced in England by a Franco-Flemish painter.

Although both the date and country of origin of the diptych will remain controversial issues, there is no denying that it is a masterpiece of International Gothic painting, outstanding in quality and in the delicacy of its technique.

Scholars have further speculated as to the role of the diptych. Was it intended for private devotion in the context of a chapel, such as Westminster Abbey, or for Richard to take with him for this purpose on campaign, such as those to Ireland in 1394 and 1399?

Winchester

The settlement of Winchester, where the east-west route across the Hampshire chalk downs crosses the River Itchen, has been traced to the 1st century B.C. and was already substantial by the time of the Roman invasion. The Romans built the walls that gave the city its shape throughout the Middle Ages and laid out a rectilinear street plan. Evidence suggests some structural continuity from the Romans into the 9th-century era of Alfred the Great, when the defenses were restored and the street plan redrawn. The river served as a source of water power for several mills, but its use as an artery of transport was always limited and did not extend into the central Middle Ages.

The administrative history of Winchester includes the development and interaction of three distinct authorities: the customs and institutions of the townsmen, of the bishop, and of the king. The townsmen enjoyed laws, customs, and physical boundaries even before the time of Alfred, and these seem always to have served as a strong force in the daily life of the community. By the late 12th century these indigenous elements of administration became embodied in the institutions of the merchant guild and came to be recognized by royal charter.

By 1200 the community came to have a mayor as its spokesman before the king, a common seal, and a governing structure including meetings of bailiffs and citizens, with the mayor and bailiffs remaining closely linked with the guild. At about the same time St. John's Hospital came to serve as both the center of local religious and charitable activities and the meeting place of the mayor and citizens. The city proper continued under the governance of the mayor and, by the 13th century, the familiar formulation of a council of 24 and

a larger assembly representing the free citizenry, all under the authority of the king. This arrangement survived for the remainder of the medieval era.

The presence of several ecclesiastical institutions created a second locus of authority. The bishop held more city land than anyone save the king. His *soke*—the land directly under his control—included much of the area immediately surrounding the town and some land within it; by the mid-13th century this was already administratively distinct from the rest of the city. Hyde Abbey, St. Mary's Abbey, and Winchester College held important claims as well. Like many towns with an active ecclesiastical presence Winchester experienced frequent friction between its secular leaders and the bishop's officers throughout the period.

In addition to these two forces, and following from its close ties to the West Saxon kings, Winchester also constituted a royal borough from an early date. With London it served as the seat of royalty at the Norman Conquest and for a time thereafter. The king's reeves presided over various administrative functions in the 11th century, and by the 13th century the king's interests seem to have been represented by royal bailiffs. The royal palace and the king's castle both symbolized and invited the royal presence, just as the cathedral did the bishop's, and the guildhall the townsmen's.

The economic vitality of medieval Winchester depended more on its early role as a royal city and its rivalry with London than upon any other factors. When London nosed it out, both as an economic center and as the *de facto* capital city, both of which had been accomplished by the 14th century, Winchester declined to the level of most other provincial centers. Its religious institutions, commerce, and manufacturing remained in place, but especially the last two of these were subject to the usual vagaries of economic conditions.

Whether measured in assessed wealth, economic resources, or the vitality of industry and trade, Winchester's economic position underwent a gradual and relative but nevertheless long-term decline between the 12th and the 16th centuries. It ranked seventeenth among English towns in its tax quota, as calculated in 1334; 29th in tax-paying population, as assessed in 1377; 37th in the subsidy ranking of 1523–27. Though its clothing industry temporarily arrested this slide at the end of the 14th century, the Reformation found Winchester once again in physical decay, substantially smaller in population and area than in the 14th century, and its corporate government was plagued by frequent fiscal shortfalls.

Winchester Cathedral

Winchester was the capital of later Anglo-Saxon England, and its Anglo-Saxon cathedral, the Old Minster ([figs. 151–52](#): see WINCHESTER OLD MINSTER), is better known from archaeological excavation than any other. As with most important Anglo-Saxon churches the Old Minster grew outward from an early and modest core to become by the 10th century a building of several sections, with an extended eastern arm ending in a rectangular chapel and a large west block, several times rebuilt, that sheltered the tomb of St. Swithun. In spite of its size and antiquity this church was replaced by the first Norman bishop, Walkelin, by a much larger church set immediately to its south and east.

The Norman cathedral was begun in 1079 and may have been close to completion when Walkelin was buried in it in 1098. Walkelin's church, one of the largest in Romanesque Europe, seems to have incorporated features from diverse sources. The extended apse may be homage to the Old Minster, but most other features of the new cathedral's design were culled from the latest trends in European Romanesque. The three-storied elevation and most of its details are orthodox Norman Romanesque, although the alternating piers of the choir may have been chosen as a reference to the rival royal abbey church at Westminster. The aisled transepts, on the other hand, seem to be part of a general European fashion of the later 11th century, seen most famously in the "pilgrimage" churches of the Continent. The multiplicity of towers originally planned, including a crossing tower, a western tower or towers, and towers flanking the transept facades, suggests rivalry with the imperial cathedrals of the Rhineland. Even the dimensions of the building may make reference to another church, Old St. Peter's in Rome.

Except for the replacement of the original crossing tower, which collapsed in 1107, this prodigious building was not seriously altered before the addition of an early Gothic retrochoir ([fig. 150](#)) and Lady Chapel begun about 1202 by Bishop de Lucy. This eastern addition was probably inspired by the new

eastern work at Canterbury, although its hall-church form has no parallel there. As at Canterbury its function may have been to provide a new and elegant setting for the house saint, in this case St. Swithun, although the evidence is ambiguous. The piers, with their detached Purbeck marble shafts, the complex arch and rib moldings they support, and the elegant outer walls with their dado arcades and double lancets are all characteristic of the mature Early English style.

Fig. 150. Winchester Cathedral retrochoir from the northwest, with Bishop William Wainfleet's chantry chapel. Courtesy of L. Hoey.

The next major alterations to Winchester Cathedral were not made until the mid-14th century. The most important of these was the rebuilding of the

Norman nave. Much of the Romanesque masonry seems to have been left in place, but recut to Perpendicular forms: the heavy compound piers, the unbroken vertical vault shafts of a fair diameter, and the thickness of wall illustrated by the arcade arches and the recessed clerestory windows. The elevation reads as two stories, with a prominent balustrade dividing the arcade and clerestory. Halfway up the latter springs a complex tierceron and lierne vault, anchored by an unbroken ridge rib and decorated with numerous foliate bosses. This vault is structurally a seemingly archaic pointed barrel with interpenetrations over the clerestory windows, an indication of how dominant visual pattern had become in English Gothic by that date. The nave rebuilding was begun by Bishop Edington before his death in 1366, but the bulk of the work was done under Bishop Wykeham by his mason, William Wynford, in the 1390s. The Norman choir was also rebuilt piecemeal in the later Middle Ages, the main elevation dating from the mid-14th century, while the aisles and wooden vault are early-16th-century.

Winchester College

The college of St. Mary Winchester was founded in 1382 by William of Wykeham, bishop of Winchester, providing for “seventy poor and needy scholars, clerks, living college-wise... studying and becoming proficient in grammaticals or the art and science of [Latin] grammar.” Wykeham had already founded New College, Oxford; the two colleges were essentially complementary. The pattern was deliberately followed by Henry VI in the 1440s, when he founded Eton College and King’s College, Cambridge, appointing the Winchester master, William Wainfleet, as the first master at Eton.

Revised statutes of 1400, operative until 1857, provided for a warden, two fellows, three chaplains, three chapel clerks, sixteen choristers, 70 scholars, and a master and usher. In addition up to ten fee-paying boarding commoners could be admitted. Collegiate foundations were in essence religious institutions, but educational activities were given unusual prominence here; by the early 15th century the school’s reputation was attracting pupils as commoners (many, probably, as day-boys) in large numbers.

The highly prized scholarships, meanwhile, were allocated by election to poor scholars aged between eight and twelve who had to be proficient in reading, plainsong, and Latin grammar. Preference was to be given first to the founder’s kin, then to inhabitants of places where Wykeham’s two colleges possessed estates, then to natives of Winchester diocese, then to inhabitants of a band of counties in southern England, and finally to any inhabitants of England.

For the remainder of the Middle Ages Winchester’s pupils, from whom New College recruited exclusively, amply fulfilled the founder’s intentions to educate men for the service of the church. There is little information about the curriculum or teaching methods before the Reformation, but the college archives contain a wealth of records relating to estates, administration, and buildings, among which the 1394 schoolroom is still in existence.

Winchester Old Minster

Old Minster, the first cathedral of Winchester, was known only through documents until excavations between 1962 and 1969 uncovered the largely robbed foundations on a site just north of the present cathedral. From the archaeological evidence, which constitutes essentially a negative imprint of the plan, a complex structural sequence could be determined (figs. 151–52). Spanning four and a half centuries, two major building periods are evident with the early Saxon church incorporated into the late Saxon design.

The earliest structure is identified as the church built by Cenwealh, king of Wessex (642–72), and dedicated to Sts. Peter and Paul. It consists of an aisleless nave, rectangular porticus north and south, and a square east end. Of four circular foundations appearing at regular intervals along the interior nave the easternmost is identifiable as the main altar by four surrounding postholes, which probably held supports for a canopy. The cruciform layout of the plan based on a system of proportions suggests continental prototypes.

In the 8th century a detached tower dedicated to SS. Martin was built 65 feet from the west front. This was followed by the transformation of the east end into a semicircular apse, including new piers for a chancel arch. No further alterations were made to the original design until the early 10th century, when two massive wings were attached to the western end of the nave, thus forming a great facade.

Included in this phase of the structural sequence is a tomb-house built between the church and tower to mark the burial site of St. Swithun, who was bishop of Winchester from 852 to 862 and became the central figure of worship in the 10th century. It was in his honor that Old Minster was reconstructed and greatly enlarged during the episcopates of bishops Æthelwold (963–84) and Alphege (984–1006). Commencing in 971 with the translation of Swithun's relics indoors, a large, double-apsidal structure was then built over his gravesite, linking the west front of the old church to St. Martin's Tower. A few years later massive additions north and south transformed this into a square westwork modeled on continental examples.

Fig. 151. Plan of Winchester Old Minster, ca. 648-ca. 930. Plan: M. Biddle, published in Butler and Morris (1986). Courtesy of the Council for British Archaeology.

At this stage a tomb-chamber was built around Swithun's shrine, which, based on documentary evidence, probably contained half of the saint's relics in a portable reliquary. The other half seems to have been connected to the high altar that was raised above a new, *confessio*-type crypt incorporating the old east end. The addition of smaller lateral apses, echoing those of the earlier link building, may further indicate the presence of Swithun's relics in these sections of the church. Beyond the altar the apse was greatly extended, ending

in an exterior crypt at the eastern tip.

Fig. 152. Plan of Winchester Old Minster, ca. 970-ca. 993/94. Plan: M. Biddle, published in Butler and Morris (1986). Courtesy of the Council for British Archaeology.

The 10th-century additions to the Old Minster reflect changes in the liturgy and the growing importance of pilgrimage and royal ceremony, which in turn relate to Winchester's position as the center of royal authority and monastic reform. The Anglo-Saxon cathedral received its final dedication ca. 993–94, only to be demolished a century later to make way and provide building material for its Norman successor.

Winchester Organa

The 173 organa notated in Cambridge, Corpus Christi College 473 (one of the Winchester tropers), constitute the only large repertoire of European polyphony written down before that associated with St. Martial-de-Limoges in the 12th century. A total of 157 of the 173 belong to a first layer notated ca. 1000; the major part of the rest were notated during the following 50 years. No organa appear in the other Winchester troper (Bodleian Library, Bodley 775), which is not in any case a sister manuscript.

The Winchester corpus includes settings for both the Ordinary and Proper of the mass (processional antiphons, Kyrie, Gloria, Alleluia, Sequence, Tract) and for the office (Invitatory, Responsory). Just over 100 organa (a proportion of two-thirds) relate to the mass; the rest relate to the office. Although parts of this large polyphonic repertoire suggest the intention to create cycles for the liturgical year (especially the 55 Alleluia settings) or substantial sets for

specific feasts (the groups of Matins responsories for Trinity, St. Swithun, and an evangelist's feast), in no sense does the recorded material represent completion of such a project.

The arrangement of the organa in correct liturgical sequence, and by type in separate gatherings, however, argues against any sense in the planning of the manuscript that gaps remained to be filled. It is easier to appreciate the nature of this repertoire against a background of unwritten practice, the improvisation of accompanimental voice lines according to prescribed rules. What is notated in this Winchester book may then be understood as specific examples that were written down and thereby preserved because of their special qualities (the fact that they represent particularly successful organal accompaniments, for example). Although the organa are often repetitive, using the same accompanimental pattern to match common chant phrases and idioms, they also show a significant degree of deliberate variation in such situations. This variation can often be explained as a response to structural qualities of the specific chant. There is thus a sense in which it can be argued that "the notated organa are to some extent composed music" (Fuller).

The organa are notated in semidiastematic insular neumes (i.e., they are only partially heightened in relation to pitch) and as single lines, without the chant voices on which they are based. Because of the difficulties of identifying the exact versions of chant melodies for which the organa were formulated, as well as those of interpretation of the notation, it is not possible to arrive at definitive reconstructions. Nevertheless, with knowledge of the main procedures employed—movement parallel to the chant at an interval of a fourth below, the holding of one tone against a moving chant voice, the observance of boundaries beyond which, in given situations, the organal voice does not move, and the arrival at a unison with the chant at points of cadence (*occursus*)—it is possible to make useful transcriptions and thus to understand something of the stylistic aesthetic of the organa.

While conforming in significant ways to the strategies spoken of by contemporary theorists, the organa represent an individual local repertoire, worked out according to its own conventions and rules. The name of Wulfstan, cantor at Winchester, poet, and author of a musical treatise (no longer extant) and of a long description of the magnificent Winchester organ, has been associated with both composition and notation of the organa. No identified example of his script survives, making this impossible to prove. In their unusually literary rubrics and their artful nature the Winchester organa can be set alongside the Winchester tropes as evidence of considerable interest in sophisticated musical techniques at Winchester in the years before and after the millennium.

Winchester Psalter

BL Cotton Nero C.iv ([fig. 153](#)) contains the Psalms and Canticles in both Latin and Anglo-Norman French and 42 prayers in Latin, some with Anglo-Norman French versions. The text is preceded by a 38-page miniature cycle including scenes from the life of Christ, the life of the Virgin, and the Last Judgment, with inscriptions in Anglo-Norman French. Initials containing scenes from the life of David and floral ornament accompany the text.

The approximate date and provenance of the manuscript have been established on the basis of entries in the calendar and text. The absence of an entry for St. Edward the Confessor suggests that the manuscript was completed before his canonization in 1161. The association with Winchester was suggested on the basis of one of the private prayers following the psalms, which is addressed to St. Swithun and states that the petitioner offers his prayer in the house (*aula*) of the saint. This points to the Priory of Winchester Cathedral, since it was dedicated to St. Swithun.

The importance of the manuscript is due mainly to its extensive miniature cycle, which with 82 separate subjects is one of the most extensive cycles to survive from the mid-12th century. The choice of scenes, their iconography, and the juxtaposition of certain scenes are unusual and noteworthy. Equally significant is the way the artist enlivened the cycle with some of the most expressive caricatures in English art.

The style of 35 of the illuminated pages first appears in the Bury Bible (Cambridge, Corpus Christi College 2) in the 1130s. It is characterized by byzantinizing head and body types and by the use of wet or clinging drapery that falls over the figures in curvilinear folds. Another distinctive feature of the style is the use of large, luxuriant flowers with fine striations and hanging berries. Both the figural and floral compositions are more highly stylized and mannered than those in the Bury Bible, supporting a date around the middle of the century. They are also carried out primarily in a line-and-wash technique, with solid blue backgrounds, in contrast to the Bury Bible's rich body color. Two full-page miniatures depicting the Death of the Virgin and the Virgin Enthroned stand apart from the rest in their use of opaque body color and in their remarkably byzantinizing style, for which many direct parallels with contemporary Byzantine art have been suggested and which may have been intended to emphasize their similarity to eastern icons.

The iconography of the miniatures was derived from a wide range of sources. The illustrations from Genesis and Exodus incorporate a wealth of details that ultimately reflect an ancient tradition. Wormald detected Byzantine elements, while Haney emphasized western models having much in common with the early Christian Cotton and Vienna Genesis manuscripts. There are numerous indications, however, that this ancient source had already passed through the hands of Anglo-Saxon artisans, and it is generally agreed that Anglo-Saxon sources also influenced the David scenes. The New Testament illustrations incorporate not only Anglo-Saxon features but also others reflecting Ottonian art and models developed in 12th-century English and continental centers. One page, fol. 4, stands apart from the rest in that it illustrates Old Testament and apocryphal New Testament subjects. The exact identification of some subjects and reasons for their juxtaposition remain controversial. Wormald and Haney emphasize themes related to the Virgin and her ancestors, while Cahn, Witzling, and Henderson stress the importance of Old Testament kingship.

"Winchester School" of Illumination

In the century before the Norman Conquest southern England witnessed one of the great flowerings of medieval art. From the time of Warner's 1910 publication of the *Æthelwold Benedictional* (BL Add. 49598; [fig. 26](#): see *BENEDICTIONAL of ÆTHELWOLD*) and Homburger's 1912 study of Winchester books works from this region and period have been attributed to the "Winchester School." The primary center was the ecclesiastical and royal city of Winchester, where the style originated, but it was not confined to that city, flourishing in other reformed Benedictine monasteries including Canterbury and Glastonbury. While a chronological development is discernible, many "Winchester School" manuscripts cannot be securely dated or located on the basis of painting style alone. This fact reflects considerable mobility among the monastic artists and also widespread English receptivity to the characteristics of the style.

Works of the Winchester School fuse a distinctive and expressive figural style with lush acanthus ornament entwined in golden frames. Figures, foliage, and frames interpenetrate, the forms of foliage and drapery in particular echoing each other and creating animated compositions with unrivaled decorative qualities. Desham has emphasized the latent insular character of these highly ornamental pages, in many of which a *horror vacui* and lack of real space hark back to Hiberno-Saxon art.

The generally well articulated figures of the school are based on

monumental and classicizing English figures of around 950, labeled by Wormald the “first style.” The essentially sober figures are energized by numerous stylistic devices: fabric hems flare in multiple trumpet folds and flickering pleats, while amply folded draperies are enhanced with glittering and dynamic patterned lines that often hide the body completely. Both Wormald and Alexander have emphasized the Carolingian components of the style, though Wormald felt that it could not derive entirely from Carolingian art. Deshman identified the extra element as a strong Middle Byzantine contribution, pointing in particular to the characteristic use of linear double-line folds. The blend of disparate stylistic elements was subordinated to an insular taste for intricate linear decoration, resulting in the distinctive figures of the “school.”

No less distinctive are the frames, and here again there was creative synthesis in response to indigenous taste. Fleshy and classicizing acanthus ornament from the Carolingian Metz School was married to paired, bossed frames of the Franco-Saxon School. The Winchester masterwork, *Æthelwold's Benedictional*, shows numerous variations on these frames. Early in the book the foliage is confined within the parallel boundaries; further on it bursts out and twines exuberantly through the bars, creating what is essentially 10th-century interlace. Later manuscripts have frames with more attenuated or straggly acanthus.

The “Winchester style” appeared in a developed form in the New Minster Charter of 964 (BL Cotton Vespasian A.viii; [fig. 101](#): see *NEW MINSTER CHARTER*) and was almost immediately brought to a peak in the *Æthelwold Benedictional*. Its formula of luxuriantly framed initial pages facing framed miniatures was repeated in a closely related but slightly later pontifical now in Rouen (*Bibliothèque Municipale Y.7*), and in the early-11th-century “Missal” of Robert of Jumièges (*Rouen, Bibliothèque Municipale Y.6*). Lush Winchester frames decorate many important Gospel books, including Cambridge, Trinity College B.10.4, and the *Grimbald Gospels* (BL Add. 34890); the latter incorporates unique iconography into roundels in the frames, and several other Gospel books have figural decorations at these points. Other manuscripts of the school also varied the synthesis. Particularly influential was the *Ramsey Psalter*, copied between 974 and 986 (BL Harley 2904), in which acanthus ornament married to a Franco-Saxon letter structure yielded the first of a long series of magnificent *Beatus* initials in English psalters. A monumental full-page Crucifixion in the same manuscript was executed in the expressive medium of colored line drawing that was really a reinterpretation of the linear Winchester figural style and was to become a prominent element in art of the Winchester School in the 11th century.

The restless, energetic tendencies of Winchester figural style increased

toward the millennium, when they were complemented by the exposure of Anglo-Saxon artists to the Carolingian Utrecht Psalter. This 9th-century masterpiece of illusionistic drawing was copied at Canterbury in the 11th century, and elements of both its iconography and its style were absorbed into the southern English vocabulary. These were manifest in many 11th-century drawings, including those of the New Minster Liber Vitae and Ælfwine Prayerbook (BL Stowe 944 and Cotton Titus D.xxvi and xxvii), and a psalter of unknown origin, Paris, BN lat. 8824.

As the 11th century progressed, the English love of pattern reasserted itself in Winchester School depictions of figure and drapery. This can be seen particularly in the Tiberius Psalter of about 1060 (BL Cotton Tiberius C.vi; [fig. 139](#): see TIBERIUS PSALTER), which in addition to several Winchester frames with attenuated and straggly acanthus has a cycle of colored line drawings. These are executed in a forceful and angular style that already presages the Romanesque at the very time that it marks the end of the Winchester School.

Winchester Songbook

The most significant collection of polyphonic songs to survive from later medieval England is a group of eighteen—ten in English, four in French, and four in Latin—gathered in a separate quire ruled for music near the rear of a modest paper miscellany whose main contents are sermons (CUL Add. 5943, fols. 161–169). Analysis of scribal hands and watermarks, English dialect, and the evidence from entries on flyleaves, most recently and extensively reviewed by Dobson, establishes a fairly secure date and provenance for the music. It appears to have been copied by (or for) Thomas Turk at Winchester College between 1395 and 1401 (perhaps by 1398) and represents a collection put together for recreational use there by the scholars and fellows in hall on feast days during Christmastide. Turk, a fellow of Exeter College, Oxford, from 1385 to 1399, was also a fellow of William of Wykeham's new foundation at Winchester College from 1395 to 1398 and again briefly from 1400 to 1401 before a later career as vicar, rector, and eventually Carthusian monk. The songs are anonymous save for one, "Thys yol," whose lower part is inscribed "quod Edmundus." An Edmundus was a clerk of the chapel at Winchester College and *informator choristarum* (instructor of the boy choristers) in 1396–97; he may well have been the song's poet or composer. Provenance is reinforced by the presence of one song, definitely a local product, that sings the praises of the city of Winchester ("Me lykyth ever the lengere the bet / by Wyngestyr that ioly syte"), and the season of year in which they were enjoyed is suggested by songs for Yuletide ("Thys Yol" and the carol "Lolay lolay / As Y lay on Yoleis nyght").

The Winchester collection's mixture of songs in Latin, French, and English is typical of insular sources of lyrical verse. The English and French settings are similar in form and style, favoring six-eight rhythms, a two-voice texture of texted melody over a textless supporting tenor, and virelai form (ABB). The

song repertoire of the manuscript Bodl. Douce 381, though smaller (five songs in English, two in French), is remarkably similar, and the two sources share one piece in common, the English song “I rede that thu be ioly and glad.”

Winchester Tropers

Two 11th-century trope manuscripts from Winchester's Old Minster: Cambridge, Corpus Christi College 473, and Bodleian Library, Bodley 775. Together they form our most important source of information concerning liturgical music in Anglo-Saxon England. The main corpus of the Cambridge troper was probably copied early in the 11th century, and it has been plausibly conjectured that Wulfstan of Winchester, cantor at the Old Minster and author of the metrical *Life of St. Swithun*, may have been one of the scribes. Additions, some on new parchment, were made during the course of the century. Bodley 775 was written in the middle of the 11th century and is known to rely in part on a Winchester manuscript of the 970s. Additions were also made to this manuscript, and some of the original notation was modernized in the 12th century. It is preserved in its 12th-century binding.

As is the case with most tropers, the Winchester manuscripts contain not only tropes (musicotextual embellishments to the sung portions of the mass) but also other genres of chant. The Cambridge manuscript is famous for its repertoire of organa (new melodies sung as counterpoint to existing chant melodies). The Bodley manuscript, better termed a cantatorium (a cantor's book) than a troper, contains virtually all of the genres of chant customarily performed by the cantor rather than the choir at mass. Both manuscripts, in contrast to most continental tropers, have the character of prescriptive liturgical books, that is, they contain a limited repertoire explicitly organized for performance in the celebration of the mass. They are also extremely handsome manuscripts by comparison with their continental counterparts.

The repertoire of tropes contained in the Winchester tropers includes both native English compositions and imported, mostly French, pieces. The continental tropes were probably learned through Winchester's contacts with Corbie and Fleury at the time of the 10th-century Benedictine monastic reform. The English tropes, which are all in quantitative verse (either hexameters or elegiac distichs), were probably composed at the Old Minster either during the episcopate of St. Æthelwold (963–84) or within a generation of his death. The English pieces, or a good number of them, may be the work of Wulfstan of Winchester, whom we know to have been knowledgeable about music and to have been composing verse in this period. The music in both manuscripts is written in typically Anglo-Saxon neumatic notation with a nearly perpendicular vertical axis. In principle this notation is adiaستمatic

(i.e., it conveys only the shape and not the exact pitches of the melodies), but sometimes relative pitch is indicated through the use of significative letters.

Windsor, St. George's Chapel

Chapel connected to Windsor Castle, the primary English royal residence. The rebuilding of the chapel was the most important architectural undertaking of Edward IV (d. 1483). It functions as the seat of the Order of the Garter, the premier English chivalric order, and as a royal chantry chapel and mausoleum. It was given a vast, cathedrallike form and scale for these reasons but also for one more: in legends of Arthur, which had a firm hold on the imaginations of English royalty, Camelot was associated not only with the Round Table but with a wondrous church.

As originally conceived, the chapel was to have a choir with seven bays surrounded by a square ambulatory, a crossing with lantern tower, transepts with polygonal ends, and a nave and aisles of only six bays. This initial plan called for 26 freestanding piers, the same number as there were Knights of the Garter (the normal total of knights needed to form two tournament teams of thirteen each, based on Christ and the apostles). This symbolism was lost, however, ca. 1503, when funding patterns changed, and it was decided to extend the nave by one bay so that polygonal chantry chapels could be added.

Because of the restrictions of the site the bays are extremely narrow. By

contrast the clear span of the central vessel is close to 36 feet. A frieze of angels, which both separate and link heaven and earth, encircles the nave and choir just below the clerestory windows.

The stylistic sources for the design evolved from the choir of Gloucester (paneling treatment) and the nave of Canterbury Cathedral (pier form and three-tier aisle windows).

The square aisle bays are covered with fan vaults, while the central vessels are covered with dazzling lierne vaults of amazing virtuosity, the bosses of which are carved with the heraldic devices mostly belonging to individual Knights of the Garter, who subscribed to the construction. Flat four-centered arches are employed throughout; and it is this astonishing flat pitch, which is even reflected in the vaulting of the central vessels, that gives distinctive character to the interior spatial conception.

Construction began in 1476–77, but planning went back to 1472–73; the surveyor of the work was Richard Beauchamp, bishop of Salisbury, while the first master mason, to whom the initial design is attributed, was Henry Janyns. Before 1483 the foundations were entirely laid, the choir and aisles were carried up first to their full height and roofed in but not vaulted, the transepts were partially built, and the nave was built in steps down, from bay to bay, until one bay east of the present front. In 1494 Henry VII started the rebuilding of the Lady Chapel, which he intended to be his future burial place and that of Henry VI. In 1498 Henry abandoned this location in favor of Westminster Abbey, and construction on the Lady Chapel came to a halt. The nave and west front, with its octagonal turret buttresses, were finished ca. 1503–06. Evidence in a 1506 contract with John Hylmer (or Aylmer) and William Vertue indicates that the nave vaulting was already complete. The choir vaulting was finished ca. 1511 and the Lady Chapel after 1512 (the vaulting is modern), when Henry VIII decided to be buried there. The idea for the lantern tower was abandoned, and, instead, the crossing was fan-vaulted in 1528. As a result the exterior has an unusual, uniform silhouette.

Winner and Waster

An allegorical dream-debate poem in 503 alliterative long lines, written between 1352 and ca. 1370. The poem is incomplete in the single manuscript (BL Add. 31042), but perhaps only a few lines are missing from the conclusion. Traditionally dated to the winter of 1352–53 on the basis of internal references, the poem is now less frequently read as a topical satire and the precision and accuracy of many of those references have been challenged. We know nothing certain about the poet, but he may have been a cleric trained in the west Midlands who later served Edward III or the Black Prince in London.

The poem sets up an elaborate series of allegorical and narrative frameworks before the debate proper begins. After an apocalyptic prologue lamenting the collapse of traditional values the narrator describes a beautiful meadow through which he wanders before falling asleep. He dreams of two armies marching to meet each other to fight before a king who will judge their dispute. A herald describes the armies, one of them in great detail, before summoning the two leaders, Winner and Waster, to the king. The king welcomes them as members of his household and invites them to debate their differences.

According to the Aristotelian conceptual model underpinning the poem Winner represents the extreme of avarice and Waster that of prodigality. Each, however, presents himself as a moderate, and his economic program as sufficient for the kingdom. Waster claims to preserve traditional class distinctions (if lords did not consume the produce of their estates, food would become too plentiful, and the rich could not attract servants) and accuses Winner of making personal profit out of scarcity by stockpiling grain in hopes of a bad harvest. Winner complains in turn that Waster neglects his estates and

sells his inherited land to buy fashionable clothes, with no thought for the future. The poet uses various ethical, literary, and rhetorical traditions to characterize the two disputants, and the terms and central issues of the debate shift rapidly. A persistent strain, however, is to depict Winner as a middle-class merchant envious of Waster's more aristocratic lifestyle.

The king is unable to resolve the complexities of the dispute and arranges to keep his two servants separate. He sends Winner to the papal court, to enjoy luxury for which he does not have to pay, and directs Waster to London, to encourage consumption that will ultimately benefit the merchant class. Winner will be recalled when the king needs to finance his overseas wars.

There are many inconsistencies and ambiguities in the poem, but its metrical and rhetorical power is undeniable. Its closest affinities are with *Piers Plowman* and *The Parliament of the Three Ages*. Perhaps the greatest challenge is to identify the position from which the implied author speaks: the poet's willingness to use a variety of traditional voices and his mastery of rhetorical dispute leave the reader with a vivid sense of problems raised, rather than an authoritative solution.

Wisdom (Sapiential) Literature

Old English

The phrase “sapiential literature” is borrowed from biblical scholarship, where it refers to Old Testament books—e.g., Proverbs, Ecclesiastes, Ecclesiasticus—consisting largely of proverbs, maxims, and sentences, or “wise sayings.” Medieval commentators included the Song of Songs and Job as part of the sapiential canon, but for present purposes we can simply accept the modern understanding of biblical sapiential texts as an appropriate model and define sapiential literature as those texts or portions of texts that are comparable to the biblical sapiential books. The related terms “proverb,” “maxim,” “gnome,” and “sentence,” or “sententia,” are much disputed (cf. Whiting, 1968: x-xvii; Mieder, 1982, 1990, 1993), but in this article they will be used in a relatively unspecialized sense.

The amount of sapiential literature in OE prose is limited. There are no continuous translations of the biblical sapiential books into OE; portions of these texts, however, were translated and are conveniently available in Albert S. Cooks volumes of *Biblical Quotations in Old English Prose Writers*. A major collection of sapiential texts, Defensors 7th-century *Liber scintillarum* (translated into OE ca. 1000), is almost entirely a collection of biblical and patristic sentences, and includes little secular and no “Germanic” wisdom literature. Two extensive proverb collections in OE prose do contain secular wisdom: the OE version of the *Disticha Catonis* and the *Durham Proverbs*. The *Disticha Catonis*, a late-antique collection of proverbs ascribed to Cato, was one of the first texts medieval students read as they learned Latin. The OE version of this text is more than a straightforward paraphrase of the Latin original and contains some apparently indigenous OE wisdom lore. The *Durham Proverbs* is a collection of vernacular proverbs that are not based on any known Latin source and that seem to be authentically vernacular. Some examples—“It is far from well,’ said he who heard wailing in hell” / “Now it is up to the pig,’ said the farmer on the boars back”—have the kind of cogency and wit that one associates with saga prose and thus reflect an aspect of OE

literature that is not well preserved in extant OE literary monuments.

There exists a much fuller corpus of OE wisdom literature in verse. Before describing these poems and discussing issues that they present it would be useful to consider in general terms some of the difficulties of interpretation peculiar to sapiential texts. The notion that proverbs are not straightforward, that they can be defined as the “*aenigmata sapientium*,” “riddles of the wise” (Prov. 1:6), is part of the biblical definition of the genre. The obscurity of wisdom literature is based in part on the compressed, enigmatic, and often figurative language characteristic of proverbial texts. Unless one knows that the ant is associated with industriousness in biblical proverbial literature, the maxim “Go to the ant, O sluggard, and consider her ways and learn wisdom” (Prov. 6:6) is likely to be opaque.

A second problem related to proverbs and maxims is that these sayings often succinctly express cultural values and attitudes that an outsider can only laboriously reconstruct. If one does not already know something about the ethos of modern American businesses, the maxim “Business is business” is not likely to be informative. One often unrecognized problem is that authors of wisdom literature frequently embed controversial or problematic maxims in as banal a context as possible in order to lend as much conventional authority to the new truth as context can provide. “Reading” a given sentential statement can thus be problematic since such texts can either be dense and charged with meaning or straightforward and “empty”; it can be difficult for a modern literary historian or critic to discern the difference on first reading.

Given these reservations, we may note that a number of OE poems are entirely sapiential and thus directly comparable to Latin and biblical sapiential literature. The most famous are *Maxims I* and *Maxims II*. The former, a poem in three parts totaling about 200 lines, is preserved in the Exeter Book; the latter is found as a kind of prologue to a text of the Anglo-Saxon Chronicle. It is difficult to characterize these poems briefly. The poems are not unified; they fall into verse paragraphs of varying length dealing with a variety of topics. Their overall perspective is Christian, but they deal directly and explicitly with secular and at times even “pagan” topics, such as burial customs, dragons, and sexual love between a Frisian wife and her seafaring husband. Some passages are of high poetic value, and all this verse is interesting from the point of view of the literary or intellectual historian. Such lines as *Maxims II*, lines 26–27, “draca sceal on hlæwe / frod frætwum wlonc,” “the dragon shall [live] on the barrow / old and proud [of his] treasure,” have been cited innumerable times by *Beowulf* critics as an example of native OE dragon lore; one of the attractive features of the two *Maxim* poems is that they offer brief vignettes of animals and the natural world as well as of Anglo-Saxon society, parenthood, and much else. Yet much remains obscure in these poems, and it is often difficult to

be sure that we fully grasp the force of any given passage.

Perhaps the most attractive and interesting sapiential poem after *Maxims I* and *II* is *Solomon and Saturn II*. In this dialogue between a pagan “Saturn” and a Christian “Solomon” the protagonists discuss old age, good and evil, the necessary afflictions of sin and death, and other topics. Here again there is much excellent poetry, but also much that is difficult. There is also a good deal of Christian sapiential poetry in the Exeter Book and elsewhere. Such texts as *The Gifts of Men*, *Precepts*, *Vainglory*, *The Fortunes of Men*, *The Order of the World*, *Resignation A* and *B*, and the recently edited *Instructions for Christians* are for the most part a body of explicitly Christian wisdom literature. These texts are interesting in a number of ways. *The Fortunes of Men* and *The Gifts of Men* offer rare and precious insights concerning Anglo-Saxon assumptions about social life and the order of society. But these explicitly Christian wisdom texts are without the aesthetic appeal of *Maxims* or *Solomon and Saturn II*. They lack the nature imagery and the glimpses of secular and Germanic life and custom that make these poems so fascinating. It must be said, though, that on the whole they are a good deal easier to interpret than the more archaic or at least more secular sapiential texts.

Even if we limit our discussion of OE sapiential poetry to texts that consist entirely of sapiential material, there is a substantial corpus of such poetry preserved. Yet some of the most interesting sapiential poetry occurs in texts that are generically identified as elegiac, heroic, or epic. Both *The Wanderer* and *The Seafarer*, usually thought of as “elegiac” poems, have significant sapiential material concerning the definition of the wise man, the ages of the world, and the necessity for patience in adversity. Even in the heroic poem *The Battle of Maldon* the climax of the famous speech of Byrhtwold that concludes the poem as we have it is phrased as a heroic maxim that pertains to any men facing death in war. It is sapiential both in its content and in its phrasing, which echoes the *sceallsculon* formulation that is such a striking feature of *Maxims I* and *II* and sapiential poetry elsewhere. One of the characteristics of the speeches of the main characters in *Beowulf* is a fondness for sapiential aphorisms appropriate to the context of their discourse. This is most true of Hrothgar, whose role as the wise old king of the Danes makes him an especially appropriate speaker of wisdom literature, but it is also true of other characters, such as the coast guard and Beowulf himself, both of whom utter wise generalizations at various occasions.

Though sapiential discourse is a common feature of different kinds of OE poetry, the scholarly community has consistently found it difficult to come to terms with this poetry. Further work on sapiential poetry and on the sapiential tradition generally is needed.

Middle English

Scholars face essentially the same methodological and conceptual problems in dealing with ME sapiential literature as they do with OE, but in addition they face the difficulty of having to deal with more, and more complexly entangled, kinds of discourse. Whereas in OE most texts are either “Christian” or “Germanic,” or to one degree or another a mixture of the two, in ME there is courtly literature as well as Christian and traditional/folkloric literature, and there are greater or lesser degrees of foreign, for the most part French, influence. Again, in the ME period there are a number of distinct strands of Christian thought and culture, whereas in OE the essential distinction is between learned Latin Christianity as exemplified in the work of Alfred or Bede and “popular” Christianity as exemplified in the Vercelli Homilies and other even more folkloric texts. By contrast in the ME period there is, in addition to the distinction between popular and learned Christianity, the issue of antifraternism, which looms large in the work of Chaucer and Langland, and in the late ME period the work of Wyclif and his followers represents yet another distinct current of Christian thought.

The size of the corpus of ME literature precludes the kind of survey offered above for OE literature. Indeed, if sapiential literature is pervasive in OE literature, it is almost as pervasive in “high” ME literature and in the huge corpus of religious and moral literature written in ME that is conventionally called didactic. The most immediate guide to ME sapiential literature is B.J. Whiting’s *Proverbs, Sentences, and Proverbial Phrases from English Writings Mainly before 1500*. Despite its title this volume covers ME literature more fully than OE, reflecting Whiting’s own interests; in his introduction and bibliography Whiting lists and discusses briefly such major sapiential texts as the *Proverbs of Alfred* and the *Poema Morale*. Whiting’s work is an immensely useful gathering of material, and since there is no book-length study of ME sapiential literature as such, it is the best text for neophytes in this field, though it must be supplemented by consulting more recent scholarship.

Among the major ME authors Chaucer and Gower in particular wrote a number of sapiential poems. A good many of Chaucer’s shorter poems, “Truth,” “Gentilesse,” and “Lak of Steadfastnesse” are explicitly sapiential, and a substantial number of Dunbar’s works—the more than twenty poems that Dunbar’s most recent editor, James Kinsley, gathers together and calls “Moralities”—are directly sapiential.

There is no question that sapiential literature is an important genre in ME literature, but in striking contrast to the various earlier literatures that directly or indirectly influenced ME, a number of poets seem to treat sapiential texts

with some measure of irony. Two immediate examples from the corpus of major literary texts are *The Owl and the Nightingale*, in which some version of the *Proverbs of Alfred* is treated with considerable ironic detachment, and Chaucer's *Troilus*, where Pandarus's speeches are full of proverbs. The interpretation of the character of Pandarus, like much else in that enigmatic poem, is open to debate, but few critics would argue that Pandarus is simply speaking sapiential truths.

As with OE literature there is ample opportunity for original research and criticism on the ME sapiential corpus. An excellent recent example is Burrow's study of a "counter-cultural" medieval proverb and the responses that it engendered ("Young Saint, Old Devil").

Few forms of medieval literature are more alien to modern and postmodern readers than sapiential literature, in which "truths" about life and the ordering of society and the world are articulated directly and forcefully—without apparent concern for dissent or qualification. However, it is precisely those texts that are most alien that are most revealing. ME sapiential texts are a rich resource that requires much more attentive and sophisticated study.

Women

Anglo-Saxon Period

Anglo-Saxon England is traditionally seen as a golden age for women, ending in 1066 with the Norman Conquest. Anglo-Saxon women are presented as exercising wide powers to hold and dispose of land, in contrast to their successors under common law. In the wills and legal disputes of the 10th and early 11th centuries women are seen bequeathing land, choosing heirs, even winning inheritance disputes against their sons. They appear in the courts, occasionally as active oath helpers, or compurgators, who swore together with defendants on behalf of their acquittal; that women could do this indicates that they had a public “word” of value.

In the church women are seen to have played a major part, epitomized by the great abbesses of 7th-century double monasteries. A woman like Hild, abbess of Whitby, was landholder, estate organizer, educator of bishops, ruler of her house, and an influence in the kingdom. The debatable imposition after 1066 of a feudal military society and its related emphasis on primogeniture is alleged to have reduced female landholding and general influence, a change in status compounded by the triumph of the male hierarchy in the church.

Though true in detail this picture requires revision. The situation in the 12th and 13th centuries can be caricatured to make the earlier period appear golden by contrast; the theory of the later common law requires tempering by, for example, the practical powers of many individual widows. A picture of extensive female landholding before 1066 is not borne out by Domesday Book (1086), a difficult source but the only comprehensive picture of Anglo-Saxon landholding. The proportion of female landholders on either side of 1066 is small. Women who did hold land in Anglo-Saxon England are not necessarily representative of all women. The majority were widows, who predominate in Domesday and in late Saxon wills. Widowhood was the period in life when a woman stood to control most land. Customary law already recognized a widow's right to a third, in some areas a half, of her husband's land. In practice Anglo-Saxon dower varied as much as it did later, already depending on the individual circumstances of families.

Women in Anglo-Saxon England were "legal persons." As such they were liable for their own crimes. They appear in court, though usually as defendants and often with men speaking for them. They offer legal proofs, but the only occasions on which they acted as oath helpers are when cases involve women, as in later common law. They never held lay offices.

Many women who received land grants or disposed of land were ecclesiastics or members of royal or great noble families. The handful of royal grants made directly to women were to one or other of these groups. Noble women did not enjoy parity with their brothers. The bulk of the inheritance went to men, and most female landholding was the temporary family provision of dower or dowry, or family patronage of churches to which their womenfolk belonged.

The role of women in the early church was significant, as abbesses and as missionaries to the Continent. There is a high proportion of female saints from the 7th and 8th centuries. However, this changes by the 10th century; in the monastic revival nunneries were less important. Former double houses like Ely, once ruled by an abbess, were refounded as male houses. The picture is distorted against the nunneries, since we see it through later male Benedictine eyes. But the heyday had passed.

The 7th and 8th centuries were the period of conversion and the first interaction between Christian ideals and social structures. In such times ecclesiastical structures are often fluid, and all resources, including women, are drawn into this primary effort. Monasticism emerged as the perfect structure for the union of Christian ideals and the early-medieval family. Monasteries were noble family houses, and women fulfilled their family roles within them. A noble abbess ruled a monastic household. From the 9th century reform was aimed at ending this close involvement of lay family and monastery and at the

related imposition of celibacy. Double monasteries and powerful abbesses were its casualties.

This was a Christian society that did not exclude women as nonpersons but that was dominated for women by roles within the family. Family and household need not always and everywhere be restrictive, and some restrictions applied to men, though men's lives were less circumscribed by such bonds. The mistress of a noble household was a powerful woman, but only one woman could be mistress at a time. We must be wary of generalizing from the lot of some to all women, while recognizing that the household and family models of early-medieval politics opened but limited opportunities for Anglo-Saxon queens to achieve importance.

Five centuries is too long a period for blanket generalizations. The fragmentary sources suggest changes within the period, affecting different groups of women. The first impact of Christianity brought changes in landholding to allow the endowment of the church out of family land. Noble women benefited as landholders from this loosening, and the enormous land acquisitions of the settlement era contributed to landed provision for women. More debatably, Christian views on marriage and divorce may also have benefited women.

There are hints of a tightening up during the 9th century, as the results of endowing women and churches became apparent. Great noble women did well in the 10th and 11th centuries, when the nobility as a whole were benefiting from the unification of England. Here a group of women profited with their class. "Anglo-Saxon women" is a simplification that must be resolved into periods, social groups, and the stages of the domestic cycle. The dependence of wives and daughters throughout the period should not be hidden behind the power of some widows.

Post-Conquest

Post-Conquest women were regarded less favorably by both the law and the church than their Anglo-Saxon predecessors, but in compensation the patterns of life in the later Middle Ages opened new avenues for women's activities, especially for townswomen and peasants.

The newly imposed code of Anglo-Norman feudal law and the development and codification of canon law both lessened women's legal rights. The legal status of a woman of any social class depended on whether she was single or married. Single or widowed, she could exercise the same private legal rights as a man; married, her rights were extinguished, and her person as well as her

goods, lands, and chattels came under her husband's control. She regained her own estate and dowry only upon her husband's death, with the addition of a lifetime share in some portion of his estate. This share could be differently computed, depending on whether feudal or manorial law or civic customs applied, and might vary from place to place as well as from time to time.

The acceptance of primogeniture as the pattern for feudal inheritance tended to disqualify noble women from any share in the family wealth, except for their assigned dowry; although in default of sons, daughters could divide the total inheritance. Both townswomen and peasants were less tied by such inheritance patterns. In all classes, though most prominently among the nobility, the well-to-do widow often found herself with remarkable freedom of action. Despite their private rights women had no right to hold office or exercise public authority. Noble women holding fiefs with their own courts normally delegated their power to a male official.

Canon law, which dealt with both marriages and wills, reflected the clerical conviction of the inferiority of women and their need to be under male authority. But it also insisted on their right to free acceptance of their marriage partners and denied parents the right to force the marriage of children under the age of consent (twelve for girls, fourteen for boys). Canon law also consistently encouraged the making of wills, even by married women who technically had no power to do so without their husbands' consent, thus giving women more power over their own belongings.

Actual conditions frequently contradicted legal theory. Feudal lords were often absent on crusade, or on other military expeditions, or at court, and their wives found themselves in charge of large households with a full complement of officials, knights, and men-at-arms, fighting legal battles over rights to lands, and maintaining adequate military strength to protect their castles. Such women exercised considerable authority.

The rapid development of the towns and their fast-growing populations by the 12th century opened new doors for townswomen. They were allowed to join most craft guilds, though their ability to attain the rank of master, independently of their husband, is difficult to track. Apparently women did not hold office within the guilds, nor did they have any share in city government. Their right to conduct business on their own, even when married, was embodied in commercial law, where a female entrepreneur could elect to trade as a *fame sole* (the legal term for an independent woman, a "woman alone"). Since most trades and crafts were family businesses, women were naturally found in most of them but were most visible in such crafts as embroidery, silk spinning, and weaving. Rich merchants were always men, although their widows often continued to trade. Women were often retailers, tavern keepers, and brewers.

Women doctors, midwives, and schoolmistresses were few in number but still traceable. At the lowest level female servants and prostitutes abounded, and the two categories often overlapped. On the manors peasant women not only worked with their husbands and children in the fields but also might run small businesses—often brewing, occasionally baking.

The basic task of all married women was to bear and rear children. Noble women were married young and bore more children at younger ages, because of the importance of heirs; they had wetnurses and servants to assist them. Townswomen and peasants often delayed marriage for economic reasons and were likely to have smaller families. Whatever the social level, child mortality was high and the mother's death in childbirth frequent. Once past the crucial childbearing years, women's life expectancy seems to have been greater than men's. Although marriage was the norm for women, some girls remained single. Townswomen and peasants found it possible to support themselves by their own labor. For the upper class and well-to-do, however, religious life was the only alternative to marriage.

English nunneries were not as rich, as populous, or as numerous as religious houses for men, but they provided a respected alternative to marriage for the upper classes. Some houses, such as the priory of Amesbury, grew rich with royal patronage and attracted the relations of royalty, including the sister and niece of Edward I. Other houses were often founded by a particular family. The nun's prime duty was to pray for the souls of patrons and for the family connection. It is not surprising that since noble birth and some wealth was required for entrance, nunneries were usually respectable but rarely fervent. Some nuns really had a religious vocation, some had intellectual interests most easily pursued in the cloister, some relished the positions of independent authority, such as abbess, prioress, or cellaress, that they could achieve. Other girls, unmarriageable because of physical or mental handicap, or the lack of dowry but with sufficient social status, became nuns as the only available alternative.

An unusual feature of English religious life was the considerable number of female recluses, or anchoresses, women who withdrew permanently to an individual cell for prayer and ascetic practice. Julian of Norwich was the most famous, and her mystical writings continue to have an audience. English women did not create major literary works or cultural monuments. Their achievements were overshadowed by the political and chivalric exploits interesting to male chroniclers. Nevertheless, many competent and some colorful English women can be uncovered and need to be remembered for their important share in creating the lively society of the later Middle Ages.

Women and the Arts

Evidence for the participation of women in the production of art is extant from the earliest centuries of the Anglo-Saxon period. We are best informed about monastic women: site remains, even though most have yet to be fully excavated, and written sources, such as Boniface and Bede, provide glimpses of the materials produced for these houses. Carved architectural elements survive at Hackness and Hart; sculptural remains have been recovered from Hartlepool (including elaborate name-stones and metalworking equipment) and Hackness, where fragments of a large cross decorated with figures, interlace, and inscriptions were found. Whitby excavations have yielded objects like decorated combs, hanging bowls, rings, brooches, pins, and a glass bracelet, as well as imported glass cups and Frankish pottery.

Early Anglo-Saxon monastic women were apparently also involved with manuscript production: an ink horn and bronze styli were among the finds at Whitby, and Boniface's well-known letter of ca. 735 to Eadburga, abbess of Minsterin-Thamet, requested that she copy for him the Epistles of St. Peter in gold. Yet manuscripts, and especially illuminated manuscripts, that can now be linked to women's houses in this period are woefully rare. Only a few recorded references to deluxe manuscripts survive; the books themselves do not.

Graves, hoards, and wills furnish evidence of small-scale works of art owned by secular women that included rings, pendants, headbands, silver cups, and brooches, such as the inscribed silver disc brooch from Sutton, Isle of Ely, owned by the lady Aedwen. The wealthy Wynflæd even left books to her daughter in her will of about 950.

It seems likely that the major art form that engaged the majority of Anglo-Saxon women, both religious as well as secular, was textiles, an art rarely practiced by men. As early as 747 the ecclesiastical council at Clovesho decried the many hours spent in needlework at convents (and recommended that the nuns spend more time reading books and singing psalms). Textiles like bedclothes, table linens, seat covers, and wall hangings are often bequeathed in the wills of aristocratic women; it seems that textiles made by the women of the household were considered female property.

Textiles are quite perishable, especially in the damp British Isles, so losses have been vast; however, texts and manuscript illustrations attest to their ubiquitous presence throughout the Middle Ages. Of the few precious Anglo-

Saxon textiles that survive the famous *casula* (chasuble) of St. Harlindis and St. Relindis and the *velamen* (veil) of St. Harlindis are the earliest, dating to the late 8th or early 9th century. The first extant examples of what came to be known as *Opus Anglicanum* (literally, “English work”), these embroideries worked in gold and colored silk on linen reveal a high level of skill. An even more exquisite group of Anglo-Saxon textiles, from the early 10th century, was preserved in the coffin of St. Cuthbert. These consist of a stole, maniple, and girdle, all embroidered in colored silks and gold thread, which were made at the command of Queen Ælfflæd for the bishop of Winchester, according to inscriptions on the stole and maniple.

The late Anglo-Saxon period continues to furnish evidence of women’s involvement with the arts, most often in the capacity of patrons. Ealhswith, King Alfred’s wife, was probably the founder of Nunnaminster at Winchester and apparently also gave the convent the small illuminated prayer book known as the Book of Nunnaminster (BL Harley 2965).

Two of the greatest female manuscript patrons of this time emerge during the second half of the 11th century from aristocratic lay society: Judith of Flanders and Margaret of Scotland. No less than four extant illuminated Gospel books can be connected to Judith’s patronage (New York, Pierpont Morgan Library 708, 709; Monte Cassino, Archiv. Badia BB 437, 439; and Fulda, Landesbibliothek Aa21). Judith herself appears in the frontispiece of the Fulda Gospels and in Morgan 709 (fol. lv) beneath the crucified Christ.

Margaret of Scotland, wife of Malcolm III, king of Scots, was praised as a great benefactor of Durham (which received many beautiful objects from her, including a cope, cross, and Gospel book written in silver, according to Reginald of Durham) and a passionate lover of books who was especially fond of her own personal Gospel book. The St. Margaret Gospels (Bodl. lat. lit. F5) miraculously survives and is illuminated with four full-page evangelist portraits and gilt capitals. Other extant illuminated books linked to Margaret include a pocket psalter (Edinburgh, University Library 56), and the famous life of St. Cuthbert (Oxford, University College 165).

Little is known of late Anglo-Saxon women as artists themselves, aside from the textile medium, where needlework continued to be a skill cultivated by women. Such ladies as Æthelswitha, daughter of Queen Aelfgyva, retired to Ely to devote herself to gold embroidery, and the Domesday Survey includes at least two references to women who were apparently professional embroideresses. The most renowned of all English textiles, the 11th-century embroidery known as the Bayeux Tapestry, was almost certainly stitched by women (though a male “designer” is often posited).

Written sources tell us that the 12th-century religious woman Christina of Markyate gave three miters and a pair of sandals that she had embroidered by

her own hand to Pope Adrian IV and also made a gift of traveling clothes to King Stephen. However, Christina is best known to art historians for the single extant object connected to her, the magnificent illuminated psalter often referred to as the St. Albans Psalter or the Psalter of Christina of Markyate (Hildesheim, St. Godehard). This psalter, which was probably made for Christina by the monks of nearby St. Albans, is a masterpiece of Romanesque illumination, containing 42 full-page miniatures, 211 historiated initials, and several line drawings. Christina herself appears in the initial beginning Psalm 105, where she is seen before Christ, interceding on behalf of the monks. The book in many ways reflects and echoes her personal experiences. Amazingly Christinas *Vita* has virtually nothing to say about her psalter (mentioning what may be it apparently only once, during a demon attack); this provides a useful example of the many lacunae encountered while tracing the role of medieval women and the arts.

The wealthiest female monastic house of the 12th century was Shaftesbury in southern England. Destroyed during the 16th-century Dissolution of the monasteries, it has been reduced to little more than its foundations. The abbey church had been rebuilt beginning ca. 1080 and was an enormous structure over 350 feet in length. We are left to imagine the splendor of the decoration the nuns ordered for their church; among the stone remnants salvaged from the partially excavated site were cable molding and palmettes, volute and leaf ornament, sculpted corbels, chevron, dog-tooth, and pellet decoration, leaf capitals, spiral and fluted shafts, as well as many figural fragments. Later Gothic embellishments to the church included decorated tiles and stained glass.

The nuns of Shaftesbury, like other female monastics, also utilized books. A 12th-century psalter from the abbey is extant. The Shaftesbury Psalter (BL Lansdowne 383) contained an illuminated prefatory cycle of full-page illuminations, of which only six survive, in addition to two others elsewhere in the manuscript. While the Shaftesbury Psalter shares iconographic and stylistic similarities, as well as virtually the same date, with the Psalter of Christina of Markyate, the frontal, staring, iconic images of the Shaftesbury Psalter are not stressed in Christinas psalter. This suggests the images were designed to enhance subtle yet marked differences in the pieties of contemporary religious women, while perhaps also simultaneously reflecting variation in their aesthetic preferences.

It is unknown whether the nuns of Shaftesbury themselves were scribes or illuminators. Reliable evidence for women illuminators in England is notoriously elusive. However, in an early-12th-century manuscript (Bodleian Library, Bodley 451, fol. 119v) the earliest attestation of a female scribe in England is preserved. The *scnptrix* seems to have been a nun of the Nunnaminster at Winchester.

While Nunnaminster, Shaftesbury, Christinas priory, and nearly all other female monastic houses in England have been lost, one Romanesque abbey church survives in nearly perfect condition, although lacking its cloister: Romsey. The church, begun ca. 1120, incorporates a nearly life-sized stone rood (Crucifixion image) from the nuns' previous church. Romsey's architectural decor features grotesque-head corbels, elaborate acanthus scroll capitals, and two historiated capitals (one inscribed "Robert made me").

A large number of manuscripts commissioned by women patrons during the Gothic period have come down to us. Among the most deluxe of these is the Munich Psalter (Munich, Bayerische Staatsbibliothek Clm.835) of the early 13th century. It contains multiple picture cycles, including numerous illustrations of the lives of heroic women from the Old Testament. Additional manuscripts from the 13th century that have been identified include, from the monastic ambience, the Imola Psalter (Imola, Biblioteca Comunale 100), the Iona Psalter (Edinburgh, National Library of Scotland 10000), a psalter in Cambridge (Trinity College B. 11.4), the Obituary Roll of Lucy (BL Egerton 2849), the Wilton Psalter (London, Royal Collection of Physicians 409), the Amesbury Psalter (Oxford, All Souls College 6), and the Carrow Psalter (Madrid, Biblioteca Nacional 6422). An Augustinian nun appears on fol. 148 of a psalter in the Bodleian Library (Laud lat. 114). This psalter probably belonged originally to Lacock Abbey, a prosperous convent, as corroborated by the elegant 15th-century cloister that remains on the site.

Secular female patrons also played a significant role in the production of deluxe 13th-century books. The Huntingfield Psalter (New York, Pierpont Morgan Library 43), the richly illuminated de Brailes Hours (BL Add. 49999), the Egerton Hours (BL Egerton 1151), and a psalter in Venice (Biblioteca Marciana lat. 1.77 [2379]) were all made for secular women. Secular women patrons were additionally responsible for at least two fine Apocalypse manuscripts. Eleanor of Provence, wife of Henry III, is the most likely patron of the Trinity Apocalypse (Cambridge, Trinity College R.16.2), the largest and most sumptuous of the 13th-century Apocalypses. Eleanor de Quincy, countess of Winchester, certainly commissioned the luxurious Lambeth Apocalypse (London, Lambeth Palace 209) and is shown in her devotions before the Virgin and Child on fol. 48 ([fig. 154](#)).

Fig. 154. Lambeth Apocalypse (London, Lambeth Palace 209), fol. 48. Virgin and Child with donor. Reproduced by permission of the Archbishop of Canterbury and the Trustees of Lambeth Palace Library.

Women's patronage is further hinted at in other media. At Worcester

Cathedral a 13th-century spandrel in the Lady Chapel shows a laywoman giving orders to a master mason. Beatrix van Valkenburg (d. 1277) appears in a stained-glass panel probably from an Oxford church, the earliest surviving donor image in English glass. Isabella Marshall (d. 1240), countess of Clare, gave chalices, reliquaries, vestments, and books to Tewkesbury Abbey.

During the period 1250–1350 the art of embroidery by English women, *Opus Anglicanum*, rose to its greatest heights and was treasured throughout Europe. Mabel of Bury St. Edmunds, apparently one of the best 13th-century embroideresses, was frequently employed by Henry III. Only a few of the many outstanding examples of embroidery from the time can be mentioned here: the Pienza Cope (Pienza Cathedral), the Bologna Cope (Bologna, Museo Civico Medievale), and the red velvet chasuble owned by the Chichester-Constable family (New York, Metropolitan Museum). While much *Opus Anglicanum* was created by secular women, monastic women also continued the ancient tradition, as witnessed by the altar frontlet (London, Victoria and Albert Museum) signed by the nun Johanna Beverlai.

Numerous 14th-century illuminated manuscripts made for women survive. Among them are the Madresfield Hours (Madresfield Court M), the Vernon Psalter (San Marino, Huntington Library EL 9.H. 17), the Hours of Alice de Reydon (CUL Dd.4.170), the Taymouth Hours (BL Yates Thompson 13), the Hours and Psalter of Elizabeth de Bohun (Ginge Manor), and the Fitzwarin Psalter (Paris, BN lat. 765).

Precious references to craftswomen during this century have been recovered. For example, in mid-14th-century London Dyonisia La Longe was a gilder, Matilda Weston a weaver, while Matilda Myms, widow of John, an “*imaginour*,” owned her own materials for making pictures, which she later bequeathed to her apprentice, William. Katherine Lyghtefote was employed supplying the king’s palace at Sheen in the 1380s along with her master-mason husband.

Fourteenth-century women continued to be important patrons. Eleanor de Clare was probably the patron responsible for rebuilding much of the east end of Tewkesbury Abbey during the 1320s and 1330s, while her contemporary Elizabeth de Burgh had in her hire at least four goldsmiths, endowed the Augustinian priory at Clare, Suffolk, and founded Clare College at Cambridge.

Women in Middle English Literature

The study of women as writers and readers of ME literature, and as figures within that literature, has undergone sweeping changes in the last twenty years. Until the 1970s little critical attention was paid to female authors or audiences of medieval English literature, and studies of female characters in ME literary works tended to focus on such matters as antifeminist satire, women as objects of courtly love, and the proper role or “place” of women in medieval literary debates on the nature of marriage. Following the rise of the women’s movement and the subsequent development of various forms of feminist theory in the 1970s and 1980s new questions began to be asked about women in ME literature, and new answers to be suggested; although many of the questions remain open, the issues raised have made an unmistakable and irrevocable mark on ME literary studies as a whole.

The broad topic of women in ME literature can be examined under four relatively distinct subheadings: literature written by women, literature written for women, representations of women in the literature, and other theoretical issues related to women and gender in ME literature.

Literature by Women

Only a few women authors writing in ME are known by name, all from the end of the 14th century or later, and almost all are authors or translators of religious works. Among these are the late-14th- and early-15th-century anchoress Julian of Norwich (author of the *Showings*, an account of her mystical visions); Margery Kempe (known for her spiritual autobiography, written down by a priest ca. 1438); Eleanor Hull (d. 1460; translator of a commentary on the penitential psalms and a series of devout meditations);

Margaret Beaufort (translator, with William Atkinson, of Thomas à Kempis's *Imitation of Christ* [1504]); several 15th-century female letter writers; and, more tentatively, Dame Juliana Berners (sometimes credited with writing parts of *The Book of St. Albans*, a treatise on hunting and related sports printed in 1486).

There were doubtless other women writers in the period. The possibility of female authorship has been suggested for *The Owl and the Nightingale* (ca. 1200). The provincial compilation of lyrics and other poetry known as the Findern Manuscript (late 15th to early 16th century; CUL Ff. 1.6) contains works possibly written and perhaps composed by women. The early-16th-century Devonshire Manuscript (BL Add. 17492), a collection of poetry probably done at court, may include lyrics by women. There also exist ME translations of works written by or attributed to women: for example, some of the *lais* of Marie de France (the only known Anglo-Norman woman author to be translated into ME), a variety of devotional and spiritual works by continental holy women like Birgitta (Bridget) of Sweden, a few of Christine de Pizan's works, and treatises on women's health attributed to Trotula of Salerno.

Literature for Women

The fact that a number of English women were book owners and patrons suggests that women were avid consumers, if not producers, of literature. Although work on medieval female literacy is only beginning, we do know generally that educational opportunities for women declined after the Norman Conquest and began to rise again only late in the ME period. In addition, while English literacy rates among women may have remained constant after the Conquest, pre-Conquest female Latin literacy appears, from the scant remaining evidence (e.g., the superb Latin of the nuns of Barking Abbey), to have been more advanced than that of nuns in later periods for whom no comparable works were written. Descriptions in 14th-century and later ME literature of women reading books or being read to by other women suggest that some women could and did read, especially in the vernacular. (Literacy in Anglo-Norman was relatively common among upper-class women from the 12th to the 14th century, but later in the period literary texts for aristocratic women came to be more commonly written in English than in Anglo-Norman.)

Women seem to have enjoyed a prominent role throughout the ME period as patrons and book owners. Women and those similarly untrained in Latin

may have provided the primary audience for certain kinds of ME texts after the Conquest, since popular secular literature, such as romances, tended to be written in Anglo-Norman and much religious literature written for men was written in Latin. Works written for women in early ME tended to be religious in subject matter and included saints' lives (such as those of the Katherine Group), religious lyrics (such as those of the Wooing Group—possibly written by women), religious guides for women (such as the *Ancrene Wisse*), and religious tracts (such as *Hali Meidhad*, or *Holy Virginity*). This picture does not seem to have changed greatly in the later period, though more ME secular works may have been written for or read by women. Lydgate says that Chaucer wrote *The Legend of Good Women* at the request of Queen Anne, and in the 15th century writers like Capgrave, Bokenham, and Lydgate himself all wrote religious works for female patrons.

Representation

Representations of women in medieval English literature are affected by the period's prevailing attitudes toward them, attitudes that have their roots in Aristotelian medical theory. The Aristotelian model dichotomized men and women as being respectively analogous to such categories as active/ passive; form/matter; completion/incompletion; possession/ deprivation. These categories in turn informed Christian commentary, especially on Genesis, in which Eve was identified with the will and the body and Adam with intelligence and the mind. As daughters of Eve all women were believed to have inherited Eve's supposed dependence on the senses, inability to think abstractly, fundamental willfulness, and sexual guilt. The Middle Ages also inherited two opposing views of woman's spiritual nature, the Platonic view of the soul's neutrality with respect to gender and an Aristotelian view of the soul as differentiated by gender. Attitudes toward women were further conditioned by patristic discussions of virginity and marriage. Among those commentaries Jerome's vitriolic argument against marriage, the *Epistola adversus Jovinianum*, proved particularly influential; it contributed greatly to a Latin and vernacular tradition of antifeminist literature that influenced many major works, most notably Chaucer's *Wife of Bath's Prologue*, with its riposte to Jerome.

The genres in which women are represented in vernacular texts include sermons, saints' lives, legends of good or holy women, romances, fabliaux, allegories, and debate poems. Sermon literature usually draws on the traditional contrast between Mary and Eve as positive and negative female

models, often with some reference to Old Testament figures, especially Judith and Esther. Saints' lives generally represent women of extraordinary power, although that power is almost always conditioned by the female saint's romantic dependence on Christ, who is usually presented as her lover and spouse. The spiritual power of these holy women is also offset in some ways by the brutal physical violence (often explicitly or implicitly sexual) done to many of them by their earthly antagonists, which the saints willingly suffer rather than renounce their faith. Like these female saints in virtuous steadfastness, but not officially canonized, are the various long-suffering "good women" found in a number of romances and romancelike narratives, such as *Octavian*, *Le Bone Florence of Rome*, the Breton lay *Emare*, or Chaucer's *Man of Law's Tale* and *Clerks Tale*.

Complex representations of women occur in some ME romances: for example, Freine in *Lai le Freine*, Melior in *William of Palerne*, Chaucer's Criseyde, and Henryson's Cresseid. However, the focus of ME romances is more often on the fortunes and misfortunes of male protagonists, and many women in the romances are relatively one-dimensional; their characterization is often based on female stereotypes drawn from the conventions of courtly love or antifeminist satire. Also influenced by the antifeminist tradition is the fabliau, a genre most complexly developed in ME by Chaucer, which usually represents women as sensual, manipulative, cunning, and witty.

Female figures are commonly found in allegorical works, due largely to the feminine grammatical gender of most abstractions in Latin and French. Familiar examples include Langland's Holy Church, Lady Meed, and Dames Study and Scripture; Chaucer's goddess Nature and Lady Fame; the Maiden in *Pearl*; and the Boethian Lady Philosophy and Fortune. Although these allegorical figures are not primarily intended as mimetic representations, they can take on "character traits" related to the available medieval concepts of women's nature: courtly beauty, shrewishness, stern virtue, maternal nurture and correction, promiscuity, and various other features. Perhaps the most explicit discussions of how women should be described occur in debate poems on the nature of love and of women, including *The Owl and the Nightingale*, *The Thrush and the Nightingale*, and Clanvowe's *Book of Cupid*.

The class of the women represented in ME literature tends to be aristocratic, although Chaucer represented women of the middle classes as well. Langland presents the widest range of class and type of woman, although his allegorical mode tends to preclude the rich representation of character achieved by Chaucer and some of the romances and saints' lives. Margery Kempe's self-representation is particularly important as one of the first extended images of a middle-class woman in English.

Other Theoretical Issues

The subject of women in ME literature has drawn much attention recently from feminist critics, especially but not exclusively in connection with Chaucer. These critics are concerned, in their studies of works by both men and women, not only with representations of women but also with the interrelated social and literary questions concerning female and male gender roles, typical modes of discourse, and the origins of those roles and discourses. At present many feminist critics locate themselves at various points between two widely separated poles. The first, an a historical psychological essentialism, assumes that men and women's biological differences radically distinguish their perceptions and experiences of the world irrespective of the cultural conditions of the two sexes. The second, a position most often adopted by cultural materialists and new historicists, assumes that the phenomenon of differing gender roles is almost entirely sociopolitical (e.g., Judith Butler's analysis of gender as a performance). Some of the most fruitful recent feminist analyses of medieval literature seek a synthesis of these two extremes.

Representations of women in ME literature are clearly bound by both social and "natural" conditions (as defined by Aristotle and patristic writers) that limited women's literary roles to those of wife, virgin, mother, or lover. One of the first questions that might be asked in feminist analyses of ME works is whether the authors seek to promulgate or question these definitions. Some feminist critics assume that it is impossible for a male writer to represent women. For example, such critics would argue that Criseyde is only a projection of Chaucer's self, a construct that allows him to explore problems of masculinity, including his own problems as a writer. Others, however, see the possibility for some male writers to construct a genuine feminine voice, understood by them by virtue of their own marginalized position in society. From such a point of view Criseyde becomes a representation of difference, of what it means to be "other," that which cannot be subsumed or explained by traditional male logic or hierarchy.

Such variations of theoretical approach can complicate our understanding of representations of women. For example, at first glance, the conventions of *fin amour*, or courtly love, seem to invert the feudal subservience of woman by reversing her social role and placing her at the top of the hierarchy. This placement nonetheless does nothing to question the representation of women as passive objects of exchange, the prizes "won" by the service of their courtly suitors. On the other hand the association of woman with the human will and with the allegorical personification of Wisdom can allow her to become, like Dante's Beatrice, a stepping stone to God. The deity itself can be seen as

“feminine” insofar as the Godhead stands for a force that calls worldly categories and assumptions into question. In mysticism, as Caroline Bynum has shown, a feminized Christ sometimes operates as a crucial center in works by both men and women.

Recent psychological theory distinguishing between a socially constructed “female” relational thinking and a socially constructed “male” hierarchical thinking has proved illuminating in some studies of medieval representations of women. For example, in the York Cycle Noahs secure place in the hierarchy is underscored by his privileged access to both God and God’s knowledge and by his predominant desire to fulfill God’s command no matter what the consequences are to others. Noah’s wife, however, denied direct access to God or God’s word, thinks relationally of the needs and concerns of her friends.

Finally we might consider stylistic questions, such as the relations between the style of a work, the sex and education of its author and its primary audience, its genre, and other aspects of its production. These and many other questions on women in ME literature cannot yet be answered fully due to the limited information presently available on medieval women writers and readers. As one critic says of the literary contributions of women throughout medieval Europe, “A comprehensive and authoritative treatment of the subject is not yet possible:... much certainly remains to be discovered and much to be charted for the first time” (Dronke, 1984: vii), especially in the large number of unedited religious works of the late Middle Ages. Feminist research and criticism have only begun to uncover the questions that can be asked about the subject of women in medieval English literature.

Women in Old English Literature

Women appear in the major extant manuscripts from the Anglo-Saxon period as characters in prose and poetry, as historical personages, and (using the term in its broadest sense) as authors. Excluded from the discussion below are the female figures represented in the illustrations along the borders or within the text of manuscripts.

Prose

Representations of women in prose are largely hagiographical, except for the secular belletristic *Apollonius of Tyre*, a translation into OE of a Greek romance. Featured therein are Arcestrate (Apollonius's wife), their daughter Thasia, and the unnamed daughter of Antiochus (with her nurse confidante), who is involved in an incestuous relationship with her father. But the major female characters are found in Ælfric of Eynsham's collection of saints' lives. Although Aldhelm had composed his *De virginitate* (dedicated to Abbess Hildelith and the nuns at Barking) and Bede his *Martyrology*, Ælfric's *Lives of the Saints* was the first collection of hagiographics in English. Ælfric's most prevalent female type is the virgin martyr; St. Agnes, St. Lucy, and the transvestite St. Eugenia are the most successfully rendered. Unlike Aldhelm's and Bede's works Ælfric's *Lives* are in alliterative prose and are characterized by clarity of style and simplicity of characterization. Among other prose hagiographic works are the fragmentary life of St. Mildrith (the granddaughter of King Penda of Mercia) in the *Lives of the Kentish Royal Saints* and the brief hagiographic narratives in the OE *Martyrology*, which include female saints like Perpetua and Felicitas and English women saints like Æthelthryth and Pega (the sister of St. Guthlac).

Historical and documentary prose is marked by portraits of strong, efficient, and intelligent women. In the OE translation of Bede's *Ecclesiastical History* the most remarkable is Abbess Hild of the double monastery of Whitby, who, among other acts, officiated over the Synod of Whitby in 664, encouraged the

poet Cædmon to translate the Christian story into Germanic meter, and mentored five monks to bishoprics. Bede depicts other memorable women religious: Æthelburh of Barking and Æthelthryth of Ely, to whom he composes a praise song, are two of many.

In contrast the Anglo-Saxon Chronicle is reserved in its inclusion of women, although those it does refer to are women of strength and volition. It mentions the razing of Taunton by Queen Æthelburh (722), the rise to the throne of Queen Seaxburh (672), and the founding of Ely by Æthelthryth, though these are only noted in passing. It speaks more fully of Æthelred's and Cnut's queen, Emma, but again, were it not for the *Encomium Emmae* and later chronicles, the full measure of her influence would be lost. In general the Chronicle steers away from emphasizing women's deeds: the West Saxon version, as an instance, avoids recording the deeds of the most prominent woman of the early 10th century, Æthelflæd, the Lady of the Mercians, King Alfred's daughter. In its treatment of women the Chronicle generally exemplifies the process of the editing out of women in history.

The extant legal writings place Anglo-Saxon women in a social context from which they emerge as serving maids, slaves, concubines, and adulteresses, as well as wives and widows. Anglo-Saxon legal codes attest to the basic rights of women (right to divorce; right of autonomy), although the evidence can only be partial since it may not reflect actual practice. In the 11th-century *Sermo Lupi ad Anglos*, for example, Archbishop Wulfstan points to the harassing and forcing of widows to remarry as a sign of social decay. Charters and wills refer to women as benefactresses of male and female monastic communities, as witnesses to numerous legal documents, and as generators of charters under their own names. A number of wills by women contain bequests that help to define more clearly the images of prosperous Anglo-Saxon women in the context of their society. Unfortunately such wills do not indicate whether the testatrix was literate or whether the will was dictated.

The literacy of OE women is clearly attested to, however, in the Anglo-Latin writings. Rudolf of Fulda's *Life of St. Leoba* and Otloh's *Life of St. Boniface* testify to the high level of learning attained by Anglo-Saxon nuns and serve as evidence for female authorship. The letters and poems of women like Berhtgyth, Bucge, Eadburh, Leoba, and a string of others reflect minds of active and creative intelligence. Even though the literature is in Latin, and not of primary concern here, the existence of these documents helps to place the women of vernacular literature in an appropriate context.

Poetry

Representations of women in the poetry present characters who range in type from sorceresses (in the charms) to Christian warrior saints (in the heroic poetry). Two of the charms (“For a Swarm of Bees”; “For a Sudden Stitch”) make reference to women as victorious warriors with superior martial strength. Another (“For Unfruitful Land”) represents woman as the center of the procreative and regenerative principles in the universe. Women’s sexuality is treated with humorous double entendre in ten of the Riddles, and the collections known as *Maxims I* and *II* present sketches of women of various social classes, from a queen who gives “secret counsel” to a woman who must seek out her “friend” (lover) with “hidden skill” (magic)—qualities of prescience and intellectual acumen that are characteristic of the women in the heroic poetry as well.

Women’s vulnerability and psychological isolation are strikingly depicted in a number of short lyrics. In the Advent Lyrics (also called *Christ I*) Mary suffers an adversarial relationship with the citizens of Salem and an estrangement from Joseph. In *Deor* Beadohild experiences the fury of Weland’s revenge, and Mæthhild is ravaged by love. In the longer lyrics—*The Wife’s Lament* and *Wulf and Eadwacer*—known as the OE *Frauenlieder* and linked to the Latin erotic women’s songs of the mid-11th-century Cambridge Songbook, emotional and psychological disquietude is intensified, the effects of which determine and define the linguistic uniqueness in the poems. Because of the poems’ situational and grammatical features arguments have been put forth not only to substantiate a female speaker but also to establish female authorship.

The range of the representation of women found in the minor, didactic poetry and in the lyrics narrows down to the depiction of three major figures in Christian and secular heroic poetry: the warrior woman, the counselor, and the peaceweaver—although, as a rule, the types overlap. The hybrid Old Testament-Christian Judith and Cynewulf’s heroines Elene and Juliana are martial figures, a blend of the patristic *miles Christi* and the Germanic valkyrie—gold-adorned, quick and piercing of mind, assertive in speech, and intractable in action. In secular heroic poetry Hildegryth of the *Waldere* fragments is related to these, and Grendel’s mother in *Beowulf* exemplifies the Germanic female warrior in her grim aspect. Complexity and strength of character define the OE warrior women: Elene and Judith emerge as political figures, counselors, and heads of state (a surrogate position in Elene’s case), and Juliana wars against her adversaries with an oratorical and forensic skill that elevates her above the typical virgin martyr. In language and action these characters are the female equivalents to the Germanic hero.

In the Christian heroic poetry other than Cynewulf’s the most prevalent female character is the counselor (whether failed, as is Eve in *Genesis B*, or

successful, as is Sarah in *Exodus*). Women give counsel in the secular heroic poetry as well, Wealhtheow in *Beowulf* being the most prominent example. One of the most discussed, and perhaps the most equivocal, of the female character types is the *frēofiuwebbe*, “peaceweaver.” In the past the term has had a domestic coloration, referring to a woman who had been given as a “peace token” by one tribe to another; however, L. John Sklute’s recent word-field study cautions against such an interpretation and, on contextual analysis, suggests a more political and diplomatic function. Only Ealhild in *Widsith*, Modthrytho in *Beowulf* and the night messenger in *Elene* are thus characterized, although Wealhtheow is described by the related term *fridusibb*. The inclination of scholars to apply the attribute of a *frēoŪwebbeto* characters who are not referred to as such (e.g., Eve and Sarah) only tends to obscure our understanding of the female functions of peaceweaving and counseling in the OE canon.

Although the first discussions of women in OE literature date to the 19th century, it is only within the last twenty years that concerted studies of them have been undertaken. For the most part the early commentaries and surveys, following the 19th-century attitudes about women, concluded that, in and out of the literature, women were socially inferior. There were exceptions, of course, that did present the Anglo-Saxon woman as socially responsible: for example, Sharon Turner in his *History of the Anglo Saxons* at the beginning of the century, Lina Eckenstein in *Woman under Monasticism* at the end. In the 20th century the ground-breaking arguments that systematically established Anglo-Saxon women’s autonomous position were those by Frank and Doris Stenton and, later, by Dorothy Whitelock and Christine Fell.

In literary criticism women characters, as a rule, were not chosen as subjects of inquiry but rather were part of excursions into genre, sources, or the lexicon. Except for Damico’s study of Wealhtheow, on those occasions when a woman character was singled out for analysis the approach was (and in some instances continues to be) allegorical. Feminist literary approaches to the characters in OE prose and poetry have been less intense and numerous than those in ME literature, a situation caused, in part by the conservative nature of scholarship in OE, in part by the language barrier, and in part by the lesser number of primary materials scholars have had available to them. Nonetheless, there has been a slow but steady advance. Questions relating to women’s personal autonomy, for example, have brought into the foreground portraits of aristocratic women with social and political strength, and religious women with independent status (Fell; Stafford). Questions of voice and style have gone toward pinpointing the distinct differences in impulse and expression between women’s talk and men’s (Belanoff), and questions related to feminine imagery and structure have offered alternative readings to traditionally male-oriented

texts (Heffernan). In general current feminist approaches lean more toward realistic interpretations, placing the characters in literary, social, or historical contexts.

Worcester Fragments

A group of fragments of medieval English polyphonic music, 62 leaves in all, removed from the bindings of manuscripts originally belonging to the Dean and Chapter Library, Worcester, that represent the incomplete remains of perhaps as many as a half-dozen music volumes. Forty-three leaves are in Worcester Cathedral Library, while the remainder are in the Bodleian Library and the British Library. The reclamation of most of these pages took place during the years 1906–26, when the library was being renovated and the manuscripts were catalogued by Floyer. The discovery in 1990 of a partial bifolio of music in another Worcester manuscript in this library suggests that there may be additional fragments remaining to be recovered from the covers and spines of other Worcester manuscripts that remain in their medieval bindings, not only in the Cathedral Library but also in those books dispersed to other collections in England. The 43 leaves in the Chapter Library are catalogued together under a single shelf number, Add. 68. The 27 leaves in the Bodleian Library have been assembled into a composite manuscript, Latin liturgical d. 20, which is made up of actual manuscript pages and rotographic copies of pages from Worcester and the British Library. The British Library manuscript (Add. 25013) comprises two leaves and two fragments in London.

Worcester Cathedral Chapter Library, originally one of the largest in medieval Britain, is today one of only two medieval monastic libraries that have remained in place and relatively intact following the suppression of the monasteries in the 16th century. Because of this good fortune we have access to a body of English polyphonic music unprecedented in its size and scope that was produced over a timespan of more than a century. Most of the manuscript pages appear to have been produced in the 13th century, perhaps at Worcester

Cathedral, though there is no conclusive evidence to support this often repeated supposition regarding provenance. Additions of new polyphonic works to a number of the leaves by a number of scribes seem to have taken place throughout the 14th century. These additions suggest that the original music books may have remained in use and intact until shortly before their dismemberment in the late 14th or early 15th century. The survival of the fragments to our own time is utterly fortuitous, as it appears that they were consigned to the binder's waste bin at the very time that the Cathedral Library was undertaking a rebinding campaign for many of its manuscripts. The incorporation of leaves from these dismembered music books into manuscripts whose contents were unrelated to music or the mass and divine office no doubt saved them from the destruction accorded virtually every medieval Catholic service book during the reign of Henry VIII and the Protectorate of Oliver Cromwell.

The fragments vary not only in size, format, content, and date but also in their state of preservation. At least two different groups of leaves preserve polyphonic music on pages that appear to have come originally from manuscripts devoted to plainsong. Two other groups were part of large anthologies of polyphony. One of the latter contained at least 131 folios, the largest manuscript from 13th-century England to have a significant amount of its contents extant. A second preserves medieval foliation up to sixteen. The remaining fragments may have come from at least another four separate music manuscripts. Three of these are small pieces of pages from one or more fine music books. Any attempt to reconstruct the originals from the evidence of these fragments is virtually impossible. The leaves in the Bodleian Library are clearly related to the two larger manuscript books, as are the fragments in the British Library. Paleographical connections between these two groups of leaves from the two anthologies, even though they differ in size and format, strongly suggest that both parent manuscripts were produced in the same scriptorium.

Over 110 anonymous individual musical compositions are contained in this body of fragments. More than 80 percent are for three voices; the remainder are for two or four. They set a wide variety of sacred texts including those from the mass, both Proper and Ordinary (with and without tropes), the divine office, and extraliturgical devotional texts. In this latter group the bulk of the settings are in praise of the Virgin Mary. The genres represented include organal settings, motets (of three different types: whole-chant settings, motets on a *pes*, and motets based on a portion of a *cantus firmus*), conducti, troped chant settings, English discant, and English cantilena. Because the manuscripts vary in age they contain compositions in varying styles. Some of the earliest do not have a determinable rhythmic pattern, while others employ the most up-to-date notational devices of the late 13th century, which often display the

English penchant for trochaic rhythms. Some of the later additions to certain leaves are notationally advanced as well. Notable compositional devices include the use of rota, rondellus, and voice exchange. Also of note is an apparent increase in the use of four voices in the later-13th-century compositions, a pattern not retained after the early 14th century. The musical, liturgical, and compositional richness and diversity of the works found in this large group of fragments suggests that vibrant centers of musical activity existed in 13th-century England, one of which was perhaps at Worcester Cathedral itself.

Writs

The Anglo-Saxon writ, or *breve* in Latin, dates at least back to the time of Alfred the Great. It was a short letter, written in English, sent by the king and authenticated by his seal, ordering someone—usually the sheriff—to carry out a royal command. These terse and direct communications, so different from the cumbersome diplomas of continental monarchs, provided easy and efficient contact between the court and outlying regions. Because William I and his successors recognized its usefulness, the writ was one of the Anglo-Saxon instruments of government to survive, although the language became Latin.

Henry II took these Anglo-Norman administrative writs and “judicialized” them. Instead of occasional royal interventions in local or feudal courts they became instruments for regular and routine extension of the king’s jurisdiction over nonroyal courts. Under Henry II writs *de cursu* could be purchased from the chancery, enabling the purchaser to initiate suits in the royal court or to secure transfer from a local court or from his lord’s feudal court. Certain writs initiated possessory assizes, directing the sheriff to summon a jury to settle a question of landholding. Other writs, such as the writ of right or the *praecipe*, still commanded someone to do something, such as to do justice to the purchaser or restore a landholding to him.

Disobedience to the writ would place the addressee in contempt of a royal command and cause him to be summoned to the king’s court to answer the charge, in effect transferring the case there. By the end of the 13th century new writs were no longer readily available. Litigants for whom no appropriate writ existed could find no remedy under common law, and they had to petition the chancellor, opening the way for chancery jurisdiction.

The late-12th-century legal treatise known as *Glanville* consists in large part of a collection of writs with commentaries on how the proceeding should progress following issue of the original writ. It gives nineteen writs initiating actions and about 30 dealing with subsequent steps in the proceedings. The treatise we attribute to Bracton, the successor to *Glanville*, also follows to some extent a writ-based scheme of organization. Registers of writs, useful to royal clerks and to litigants or their representatives, date from the early 13th century

Wulf and Eadwacer

The nineteen-line *Wulf and Eadwacer* is one of the few OE poems generally agreed to have a female narrator, but it is also one of the most obscure of all OE poems. The exasperated comment of Benjamin Thorpe, the poem's 19th-century editor, "of this I can make no sense," fairly typifies the reaction of many readers to this day. Critics agree that the poem is an expression of suffering, but there is little agreement on the narrative context of that suffering, and a remarkable diversity of readings has been proposed. Because the only extant copy of the poem, in the Exeter Book miscellany of OE poetry, is separated from a series of riddles by no clear paleographical demarcation, early commentary regarded the poem as a riddle, the proposed solutions of which included an ingenious but now discredited theory that it is an autobiographical riddle by the poet Cynewulf. Other proposed interpretations have associated the poem with Germanic legends, especially the Odoacer legends, a connection most recently and convincingly argued by Joseph Harris. It has also been read as a dog's lustful dream of a wolf, a charm against disease, and a complaint about bad copying.

The most widely accepted reading today is that the poem is a *Frauenlied* ("woman's song") whose unnamed speaker is a woman lamenting separation from her lover. She is on one island; her lover, Wulf, is on another. They are kept apart by some hostile figure, apparently a man named Eadwacer, who may be the woman's husband; however, it has also been suggested that Wulf is her husband—or son—and that Eadwacer is not a name but merely a noun meaning "property watcher."

Wulfstan of York (d. 1023)

Bishop of London 996–1002, bishop of Worcester 1002–16, and archbishop of York 1002–23, who served two kings (Æthelred II and Cnut) as adviser and author of legislation while addressing the pressing moral and ecclesiastical issues of his time. One of two great stylists in the history of OE prose (with Ælfric), Wulfstan had a distinguished career as a homilist and statesman. Although educated as a Benedictine, he was very much a public figure who began signing himself “Lupus” (“Wolf”) early in his career, as he developed a reputation for spoken and written eloquence and for moral reform. The 12th-century *Liber Eliensis* (*Book of Ely*) provides the only medieval information, much of that questionable, about his life.

When he assumed the sees of Worcester and York in plurality (holding both simultaneously) upon the death in 1002 of Archbishop Eadulf, Wulfstan had experienced the worst ravages of the Danes and the largely ineffectual responses of Æthelred’s army. With its rich library and scriptorium removed from the worst of the fighting Worcester provided him an opportunity to study important patristic and canonical texts and thus to develop as a writer and reformer. Much of his work was also done at York, where he performed the

functions of a leader of the church. Extant manuscripts from both centers show Wulfstan's hand in the annotations. In addition several versions of his "commonplace book" survive, containing collections of materials intended for use in his own work. Either at Worcester or York he wrote versified entries for 957 and 975 in the D version of the Anglo-Saxon Chronicle.

Wulfstan's reputation grows from his sermons. These include a series of eschatological works, impassioned calls for repentance in response to signs of the coming of Doomsday. Another series on the elements of Christian faith treats the subjects of baptism, the Creed, the gifts of the Holy Spirit, and the duties of a Christian. In both series he draws on a variety of Latin sources largely from the Carolingian period and shapes his work to specific audiences. Only two of his sermons are proper to the church year, and those address the matter of penance during Lent. Wulfstan's sermons are topical, hortative, and utilitarian messages rather than explications of the Gospels or hagiographic narratives.

The best-known sermon also seems to have been the most popular in its time: *Sermo Lupi ad Anglos* (*The Sermon of Wulfstan to the English*), so called from the opening words of its rubric. Surviving in five manuscript versions, this work probably was composed in 1014, the year in which Æthelred was exiled. The *Sermo Lupi* is noteworthy for drawing on themes and materials that engaged Wulfstan throughout his career, here brought together and presented urgently when it seemed that God was punishing the English at the hands of the Danes. In particular Wulfstan uses phrases from his eschatological sermons in depicting the present evils that presage the end of the world. He ends with a typical exhortation to return to the faith of baptism, where there is protection from the fires of hell.

As trusted counselor to Æthelred, and to his Danish successor Cnut, Wulfstan wrote a variety of legislation intended to reassert the laws of earlier Anglo-Saxon kings and bring order to a country that had been unsettled by war and the influx of Scandinavians. Although he put into writing edicts that had been decreed by the ruling witan, or council, Wulfstan echoed there the concerns about present conditions and the urgency for change expressed in his homiletic writings. The laws are of three distinct types: short codes addressing such specific issues as the need to christianize the Danelaw, protect the clergy and the church, and reinforce a hierarchical social order consistent with the past; drafts of legislation for Æthelred and Cnut; and a comprehensive, formal code for Cnut. Through these legal writings Wulfstan used his influence to press for social, moral, religious, and political reforms extending even to the obligations of the king.

Beginning about 1005 a remarkable interchange occurred between Wulfstan and his talented contemporary Abbot Ælfric of Eynsham. Wulfstan requested

from Ælfric two pastoral letters in Latin treating duties of the secular clergy. Shortly thereafter he asked Ælfric to translate the letters into OE. Although the versions that survive today bear evidence of Wulfstan's revisions, they are important because they strongly influenced his own prescriptions for the secular clergy, the *Canons of Edgar*, as well as the code he drafted for Æthelred at Enham in 1008. These and other letters by Ælfric formed part of a group of canonistic materials including Frankish capitularies and Wulfstan's translation of Amalarius's *De regulacanonorum*., materials that underlie one of Wulfstan's sermons on baptism, his *Institutes of Polity*, and certain legal codes, in addition to the *Canons of Edgar*.

Because they provide yet another strong example of his reforming philosophy, Wulfstan's own canonistic works command interest. The *Canons of Edgar*, so-called because they hark back to better times during the reign of Edgar, provide instruction on proper conduct and training for the secular clergy and detailed instructions on their duties, including how to conduct the mass. The *Institutes of Polity* form a treatise on the organization of society, an early example of estates literature that attempts to define the duties of each class. His lengthy discussion of the bishop's role provides insight into the career Wulfstan fashioned for himself. Wulfstan also translated prose portions of the Benedictine office into OE, presumably to help the secular clergy with their devotions.

The effectiveness of Wulfstan's writing owes much to his rhythmic style, distinctive vocabulary, and use of rhetorical figures. He usually wrote with two-stress, alliterating, sometimes rhyming phrases syntactically independent of one another, which he could use to build toward a powerful climax. His stylistic touches include a large stock of intensifying words, repeated phrases, and forceful compounds. Figures of sound as taught by medieval manuals of rhetoric appear prominently in his work. All of these tools Wulfstan used in his attempts to restore England to the order and piety it had enjoyed before the Viking depredations.

Wyclif, John (ca. 1330–1384)

The most distinguished English philosopher and theologian of the later 14th century and a significant influence on the emergence of the heretical Lollard movement. His popular fame as a church reformer, however, is largely unjustified and only dates from the Reformation period.

Wyclif was probably born in Yorkshire. For most of his adult life he was a scholar and teacher at Oxford, and only in his last decade did he make any impression on a wider stage, first as a royal servant and then as the inspiration of heresy. He first appears in the records as a fellow of Merton College in 1356, as master of Balliol College in 1360, and later as warden of Canterbury Hall, an appointment that involved him in a struggle with the regular clergy. He proceeded from Arts to Theology in the late 1360s and became a doctor of theology about 1372–73. He was, it appears, a conventional academic and like most of his contemporaries was supported, as an absentee, by the revenues of various benefices, none of great value. He was granted a canonry at Lincoln in 1371, though the promise of a prebend there with substantial resources was never fulfilled. In 1374 he was granted the Leicestershire benefice of Lutterworth, which was in the gift of the crown.

This undoubtedly was a reward for services as a polemicist and a diplomat. He defended the crown's right to tax the clergy and even its violation of sanctuary in order to arrest crown debtors, and in 1374 he took part in a diplomatic mission to Bruges. By 1378 he was compelled to withdraw from politics, although his lay patrons continued to protect him from the assaults of church authorities who had secured papal condemnation of his views on the subject of civil and divine lordship. In 1381 he was forced to leave Oxford, retiring to Lutterworth, where he died of a stroke at the end of 1384. Although his enemies alleged that he had inspired the Peasant Rebellion of 1381, this view cannot be substantiated and his earlier strong royalism makes it inherently unlikely.

Increasing knowledge of the development of scholastic philosophy has enhanced Wyclif's reputation as a thinker. A man of great learning and incisive mind, he was a vigorous defender of realist metaphysics against the nominalism of William of Ockham. In this he followed the tradition active during his formative years in Oxford, but he went beyond his teachers as an independent thinker. As a philosopher his views remained acceptable, but when he began teaching theology he clashed with the authorities.

His early theological concern with questions of dominion and grace probably arose more from his activities as a royal servant than from philosophical principles. Concurrently with his royal service, however, he became involved in biblical studies, writing a commentary on the whole Bible, something none of his contemporaries did. His reverence for scripture led to a fundamentalist view of the Bible as eternally present in God and probably influenced his denial of transubstantiation in the eucharist, an opinion in accord with his metaphysical views. There has been recent debate on whether metaphysics or biblicism gave the first impetus to this opinion, the issue that led to his final breach with orthodoxy. Even by the end of his life Wyclif had

probably not worked out his precise belief in the nature of the eucharist, but it may have come close to the later Lutheran doctrine of consubstantiation.

His influence survived his death, and his eucharistic views were, in a simplified form, one of the hallmarks of later Lollardy. More important perhaps was the production by his followers, under the influence of his biblicism, of two English versions of the Bible, the staple reading for heretical groups and material for works of orthodox devotion. His philosophical views were taught for a time in Oxford and spread also to Bohemia, where they influenced the thought of religious reformers. Later his theological teachings also reached Bohemia and probably contributed to the more radical wing of Hussite thought. A substantial number of Wycliffite manuscripts have survived in libraries there.

By this time the church authorities were taking steps against his writings. Forty-five articles from his works were condemned at Prague in 1403, 267 articles were condemned after Archbishop Arundel's purge at Oxford in 1409, and the attacks continued at the councils of Rome (1413) and Constance (1415). At the last a command was issued for the exhumation and burning of his body, though this part of the sentence was not carried out until 1428.

Wycliffite Texts

Works associated with the heretic John Wyclif (d. 1384) and his English followers, the Wycliffites or Lollards (terms we should probably use synonymously). Although we know Wyclif sometimes wrote in English, we now have only Latin texts we can confidently assign to him. All the English texts that have reached us are probably the work of his followers. These texts develop the vernacular as a vehicle for expressing theological and political ideas; some are also fine pieces of writing in their own right. Most Wycliffite texts are in prose; many remain unedited.

Scholars long tried to assign particular texts to particular persons. If we set aside the Latin texts we know to be by Wyclif, however, we are increasingly having to accept that with few exceptions these texts remain anonymous. We cannot date most of them any more precisely than after ca. 1380 (a date determined by their occasional topical allusions) and before ca. 1420 (a date determined by the handwriting in their manuscripts). For some we cannot even do this, usually because they have reached us only in late, even postmedieval, copies.

A large body of these texts survives, for the Wycliffites were exceptional among medieval heretics in the importance they gave the written word. Wyclif evolved the views that finally carried him into heterodoxy during a distinguished career as a philosopher and theologian at Oxford. His was undoubtedly a charismatic presence, and he successfully spread his views in lecture hall and from pulpit. But he also prepared the many texts that allowed these views to be influential far beyond England and well after he had died. The able young scholars he inspired quickly realized how well the written word could serve their purposes. Besides attempting to spread the Wycliffite message around the country in person, therefore, they systematically set about the large-scale production and distribution of texts. The preachers and teachers they inspired did likewise, though on a smaller scale. And texts remained the valued possession of the tightly knit communities that kept the Wycliffite message alive until the English Reformation.

Nevertheless, because the Wycliffites came to be persecuted as heretics, many of their texts must be lost to us. Wyclif's own views were condemned three times during his lifetime. They had caused him to challenge the authority of members of the established church with increasing virulence, and they provided his followers with a justification in theory for dismissing that church's authority in fact. When these followers showed some success in providing the laity with the spiritual learning they claimed the church was maliciously withholding, the church's hostility was ensured. From 1401 on the

penalty for a relapse into heresy could be death by burning, and burnings took place from that year until Lollard merged with Reformer in the 16th century. Books, too, were burned, sometimes along with their owners. We would more than halve our present knowledge of both Wyclif's and the Wycliffites' Latin texts if they had not survived outside England (especially in Bohemia, home of the reformer and heretic Jan Hus). That we know as much as we do of the vernacular texts, whose only chance of survival lay at home, testifies to how well-organized and influential the Wycliffite movement must initially have been.

Wyclif's own writings range from the philosophical and political to the theological, exegetical, and homiletic: those that seem most directly to have influenced his English followers include sermons, a commentary on the Ten Commandments, and the *Opus evangelicum*, a stridently polemical commentary on Matthew 5–7 and 23–25 and John 13–17. These are less central to the Wycliffite textual corpus, however, than the texts designed by Wyclif's immediate followers. The latter texts almost certainly stem from team endeavor, for they bear witness to elaborate processes of correction and revision. They also seem to have come from some well-endowed center or centers when the concern for secrecy was not yet pressing, for they often survive in multiple copies and in good-quality manuscripts. Most prominently they include two major versions of a translation of the whole Bible into English; they also include an extensive vernacular sermon cycle, part of a similar cycle in Latin, two major versions of a preacher's handbook in Latin, and three versions of a vernacular commentary on the Gospels.

There are also other, more peripheral texts. These often reach us in unique, sometimes incomplete, copies in manuscripts of relatively poor quality. Their number and variety speaks to how voracious the Wycliffite appetite for the written word must have been. So do their sources, for their writers often seem simply to have taken over and adapted almost anything that came to hand—texts by Wyclif, texts by other Wycliffites, texts by all sorts of orthodox writers. They include further texts appropriate to an evangelical program—sermons and sermon notes, a concordance and summaries to facilitate use of the Bible translation, preachers' proof texts. They also include didactic treatises—several on the Pater Noster, for example, as well as versions of such well-known orthodox works as Rolle's *Psalter Commentary*; the *Ancrene Wisse*, and *The Poor Caitiff*. More open confrontations with authority appear in polemical tracts, political manifestos, even satirical poems; still other works were molded by the judicial response to the Wyclif Fites—model answers to help suspects on trial for heresy, two firsthand accounts of their trials by such suspects, and a Latin Apocalypse commentary written by a suspect while in prison.

We may have assigned some of these texts wrongly to the movement. We have tended to rely on ideological criteria alone when trying to decide on a text's Wycliffite affiliations. But the Wycliffites drew their ideas from well-established sources, and their discussion then caused them to become widely pervasive. These ideas were never entirely distinctive. It does seem, however, that for ideological reasons the Wycliffites tried to speak and write distinctively. If we turn our attention to the rhetorical and stylistic features of known Wycliffite texts, we may be able to refine our criteria for assigning other texts to the movement. At the very least we would enhance our understanding of the Wycliffites' literary achievement.

Wyntoun, Andrew (ca. 1350-ca. 1422)

A canon regular at St. Andrews who became prior of St. Serf's Inch, Lochleven, by the early 1390s; author of the *Orygynale Cronykil of Scotland*, a universal history in four-stress couplets, beginning with the creation of the angels and running (in its later forms) to 1408. The *Cronykil* survives in three versions, the last completed ca. 1420; it incorporates some material from Barbour's *Bruce* as well as drawing on a wide range of other historical sources, both English and Scottish.

Year Books

Of all the materials available to the historian of medieval English law the year books are preeminent. It is through their pages that we experience, almost at first hand, the cut and thrust of skilled advocacy that refined the common law. They may also claim (in Maitland's words) a "unique position ... in the history of civilization, in the history of mankind," being the earliest systematic reports of oral debate from anywhere in Europe.

Though more concerned with pretrial procedure and oral pleading than with the process of trial and judgment, they are the lineal ancestors of the law reports published throughout the common-law world today. Indeed there is no meaningful break between the year books and the "reports" of later times; the tradition of reporting was more or less continuous. All English law reports before 1500 are generally reckoned as "year books"; the name refers simply to the custom of citing them by regnal year. For reports after 1500, however, the term is reserved for those texts that were *printed* as year books in the 16th century, the last of which are dated to the 27th year of Henry VIII's reign (1535).

The reports preserve in Anglo-French (or law French) the arguments of counsel and judges in the central royal courts in Westminster Hall, especially the Common Pleas, and (until 1330) on the traveling circuits known as the eyre. A few have also been found from local courts. French was the language of the courts when they began, but not when they ended; the style, however, is throughout one of *precis* rather than a verbatim record. The earliest reports date from the 1250s or 1260s, and by the 1290s they were being regularly produced and circulated, though the annual format was not established as the norm before the end of the century. How and why they began is a matter of doubt; they may well have originated from a case method of instruction in the shadowy law school that preceded the Inns of Court. An old legend that the reporters were once crown officials was demolished by Maitland. If the continuity and growing regularity suggest some kind of organization, no evidence of such organization has yet come to light.

The identity of the reporters is unknown before the 15th century. The earliest so far identified, John Bryt (fl. 1410), was an obscure apprentice of the law who attended and reported cases at Wiltshire assizes as well as in Westminster Hall in term-time. Several reporters later in the century are known to have continued reporting throughout their careers, a characteristic of the better reporters of later times; the earliest example is Roger Townshend (d. 1493), who began in the 1450s as a student of Lincoln's Inn and was still reporting as a judge in the 1480s.

The precious heritage of the year books still languishes in a state of some neglect. The old printed texts are often inadequate and cannot safely be used without recourse to manuscripts. They are poorly indexed, if at all, and use has still to be made of alphabetical reference books printed in the 16th and 17th centuries. Valiant work has been done on the earlier year-book manuscripts by modern editors, beginning with the Rolls Series (1866–1911) and followed in the present century by the Seiden Society and Ames Foundation. For most years, however, there are no modern editions; no small number of wholly unprinted texts await attention.

Most of the year books have still to be approached through the ten-volume "vulgate" reprint of 1679–80, itself recently reprinted in facsimile (Abingdon: Professional Books, 1981); and the only printed text of the later years of Edward II is the inaccurate "Maynard" edition of 1678. A full bibliography of the pre-1678 printed editions is found in the second edition of the *Short Title Catalogue of Books Printed in England... before 1640*. Some modern editions, mostly of years missing from the vulgate, have been published in the Rolls Series (part of Edward I and 11–20 Edward III), by the Seiden Society (Edward I before 1290, most of 1–14 Edward II, and some later examples), and by the Ames Foundation (much of Richard II). These editions give variant readings, relevant material from the plea rolls, parallel translations, and indexes. There is a preliminary list of manuscripts by Jennifer Nicolson, *Register of Manuscriptsof Year Books Extant* (London: Historical Manuscripts Commission, for the Seiden Society, 1956).

Yeavinger

Bedes mention of “Ad Gefrin” (“Hill of the Goats”), the royal palace of the Northumbrian king Edwin, visited by the missionary Paulinus, has always been taken to refer to Yeavinger, a hill in Northumberland. The probable site of the palace was identified from aerial photographs in 1949 and excavated in the 1950s ([fig. 155](#)).

The site was already important to the local Celtic Britons of Bernicia. Although there is a twelve-acre Iron Age hill fort on the summit, the focus of Celtic activity was on a lower slope overlooking the River Glenn and was defined by cremation burials concentrated near a western ring ditch with a central standing stone, encircled by stone uprights, and a ditched barrow to the east. A fortlike Great Enclosure was built nearby and cremation gave way to inhumation between A.D. 300 and 500, when a wooden structure with a central post replaced the western stone complex, while the eastern round barrow received its own central wooden post. The Celtic ritual function of the site was adapted after the mid-6th century by the Anglian invaders, who retained the Celtic place-names and continued to erect wooden posts. Celtic freestanding posts at Yeavinger had cognates in the Germanic world.

The absence of Romano-British objects shows that the first structures belonged to the 5th century or later, but only two objects from the site can be dated with any certainty: a gold coin and a silver-inlaid iron buckle, both 7th century. Differing interpretations identify the earliest buildings as Anglian or British. The more important are accepted as Anglian, including a probable pagan temple, with associated freestanding posts and inhumation burials, and a wooden outdoor theater, whose formal antecedents are clearly Roman.

The largest of the excavated structures, the “great hall,” was aligned with the central post of the eastern round barrow and had a burial under a post at its eastern entrance. (A wooden stave with an iron tip and copper-alloy mount from this burial has been compared with objects from burials at Benty Grange, Derbyshire, and Sutton Hoo, Suffolk.) A partially excavated palisaded enclosure has been interpreted as a “corral” into which animals owed as tribute to the king were herded. Ox skulls associated with another structure could be evidence of ritual slaughter.

King Edwin of Northumbria introduced Christianity to the area ca. 627,

when Paulinus, the first archbishop of York, taught and baptized at Yeavinger. The burning of the complex may be linked to Edwins overthrow by Penda of Mercia and Cadwallon of Gwynedd ca. 632–33. Christianity survived, and a wooden church with a fenced graveyard, possibly reflecting the architectural tradition of Iona, was built over the southwestern corner of the destroyed fort. The wooden church was rebuilt later in the 7th century with an annex, which Douglas Mac Lean suggests may be a porticus, recalling the late-7th-century stone churches known from Wearmouth and Jarrow.

Because of the long occupation of the site, the numerous alterations of destruction and rebuilding, and the merging of cultures and styles Yeavinger poses many questions about patterns of settlement and assimilation, about the transition from paganism to Christianity, and about the emergence of a dominant royal authority in the north.

York, Anglo-Saxon Churches in

Architecturally the ecclesiastical history of York begins in 627, when King Edwin erected a wooden church dedicated to St. Peter for his own baptism. The plan of Edwins church does not survive. The fact that it was used for baptism suggests that it may have been a central-plan structure, but this is far from certain. The wooden church was later enclosed in stone, a process begun by

Edwin shortly before his death and completed by his successor Oswald. When St. Wilfrid became bishop of York in 669, he whitewashed the walls of the church, added glass to the windows, and covered the roof with sheets of lead.

No trace of the plan or fabric of the Anglo-Saxon Church of St. Peter survives, although its presence is noted in documentary sources. Alcuin writes that Archbishop Ælberht (767–80) raised an altar to St. Paul in the church, and Simeon of Durham records the crowning of King Eardwulf at Ælberht's altar in 796. Fragments of Anglo-Saxon sculpture from beneath the present minster provide material evidence for pre-Conquest use of the site.

According to the Anglo-Saxon Chronicle St. Peter's was burned and looted by the Danes in 1069 and 1075, respectively. The earliest surviving structural remains are the foundation of the Norman Cathedral built by Archbishop Thomas of Bayeux (1069–1100).

A church dedicated to the *alma sophia* (Holy Wisdom) was also built by Archbishop Ælberht and dedicated in October 780. Alcuin describes the church as having 30 altars, rounded arches, porticus, and upper chambers, details that call to mind Wilfrid's church at Hexham. The accuracy of Alcuin's description has been questioned. No trace of the church has ever been discovered, and its precise location remains uncertain.

Richard Morris has suggested that the *alma sophia* was most likely a monastic church, hence the need for 30 altars, located in the Bishophill district of York across the Ouse from St. Peter's. Prior to Danish settlement York would then have had two ecclesiastical centers, serving different but related functions, and perhaps also reflecting the multifocal settlement of the area. Moreover, if Christ can be identified as Divine Wisdom, the dedication of York's two major churches may have been patterned after those of 8th-century Rome and Canterbury.

York, City of

Unlike the great majority of medieval English cities York was founded as an act of deliberate will. In A.D. 71 the Roman commander Q. Petilius Cerialis chose a previously obscure site at a river crossing on the Ouse as headquarters for the Ninth Legion when it advanced from Lincoln to invade the territory of

the Brigantes. Within a few years Eboracum was the most important military center and most substantial civilian settlement, or *colonia*, in the north. Despite the many vicissitudes ahead, for at least the next 1,500 years York was usually the most important provincial city in the country (fig. 156). All in all the aldermen of York during the 1390s were still justified in describing themselves as the rulers of the “secounde citee du Roialme.”

Of the many phases in the complex history of medieval York the most mysterious by far was the two centuries, ca. 400-ca. 600, during which groups of Anglians gradually infiltrated the southern part of what came to be the kingdom of Northumbria. By the early 7th century York had reemerged as a major power base of Edwin (616–32), a monarch whose authority was recognized—in however vague a fashion—throughout the whole of Anglo-Saxon England. More significantly he was the first king of Northumbria to be baptized a Christian, at York on Easter Day 627. From that date on there was never any doubt that the church of York, raised to metropolitan status in 735, would enjoy primacy in the ecclesiastical organization of northern England. By the late 8th century, when Alcuin, its greatest scholar, was summoned to Charlemagne’s court to serve as one of his intellectual elite, York Minster was the most active center of higher learning in England.

Alcuin himself lived long enough to lament the destruction caused by the first Viking attacks on the holy places of Northumbria, but it was only in 866–67 that a great Danish army, led by Ivar the Boneless, ejected the last Anglian rulers from York itself. The two centuries (866–1066) of Viking York (Jorvik) are poorly recorded. However, during the 1970s and 1980s the lack of written documentation has been redeemed by perhaps the most intensive excavations hitherto conducted in any medieval English town. The York Archaeological Trust’s recreation of an urban street at the Jorvik Viking Centre provides modern tourists with a unique opportunity to experience the bustling if squalid quality of life in what was one of the great entrepôts of the Scandinavian world. According to one contemporary, writing about the year 1000, York was then a city “crammed with the goods of traders who come from all parts of the world, especially those of the Danish people.”

Much of that commercial activity, and much of York’s economic prosperity, was temporarily reversed after the battles of Stamford Bridge and Hastings in 1066. Indeed the most obvious surviving memorial to the Norman regime in York are the remains (misleadingly known as Clifford’s Tower) of the most important royal castle in the north. It was here that the king himself, as well as his officials, usually stayed during their frequent visits; it was here that the sheriff of Yorkshire administered the largest county on behalf of his monarch; and it was here, less happily, that the Jews of York were massacred in March 1190, when they vainly sought royal protection.

More impressive still were the successive ecclesiastical building campaigns that transformed the physical appearance of York during the two centuries after the Conquest. Both York Minster itself and the Benedictine Abbey of St. Marys, the richest monastery in the north, were built—first in large-scale Romanesque and then in even more spectacular Gothic—and during the course of the 13th century mendicant convents of the Franciscans, Dominicans, Carmelites, and Austin friars were gradually added to the city's many existing smaller religious houses and hospitals.

Equally revealing in a different sphere was the constant building and rebuilding of the parish churches. That there were at least 40 of these by the 13th century (of which half survive, from a total greater than in any English town except London and Winchester) testifies to the economic growth of a city that probably had a total population of over 15,000 by the eve of the Black Death.

It is something of a paradox that the citizens of York have left us the greatest evidence of their personal attitudes and priorities at exactly the period when they were forced to wrestle with the strains of acute demographic and economic recession. From the 1370s on the archives of the city, minster, and archbishop (above all perhaps the latter's probate registers) survive in considerable quantity; as a result recent research has made the canons, merchants, and artisans of 15th-century York better known than their counterparts anywhere in England. It is, for instance, now quite clear that despite the onslaught of plague York still enjoyed a considerable degree of economic and artistic efflorescence until at least the middle of the 15th century.

The reputation of the city's stained glass and of its famous Corpus Christi plays was at its height in the years around 1400. It was exactly then that the merchant oligarchy that ruled York was not only at its most individually wealthy but had also recently acquired (18 May 1396) a charter from Richard II elevating the city to county status, an urban privilege previously only secured by London and Bristol.

A century later the high self-confidence of the citizens was rapidly evaporating, under the evils of inadequate recruitment from the countryside and successful economic competition from London's merchants and the new textile centers of West Yorkshire. For us the consolation for the townsmen's impoverished years is that the post-Reformation inhabitants of York nearly always lacked the resources to destroy the medieval monuments that now make the city one of the most-visited medieval towns of the world.

York, Ecclesiastical Province of

The city of York, where Constantine the Great was probably proclaimed Roman emperor in A.D. 306, is almost as old as Christianity itself, and as early as 314 there existed a bishop of York, probably named Eburius, known to have attended the Council of Arles.

More significantly it seems to have been memories in faraway Italy of the long years during which Eboracum, or York, had been the capital of the Romano-British province of *Britannia inferiora* that influenced Pope Gregory's famous and fateful letter of 601 to Augustine of Canterbury. In what is the single most important document for the history of the church of York the pope recommended that after the Anglo-Saxon peoples had been converted, they should be spiritually subject to many bishops but to only two archbishops, one at London (later Canterbury) and one at Eboracum.

After the initial missionary successes in Yorkshire of one of Augustine's disciples, Paulinus, consecrated as first post-Roman bishop of York in 625, the new see proved vulnerable to pagan revivals and confrontations between warring Christian factions. The controversial Wilfrid (archbishop, 664–78) was, however, able to impose Roman usages in his cathedral see, and in 735 York was raised to the archiepiscopal dignity and the metropolitan primacy in northern England it has never lost.

The history of the province and archdiocese of York in the later Anglo-Saxon period is nevertheless mysterious. Not one of the several churches known to have served at various times as York Minster has yet been discovered by archaeological excavation, and it seems certain that much of the pastoral work involved in supervising so vast a diocese was delegated to subordinate "minsters," notably the famous churches of Ripon, Beverley, and Southwell in Nottinghamshire, all well-endowed pilgrimage centers long before the Conquest.

York Minster itself harbored a famous library and a distinguished reputation for scholarship during the 50 years or so before the death of Alcuin in 804. Thereafter neither learning at the cathedral nor the spiritual nor political authority of the archbishop altogether recovered from the dislocation of the Viking invasion—until the Normans restored order and discipline to the northern ecclesiastical scene after 1066.

During the first 50 years after William the Conqueror's "harrying of the north" in 1069–70 a series of gifted Norman and French archbishops placed the affairs of the archdiocese on a new and more secure footing. Admittedly it took longer to regularize York's supremacy over the two other sees, Carlisle and Durham, in the northern province. In addition the dispute for primacy between Canterbury and York remained potentially explosive until the end of the Middle Ages. Meanwhile the archbishop's own cathedral, York Minster, was built and rebuilt, more or less continuously, during the 400 years preceding its final service of consecration and dedication in July 1472. By then—indeed long before then—it was the largest cathedral in England.

Even more essential to the welfare of the diocese and province of York was the establishment of a large complement of cathedral canons (36 after 1294), together with their vicars-choral and an increasingly numerous group of chantry priests. The great majority of these secular canons were always absent from their cathedral, for not the least important function of the churches of York, Beverley, Ripon, and Southwell was to divert wealth to the hands of ecclesiastical administrators in the service of the national government. However, the copious evidence of York's splendid series of archiepiscopal registers from the pontificate of Walter de Gray (1215–55) onward leaves no doubt of the central role played by the residentiary canons in supervising a vast disciplinary and pastoral machine with, or even without, the archbishop himself.

A proper assessment of the religious life of the archdiocese in the later Middle Ages is by no means easy. Despite the popular cult of Richard Scrope after his execution, on orders of Henry IV, for his role in the Percy rebellion of 1405, the archbishops rarely emerge as vivid figures from their administrative records. Nevertheless, and whether under archiepiscopal sponsorship or not, recent research has done much to suggest that a diocese that produced both the most influential heretic (John Wyclif) and the most influential mystical writer (Richard Rolle) of late-medieval England can hardly be found guilty of religious torpor.

York and Ripon Minsters

In 1154 the archdeacon of Canterbury, Roger of Pont l'Évêque (d. 1181), was elected archbishop of York, and shortly thereafter the rebuilding of the east end of St. Peter's Cathedral, damaged in a fire of 1137, began. The new choir was to become one of the great monuments of Transitional English Gothic architecture. It combined elements of traditional English Romanesque architecture with new Gothic features introduced to the north of England,

from France, via Cistercian architecture. This combination of traditional English forms with specific elements of French contemporary style would become a hallmark of English Gothic architecture.

Roger's choir was built outside of rather than on the walls of its Norman predecessor; nevertheless, its flat eastern wall and elevation, consisting of a tall nave arcade, single-arched false gallery, and clerestory with triple arcades and wall passage, preserved characteristic features of Anglo-Norman design. The choir was eight bays deep with aisles, an ambulatory, and an eastern transept (each arm consisting of a single bay), the latter a Cluniac innovation that appealed to English tastes. A pier with four detached shafts stood at the center of the opening of each arm of the transept from the choir wall. Elsewhere the choir was supported by clustered piers and clustered wall shafts that helped to unite the different parts of the structure visually. The choir was most likely designed to rival that of Canterbury; not only were the two churches traditional rivals, but there was animosity between Roger and Canterbury's archbishop, Thomas Becket.

Due to remodeling in 1391 the Transitional choir at York no longer survives. However, much of its original flavor is preserved in the choir at Ripon.

Rebuilding of the western transept of St. Peter's, York, commenced in the early 13th century. Under the influence of Cistercian architecture three square chapels were built on the eastern side of each arm, though they disappeared in the later rebuildings of the 13th and 14th centuries. Both arms of the transept are three bays deep, with an elevation consisting of arcade, false gallery decorated with plate tracery, and a low clerestory. The wooden high vault has been described as one of the finest examples of Early English wooden vaulting (Wilson, 1990: 170). The combination of lancets and rose window that crowns the south transept is a typically French detail added ca. 1250.

French influence continues in the nave (begun ca. 1291), the finest example of the 13th-century Rayonnant style in England. Here the clerestory is enlarged, flat, and decorated with bar tracery that extends down into the triforium level, visually uniting the two upper levels of the elevation. The narrow pointed arches of the nave arcade rise to triforium level, while slender wallshafts rise uninterrupted to the springing of the vaults, now level with the base of the clerestory. A French-style quadripartite vault was also planned; however, in 1345 the nave was covered with a wooden lierne vault decorated with gold stars on a blue field. The present vault is a 19th-century reproduction.

The increased French influence in the York nave may be due to the new French archbishop, John le Romeyn. The contributions of the local nobility are commemorated by statues in the openings of the triforium (one per bay) and by heraldic motifs in both the stonework and the stained-glass windows. The

western window was inserted in 1338.

Possibly as a concession to local taste some traditionally English elements are maintained; the nave is wide and supported by thick walls, and the profiles of piers and moldings are more complex than their French counterparts. While the design of the York nave did not have much of an impact on architecture beyond the diocese, the Rayonnant extension of tracery from window to wall surface would be developed to become an important feature of the English Perpendicular style.

Remodeling of the choir, begun in 1361 under the direction of local architect William Holton, was intended to continue the style of the nave into the east end of the church. However, the addition of Perpendicular tracery to both the windows and wall surfaces of the new choir makes the cathedral an example in microcosm of the development of 14th-century English architectural style.

Ripon was one of four minsters in the archdiocese of York, and it is therefore appropriate that the architecture of this subsidiary cathedral reflect that of the central minster. An Anglo-Saxon monastery dedicated to St. Peter, Ripon gained minster status in the 11th century. Its Gothic rebuilding began ca. 1160 when work commenced on a new choir, again under the patronage of the archbishop of York, Roger of Pont l'Évêque. The church was also rededicated at this time to Sts. Peter and Wilfrid (Hearn, 1983: 95). The choir at Ripon is only six bays deep and has no eastern transept, but its flat eastern wall and elevation, consisting of a tall nave arcade, low false gallery (glazed ca. 1300), and triple-arcaded clerestory with wall passage, mirrors that of York. As at York the clustered piers, recalling the compound piers of the Romanesque, are typically English. French influence is evident in the slender nave piers, narrow arches of the nave arcade, and pointed ribbed-groin vaults covering the aisles. Originally intended to be roofed with a quadripartite vault, the choir was ultimately covered by a flat wooden ceiling, which was replaced by a vault ca. 1300. The present vault is a 19th-century reproduction.

Hearn has suggested four phases for construction of the minster: 1) 1160s–1181: the choir, transepts, and chapter house were begun but left incomplete at Bishop Roger's death, which necessitated a scaling back in the plans; 2) 1180s: the choir transepts and chapter house were completed; 3) 1180s-1210: the nave and crossing tower were completed and the west front begun; 4) ca. 1217-ca. 1224: the west front was completed.

The transepts are three bays deep, half as long as the new choir but of equal width; two chapels built into the eastern side of each transept may reflect the early-13th-century design of the western transepts at York. Analysis of the elevation of the transept indicates that, as in the choir, a Gothic high vault was intended but that plans were changed at the clerestory level, possibly due to lack of funds.

Little of the 12th-century nave survives, though evidence suggests that it was modeled on the late-11th-century nave at York. The Ripon nave was aisleless, with a tall triforium, composed of alternating blind double bays with narrow arches and lighted single bays with wide arches, and a low clerestory displaying similar alternations. There is no indication that a high vault was planned, the architects seemingly preferring a flat wooden ceiling.

Although they had little influence outside of their immediate locality, both Ripon and York minsters are important examples of the birth and development of the Gothic style in the north of England. Beyond that they are important examples of the way in which architectural innovation might be used to political ends, expressing rivalry with Canterbury at York and dependence on York at Ripon.

York Virgin and Child

A stone block carved in relief presently in the east wall of York Minster's choir and measuring approximately 33 inches high by 15 inches wide. It is thought to have originally come from the Lady Altar of the Norman choir (ca. 1080), which apparently survived until 1361.

The Virgin holds the Child in both hands as in a Presentation or Adoration. This iconography has only one English parallel: a 12th-century ivory Virgin and Child (London, Victoria and Albert Museum A.25–1933), which may have been part of an Adoration group, since an ivory magus in the same style and scale and dyed the same greyish purple also survives. That this ivory Virgin came from a Yorkshire collection connects it more closely with the York relief.

The iconography may be Byzantine. The large Child raised above the Virgin's lap, his head almost level with hers, is paralleled in the mid-12th-century Mellon Madonna. But MacLagan finds similar parallels in combined Adoration and Nativity reliefs in Italy, southern France, and Spain (e.g., St. Gilles du Garde, ca. 1150–75; Parma Baptistery, ca. 1196), and this subject matter may be more closely connected with the York relief. MacLagan's stylistic parallels include the ambulatory sculptures at Toulouse, which head a well-established group of southern French and Spanish sculptures dating from the late 11th to mid-12th century, and the York relief probably finds its origin in this ambience. But the closest stylistic parallels are the relief figures at Lincoln, ca. 1145, and those made for Malmesbury Abbey between 1145 and 1169.

Zarnecki has suggested that the York relief was produced in the ambience of William, archbishop of York 1142, deposed 1147. After arguing his case in Rome William stayed with Roger of Sicily before being reinstated in 1153. William's travels could account for the stylistic and iconographic parallels of the relief and coincide with its date, which must be around the middle of the 12th century.
